QUICKSET Hedge, a name given to all sorts of hedge-fences which are constituted of any sort of living plants; but more especially of those of the white-thorn kind. Hedges of this nature compose the principal fences of this country. In the drier and better sorts of soil, those of the thorn kind generally prevail; but in most other situations, those of some other sorts of plants, according to the particular nature of the soils and exposures. The quicks or quicksets of the thorn sorts are commonly supposed to form the best hedges, when planted in the raised bank or dike method. The manner of placing them out in these, is different in different cases, both in respect to the form and number of the rows, as well as the distances of the plants from each other. Some think one regular or irregular row the most proper, others prefer two straight ones; and some suppose a few inches distance from plant to plant the most beneficial; while others think eight or nine inches to be much better. Strong well-grown quicksets are commonly preferred in all cases. It is remarked in the Essex Report, by one of the persons engaged in drawing it up, that in the parish

parish of Birdbrook, in the north-east part of it, "some excellent hawthorn hedges have been lately raised, by planting one row only at six inches asunder, rather than two rows nine inches or a foot apart. The hedges have not been cut down, nor do they require it, to thicken their bottoms, as they are, at this time, a complete protection against hogs, and in other respects form a beautiful and effectual fence. Nothing can be more evident, it is thought, than that a row of plants set thus, six inches distant from each other, must form a more complete and effectual fence at the bottom, than an equal number planted thus, at a double distance, and occupying the same length, but a greater depth of ground upon the hedge row." This reasoning of Mr. Vancouver's, Mr. Young observes, may, for aught he certainly knows, be conclusive, but it strikes him in a different light. It is true, that the plants in each row are, in the latter mode, at double the distance from each other than they are in the former; but it is to be observed, that in the double row, the plants are diagonally as near each other as in the single row, and, consequently, there is the same vacant space for any animal to pass through in the single row as in the double; and what must be a great advantage to the latter, the plants will shoot out their branches laterally on the out-sides at least, just as far as those in the single row, and twice as far lengthwise, meeting with no obstruction in their progress. Of course, it is naturally to be concluded, that the double-rowed plantation must form a fence, if not altogether twice as strong and secure, yet vastly stronger and securer than the single one. He does not, however, presume to set speculation against fact, as he has not seen the hedge noticed above, while Mr. Vancouver has. He has, however, himself planted one in a single row, as above described and recommended; the plants have grown well; the hedge is a good one, but would, he thinks, have been still better, if there had been two rows instead of one, as some others are that he has of that description.

In Suffex, the quickset hedges at Goodwood are capital, and deserving of every attention, being raised and trained in a most masterly manner. The duke of Richmond planted them about eighteen or twenty years ago. They surround a very considerable farm, and are in a wonderful state of preservation. They form an excellent fence, without the assistance of any ditch, bank, rail, or pale; consist of three rows of white-thorn plants, which spread three or four feet at bottom, but are clipped regularly and gradually to a thin edge at top; the shoots are so numerous, and trained with such care, that even in winter, without a leaf, the thickness is uncommon. By the young hedges now in training, it appears that one method pursued has been to plant the centre row first, and when that is well established, to add another on each side of it; at least this is done in these new hedges. They are kept in a state of garden cleanness; the branches are drawn into the line desired, by being tied with mat, or other lines, and the clipping done with the exactest attention; the union of the hedges with the gate-posts is close and perfect, and as to gap, &c. there is no such thing. How they have been preserved from cattle, but especially from sheep, is marvellous, if either are ever allowed to enter these closes;—an attention never ceasing, and a boundless expence, so far as necessary, must have been exerted. They cannot be recommended to the imitation of farmers on account of the trouble and expence of them, but they are beautiful as an object to the farming eye, and for their perfection, they merit all that can be said of them.

On the Walburton farm in the same district, there are some very good quickset hedges, which were planted about twenty-three years ago; the quick was set about two inches

asunder, and single; they are cut twice in a year; are four and a half feet high, and two feet thick. There is very little ground lost by the hedge, as it occupies only four feet. The same excellent sort of quickset hedges has also been made in some other places.

Here two rows of white-thorn plants are common, which are put on the bank of the ditch, care being taken not to have them too near it, for fear of its draining them too much and preventing their growth.

In some districts, where the cultivation is principally of the arable or tillage kind, and in exposed upland situations, there is frequently a great prejudice and objection to the introduction and formation of any sort of live hedges, whether of the quickset or any other description, as they take up much space, harbour birds and insects, greatly shade the grain, and tend to promote blight, rust, and mildew, by preventing the free circulation of air. Also in bleak exposures they are not raised without great difficulty. Such objections, however, speedily vanish where they are kept sufficiently low and well cut in and trained on the sides. See HEDGE and FENCE.

QUICKSILVER, a very ponderous fluid mineral, by the chemists called *mercury*. For the method of gaining, preparing it, &c. with its properties, uses, &c. see MERCURY.

Quicksilver, when rubbed down and blended with unctuous matters, forms a sort of ointment, which is useful in the curing of different diseases of the cuticular kind, as well as in destroying lice and other vermin that infest animals of different kinds, which form the live-stock of the farmer.

It has also been stated on the authority of Mr. Bradford, as communicated to the Society for the Encouragement of Arts, &c. to have been found useful in its crude state in destroying insects on fruit trees. On a plum-tree he made the following trials: he took a small awl, and pierced, sloping, through the rind, and into part of the wood of the branch, but not to the heart or pith of it; and poured in a small drop or two of the quicksilver, and stopp'd it up with a small wooden plug, made to fit the orifice: and the result was, he says, that the insects all dropt off from that very branch the next day; and in a day or two more, from off the other branches of the tree, without any other puncture: and the tree continued in full vigour, and thrived well all the summer after. Encouraged by this success, he next tried it upon an honeysuckle, the leaves of which were quite covered with them: and here he scraped away the top of the ground with a trowel, and run his awl, in the same sloping manner, into the main stem, just above the roots; but with the same caution as above, not quite to the inner pith; and the success was the same as before. The insects all dropt off dead the next day after the experiment was made.

These trials are said to have been confirmed by other experiments; but they are still in want of full and satisfactory confirmation.

QUICKSILVER, *Virgin*. See VIRGIN.

QUICKSILVER *Water*. See WATER.

QUICKSTADT, in *Geography*, a town of Norway, in the province of Aggerhuus; 42 miles N. of Christiania.

QUICK-WORK, in a *Ship*, is a general name given to all that part of a ship which is under the surface of the water, when she is laden fit for a sea-voyage. The term is also applied, occasionally, to that part of the side which is above the sheer-rail, and which is usually painted with trophies, &c. on the outside. Falconer.

QUICK-WORK is likewise applied to the strakes that shut in the inside, between the spirkitting and clamps.

QUID,

QUID, *What*, in the *Schools*, is used to denote the definition of a thing.

It is thus called, because the definition answers to the question, *quid est? what is it?*

Hence we have two kinds of quids; nominal, *quid nominis*; and real, *quid rei*.

QUID *juris clamat*, in *Law*, a writ that lies where I grant the reversion of my tenant for life by fine in the king's court, and the tenant will not attorn; then the grantee shall have this writ to compel him.

This writ seems to be obsolete, since the fourth and fifth of Anne. See ATTOURNMENT.

QUID *pro quo*, q. d. *what for what*, denotes the giving one thing of value for another; or the mutual consideration and performance of both parties to a contract.

QUID *pro quo*, or QUI *pro quo*, is also used, in *Physic*, to express a mistake or cheat of an apothecary, in administering one medicine for another: or in using an ingredient in a composition different from that prescribed.

A northern physician, in a printed thesis on *quid pro quos*, owns ingenuously, that they are very frequent. He distinguishes very accurately a great variety of kinds of *quid pro quos*; some with regard to the operation, others with regard to the subject; and others with regard to their form, or effects. The first comprehends the *quid pro quos* of the physician; the second, those of the patient; the third, those of the apothecary.

QUID *Loss*, a term which signifies the loss of the ruminant power in animals of the live-stock kind. It is mostly produced by local weakness of the stomach, caused by eating improper coarse kinds of food in too large quantities, or other similar means. It may be best restored by the use of strong acids of the vegetable and other kinds, and its return prevented by strong bitter infusions, as those of gentian, bark, &c. See CUD.

QUIDDEINEN, in *Geography*, a town of Prussia, in Oberland; 6 miles S.E. of Holland.

QUIDDENY, QUIDDANY, (of the Latin *cydonium*, or *cydoniatum*,) a conserve of quinces, called also marmalade.

QUIDDITY, QUIDDITAS, in the *Schools*, a word of the same signification with *essence*.

The name is derived hence, that it is by the essence of a thing that it is *tale quid*, such a quid, or very thing, and not another. When upon seeing, or hearing, the name of a thing, with whose nature, &c. we are unacquainted, we ask, *Quid est? What is it?* we mean no more by the interrogation, but that we desire to have its nature and essence explained by a definition. Whence quiddity is usually defined the essence known or expressed in a definition.

And hence what is essential to a thing is said to be quidditive; as quidditive knowledge, &c.

QUIEBOU, in *Geography*, a town of France, in the department of the Channel; 6 miles S.W. of St. Lo.

QUIEN, MICHAEL LE, in *Biography*, a learned Dominican monk, who flourished in the latter part of the 17th and in the 18th century, was born in the year 1661. He received a liberal education, having been instructed in classical learning at his native place, and he was then sent to study philosophy at the college du Pleffis, at Paris. At twenty years of age he determined to renounce the world, and took the habit in a Dominican convent. Here he studied with uncommon assiduity and proportionate success, the Greek, Hebrew, and Arabic languages, criticism, divinity, the sacred scriptures, and ecclesiastical antiquities. In the year 1690 he first appeared as an author, by publishing "A Defence of the Hebrew Text and the Vulgate Version," against a work, entitled "The Antiquity of Time restored," written

by father Pezron. The latter having published a reply, Quien answered in a work entitled "The Antiquity of Time exploded." He next attacked him in "Remarks" on his "Attempt at a literal and historical Commentary on the Prophets," printed in the Memoires de Trevoux, for March 1711. During the following year he published "S. Joannis Damasceni Opera quæ extant Gr. et Lat." in 2 vols. fol. accompanied with dissertations abounding in erudition. He intended to have given a third volume, containing such pieces as had been falsely attributed to that father, but it was never sent to the press. The same fortune has attended his labours on "The Works of Leo of Byzantium," to which he had paid a considerable share of attention. Towards the close of his life he entered into a controversy with father Courayer, concerning the validity of the ordinations of the church of England, in which the palm of victory was given to his opponent. Le Quien died in 1733, at the age of 72 years, respected for his piety, and uniform correctness of conduct. He was author of various "Dissertations" to be found in Desmolets "Memoires de Literature et d'Histoire," and the "Mercure de France." At the time of his death he was engaged in printing the most considerable of his works, relating to the ancient and present state of the eastern churches. "His plan includes the whole of his churches, under the four grand patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem; presents a geographical description of each diocese, and of the episcopal cities, and then gives a particular account of the origin and establishment of the churches, their extent, their jurisdiction, their rights, their prerogatives, the succession and order of their bishops, their political government, the changes which they have undergone," &c. As the author did not live to finish his work, it was published with additions, in the year 1740, under the title of "Michaelis le Quien Oriens Christianus, in quatuor Patriarchatus digestus, qua exhibentur Ecclesiæ, Patriarchæ, cæterique Prefules Orientis," &c. in 3 vols. fol. Moreri.

QUIENFIORD, in *Geography*, a bay on the coast of Norway; 27 miles N. of Christianfand.

QUIENS, a river of Norway, which runs into the sea, 18 miles N. of Cape Lindesnes.

QUIESCENT, something at rest.

QUIETISM, in *Ecclesiastical History*, the sentiments of the Quietists, a religious sect, which made a great noise towards the close of the 17th century.

Molinos, a Spanish priest, who died at Rome in the prison of the inquisition, passes for the author of Quietism; and yet the Illuminati in Spain had taught something like it before.

A sect similar to this had appeared at Mount Athos, in Thessaly, towards the close of the fourteenth century, under the appellation of Hesychasts, which denotes the same with Quietists. These were a branch of the *Mystics*, (which see,) or those more perfect monks, who, by a long course of intense contemplation, endeavoured to arrive at a tranquillity of mind entirely free from every degree of tumult and perturbation. These Quietists, in conformity to an ancient opinion of their principal doctors, (who imagined that there was a celestial light concealed in the deepest retirements of the mind,) used to sit every day, during a certain space of time, in a solitary corner, with their eyes eagerly and immovably fixed upon the middle region of the belly, or navel; and boasted, that, while they remained in this posture, they found, in effect, a divine light beaming forth from the soul, which diffused through their hearts inexpressible sensations of pleasure and delight. To such as inquired what kind of light this was, they replied, by way of illustration, that it was the glory of God, the same celestial radiance that surrounded Christ

Christ during his transfiguration on the mount. Barlaam, a monk of Calabria, from whom the Barlaamites derived their denomination, styled the monks, who adhered to this institution, Maffalians and Euchites: and he gave them also the new name of Umbilicani. Gregory Palamas, archbishop of Thessalonica, defended their cause against Barlaam, who was condemned in a council held at Constantinople in the year 1341.

The name is taken from a sort of absolute rest, and inaction, which the soul is supposed to be in, when arrived at the state of perfection, which in their language is called *the unitive life*. To arrive at this, a man is first to pass through the purgative way; that is, through a course of obedience, inspired by the fear of hell: hence he is to proceed into the illuminative way, before he arrives at perfection.

The sentiments of the Quietists, with regard to God, are wonderfully pure and disinterested. They love him for himself, on account of his own perfections, independently of any rewards or punishments: the soul acquiesces in the will of God, even at the time when he precipitates it into hell; inasmuch that instead of stopping him on this occasion, B. Angelo de Foligny cried out, "Haste, Lord, to call me into hell: do not delay if thou hast abandoned me: but finish my destruction, and plunge me into the abyss."

At length the soul, after long travail, enters into rest, into a perfect quietude. Here it is wholly employed in contemplating its God; it acts no more, thinks no more, desires no more; but lies perfectly open, and at large, to receive the grace of God, who by means thereof drives it where it will, and as it will.

In this state it no longer needs prayers, or hymns, or vows; prayers where the spirit labours, and the mouth opens, are the lot of the weak, and the imperfect: the soul of the faint is, as it were, laid in the bosom, and between the arms of its God, where, without making any motion, or exerting any action, it waits, and receives the divine graces. It then becomes happy: quitting the existence it before had, it is now changed; it is transformed, and, as it were, sunk and swallowed up in the Divine Being, inasmuch as not to know or perceive its being distinguished from God himself. Fenel. Max. des Saints.

QUIETISTS, the disciples of Mich. de Molinos; or the adherents to the opinions delivered in the article QUIETISM. The sentiments of Molinos were contained in a book, which he published at Rome in the year 1681, under the title of the "Spiritual Guide:" in consequence of which he was cast into prison in 1685, where he was soon obliged to renounce, in a public manner, the errors of which he was accused: and this solemn recantation was nevertheless followed by a sentence of perpetual imprisonment, from which he was in an advanced age delivered by death, in the year 1696. Molinos had a considerable number of disciples in Italy, Spain, France, and the Netherlands. One of the principal patrons and propagators of Quietism in France, was Marie Bouvieres de la Mothe Guyon, a woman of fashion, remarkable for the goodness of her heart, and the regularity of her manners; but of an unsettled temper, and subject to be drawn away by the seduction of a warm and unbridled fancy. This female apostle of mysticism derived all her ideas of religion from the feelings of her own heart, and described its nature to others as she felt it herself. Accordingly, her religious sentiments made a great noise in the year 1687; and they were pronounced unfound, after accurate examination by several men of eminent piety and learning, and professedly confuted, in the year 1697, by the celebrated Bossuet. Hence arose a controversy of great moment, between the prelate last mentioned, and Fenelon, arch-

bishop of Cambrai, who seemed disposed to favour the religious system of Madame Guyon, and who, in 1697, published a book, cited in the last article, containing several of her tenets. Fenelon's book, by the interest of Bossuet, was condemned in the year 1699, by Innocent XII. and the sentence of condemnation was read by Fenelon himself at Cambrai, who exhorted the people to respect and obey the papal decree. Notwithstanding this seeming acquiescence, the archbishop persisted, to the end of his days, in the sentiments which, in obedience to the order of the pope, he retracted and condemned in a public manner. See the article FENELON.

QUIETO, in *Geography*, a river of Istria, which runs into the Adriatic, two miles W. of Bastia.

QUIETUS, *freed or acquitted*, a term used by the clerk of the pipe, and the auditors in the exchequer, in their acquittances or discharges given to accountants, which usually conclude with the words *abinde recessit quietus*; which is called a *quietus est*.

A *quietus est* granted to a sheriff, discharges him of all accounts due to the king.

QUIFORO, in *Geography*, a district of Africa, on the Gold Coast

QUIGNONES, FRANCIS DE, in *Biography*, an eminent Spanish cardinal in the 16th century, who embraced the religious life at an early age, in a monastery of Franciscans, and subsequently afforded such evidence of superior talents, that he was elected general of his order in the year 1522. He obtained the office of confessor to Charles V. and upon the capture of Rome by the imperial army in 1527, and the imprisonment of pope Clement VII. in the castle of St. Angelo, his services were solicited by that pontiff, in negotiating for his liberty, and were afterwards rewarded with a cardinal's hat. After this, he was by the same interest nominated bishop of Cauria, and sent in the capacity of apostolical legate into Spain, and the kingdom of Naples. He died in the year 1540. He was author of a reformed breviary printed at Rome in 1536, which met with the approbation of popes Clement VII. and Paul III. but it was afterwards suppressed by Pius V.; hence it has become scarce, and is sought after by collectors. Several spurious editions have been printed at different times. It is inserted in the "Annales Minores" of Wadingus, and in the second edition of Joly's treatise "De Reformandis Horis Canonicis."

QUIJUBATUI, in *Ornithology*, the name of an American species of paroquette.

It is of the size of a lark, and in general of a yellow colour. Its eyes are black, and its beak grey. The edges of its wings are of a dusky green, and its tail long and yellow. It is a very beautiful bird, and very easily tamed. See PSITTACUS *Guarouba*.

QUIKNE, in *Geography*, a town of Norway, in the province of Bergen; 105 miles N. of Christiania.

QUIL, in *Zoology*. See QUIRPELE, and VIVERRA *Mungo*.

QUILAQUIL, in *Ornithology*, the name given by the people of the Philippine islands to a very beautiful species of parrots, which is commonly found wild in the woods there. It is all over of a fine green colour, and is smaller than the common parrots, and has a broad black bill, and black legs. It is a very wild bird, and will not learn any thing.

QUILATE, in Spanish and Portuguese *Coinage*, a term used for *carat*; which see.

QUILEA, in *Geography*, a sea-port town of Peru, near the Pacific ocean, which gives name to a fertile valley, in the jurisdiction of Arequipa. S. lat. 16° 45'.

QUILICI,

QUILICI, GAETANO, in *Biography*, an Italian opera-singer, with a base voice: a good musician, who arrived here in 1759, during the performance and opera regency of the Mattei. He continued to perform on our lyric stage near thirty years, and is, we believe, still living in London, we fear, in penury and obscurity. Since quitting the stage, he has supported himself, a bed-ridden wife, and an idiot son, by teaching to sing, and has made some admirable scholars.

QUILIMANCY, in *Geography*, a river of Africa, which runs into the Indian sea, 20 miles S. of Melinda. S. lat. 3° 16'. E. long. 40° 10'.—Also, a sea-port town of Africa, in the kingdom of Melinda, at the mouth of the before-mentioned river, belonging to the Portuguese. S. lat. 3° 10'.

QUILIMANE, a town of Africa, in Mozambique. S. lat. 18° 15'. E. long. 37° 30'.

QUILLAJA, in *Botany*, a genus of plants found in Chili, and described by Molina. Juss. 444. Lamarck Illustr. t. 774.—Class and order, *Monoclea Dodecandria*. Nat. Ord. uncertain.

Eff. Ch. Male, Calyx five-cleft. Corolla none. Stamens twelve, or more.

Female, Calyx five-cleft. Corolla none. Germens five, superior, opposite to the segments of the calyx. Styles five. Capsules five, coriaceous, of two valves, and one cell. Seeds numerous, oblong, inserted into the bottom of the capsule, dilated and winged at the summit.

Such is the character made out by Jussieu, from the publications of Molina and Frezier, and from specimens of the fruit, brought to Europe by Dombey. They belong to a tree, whose bark has a soapy quality. The leaves are alternate, simple, evergreen. Flowers axillary.—The genus appears akin to the *Magnolia* of Jussieu, but whatever it may be, the name is barbarous and quite inadmissible; only tolerable for a time, till some botanist, furnished with better materials to define the genus, shall be entitled to give it a more classical appellation. Jussieu remarks, that another plant of Dombey's appears to belong to the above genus. This is a tree referred by him to *Dioclea Icosandria*, whose fruit is called *Gayo colorado*, and which is the same with the "Loque, or Peruvian tree with five capsules," of Joseph de Jussieu, whose branches, according to his manuscript account, are so long and pliant, as to be twisted into cords, serving, in the province of Cusco, for the support of hanging bridges.

QUILLALA, in *Geography*, a town of Chili, on the Aconcagua; 30 miles E.N.E. of Valparaiso.

QUILLAN, a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux; 10 miles S. of Limoux. The place contains 1568, and the canton 9195 inhabitants, on a territory of 272½ kilometres, in 22 communes. N. lat. 42° 52'. E. long. 2° 16'.

QUILLA-YACU, a town of Peru, in the diocese of Lima; 60 miles E.N.E. of Guanuco.

QUILLE, a town of Sweden, in West Gothland; 23 miles N. of Uddevalla.

QUILLEBEUF, a town of France, in the department of the Eure, and chief place of a canton, in the district of Pontaudemer, seated on the Seine; eight miles N. of Pontaudemer. The place contains 1200, and the canton 7272 inhabitants, on a territory of 107½ kilometres, in 16 communes. N. lat. 49° 29'. E. long. 0° 38'.

QUILLET, CLAUDE, in *Biography*, born at Chinon, in Touraine, about the year 1602, was brought up to medicine, which he practised some years, till he was obliged to

quit the country on account of his opposition to a measure of Richelieu, which is thus narrated. Quillet was at Loudun at the time that Loubardemont, a creature of the cardinal, was sent thither to take informations respecting the pretended possession of some nuns by the sorceries of Urban GRANDIER (see his article), an imposture which Richelieu thought fit to favour. The counterfeit Satan one day threatened, that on the morrow he would lift up to the roof of the church any one who should presume to call his power in question. A large company appeared on the next day with M. Loubardemont, when Quillet, who also was present, challenged the devil to keep his word. To the surprise of the superstitious who had met on the occasion, nothing followed, but the challenger found to his cost that he had given offence to a mightier power than Satan, and felt it necessary to quit Loudun in haste, and retire to Italy. He went to Rome, and was engaged as secretary to the French ambassador at that court. He probably returned to France with that minister, after the death of Richelieu, and in 1655 he published at Leyden, under the name of Calvidius Lætus, the poem by which he is chiefly known, entitled "Callipædia five de pulchræ Proles habendæ ratione." In the first edition were some satirical lines against Mazarin. The cardinal sent for him, and having gently remonstrated with him for treating his friends with severity, promised to give him the first vacant abbey. Quillet threw himself at the cardinal's feet, asked pardon, assured him he would instantly obliterate the offensive lines, and begged, as a sign of his penitence, to be allowed to dedicate the poem to him. This was done in the Paris edition of 1656, and Quillet became the flatterer of him who had been the object of his satire. He died at Paris in 1661, repenting not of his adulation, but of the licentious cast of some of his verses. The Callipædia has gone through many editions, and has been translated into various languages. "It is," says an able critic, "an ingenious performance, agreeably varied by fable and episode, but frivolous in its main topic, and in its reasonings. Its details are frequently loose and inflammatory, and that a cardinal should have allowed it to have been dedicated to him, is a proof how little regard was paid, at that period, to the rules of decorum. The versification, though generally free and flowing, is by no means correct, and the diction is frequently impure." Quillet composed a version of Juvenal in French verse, and a Latin poem in twelve books, entitled "Henriados," or the actions of Henry IV. This, with other papers, he left to Menage, with 500 crowns to defray the charge of printing them, but the abbe took the money, and neglected the conditions.

QUILLIGA, in *Geography*, a country of Africa, in Upper Guinea, near the river Maqualbary.

QUILLOBO, in *Botany*, a name given by some to a species of ketmia, called also *quingombo*.

QUILLOT, KILLO, or *Killo*, in *Commerce*, a Turkish corn measure, weighing, in wheat, about 23 okes, or 60lbs. avoirdupois: 4 killos make 1 fortin; 8½ killos answer nearly to 1 English quarter. A killo of rice contains 10 okes, and the oke is 400 drachms.

QUILLOTA, in *Geography*, a town and jurisdiction of Chili. The town does not contain above 100 families, but those scattered over the country exceed 1000.

QUILLY, a town of France, in the department of the Lower Loire; 7 miles N. of Savenay.

QUILOA, a country and kingdom of Africa, situated near the east coast, near the mouth of the Coavo, about 180 miles from north to south; but the extent inland towards the west is unknown. This country was first discovered by the Portuguese, in the year 1498. The king and his sub-

jects are Mahometans; the latter partly black and partly tawny. They all speak the Arabic and several other languages, which they learn from the nations they traffic with. Their dress is that of the Arabian Turks: the women especially affect finery, with variety of ornaments about their necks, arms, wrists, and ankles; particularly bracelets made of ivory, curiously wrought, which upon the death of a parent, husband, or near relation, they break in pieces, in token of sorrow, whilst the men express theirs by shaving their hair, and abstaining from food. The capital of the kingdom is situated on an island near the mouth of the Coavo, and is said to be large, rich, and well built. The houses are of stone and mortar, handsome, and after the Spanish manner. They are several stories high, and have each a pleasant garden behind, well watered and cultivated, here being plenty of springs of fresh water. The houses are finely furnished within, and terraces on the top, with a kind of hard clay, and the streets so narrow, that one may easily step from one side to the other. On one side of the town is the citadel, where resides the Mahometan prince. It is adorned with stately towers, and surrounded with a ditch and other fortifications. It hath two gates, one towards the port, whence one may see the ships sailing in and out; the other looking towards the land. The country about Quiloa, though low, is yet very pleasant and fertile in rice and millet, fruits and good pasture; so that they breed abundance of cattle, besides poultry of all sorts, both wild and tame. They have fish likewise in great plenty, and very good. The climate is likewise affirmed by most travellers to be very temperate and healthy; Sanut being the only author we know of who hath ventured to assert the contrary in all these respects. S. lat. 8° 35'.

QUILONNE, a province of Africa, in the kingdom of Sabia.

QUILOVIA, a small island in the Indian sea, near the coast of Africa. S. lat. 13°.

QUILTAINEN, a town of Prussia, in the province of Oberland; 8 miles S.E. of Holland.

QUILTAON, one of the Laccadive islands, in the Indian sea. N. lat. 12°. W. long. 72° 45'.

QUILTING denotes the operation of weaving a sort of coat or texture, formed of the strands of rope, about the outside of any vessel, to contain water, &c. as a jar, cask, bottle, &c.

QUIMICHPATLAN, in *Zoology*. See *SCIURUS Volucella*.

QUIMINATIN, in *Geography*, a small island in the sea of Mindoro. N. lat. 10° 55'. E. long. 120° 40'.

QUIMIRI, a town of Peru, in the diocese of Lima; 40 miles N.E. of Nasca.

QUIMO, a small island on the east side of the gulf of Bothnia. N. lat. 63° 17'. E. long. 21° 52'.

QUIMPER, a city of France, capital of the department of Finisterre, and chief place of a district, seated on the Oder; before the revolution the see of a bishop, the seat of a governor, an admiralty, &c. The place contains 6608, the canton 17,028 inhabitants, on a territory of 90 kilometres, in seven communes. N. lat. 47° 59'. W. long. 4° 1'.

QUIMPERLE, a town of France, and chief place of a district, in the department of the Finisterre. The place contains 4162, and the canton 9128 inhabitants, on a territory of 125 kilometres, in 15 communes.

QUIN, DR., of Dublin, in *Biography*, an eminent physician, and one of the most enlightened dilettante musicians with whom we have ever been acquainted. This gentleman, who, during his travels, resided in Italy some years, had

heard and studied music with such taste and intelligence, that his opinions and conversation on the subject were equally entertaining and instructive. He resided in Dublin at the time of Handel's arrival in that city, 1742, and perfectly remembering his performance, person, and manners, in 1788 wrote us word, that "he (Handel) was received in Ireland by persons of the first distinction with all possible marks of esteem, as a man, and admiration as a performer and composer of the highest order." And adds, "the Messiah, I am thoroughly convinced, was performed in Dublin for the first time, and with the greatest applause. Mrs. Cibber and signora Avolio were the principal performers. These, with the assistance of the choristers of St. Patrick's cathedral and Christ-church, formed the vocal band; and Dubourg, with several good instrumental performers, composed a very respectable orchestra. There were many noble families here, with whom Mr. Handel lived in the utmost degree of friendship and familiarity. Mrs. Vernon, a German lady, who came over with king George I. was particularly intimate with him, and at her house I had the pleasure of seeing and conversing with Mr. Handel; who, with his other excellencies, was possessed of a great stock of humour; no man ever told a story with more. But it was requisite for the hearer to have a competent knowledge of at least four languages: English, French, Italian and German; for in his narratives he made use of them all."

QUIN, JAMES, was born in London in 1693. He was the son of an Irish gentleman, and received his education in the capital of that country. His father had, ignorantly, married a woman supposed to be a widow; whose husband, after a long absence, returned and claimed her. The subject of this article was the offspring of this connection, and was accordingly illegitimated, and upon his father's death, in 1710, was left almost destitute. For want of education he was, at the age of twenty-one, without a profession, and was under the necessity of appearing on the stage at Dublin, in the very lowest characters. He displayed, however, rising talents, which induced a friend to advise him to attempt some better parts in London, and he was accordingly admitted into Drury-lane company in 1715. After the experience of a year or two, he entered himself under Rich at Lincoln's-Inn theatre, where he continued to perform during seventeen years. He was allowed, by the most competent judges, to shine both in tragedy and comedy. His utterance was weighty and impressive, which, however, was accompanied with various defects. He was, from causes not well ascertained, continually changing from one theatre to another, and perhaps he may be ranked among that number with whom it was difficult to keep terms. His passions were strong, his temper irritable, and his language often coarse. He was of convivial habits, and, it has been said, grossly attached to the pleasures of the table. There was, however, a fund of generosity in his temper, which shewed itself in many sentiments, and, occasionally, in benevolent actions. The circumstance of his giving a 100*l.* to the poet Thomson, when he was under an arrest for debt, has often been told to his honour. It was the commencement of a strong friendship between them. After Thomson's death, he appeared in that poet's tragedy of Coriolanus, and spoke a prologue, written on the occasion by lord Lyttleton, with a pathos that did honour to his feelings. His last performance was the favourite part of Falstaff, for the benefit of his friend Ryan in 1753. He now retired to Bath, where his fund of anecdote, and strong pointed sense, rendered his company much sought after. He had good breeding, which fitted him for the highest societies, when he chose to act the gentleman; and his sensuality and coarseness were frequently

frequently put up with for the sake of his companionable qualities. Quin died at Bath in 1766, at the age of seventy-three. Garrick, whose superior talents are supposed to have driven him from the stage, but afterwards his steady friend, wrote a poetical epitaph for his monument. While Quin continued on the stage, he constantly kept company with the most celebrated geniuses of the age. He was on intimate terms with Pope and Swift; and was frequently invited by the earl of Cheltenham to his table. His peculiar judgment in the English language recommended him to his royal highness, Frederic prince of Wales, who appointed him to instruct his children in speaking and reading with graceful propriety. When Quin was informed of the elegant manner in which his present majesty had delivered his first gracious speech from the throne, he was in raptures, and the king soon after gave orders, without any application on the part of Quin or his friends, that a genteel pension should be paid him during his life.

QUIN, in *Geography*, a village of the county of Clare, Ireland, where are the remains of a monastery, which was founded for Franciscan friars in 1402, and repaired by the Roman Catholics in 1604. Bishop Pococke speaks of it as one of the finest and most entire monasteries he saw in Ireland. It is situated on a fine stream, with an ascent of several steps to the church: at the entrance one is surprised with the view of the high altar, entire, and of an altar on each side of the arch of the chancel. The building is quadrangular, with piazzas supported by a number of pillars; there are apartments on three sides of the cloisters, with a vaulted room under them all. A round tower and some other ruins are adjoining. Quin is 15 miles from Limerick, on the road to Galway, and about 106 miles W.S.W. from Dublin. Archdean's Monasticon. Carlisle.

QUINA FOLIA, in *Botany*. See LEAF.

QUINABAUG, in *Geography*, a river of America, formerly called "Mobegan," which rises in Brimfield, Massachusetts, and is joined at Oxford by French river, which has its source in Sutton, Worcester county. It runs a southerly course, and discharges itself into Shetucket, about three miles above Norwich Landing, in Connecticut. In the first part of its course it furnishes many good mill-seats: as it advances, the intervals in many places are wide, and afford a most excellent soil.

QUINA-QUINA, in *Botany*, a Peruvian name, generally applied to the Peruvian bark. (See CINCHONA.) Jussieu, however, in his Gen. Pl. 366, informs us, that it properly belongs to a tree, nearly if not entirely agreeing in genus with *Myrospermum* of Jacquin, or *MYROXYLON* of Linnæus. (See the last-named article.) An account of the *Quina-quina* may be found in the *Memoires de l'Acad. des Sciences* for 1738, p. 237.

QUINARIA, so called by Loureiro, Fl. Cochinch. v. 1. 272, from the prevalence of the number five in the parts of fructification, is the *Wampse* or *Wampi* of the Chinese, now established as a genus by the name of *COOKIA*. (See that article.) This plant passed long, in the gardens of England, for *Guarea trichiloides*, according to the observation of the late Mr. Dryander.

QUINARIUS, QUINARY, in *Antiquity*, a little Roman coin, equal to half the denarius. See COIN.

The quinarus was properly the Roman halfpenny.

Medalists indeed use the term quinarus in the general for a medal of any matter, not exceeding the size of our sixpence; but F. Chamillart, in an express dissertation, shews this to be an abuse. The silver coins, current under the republic, he shews, were two: the one weighing a drachm, and called denarius, as containing ten asses; the other

weighing half a drachm, and called quinarus, as containing five asses: which coins continued on the same footing under the emperors.

Hence the origin of the word quinarus: and hence, in propriety, it is only the silver medal of the weight of half a drachm that the name belongs to; the Romans having never given it to any other species of the same size with it. It is only by way of analogy, therefore, that the moderns apply it to the medals of gold, or copper, of the same size with the silver quinarus; those of gold being fixed at a value much above, and those of brass much below five asses.

The only relation between these quinariis, that the gold quinary is the half of a gold medal, as to weight and value; and the brass quinary half a brass medal, as the silver quinary is half a silver one.

Hence a series of quinaries should seem at least a necessary in the cabinets of the curious, as the series of great medals; they being all equally different species of money, which teach us how many kinds of pieces there were of any metal current in commerce.

Add to this, says our author, that the quinaries were of a finer and more finished coin than the other medals, being wrought by the hands of the masters; which seems owing to the nicety required in engraving whole figures in so small a compass. He adds, that though quinaries are very scarce, yet M. the duke of Maine had almost a complete set of them.

QUINAULT, PHILIP, in *Biography*, a French poet, was born in 1636, probably in a low condition; though while some say he was the son of a baker, others maintain that he was descended from a family of consequence at Paris. He had, however, very few advantages of education, but was soon found to possess a talent for poetry and the belles lettres. Before the age of twenty he brought out some pieces on the stage; and for a number of years, he continued to produce dramatic works of different kinds, which were much applauded by the public voice; but some of which drew upon the author the satires of Boileau, who carried the matter so far as to injure his own reputation. Quinault now associated himself with Lulli in the composition of operas, and displayed an excellence in lyric poetry, or that adapted to music, which placed him beyond competition in that branch, and has ranked him among the distinguished characters of the age of Lewis XIV. Nothing, it is allowed, can be more tender, delicate, and ingenious, than the turn of his songs and love-dialogues; and no one has more happily accommodated the melody of French verse to musical expression. His "Armida" and his "Athys" are spoken of as master-pieces of their kind. Notwithstanding the high reputation which he enjoyed as a poet, he applied himself to the study of the law, and eventually made his fortune by marrying the rich widow of a merchant, to whom he had been useful in his profession. After this, he purchased the place of an auditor in the chamber of accounts. He was received into the French academy, and, in the same of that society, harangued the king on his return from the campaigns of 1675 and 1677. He died in 1688, having enjoyed a pension from Lewis XIV. several years previously to his decease. In his last illness he was extremely penitent, on account of his having devoted his talents too frequently to the excitement of the licentious passions. He left a family of five daughters, and was esteemed in society attentive, polite, and mild. Besides his numerous pieces for the stage, he wrote occasional poems. His works were printed at Paris in 5 vols. 12mo., 1739, and again in 1778.

It has been said that Quinault's apprenticeship to poetry was served under Trifan l'Hermite, by being his domestic. The lessons of Trifan were probably of some use to him, as that author had had long experience in theatrical matters; but Quinault owed still more to nature: as before he was twenty years old, he had distinguished himself by several pieces for the stage, which had considerable success; and before he was thirty, he produced sixteen dramas, some of which were well received by the pit; but not all equally. It is supposed that some of these early pieces prejudiced Boileau against Quinault early in his career. There was neither regularity in the plan, nor force in the style: romantic lovers and common-place gallantry, in scenes which required a nervous pencil and vigorous colouring. These were defects not likely to escape the lash of the French Juvenal. He covered the young poet with ridicule; reproached him with the affectedly soft and languishing dialogue of his lovers, by whom even *I hate you* was said tenderly.

Quinault, born with great sensibility, was so wounded by his severity, that he applied to the magistrates, not only to silence Boileau, but oblige him to remove his name from his satires; but the attempt was vain. His enemy insulted him still more cruelly by an epigram on the subject.

“ —Peace! peace! my friend—
If from the public thou'dst avoid disgrace,
From thy own works, not mine, thy name efface.”

It was not till after Quinault was insulted by Lulli to write for the opera, that he silenced all his enemies, except Boileau and his party, who envied him his success. The French nation knew no better music than that of Lulli, and thought it divine. Quinault's was thought of secondary merit, till after his decease; and then, in proportion as the glory of Lulli faded, that of Quinault increased. Voltaire, in the first edition of his “*Siecle de Louis Quatorze*,” in 1749, seems to have been the first who spoke out on the subject; not sorry, perhaps, to lower Boileau a little in the eyes of the public. He there says, that “Quinault was celebrated for his beautiful lyric poetry, and for the gentleness with which he opposed the unjust satires of Boileau. His poetry was greatly superior to the music of Lulli. It will always be read; and Lulli, except in a few of his recitatives, can no longer be supported. However, it was long believed that Quinault entirely owed his favour to Lulli. Time appreciates all things.”

After this, his writings began to be examined and felt; and of late years, his name is never mentioned by his countrymen without eulogium. His operas, though admirable to read, are ill calculated for modern music; and are obliged to be new written, ere they can be new set, even in France. Marmontel, who had modernized several of them for Piccini to set in 1788, gave M. Laborde a dissertation on the dramatic writings of Quinault for music; which is published in the fourth volume of his “*Essai sur la Musique*.”

He begins by asserting that Quinault was the creator of the French opera upon the most beautiful idea that could be conceived; an idea which he had realized with a superiority of talent, which no writer has since approached.

His design was to form an exhibition, composed of the prodigies of all the arts; to unite on the same stage all that can interest the mind, the imagination, and the senses. And this illusive theatre Voltaire has admirably described:

“ Il faut se rendre à palais magique,” &c.

“ Hasten to the magic palace, where abound
The joys sublime of verse, of dance, and sound;

Where bright illusion fascinates the sight,
And fire-notes the enchanted ear delight;
Where all the plastic powers of art are shewn,
And joys unnumber'd are combin'd in one.”

For this purpose a species of tragedy is necessary, that shall be sufficiently touching to move, but not so austere as to refuse the enchantments of the arts that are necessary to embellish it. Historical tragedy, in its majestic and gloomy simplicity, cannot be sung with any degree of probability, nor mixed with festivals and dances, or be rendered susceptible of that variety, magnificence, show, and decoration, where the painter and the machinist ought to exhibit their enchantments.

In Italy, where genuine tragedy has no theatre appropriated to its use, a people passionate for music have permitted Regulus, Themistocles, Alexander, and even Cato himself, to utter their speeches in song; but a people, whose taste ought to be more severe, and more delicate, as to probability, having for comparison the school of Corneille and Racine, would have been very unwilling to substitute the recitative of Lulli to the declamation of Baron. Melody itself is a fabulous and magical language; and in a theatre “where all is prodigy, it seems consistent that the manner of speaking should be that of enchantment as well as the rest. We are then in a new world: it is nature enchanted, and visibly animated by a crowd of intelligences, whose wills are laws. Music there plays a marvellous part; music there constitutes the probability of the marvellous; but in a representation where all passes for natural, according to truth and history, by what means can we be prepared to hear Augustus, Cornelia, Agrippina, or Brutus sing?” Might it not be replied, “By the same means as the French are reconciled to these same exalted characters conversing in rhyme.” When once it is settled that all the characters converse in a musical language, no other is expected, and the audience is soon reconciled to it. But all this is to prove that the French alone are right, and Italy and all the rest of the world wrong as to the musical drama. The rest of Europe is tired and ashamed of flying gods and goddesses, and have long since surrendered mythological wonders both in poetry and music to their children. But all people are thought barbarians, who do not implicitly adopt the taste and fashions of France.

But to return to Quinault, whom all the wits of the time tried to write down. Ignorant of music and its powers, they thought Lulli always right, and the poor, modest, unpretending Quinault always wrong. Posterity has long discovered the converse of this supposition to be the truth. Quinault's great mistake and misfortune, says La Harpe, was the calling his pieces tragedies, and not operas. He would not then have been regarded as a rival of Racine, or have offended classical hearers or readers with the little resemblance these compositions had to Greek and Roman dramas, or to the genuine tragedies of the moderns.

QUINCE TREE, in *Gardening*, the common name of a tree of the apple kind. See *Pyrus Cydonia*.

QUINCE, in the *Materia Medica*. The fruit of the quince is allriugent and stomachic; and its expressed juice, in small quantities, as a spoonful or two, is of considerable service in nausea, vomitings, nidorous eructations, and some kinds of alvine fluxes. This juice was formerly ordered in the Lond. Phar. to be made into a syrup, called “syrupus cydoniarum,” or syrup of quinces, prepared by digesting three pints of the depurated juice with a drachm of cinnamon, half a drachm of ginger, and half a drachm of cloves, on warm ashes,

ashes, for six hours, then adding a pint of red port, and dissolving in the strained liquor nine pounds of sugar. But the only preparation of the quince which it now directs is, a mucilage of the seeds, made by boiling a drachm of the seeds in eight ounces of water, till it acquires a proper consistence. This has been recommended in apthous affections, and excoriations of the mouth and fauces: however, though it may be a more pleasant mucilage, it is certainly less efficacious than that of the simple quince. Lewis and Woodville.

An useful restringent marmalade is made by boiling the juice with fine sugar to a due consistence, in the proportion commonly of three pints to a pound. The juice of quinces becomes richer, by keeping them for some time, after they are gathered, in a dry airy place.

QUINCE *Island*, in *Geography*, a small island near the S.W. coast of Ireland, and county of Cork; five miles W. of Gally-Head.

QUINCHAC, a small island in the Pacific ocean, between the island of Chiloe and the continent of Chili. S. lat. 43° 30'.

QUINCHAMALA, in *Botany*, altered by Willdenow, one can scarcely see with what reason or advantage, from *Quinchamalium* of Jussieu, a barbarous and totally exceptionable name, taken from the Peruvian *Quinchamali*.—Willd. Sp. Pl. v. 1. 1217. Mart. Mill. Dict. v. 4. Juss. 75. Lamarek Illustr. t. 142.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Elæagni*, Juss. Rather perhaps *Rubiaceæ*.

Gen. Ch. *Cal.* Perianth superior, of one leaf, in four deep, ovate, unequal segments, one larger than the rest. *Cor.* of one petal; tube funnel-shaped, much longer than the calyx, quadrangular, curved; limb in five lanceolate, acute, spreading segments. *Stam.* Filaments five, very short, inserted into the top of the tube; anthers oblong, the length of the limb. *Pist.* Germen roundish; style thread-shaped, the length of the tube; stigma capitate. *Peric.* Berry (rather drupa) roundish. *Seed* solitary.

Eff. Ch. Calyx in four unequal segments, superior. Corolla funnel-shaped, five-cleft. Stigma capitate, undivided. Drupa dry.

1. *Q. chilensis*. Willd. n. 1. (*Quinchamali lini folio*; Feuill. *Plantes Médicinales*, 57. t. 44.)—Gathered by Feuillée on the mountains of Chili, and by Dombey, among stones on the hills about Lima, flowering in December and January. The root is annual, composed of a few simple yellow fibres. *Stems* several, prostrate, simple, round, leafy, from four to six inches long. *Leaves* scattered, sessile, linear, entire, fleshy, smooth, bluish with a small point. *Flowers* in simple, terminal, solitary, dense spikes. *Corolla* green externally, of a saffron yellow within. *Seed* round, unconnected.—We have taken the generic character, and the description, from Dombey's manuscript, compared with one of his original specimens. The fruit appears to be a drupa, (he terms it *bacca*;) the size of hemp-seed, whose coat becomes coriaceous by drying, and separates, along with the permanent calyx at its summit, from the seed, or nucleus, to whose upper part the corolla remains attached. Jussieu, Lamarek, and Willdenow, having formed their ideas from dried specimens only, take the coat of the drupa for an inferior calyx, and the first of these writers conceives the flower to consist of a superior inner calyx, to which he was led by an idea of the affinity of this genus to *Thestium*. Willdenow, not adverting to any such affinity, terms the inner calyx of Jussieu, a corolla, which agrees with the opinion of Dombey, the only botanist who has examined the living plant, and by whose authority we are led to consider the true calyx as

superior. If we are right, this genus will belong to the natural order of *Rubiaceæ*, notwithstanding its solitary seed. Dombey expressly says it is akin to *Morinda*.

Feuillée relates, that the Indians take a decoction of this plant for internal disorders, especially when they believe themselves labouring under an internal abscess, of which there is no external appearance. The decoction, taken warm, is supposed to break the abscess, and to cause an evacuation of its contents by the usual passages.

QUINCUNX, *Quinque uncie*, denotes a thing that consists of five twelfth parts of another.

QUINCUNX, in *Gardening*, is the name of a form of planting in which trees are planted by fives, four of them form-

ing a square, and the fifth placed in the middle, thus, * * *

and which may be repeated over and over again in one continued plantation, with as many trees in several ranges as may be proper. It was formerly a fashionable mode of planting groves and other regular plantations, but is now less common. It is seen more fully below:

Something of this mode of arrangement has always a good effect in the disposition of shrubby plants, &c. though not in the regular order of it, but something nearly so, which gives the shrubs a greater scope of growth, and shews them to greater advantage. It is likewise a mode of planting that is proper in the kitchen-garden, in transplanting many kinds of esculent plants; such as lettuces, endive, strawberries, and even all the cabbage kinds, and many other plants, which gives them a greater scope to grow than if planted exactly square at the same distance from each other.

It is of this kind of quincunx that Cicero speaks, in his *Cato Major*; and Quintilian, lib. viii. cap. 3.

The modern quincunxes, Daviler observes, are made like those of the ancients, except for the fifth tree, which is now generally diffused; so that, being as it were netted, and their alleys viewed by the side of the rectangle, they formed a perfect chequer.

QUINCUNX, in *Astronomy*, &c. denotes a position, or aspect of the planets when distant from each other a hundred and fifty degrees, or five signs.

QUINCY, in *Geography*, a town of France, in the department of the Seine and Marne; six miles S.W. of Meaux.

QUINCY, a post-town of America, in Norfolk county, Massachusetts, taken from Braintree; 10 miles S. of Bolton. It contains 1281 inhabitants, most of whom are farmers; but large quantities of shoes and boots are manufactured for exportation. The town has an episcopal and congregational church.

QUINDECAGON, in *Geometry*, a plain figure which has fifteen sides and fifteen angles.

The word is formed somewhat irregularly, from the Latin *quinque*, five, and the Greek *δέκα*, ten, and *γωνία*, angle. *Pentecagon* would be a more regular term.

If the sides be all equal, it is a regular quindecagon. Euclid shews how to inscribe it in a circle, Prop. xvi. lib. 4. And the side of a regular quindecagon so described, is equal in power to the half-difference between the side of the equilateral triangle, and side of the pentagon; and also to the difference of the perpendiculars let fall on both sides, taken together.

QUINDECIM VIR, XV. VIR. a Roman magistrate, who

who had fourteen colleagues joined with him in the same function.

Under Tarquin the Proud, there were first two magistrates erected to take care of the sacrifices to be performed; these were called *duumviri*. Their number, at length, grew to ten, and then they were called *decemviri*. In the time of Cicero it had reached to fifteen, when they assumed the name of *quindecimviri*: and though their number grew to forty afterwards, yet Servius observes, on the sixth of the *Æneid*, that their name never after changed, but they still continued to be called *quindecimviri*.

They were the persons who examined the Sibyls' books, and were the interpreters of them; yet they never did this but by express order of the senate, declared by a *senatus consultum*. They also presided at the sacrifices, and all other extraordinary ceremonies of religion.

On medals, a dolphin joined with a tripod marks the priesthood of the *quindecimviri*; who, to publish their solemn sacrifices, used on the eve of them to carry a dolphin at the end of a pole throughout the city; that fish being esteemed sacred to Apollo, as the crow was among birds.

QUINEPAUGE, or *East River*, in *Geography*, a river of America, in Connecticut, which runs a southerly course into the N.E. corner of New Haven harbour.

QUINGEY, a town of France, in the department of the Doubs, and chief place of a canton, in the district of Besançon; nine miles S.W. of Besançon. The place contains 1079, and the canton 11,734 inhabitants, on a territory of 272½ kilometres, in 36 communes. N. lat. 46° 6'. E. long. 5° 57'.

QUINGOMBO, in *Botany*, the name given by the people of Congo to a species of ketmia, distinguished by M. Tournefort by the name of the ketmia Brasiliensis folio ficus, fructu pyramidato fulcato, the fig-leaved Brazilian ketmia, with a pyramidal fulcated fruit.

QUINISDAL, in *Geography*, a town of Norway, in the province of Christianland; 35 miles W.N.W. of Christianland.

QUINI-SEXTUM, in *Ecclesiastical History*, denotes a council held at Constantinople in the year 692; called also the council in Trullo, and by the Greeks *Pentheôte*, *q. d. five-sixth*; as intimating that it was only a supplement of the two preceding councils. Though, in propriety, Fleury observes, it was a council itself.

Marshall observes, that the fifth and sixth general councils having made no canons relating to the external celebration of divine worship, the government of the church, and the lives and manners of Christians, the Orientals judged it necessary to supply that defect by this; so that the 102 canons falsely attributed to those, were in reality made here. See **TRULLUM**.

QUINNET, in *Mining*, the name of a tool used in the cleaving rocks by means of gunpowder. This is a sort of wedge fitted to the flat side of what is called the *gun*; that is, a cylindrical piece of iron, only flattened in one part to receive this, and drilled through. When a proper hole has been made in the rock by the borer, the powder is put in, and then the orifice being stopped by the gun, and that wedged in by this quinet, the powder being fired by a train communicating with the hole drilled through the guns, exerts all its force on the rock, and splits it in several directions at one explosion. Phil. Trans. N° 167.

QUINOLA, in *Geography*, a town of Mexico, in the province of Culiacan; 50 miles S.E. of Culiacan.

QUINQUAGENARIUS, among the Romans, was an

officer in the army, who had the command of a company of fifty men.

QUINQUAGENARIUS was also an officer of policy, who had the inspection of fifty houses, or families.

And in the ancient monasteries, *quinquagenarius* was a superior who had fifty monks under his guidance.

QUINQUAGESIMA-SUNDAY, **SHROVE-SUNDAY**. It is thus called, as being about the fiftieth day before Easter. Anciently they used *Quinquagesima* for Whit Sunday, and for the fifty days between Easter and Whit Sunday; but to distinguish this *Quinquagesima* from that before Easter, it was called the Paschal *Quinquagesima*.

QUINQUANGULAR LEAF. See **LEAF**.

QUINQUANNION, **QUINQUENNium**, in the *French Customs*, a respite of five years, which insolvent debtors formerly obtained by virtue of the king's letters, to have time for the payment of their debts.

When the thing intended was only to prevent the sale of their effects at an under-value, the term of one year was ordinarily granted, and this was called the benefit of *annion*.

But when the debtor would avoid the surrendering of his effects, upon proving that he was reduced by poverty, losses, &c. to make use of this expedient, the term of five years was granted, and called the benefit of *quinquannion*.

QUINQUATRIA, in *Antiquity*, a name given to the feasts of Minerva, otherwise called *Panathenæa*.

Some think they were termed *quinquatria*, because they lasted five days; but others, with more reason, think it was because they fell out five days after the ides of the month.

QUINQUE PORTUS, the five cinque ports.

“*Servitium quod barones quinque portuum præscriptorum recognoscunt facere ad summationem regis per annum, si contigerit per 15 dies ad cultum eorum proprium; ita quod primus dies computatur a die quo vela navium exerunt, usque partes ad quas tendere debent, vel ulterius, quamdiu rex voluerit ad cultum ejus.*” Thorn.

QUINQUEFOLIUM, in *Botany*, Cinquefoil, the old name of the Linnæan genus *Potentilla*, many, but by no means a majority, of whose species have five leaflets on a stalk. Gærtner, who, like many others, was discontented with *Potentilla*, substituted the word *Pentaphyllum*. See **POTENTILLA**.

QUINQUEMPOIX, in *Geography*, a town of France, in the department of the Lower Seine; seven miles N. of Rouen.

QUINQUENNALIA, in *Antiquity*, games, or feasts founded at Tyre, celebrated every five years, in honour of the deified emperors.

The *quinquennalia* began to be expressed on medals about the middle of the third century. F. Pagi produces a medal whereon are engraven those of the emperor Posthumus; they are not found on any medals of his predecessors.

QUINQUENNALIS, a magistrate in the colonies, and municipal cities of the Roman commonwealth; much the same with *ædile* at Rome.

They were not thus called from their continuing in their office five years; but because they were elected every fifth year, to preside at the census, and to receive the declaration each citizen made of his effects.

QUINQUENNES, in some old *Historians*, a name given to a certain people of India, among whom the women began to bear children at five years old, and seldom lived to more than eight years. Pliny gives us this account; and Solinus, who repeats it from him, increases the miracle by telling us, that

that they were a nation of women who had no men among them.

QUINQUEPARTITE LEAF, among *Botanists*. See **LEAF**.

QUINQUEPRIMI, among the Romans, the five principal men in the senate of every municipal town.

QUINQUEREMIS, in the *Naval Architecture of the Ancients*, a name given to a galley which had five rows of oars. They divided their vessels in general into monocrota and polycrota: the former had only one tier of rowers; the latter had several tiers of them, from two or three, up to twenty, thirty, or even forty; for such a vessel we have an account of in the time of Philopater, which required no less than four thousand men to row it. See **POLYCROTA**.

QUINQUERTIONES, among the Romans, an appellation given to those who had gained the victory in the *quinquertium*, or *pentathlon*.

QUINQUERTIUM was the same with the Grecian pentathlon, comprehending the five exercises of running, leaping, throwing, darting, and wrestling. See **PENTATHLON**.

QUINQUE VIR, frequently wrote **V. VIR**, a Roman magistrate, who had four colleagues joined with him in the same function.

There were various kinds of officers thus denominated. Pomponius the lawyer mentions *quinqueviri* on this and on that side of the Tiber, established for the administration of justice in the night-time, in lieu of the ordinary magistrates, who were not judged proper to run up and down the streets in the dark.

Rofinus tells us, that they were sometimes the *quinqueviri* who conducted the colonies, and divided the lands assigned to them among the several families.

Sometimes the *epulones* were five in number; in which case they were called *quinqueviri*. See **EPULO**.

QUINQUEVIRI MONETARII, were officers first erected under the consulate of Valerius Poplicola, to moderate the excessive usury, or interest, which creditors or bankers used to exact from the people.

QUINQUINA. See **CORTEX Peruvianus**.

QUINSEY, sometimes written *Quinansy*, and *Quinzy*, in *Medicine*, a corruption of the French word *esquinancie*, which again is derived from the Greek, *cynanche*, $\kappa\upsilon\upsilon\alpha\gamma\chi\eta$, signifying fore-throat, or inflammation and tumour of the internal fauces. The term is applied generally to inflammations of the throat, but more particularly to the acute inflammation of the tonsils. A tonsil, enlarged from inflammation, is also emphatically called a *quinsy*. See **CYNANCHE tonsillar**.

QUINSEY, among domestic animals of the live-stock sort, is an affection about the throat and breast, which often attacks them, and which is very obstinate and troublesome. In horses it is usually called *anticor*.

QUINSIEME, or **QUINZIEME**, in our old *Law Books*. See **FIFTEENTH**.

QUINSIGAMOND, or *Long Pond*, in *Geography*, a lake of Massachusetts, between Worcester and Shrewsbury. This is a beautiful lake, in form of a crescent, about five miles long, and from 60 to 100 rods broad. It is intersected with a number of islets, one of which is upwards of 200 acres in extent.

QUINSON, a town of France, in the department of the Lower Alps; 25 miles S.S.W. of Digne.

QUINT, a sequence of five cards of the same colour. See **SEQUENCE**.

QUINTA, Ital. **QUINTE**, Fr. (See **FIFTH** and **DIAFENTE**.) The chord of the $\frac{5}{2}$ in thorough-bass is resolved two ways: first, by the bass rising one note, and the lowest

treble note descending; secondly, by the highest note of the chord rising, and the lowest remaining stationary, when the discord is resolved upwards. This is what Rameau calls *le double emploi de la dissonance*.

QUINTA Pars, in old madrigals, a 5th vocal part, composed of the refuse of the other four.

QUINTA Essentia. See **QUINTESSENCE**.

QUINTAIN, **QUINTANA**, in *Ancient Customs*, a post, or pillar, driven into the ground, with a buckler fixed to it, for the performance of military exercises on horseback, the throwing of darts, breaking of lances, &c.

Matth. Paris describes the quintain as a kind of mark, formed like a man from the navel upwards, holding a shield in his left hand, and in his right a sword or stick; the whole so fitted as to turn round on its foot, and so, as that a cavalier running a-tilt against it with a lance, if he hit it in the breast, it wilked round, and, unless he were very dextrous, struck him with the sword held in the other hand.

In other places, at the top of a post, was erected a slender beam fitted to turn round a spindle; at one of whose ends was a slope or flat board, and at the other a bag of sand or dirt. The sport was, with a long staff, or wooden lance, to ride a-tilt at the board, and to be either so skilful or lucky to escape the blow of the sand-bag.

This some take to be the same with the *arietum levatio*, frequently prohibited in our old synods and episcopal constitutions.

The custom is still retained in Shropshire, and some other counties, among the nuptial solemnities. He that breaks the most poles against the quintain, has the prize; which was anciently a peacock, but is now a garland.

Some derive the word from an ancient game called *quintus*; others from a man of the name of Quintus.

The *vallus* and *palus*, mentioned in Cæsar, are taken, by Vigenere, for a kind of quintain, or wooden man, fixed up as an adversary, or man of straw, to prove one's dexterity against.

Mention is made of this exercise in the Code, *De Aleatoribus*, and in the Paratitles of Cujas on the same. Juvenal speaks of women engaging in it:

“ Aut quis non vidit vulnera pali? &c.”

QUINTAIN was also a right which the lord had to oblige all the millers, watermen, and other young people unmarried, to come before his castle every three years, and break several lances or poles against a post, or wooden man, for his diversion.

QUINTAL, in *Commerce*, the weight of a hundred pounds.

The quintal admits of some difference in different places, according as the pound consists of more or fewer ounces, and as the ounce is lighter or heavier.

Thus, *e. gr.* the Paris quintal, or hundred, in the old system, yields 123lbs. at Montpellier; and the Montpellier hundred only 81lbs. 9 oz. 18 gr. French poids de marc, or 88lbs. avoirdupois nearly. The quintal of Constantinople is esteemed the heaviest of all those used in the Levant: it contains 44 okes, or 100 rottoli; the oke being 4 yfudromes or cheques, or 400 drachms, and the rottolo 176 drachms. The quintal, or kintal, of cotton yarn is 45 okes. The quintal, or cantaro, weighs about 123 $\frac{3}{4}$ lbs. avoirdupois, and the oke 2lbs. 13 oz.; the rottolo, 19 $\frac{3}{4}$ oz. and the cheque, 11 $\frac{1}{4}$ oz. avoirdupois. The quintal is equal to 112 $\frac{3}{4}$ lbs. of Amsterdam; 124lbs. of Venice; and 160 of Leghorn. The quintal of Lisbon contains 4 arrobas, the arroba 32 pounds, the pound, libra, or arrate, 2 marks, or 16 ounces; the ounce, 8 outavas: 13 $\frac{1}{2}$ quintals make a ton. The

pound of Lisbon weighs 9552 Dutch ascs, 7084 $\frac{3}{4}$ grains English troy weight; and therefore 83lbs. of Lisbon = 84lbs. avoirdupois weight.

The English quintal usually consists of 112lbs. avoirdupois, and is divided into four quarters.

QUINTAL was also formerly used for a weight of lead, iron, or other common metal, usually equal to a hundred pounds, at six score to the hundred.

QUINTE', *Isle de*, in *Geography*, an isle in lake Ontario, Upper Canada, which lies close off the shore of Ameliasburg, and opposite the W. point that forms Sandy bay.

QUINTE, in *French Music*, is the name of the instrumental tenor part in full pieces, usually written in the mezzo soprano clef on the second line. All the instrumental tenor or alto viola parts, in Purcell's time, were written in this clef, as may be seen in his overtures and act-tunes. This was an imitation of France, where all the tenor parts in Lulli and Rameau's operas are in the mezzo soprano clef.

QUINTELLO, Ital. QUINQUE, Fr. a vocal or instrumental composition in five parts, dialogued, and generally *a parte eguale*. The instrumental quintets of Boccherini and Mozart are sublime productions: there is, perhaps, no instrumental music in which more genius and abilities are manifest, than in the quintets of these great masters.

QUINTENAR, EL, in *Geography*, a town of Spain, in New Castile; 37 miles S. of Hueta.

QUINTER, QUINTOIER, Fr. in the first attempts at harmony, was counterpoint in a series of 5ths, any two of which, in aftertimes, would ruin for ever the reputation of a composer.

QUINTESENCE, *quinta essentia*, in the old *Chemistry*, properly denoted the fifth essence, or the result of five successive distillations. The term, now obsolete, was used to express the highest degree of rectification to which any substance can be brought. It also signified a preparation consisting of the essential oil of some vegetable substance, mixed and incorporated with spirit of wine.

This, on a proper quantity, *e. gr.* of essential oil of fennel, pouring twelve times the quantity of pure alcohol prepared *per se*, they instantly unite into one similar liquor, which is the quintessence of that plant.

The ancients were perfectly unacquainted with the method of dissolving oil in spirit of wine; and even some of the moderns have questioned its reality: but the certainty of the thing is easily proved, from the instance above, and from a thousand others.

If such quintessence be several times digested, cohobated, &c. the oil will at length be broken so fine, as, like the spirit itself, perfectly to mix with water; which is one of the most extraordinary effects in all chemistry.

After the like manner is made a quintessence of camphor, by only pouring on it spirit of wine.

Quintessences, thus prepared, were supposed to have great medicinal virtues; on account of the pure and potent ingredients used in their composition; which retain, in a great degree, all the virtues of the plants they are procured from: and hence their denomination.

Boerhaave thinks, they might properly be called vegetable sulphurs made potable, and raised to their utmost degree of power and efficacy.

Dry quintessences may be made from the liquid ones, by adding to them some more essential oil of the same vegetable from whence the liquid quintessence was procured, with a little sugar, all mixed together, and distilled, by a very gentle heat, till all the moisture is come over; the matter remaining is then a dry quintessence.

This form was deemed principally useful for travellers, sailors, &c. inasmuch as it renders the quintessence portable; so that the quantity, *e. gr.* of a pin's point, shall be an efficacious medicine.

QUINTESENCE, in *Alchemy*, is a mysterious term, signifying the fifth, or last and highest essence, or power, of a natural body.

This is supposed to be, as it were, the soul drawn from the gross body and its four elements, by a most perfect distillation; and, by means of which, the thing is said to be spiritualized, *i. e.* rendered exceedingly pure, spirituous, and, as it were, incorruptible.

The ancients, who allowed nothing to be real but what has a body, would have the soul of man to be a fifth element, a kind of quintessence without a name, unknown here below, indivisible, immovable, all celestial, and divine. Fenelon.

QUINTESENCE of the *Elements*, is the hermetical mercury.

QUINTESENCE of *Wine*, a term used by Glauber to express an essential oil of wine, which he directs to be made by a careful distillation; and which he is very fond of, as having a power to meliorate, improve, and even to specificcate the poorer wines into the nature of those from which it was obtained.

This is one of the schemes of Glauber, generally esteemed an impracticable one, though very plausible in theory: but though in general there is a disagreeable flavour in the quintessence drawn after his method, which is different from the true flavour of the wine, and spoils the liquor it is added to; yet, by proper care, there is a possibility of succeeding so far as to render this extraneous flavour almost imperceptible, and produce an oil that will mend poor wines extremely, and give a truly vinous flavour to such as are in themselves tasteless. But whatever may be done by this method, may also be done with much more certainty, and much less trouble, by the concentration of wines by freezing. This may be easily practised in the wine countries; and by this means Burgundy, Champagne, and other the most valuable wines, may be reduced into thick extracts and robs, by the means of which wines may be made in England; a very small quantity of these concentrated wines being sufficient to convert the whole of any of the poor tasteless and insipid wines, which are of themselves of little or no value, into the very wine from which the rob was made; and that in such perfection, that the nicest judge cannot find out the difference.

These robs of wine, made and preserved upon the spot, would also be of infinite use in the wine countries, as they might be kept to improve the wines of bad years. Stahl, *De Concentr. Vin.* Shaw's *Chem. Ess.*

QUINT-EXACT, in old *Law Books*, the last call of the defendant sued to an outlawry. If he appear not to it, he is, by the judgment of the coroners, returned outlawed, if a feme, waived.

QUINTI, *Bay of*, in *Geography*, a bay and harbour in the N.E. part of lake Ontario, at the mouth of the Trent; formed by a large peninsula, consisting of the townships of Ameliasburg, Sophiasburg, and Marysburg, extending easterly from an isthmus, where is a portage at the head, or W. end of the bay, to Point Pleasant, the calthernmost extremity of the peninsula, opposite to Amherst island. The river Trent discharges itself into the head of the bay, westward of the portage, and supplies it with the waters of the Rice lake. Westward of the portage in lake Ontario, is the harbour of Presque Isle de Quinté, now called Newcastle. The fertility of the soil about the bay of Quinté is generally allowed. The land is rich and easily wrought, and produces several crops without manure; 25 bushels of wheat being often

often produced from an acre. The timber, like that of the other parts of the province, consists of oak, elm, hickory, maple, &c. The bay is narrow throughout, and about 50 miles long, through which distance it is navigable for the small vessels that are used on the lakes. It abounds with wild fowl, and various kinds of fish. The river Trent affords a salmon fishery. In passing from the head of the bay of Quinté into lake Ontario, you cross a short portage, in front of the township of Murray, being the isthmus between it and the peninsula of Prince Edward. At the end of the portage, and before you enter lake Ontario, is a small but very beautiful lake, having very good land on its banks. To the northward of this portage it has been proposed to make a canal for connecting the waters of the bay with those of the lake. A little to the westward of the portage and proposed canal, is the harbour of Newcastle, a situation well suited for commerce and protection, and sheltered from all winds. A knoll on the peninsula affords a healthy scite for the town.

QUINTILE, QUINTILIS, in *Astronomy*, an aspect of the planets, when they are seventy-two degrees distant from one another, or a fifth part of the zodiac.

QUINTILIAN, MARCUS FABIVS, in *Biography*, a celebrated teacher of eloquence, was born about the year 42 of the Christian era, during the reign of the emperor Claudius. He is supposed to have descended from a family originally Spanish, but that his father, or grandfather, had settled in Rome. The place of his birth is not known, but it seems certain that he was educated in that capital, where he studied rhetoric under Domitius Afer, a celebrated orator. He opened a school at Rome, and was the first who obtained a salary from the state as a public teacher. After he had remained twenty years in this laborious employment, and obtained the applause of the most illustrious Romans, not merely as a preceptor, but as a pleader at the bar, Quintilian retired to enjoy the fruits of his labours and industry. In his retirement he assiduously devoted his time to the study of literature, and wrote a treatise on the "Causes of the Corruption of Eloquence." Some time after, he wrote his "Institutiones Oratoriæ," the most perfect and complete system of oratory extant. It is, in truth, one of the most valuable remains of antiquity. It was composed for the use of his son, whose early death he had occasion to deplore, and is an institute for the education of an orator, whom he takes up from the cradle, and conducts through all the periods of instruction to the exercise of his proper art. It accordingly contains many excellent precepts with respect to education in general, especially the early parts of it, which are applicable in all times and countries, as being founded on the nature of the mind. The style of Quintilian is said, by critics, to exhibit tokens of the deterioration of the Latin tongue; but, on the other hand, it must be observed, that every deviation from the usage of the Augustan age has been too readily regarded as a deprivation. Quintilian was appointed preceptor to the two young princes whom Domitian destined for his successors on the throne; but the celebrity which the rhetorician received from the favours and attention of the emperor, and from the success which his writings met with in the world, were embittered by the loss of his wife, and of his two sons, one of whom he describes as a prodigy of early excellence. It is said that Quintilian was poor in his retirement, and that his indigence was relieved by the liberality of his pupil, Pliny the younger. He is supposed to have died about the year 95. His "Institutiones" were discovered in the year 1415, in an old tower of a monastery at St. Gall, by Poggio Bracchiolini. The treatise on the "Causes and Corruption

of Eloquence" has not come down to us. The name of Quintilian is affixed to certain "Declamations," of which there are 19 of moderate length; but as the style, method, and manner, are totally different from the rules laid down in the "Institutiones," no good judges attribute them to the name of Quintilian. Of the editions of Quintilian some of the most valuable are those of Gesner, 4to. Gotting. 1738; of Lug. Batavorum, 8vo. cum notis variorum, 1665; of Gibson, 4to. Oxon. 1693; and that of Rollin, re-published in London in 1792. There is an English translation by Mr. Guthrie.

QUINTILIANS, QUINTILIANI, in *Ecclesiastical History*, a sect of ancient heretics, the same with the Pepuzians; thus called from their prophets Quintilia.

In this sect, the women were admitted to perform the sacerdotal and episcopal functions; grounding their practice on that passage of St. Paul to the Galatians, where he says, "That in Christ there is no distinction of males and females."

In their assemblies, it was usual to see the virgins enter in white robes, personating the prophetesses. The Quintilians bore some resemblance to the modern Quakers.

QUINTILIS, in *Chronology*. See JULY.

QUINTIN, or QUINT, in *Commerce*. See QUENTIN.

QUINTIN, in *Geography*, a town of France, in the department of the Northern Coasts, and chief place of a canton, in the district of St. Brieuc; nine miles S.W. of St. Brieuc. The place contains 3976, and the canton 12,510 inhabitants, on a territory of 147½ kilometres, in eight communes.

QUINTINIE, JOHN DE LA, in *Biography*, famous for his skill in horticulture, was born at Poitiers in 1626. He received a learned education, and was brought up to the profession of the law, in which he gained reputation as a pleader at the bar. A passion for agricultural knowledge led him to study, with great attention, all the authors, ancient and modern, upon that topic; and on a visit to Italy as tutor to a youth, he made great additions to his knowledge from actual observation. On his return he devoted himself almost entirely to experiments on the culture of trees and plants, and made many discoveries which greatly improved the art of gardening. He was the first person who laid down just principles of the art of pruning fruit-trees. He also remarked that a transplanted tree grew only by the new roots which it threw out, and that the old fibres were useless, and ought to be cut off. It does not appear at what time he began to follow gardening as a profession, but he had certainly acquired a high degree of reputation in it when he was invited to England by Charles II. who offered him a considerable pension to engage him in his service. He twice visited London, and a paper of his was published in the Philosophical Transactions, on the culture of melons. He was made, by Lewis XIV., director-general of the gardens in all the royal palaces. In 1690 he published "Instructions pour les Jardins Fruitiers et Potagers," which obtained a high degree of popularity, was frequently reprinted, and was translated into several modern languages. The last edition was entitled "Parfait Jardinier," in two vols. 4to. The author died at Paris in the year 1700.

QUINTO, in *Geography*, a town of Spain, in Arragon; 20 miles S.E. of Saragossa.

QUINTUS CALABER, in *Biography*, a Greek poet, who wrote a supplement to Homer's Iliad, in 14 books, in which a relation is given of the Trojan war from the death of Hector to the destruction of Troy. He is supposed, from the style of his work, to have lived in the fifth century, but nothing certain can be collected concerning his person and country. His poem was first made known by

cardinal Bessarion, who discovered it in St. Nicholas' church, near Otranto in Calabria; hence the author was named *Quintus Calaber*. It was published at Venice by Aldus, but there is no date attached to the title page.

QUINTUS CURTIUS. See CURTIUS.

QUINTUS Femoris, in *Anatomy*, a name given by Fallopius and many others to one of the muscles of the thigh, now called the psoas magnus.

QUINTUS Oculorum, a name given by Vesalius and some others to one of the muscles of the eyes, more expressly called by others obliquus superior oculi, and opifex circumgyrationis oculi.

QUINVA, in *Botany*, a name by which some authors have called the amaranth, or cockscomb.

QUINZANO, in *Geography*, a town of Italy; 18 miles S.W. of Brescia.

QUINZIEME, Fr. in *Music*, the double octave, above or below any sound (see FIFTEENTH); which is the name of a stop in our organs, equidistant from the diapason.

QUIOPELA, in *Zoology*. See VIVERRA Mungo.

QUIPOS, in *Literary History*, a name given to knots on cords of different colours, in Peru, which imperfectly supplied the place of writing. This device was adopted, as it has been said, for rendering calculation more expeditious and accurate. The various colours denoted different objects, and each knot expressed a distinct number. Thus an account was taken, and a kind of register kept of the inhabitants in each province, or of the several productions collected there for public use. But as by these knots, however varied or combined, no moral or abstract idea, no operation or quality of the mind could be represented, they contributed little towards preserving the memory of ancient events and institutions. The Mexican paintings and symbols, rude as they were, conveyed more knowledge of remote transactions than the Peruvians could derive from their boasted quipos. If, indeed, the latter had been of more extensive use, and better adapted to supply the place of written records, they perished so generally, together with other monuments of Peruvian ingenuity, in the wreck occasioned by the Spanish conquest, and the civil wars subsequent to it, that no accession of light or knowledge is derived from them. Robertson's *Hist. Amer.*, vol. iii.

QUIQUI, in *Zoology*, a species of *Mustela*; which see.

QUIRAZAI, or CURAPOA, in *Ornithology*. See CRAX Alegor.

QUIRE of Paper, of the French *cabier*, the quantity of twenty-four or twenty-five sheets.

QUIRICIA, a name given by some to the stone called *quiris* by the generality of writers.

QUIRICU, in *Geography*, a town of France, in the department of the Isere; 12 miles E. of Ballay.

QUIRINACIUM OPIUM, in the *Materia Medica*, a name given by some to the gum we know by the name of *assa fetida*.

QUIRINALIA, in *Antiquity*, feasts celebrated, among the Romans, in honour of Romulus, who was called Quirinus. See QUIRITES.

The Quirinalia, called also *stultorum ferie*, were held on the 13th of the calends of March, i. e. on our 17th of February.

QUIRINI, ANGILO-MARIA, in *Biography*, a learned cardinal, by descent a Venetian, was born in the year 1680. While young he entered into the order of the Benedictines of Monte Cassino. At Florence he pursued a very extensive course of study under several of the most eminent men in science and literature of that age.

Upon his entering a professorship in his convent, he delivered an oration "De *Mossicæ Historiæ Prestantia*," which was printed. His studies were interrupted some time, by an imagination that he was afflicted with a stone in his bladder; but the death of his physician, who fell a victim to a false impression respecting his own case, freed him from his fancied complaint, and in the year 1710 he set out upon his literary travels. He visited Germany, Holland, England, and France, making in the latter country an abode of more than two years, during the greatest part of which time he resided in the Benedictine abbey of St. Germain des Pres. In the course of his travels he formed an acquaintance with almost all the literary characters in those countries, and visited every object of learned curiosity, at the same time every where exciting a general esteem of his talents, his industry, and his conduct. Upon his return to Italy he published a Dissertation containing a Plan for a History of Italy;—an Essay on the History of Farfa, in the Duchy of Spoleto;—and an edition of the Office for Divine Service according to the Usage of the ancient Greek Church. He was soon after created bishop of Corfu, by pope Innocent XIII., a dignity which he filled in such a manner as to inspire the Greek separatists with veneration for his person. His residence in Corfu was the cause of his composing a learned work, entitled "*Primordia Corcyræ ex antiquissimis Monumentis illustrata*," 4to. 1725. In the year 1727, Benedict XIII. raised Quirini to the cardinalate, after having nominated him to the bishopric of Brescia. His promotion to that see was followed by some publications relative to the literature of Brescia. His attachment to the see of Rome was displayed by a life of pope Paul II. printed in 1740, the object of which was to defend the memory of that pontiff against the attacks of Platina. Soon after this he was appointed librarian to the Vatican; in this and other posts he continued to serve the cause of literature. It was through his means that a new edition of the works of St. Ephrem was given in 6 vols. fol. in the Greek, Syriac, and Latin languages. He likewise edited the letters of cardinal Pole, written against the principles of the reformers. This prelate died, greatly regretted, at his episcopal residence, in 1755, at the age of 75. Though a vigorous champion of the papacy, he wrote with a spirit of candour and moderation, which obtained the applause of the Protestants themselves. He was associated to several literary societies, among which were the academies of Petersburg, Berlin, and Vienna, and the Institute of Bologna. He enjoyed a large revenue, which he expended with munificence, on objects of charity and public splendour. At Rome he beautified the church of St. Mark, whence he derived his cardinal's title, and he contributed liberally to the fine Catholic church at Berlin. He laid the foundation, by a valuable gift of books, of a public library at Brescia. His own select and valuable library he presented to the Vatican. His charities were numerous and extensive, and he was indefatigable in performing his pastoral duties, visiting the alpine parts of his diocese in the most inclement seasons. Besides the works already mentioned, he published an account of his own life, and a narrative of his travels.

QUIRIQUING, in *Geography*, an island on the coast of Chili, near the entrance into the bay of Conception. S. lat. 36° 35'.

QUIRIS, *Quirinus lapis*, a name given, by the writers of the middle ages, to a stone famous among them for its imaginary virtues, but of which they have left us no description.

QUIRISTER, CHORISTER, or *Chorista*, a person appointed

pointed to sing in the quire, or choir, of a cathedral. See ANTHEM, CHANTOR, and CHOIR.

QUIRITES, in *Antiquity*, an appellation given to the people of Rome, chiefly the common citizens, as distinguished from the soldiery.

It took its rise from the Curetes, the inhabitants of the Sabine town Cures. On this occasion Romulus, and Tatius king of the Sabines, having united their two people, and their two states, into one; upon Romulus's death and deification, the Sabines, outdoing the Romans in number, became masters of the councils; and accordingly appointed, that Romulus should be denominated Quirinus, from Cures, a city of the Sabines; or rather from Quirinus, the name of a god worshipped in that city.

From the new Quirinus, all the people came afterwards to be called Quirites; unless we will suppose, that the same authority which denominated Romulus Quirinus, from Cures, did also denominate the people Quirites, immediately from the Curetes.

Some authors derive the word Quirinus from Curis; which, in the Sabine tongue, signified a pike, or halbert. Struvius adds, that Romulus was always painted with a pike in his hand.

Julius Cæsar, as Tacitus informs us, (*Annal.* i. 43.) appeared a sedition by the use of this word *Quirites*, which opposed to *soldiers*, expressed contempt, and reduced the offenders to the less honourable condition of mere citizens. The emperor Alexander also applied it to the same purpose. See his biographical article.

QUIRK, in *Building*, a piece of ground taken out of any regular ground-plot, or floor.

Thus, if the ground-plot were square, or oblong, and a piece be taken out of a corner, to make a court, or yard, &c. the piece is called a quirk.

QUIROGA, in *Geography*, a town of Spain, in Galicia; 24 miles N.E. of Orenfe.

QUIROS, CAPE, lies on the E. coast of the island of Espiritu Santo, in the South Pacific ocean. S. lat. 14° 56' 8" E. long. 167° 20'.

QUIRPELE, in *Zoology*, the name of a small animal, called by some authors the *Indian ferret*, or *viverra Indica*, and by others *quill*. See VIVERRA *Mungo*.

Garcias and some authors give very remarkable accounts of the enmity this creature has to serpents of all kinds. They tell us, that when this little creature intends an attack upon one of these animals, it first prepares against danger, by gnawing a quantity of the root of the lignum colubrinum, or snake wood; and when it has thoroughly impregnated its saliva, it wets with it first its fore-feet, and with them daubs over its head and its whole body; and that thus prepared, it boldly attacks the snake, and never leaves off till it has killed it. Garcias assures us, that many of the Portuguese have been eye-witnesses of these combats.

It is probable enough, that this creature may attack a snake when thoroughly hungry, knowing its flesh to be good food; but the story of the antidote is to be suspected. See ICHNEUMON.

QUIRPEN, in *Geography*, an island in the North Atlantic ocean, near the N. coast of Newfoundland. N. lat. 51° 40'. E. long. 52° 22'.

QUIRSWYCK, a town of Norway; 60 miles N.N.E. of Romfald.

QUIS, in *Natural History*, a kind of marcasite of iron or copper, from which vitriol is drawn. It is more frequently called pyrites.

QUISBRO, in *Geography*, a town of Sweden, in Nericia; 12 miles S.W. of Orebro.

QUISCALA, in *Ornithology*, a species of *Gracula*; which see.

QUISIBI, in *Geography*, a town of Arabia, in the province of Oman; 180 miles W. of Julfar.

QUISIL AUREN, a town of Asiatic Turkey, in Carmania; 15 miles W. of Cogni.

QUISONGALA ISLANDS, a cluster of small islands in the Indian sea, near the coast of Africa. S. lat. 10° 40'.

QUISPICHANCHI, a jurisdiction in the diocese of Cusco in Peru, beginning at the south gates of Quito, and stretching from E. to W. about 20 leagues. The lands of this jurisdiction belong, in general, to the richer inhabitants of Cusco, and produce plenty of wheat, maize, and fruits. Here are also manufactures of baize and coarse woollen stuffs. Part of the jurisdiction borders on the forests inhabited by wild Indians, and produces great quantities of coca, or cacao, an herb greatly used by the Indians working in the mines, and forming one of the principal branches of its commerce; the town lies 12 miles S. of Cusco.

QUISQUALIS, in *Botany*, a name combined by Rumphius of *quis*, who, and *qualis*, what kind or manner, by which he intended to express the singular variableness of the plant, as if nothing could be found like it.—Linn. Gen. 215. Schreb. 292. Willd. Sp. Pl. v. 2. 579. Mart. Mill. Dict. v. 4. Juss. 78. Lamarck Illustr. t. 357.—Class and order, *Decandria Monogynia*. Nat. Ord. *Verprecula*, Linn. *Thymelea*, Juss.

Gen. Ch. Cal. Perianth inferior, tubular, thread-shaped, very long, deciduous, its border in five spreading segments. Cor. Petals five, inserted into the mouth of the tube, sessile, oblong, obtuse, spreading, much larger than the segments of the calyx. Stam. Filaments ten, bristle-shaped, inserted into the tube of the calyx, five of them below the rest; anthers oblong, in or above the mouth of the tube. Pist. Germen superior, ovate; style thread-shaped, longer than the stamens; stigma obtuse, dilated. Peric. Drupa dry, with five unequal angles. Seed. Nut elliptic-oblong, pentagonal.

Eff. Ch. Calyx with a thread-shaped tube; five-cleft. Petals five. Drupa superior, with five angles.

1. *Q. indica*. Linn. Sp. Pl. 556. (*Quisqualis*; Rumph. Amb. v. 5. 71. t. 38. *Q. pubescens*; Burm. Ind. 104. t. 35. f. 2, and *Q. glabra*; t. 28. f. 2.)—Native of Java, and the Molucca isles; naturalized by Rumphius in Amboyna. The stem is shrubby, at first low and stumpy, but subsequently throwing out long trailing or twining shoots, which become as thick as a man's arm. To this diversity of habit, and the changeable hue of the flowers, the name alludes. The young branches are clothed with fine soft down. Leaves opposite, occasionally scattered, on shortish downy stalks, ovate, pointed, entire, two or three inches long; their ultimate veins finely reticulated; both surfaces more or less downy, rarely smooth. Flowers in axillary or terminal bracted spikes. Bractees ovate, downy. Corolla two inches long, downy, whitish in the morning, turning pale red in the afternoon, rose-coloured in the evening, and the next morning of a blood red. Fruit as big as one joint of the finger. Nut eatable when quite ripe, having the flavour of a filbert. When unripe, Rumphius compares its taste to that of a radish. These nuts are a popular remedy, among the Malays, for worms in children. Two or three of the pungent unripe ones, or five of those that are arrived at maturity, are a dose. Some persons are attacked with a dangerous hiccup from eating two or three of the nuts in question, whilst others find no such effect from a considerable number. The integuments are carefully removed. They probably partake of the

poisonous qualities of the Mezereon tribe; though in a mild degree, as Rumphius speaks of the flavour of several parts of the plant, without mention of any very hurtful properties. Even the kernels of our European *Daphnes* are highly acrimonious.

QUISQUISANA, in *Geography*, a town of Peru, in the diocefe of Cusco; 32 miles S.S.E. of Cusco.

QUISSAC, a town of France, in the department of the Gard, and chief place of a canton, in the diftrict of Le Vigan, having a mineral fpring; 20 miles N. of Montpellier. The place contains 1310, and the canton 3884 inhabitants, on a territory of 160 kilometres, in 12 communes.

QUISTELLO, a town of Italy, in the department of the Mincio; 15 miles S.S.E. of Mantua.

QUISTORP, JOHN, in *Biography*, a German Lutheran divine and professor, was born at Rostock in the year 1584. He pursued his academical studies at his native city, at Berlin, and at Franckfort on the Oder; and afterwards travelled through Holland, Brabant, and Flanders, in the capacity of governor to the son of a patrician of Lubec. In 1614, his learning and abilities pointed him out as a fit person to fill the divinity chair at Rostock; but before he entered upon the duties of his office, he was created doctor of divinity. He obtained other preferments in the church, particularly the archdeaconry of St. Mary's at Rostock. In 1645 he was appointed pastor of the same church, and superintendent of the churches in the diftrict of that city. He had the felicity of rendering important services to the celebrated Hugo Grotius, during his last fatal illness at Rostock. Upon the death of that great man, he wrote a Latin letter to Calovius, containing an account of his sickness and last sentiments, which is inserted in the "Bibliothèque Choisie" of Colomies; and in the "Vindiciæ Grotianæ," under the title of "Grotii Manes." Quistorp died in 1648, at the age of 64. He was the author of "Annotationes in omnes Libros Biblicos," "Commentarius in Epistolas Sancti Pauli," and several other works. He left a son of the same name, who was born at Rostock in 1624, and died in 1669. He became pastor, professor of divinity, and rector of the university in that city.

QUISTRUM, in *Geography*, a town of Sweden, in the province of West Gothland; 9 miles N.W. of Uddevalla.

QUITANGONE, a river of Africa, which runs into the Indian sea, 15 miles N. of Mozambique, S. lat. 14° 40'.

QUITAPABILLA, a river of America, being a branch of the Swetara, which falls into the Susquehannah at Middleton.

QUITAPORA, a town of the state of Georgia. N. lat. 33° 27'. W. long. 89° 58'.

QUITCH, in *Agriculture*, a name frequently applied, in many diftricts, to a very troublesome set of plants of the weed kind; for though it properly belongs to the couch-grass plant only, it is much used to signify others of the creeping perennial rooted sort, as the bent, creeping, soft, and tall oat-grass, as well as some others, which are only capable of being destroyed by repeated summer ploughings, or forking them out and burning them on the ground. See **COUCH**.

QUITCU-Grass, the common name given in some places to a very troublesome sort of weed, found in many diftricts, and which requires great exertion to eradicate it out of the land. See **COUCH**.

QUITCH-Drags, that sort of useful tool of the drag-kind, which is employed in the dragging out and removing this sort of weed from ploughed lands. It is made in several different methods, according to circumstances; but has

mostly something of the long triangular form in the beam part, into which the teeth or tines are fixed. These are seldom made so large in this as in the heavy sorts of drags; but they are mostly a little hooked, or bent forward, towards the points or lower ends. The frame-part is sometimes set with two rows of tines, or more.

It is a sort of tool which is frequently made use of for rendering arable ground perfectly clear of root weeds, being had recourse to before the last ploughings. Where the land has been cross-ploughed, this kind of drag may be employed with great advantage in bringing it into proper order. It has some other names in different counties. See **COUCH-Drags**, and **DRAG**.

QUITCH-Rake, a name given in many diftricts to the rake employed in collecting the weed called couch, from the surface of ploughed ground, as well as some other sorts in particular cases. The head of this tool, into which the teeth or tines are fastened, is usually about five feet in length; the tines are made in a round form, having a projection of about eighteen inches below the head, each being gradually turned or crooked forward about two inches; the distance from each other also about two inches. There is commonly a small beam made to fasten in the middle with two pieces of wood, which come from each corner of the rake-head, into which the tines are fastened by means of a pin that goes through the beam, and keeps the rake steady. In working, this implement may be put on the carriage-part of a two-wheeled plough, to be drawn by one horse; a man going behind to occasionally lift up the rake when full, in order to leave the couch and other weeds in rows, for the purpose of burning them. In this manner, a great deal of weeds and trumpery may be collected together in the course of a day. See **COUCH-grass Rake**.

QUIT-CLAIM, a release, or quitting one's claim or pretensions to a thing.

QUITERVA, in *Geography*. See **SOFALA**.

QUITEVA, or KITEA, a town of Africa, in the country of Darah, defended by a castle; 75 miles S.E. of Morocco. N. lat. 28° 6'. W. long. 5° 26'.

QUITO, an extensive province of South America, which was subjected to the Peruvian empire, by Huana Capac, about the year 1526, at the time when the Spaniards first visited the coast of Peru. Huana prevailed on his legitimate and eldest son Huascar to allow one of his natural children, Atahualpa, by the daughter of the last king of Quito, to hold this kingdom as a fief of the empire. Atahualpa, however, rebelled, seized the empire, imprisoned his brother, and soon after put him to a violent death. His prosperity was of short duration; for in the year 1533 he suffered the same fate, by order of Don Francisco Pizarro, who had deputed Sebastian de Benalcazar to conquer the kingdom of Quito. Having by a series of victories made himself master of the kingdom, he proceeded in the year 1534 to rebuild the capital, which had suffered much from internal commotions, and called it "San Francisco de Quito," a name which it still retains, though it was not till seven years after this date that it obtained the title of city. The province, which the Spaniards found annexed to the kingdom of Peru, continued in that state till the year 1718, when it was dismembered from Peru, and attached to the viceroyalty of New Granada. At the same time the audience of Quito was suppressed, together with that of Panama, in the kingdom of Terra Firma: though the latter continued dependent on the viceroys of Lima. See **NEW GRANADA** and **PERU**.

This province is bounded on the north by that of Santa Fé de Bogota, and includes part of the government of Popayan; on the south it is limited by the governments of Peru

QUITO.

eru and Chachapoyas; towards the east it extends over the whole government of Maynas, and the river of the Amazons, to the meridian of demarcation, or that which divides the dominions of Spain and Portugal. Its boundary on the west is the sea, from the coast of Machala, in the gulf of Puna, to the coast of the government of Atacames, and the jurisdiction of Barbacoas, in the bay of Gorgona. Its greatest breadth from north to south is about 200 leagues; and its length from east to west, the whole extent from Cape de Santa Elena, in the South sea, to the above-mentioned meridian, which, by the most accurate computation, is 600 leagues. All the parts, however, that can properly be said to be peopled, and actually subject to the Spanish government, are those intercepted by the two Cordilleras of the Andes, which, compared with the whole extent of the country, may be termed a street or lane, extending from the jurisdiction of the town of St. Miguel de Ibarra to that of Loja; the country from hence to the government of Popayan, and also that comprehended between the western Cordillera and the sea. With this limitation, the extent of the jurisdiction from east to west will be 15 leagues, or somewhat more, being the distance intercepted between the two Cordilleras. But to this must be added the countries comprehended in the governments of Jaen de Bracamoros, which borders on the jurisdiction of Loja, and the extremity of the whole province, and situated on the east side of the eastern Cordillera; and to the northward, the government of Quixos, and that of Maynas to the eastward of it, but separated by large tracts of land inhabited by wild Indians; and on the north side of the province from that of Popayan; though the latter is properly a distinct province from that of Quito. Thus on the west side of that interval between the two Cordilleras lies the government of Atacames, and the jurisdiction of Guayaquil; on the east side, the three governments above mentioned; and on the north, that of Popayan.

This province, exclusive of these five governments, consists of nine jurisdictions, called in that country provinces, that of Quito being subdivided into as many others as there are governments and jurisdictions. Those in the province of Quito, beginning with the most northern, are the following, *viz.* the town of San Miguel de Ibarra, the village of Otabalo, the city of Quito, the asiento of Latacunga, the town of Riobamba, the asiento of Chimbo, or Gaaranda, the city of Guayaquil, the city of Cuenca, and the city of Loja.

The jurisdiction of Quito, the third of those above enumerated, consists of 25 parishes, besides those in the city, and extends more than five leagues, comprehending lands covered with plantations, producing a variety of plants and fruits, according to the quality, situation, and exposure of the ground. Those in the temperate parts yield plentiful harvests of maize; and those at the bottoms of deep cavities, being in a hot temperature, are planted with sugar-canes, from which are extracted great quantities of sugar and rum. The plantations near the summits of the mountains, having a variety of temperatures, produce wheat, barley, pot-herbs of all kinds, and potatoes. Above these plantations are fed numerous flocks of sheep, producing that wool which affords employment to a great multitude of people. Some farmers breed cows, with the view to the advantage derived from their milk in making cheese and butter. In other farm-houses, various occupations are observed, such as breeding of cattle, agriculture, and manufactures, particularly of cloth, bays, and serges. The degree of cold and heat in this jurisdiction is subject to sudden variations, according to the situation of different places; but in the

same place vicissitudes seldom occur. The villages in this jurisdiction are constructed with little regularity. They consist principally of a church and parsonage, called the convent, the priests being formerly all religious; the other parts present a number of huts with mud-walls, scattered all over the country, where every one has his appropriate piece of ground, which he tills for his subsistence. A great part, and in some villages the whole, of the inhabitants are Indians, who live there when out of place; though in some parts the inhabitants are Mestizos, and here and there a Spanish family; but these are extremely poor. Ulloa's Voyage, vol. i.

QUITO, the capital of the above described province, rebuilt in the year 1534, (see the preceding article,) and situated in the inland parts of the continent of South America, on the eastern skirts of the West Cordillera of the Andes; distant from the coast of the South sea about thirty-five leagues to the west. On the N.W. is the mountain and desert of *Pichinca* (which see), on the acclivity of which the city is built, and also among the breaches that are formed by the eminences of this mountain; so that many of the buildings stand upon arches, and the streets are of course very irregular and uneven. With regard to magnitude, this city may be compared to one of the second order in Europe; but the unevenness of its situation is a great disadvantage to its appearance. Near the city are two spacious plains, one on the S., called *Turu-bamba*, three leagues in length; and the other on the N., termed *Inna-Quito*, about two leagues in extent; both of which are interspersed with seats and cultivated lands, which much contribute to the variety and beauty of the scenery. These plains contract as they approach the city, and at their junction form a neck of land, covered with those eminences on which part of Quito stands. The principal square in Quito has four sides, in one of which stands the cathedral, and in the opposite the episcopal palace; the third side is taken up by the town-house, and the fourth by the palace of the audience: this square is very spacious, and has in its centre an elegant fountain. The four streets terminating at the angles of the square are straight, broad, and handsome; but at the distance of three or four *quadras*, (each *quadra* being about one hundred yards,) the troublesome declivities commence; and on this account the inhabitants cannot enjoy the benefit of coaches, or wheel carriages. The principal streets are paved; and those which are not paved are almost impassable after rain, which is here very common. Besides the principal square, there are two others, that are very spacious, and several that are smaller. In these most of the convents are situated, and these make a handsome appearance, and some of them, particularly that of the order of Franciscans, are elegant structures. The principal houses are large, and some of them have spacious and well-contracted apartments, though none are above one story in height, but their doors and windows are low and narrow. The materials made use of in building at Quito are "adobes," or unburnt bricks and clay, cemented by a substance called "fangagua," a species of mortar that is uncommonly hard, used by the ancient Indians for building all kinds of houses and walls. The city is divided into seven parishes; the cathedral is richly adorned with tapestry hangings and other costly decorations; but the parish churches are of mean appearance. The convents of monks are those of the Augustines, Dominicans, and Fathers of Mercy, &c. colleges, &c. Quito has also several nunneries. The college of Jesuits, as well as all the convents of monks, are large, well built, and very splendid. Here is also an hospital, with separate wards for men and women, under the name of the order of our Lady of

of Bethlehem. Among the courts whose sessions are held at Quito, the principal is that of the Royal Audience, established there in 1563; the exchequer or chamber of finances, a treasury for the effects of persons deceased, &c. The corporation consists of a corregidor, two ordinary alcaldes chosen annually, and regidores. The cathedral chapter consists of the bishop, dean, archdeacon, chanter, treasurer, a doctoral, a penitentiary, a magistral, three canons by presentation, four prebends, and two demi-prebends, with the following salaries; that of the bishop 24,000 dollars, the dean 2500, the four succeeding dignities 2000 each, the canons 1500 each, the prebends 600, and the demi-prebends 420. This church was created into a cathedral in 1545, and among other festivals celebrated in it, the most magnificent are those of Corpus Christi, and the Conception of our Lady, when all the courts, offices, and persons of eminence assist. In the former there is a singular pomp of the procession of the host, and here are also dances of a peculiar nature, which were performed before their conversion to Christianity. The corporation and cathedral chapter keep, by vow, two annual festivals in honour of two images of the Virgin, which are placed in the villages of Guapulo and Quineha, belonging to this jurisdiction. These images or statues are brought with great solemnity to Quito, and each festival is succeeded by nine days' devotion, the audience and other courts assisting on the occasion. These festivals are held in commemoration of the assistance vouchsafed by the holy Virgin, at the time of an earthquake and terrible ejection from Pichincha, by which Latacunga, Hambato, and a great part of Riobamba, were utterly destroyed; whereas by the supposed interposition of the Virgin, the city escaped even the slightest damage.

The celebrated city of Quito is said by Alcedo to contain 58,000 persons, some of whom are distinguished by their rank. These are the descendants either of the original conquerors, or of other persons who in succeeding times came over from Spain invested with some lucrative office, and who have preserved the lustre, both of their descent and wealth, by intermarriages, without mixing with meaner families though famous for their riches. The lower orders of people consist of four classes, Spaniards or whites, Mestizos, Indians or natives, and Negroes, with their progeny. The former, according to the statement of Ulloa, compose about a sixth part of the population; the Mestizos, or descendants of Spaniards and Indians, amount to about a third part; the Indians form about another third; and the others, who are about one-sixth, are the Casts. The Spaniards are prevented by their pride from applying to any kind of business, and therefore many of them are poor and wretched. The Mestizos occupy themselves in arts and trades, but principally in those of the highest repute, such as painting and sculpture, in which they excel. These men of talents, however, are indolent and slothful, so that they loiter about the streets during the whole day. The Indians, who are generally shoemakers, bricklayers, weavers, or engaged in similar occupation, are not more industrious. Persons of fortune among the Spaniards affect great magnificence in their dress, wearing the finest gold and silver tissues; but that of the middling and lower class is a black cloak, and under it a long coat, reaching down to their knees, with a close sleeve, open at the sides, without folds, and ornamented with rows of buttons. The Mestizos generally wear blue cloth, manufactured in this country. The dress of the Indians consists only of white cotton drawers, made either from the stuffs of the country, or from others brought from Europe, reaching down to the calf of the leg, and edged with lace suitable to the stuff. The use of a shirt is

supplied by a black cotton frock, wove by the natives; and over this is a kind of serge cloak, through which the head passes, and a hat made by the natives. The men, both Creoles and Spaniards, are well made, of a proper stature, and of a lively agreeable countenance. The Mestizos in general are also well made, often taller than the ordinary size, very robust, and have an agreeable air. The Indians, both men and women, are generally low, but well proportioned and very strong. The Indians have no beard, nor have either males or females any indications of the age of puberty. The youths of family are instructed in philosophy and divinity, and some, with reluctance, proceed to the study of the civil law. The country is observed to abound more in women than men; and it is observed, that nature begins to decay at the age of thirty in the male sex, especially among those who have been tenderly brought up; whereas the females enjoy a more confirmed state of health and vigour. This difference is ascribed partly to the climate and partly to the food, but principally to early intemperance and voluptuousness, and also the want of proper employments. The liquors that are used here are rum and brandy, in which they freely indulge, and also the infusion of the Paraguay herb, which serves for tea. The vices prevalent here are idleness, drunkenness, and gaming. The common people and Indians are much addicted to theft, in which they are very artful and dextrous. In Quito, and in all the towns and villages of its province different dialects are spoken, Spanish being no less common than the Inga.

Quito is so happily situated, that neither the heat nor cold is troublesome; though the extremes of both may be felt in its neighbourhood. An equality of temperature takes place throughout the whole year, the difference between the seasons being scarcely perceptible. The winds are salubrious, and blow continually, but never with any violence. The rain occasionally descends in impetuous torrents. Earthquakes are not uncommon, and when they occur very violent; that of 1775 was very destructive. The great earthquake on the 4th of February 1797, which changed the face of the whole province, and in one instant destroyed thirty-five or forty thousand persons, has so altered the temperature of the air, that the thermometer is now commonly 41° to 54° , and seldom rises to 68° or 70° ; whereas Bouguer observed it constantly at 66° or 68° . Since this catastrophic earthquake are continually recurring; and such shocks, it is probable, that all the higher ground is one vast volcano. Von Humboldt adds, that what are called the mountains of Cotopaxi and Pichincha are but little summits, the craters of which form different conduits terminating in the same cavity. The earthquake of 1797 afforded a melancholy proof of this; for the ground then opened every where, and vomited forth sulphur, water, &c. Notwithstanding the dangers and horrors that surround them, the people of Quito are gay, lively, and variable, and very much addicted to pleasure, luxury, and amusement. Humboldt informs us, that the volcanos of Quito eject pumice, basalt, and porphyry scorified; with enormous quantities of water and liquid clay, which diffuse fertility eight or ten leagues round. The fertility of this country is such, that, as we are informed, a full description of it would appear incredible. The equability of the climate, as well as the fertility of the soil, occasion a regular succession of the productions of the earth: when the fruits have obtained their maturity, and the leaves begin to change their colour, fresh leaves, blossoms, and fruits, are seen in their proper gradations on the same tree. The same incessant fertility is conspicuous in the corn, reaping and sowing being both carried on at the same time. This remarkable fecundity of the soil is naturally productive of
 excellent

excellent fruits and corn of every kind, as is evident from the delicacy of the beef, veal, mutton, pork, and poultry of Quito. One of the principal foods used by the inhabitants is cheese, of which it is computed that the quantity annually consumed amounts to between seventy and eighty thousand dollars of the money of that country. The vicinity also affords excellent butter. The manufactures of this province are cottons, some white, called tucuyos, and others striped bays and cloths, which meet with a good market at Lima, for supplying all the inward provinces of Peru; and the returns are made partly in silver, and partly in gold and silver fringes made in that city, wine, brandy, oil, copper, tin, lead, and quicksilver. The products of the earth are chiefly consumed within the province; except the wheat, part of which is sent to Guayaquil. But this trade is carried on by Meltizos and poor people. Goods, manufactured by the public, or woven by private Indians, are sent, together with some kinds of provisions, to the jurisdiction of Barbacoas. These provisions are exchanged for gold, found in that country, and which is afterwards sent to Lima, and disposed of at a greater price. Their stuffs find a vent in the governments of Popayan and Santa Fé. The coast of New Spain supplies this province with indigo, of which a great quantity is consumed; blue being universally the colour which these people affect in their apparel. They also import, by way of Guayaquil, iron and steel, both from Europe and the coast of Guatemala. S. lat. $0^{\circ} 13' 27''$. W. long. $78^{\circ} 10' 15''$. Ulloa's Voyage, vol. i.

QUIT-RENT, q. d. *quiet rent*, a certain small rent, payable yearly, by the tenants of most manors, in token of subjection; upon the payment of which, they are quiet, and free. It includes both rents of assise and chief rents.

These rents differ very greatly in different manors, being in some a mere trifle, while in others they are very heavy and oppressive to the tenants. This part of the feudal system is now considerably on the decline.

In some ancient records it is written white rent, because paid in silver, to distinguish it from rent-corn, rent-pepper, &c.

QUITTA, in *Geography*, a town of Africa, on the Slave coast. N. lat. 6° . E. long. $0^{\circ} 8'$.

QUITTANCE. See **ACQUITTANCE**.

QUITTER, or **QUITTOR**, in horses, is an ulcer formed between the hair and hoof, usually on the inside quarter of a horse's foot; it often arises from treads and bruises, sometimes from gravel, which by working its way upwards, lodges about the coronet; if it is only superficial, it may be cured with cleansing dressings, bathing the coronet every day with spirits of wine, and dressing the fore with lime-water, or a detergent application, such as red precipitate. But where the matter forms itself a lodgment under the hoof, there is then no way to come at the ulcer but by taking off part of the hoof; and if this be done well, the cure may be effected without danger.

When the matter happens to be lodged near the quarter, the farrier is sometimes obliged to take off the quarter of the hoof, and the cure is then for the most part but palliative; for when the quarter grows up, it leaves a pretty large seam, which weakens the foot; this is what is called a false quarter, and a horse with this defect seldom gets quite sound.

If the matter, by its consuetment, has injured or destroyed the coffin-bone, which is of so soft and spongy a nature that it soon becomes carious, it will be necessary to enlarge the opening, cut away the spongy flesh, and apply the actual cautery, or hot iron, pointed pyramidically, dressing the bone with dossils of lint dipped in tincture of myrrh, and the wound with the green or precipitate ointment. When the sore is not enlarged by the knife, which is the best and

least painful method, sublimate is generally applied; or blue vitriol powdered, and embued with a few drops of oil, is also used for this purpose, and is said to act as effectually, and with less pain to the animal.

In the time of the action of these caustic remedies, the foot should be kept in a poultice. And where sinuses form they should be laid open by a knife, and be afterwards stimulated by the application of some detergent remedy. The following has been advised by a late writer: Take of corrosive sublimate, red precipitate in fine powder, of each equal parts; honey sufficient to form a paste.

The wound is advised to be afterwards dressed with common digestive ointment, pressure being given by means of a bandage. It is sometimes written quitor.

QUITTER-Bone, another term applied to the same disease by farriers and persons engaged in husbandry.

QUITY, in *Botany*, a Brazilian name used by some authors for the sapindus, or soap-berry tree of the West Indies.

QUIVER, seemingly corrupted from the Fr. *couvrir*, to cover, a case or sheath for arrows.

QUIVISA, in *Geography*, a town of Hindooستان, in Bahar; 25 miles S.W. of Bettyah.

QUIVISIA, in *Botany*, from the vulgar name of this tree or shrub in the isles of Bourbon and the Mauritius, *bois de quivi*. Juss. Gen. 264. Cavan. Diss. 367. (See **GILLBERTIA**.) One cannot but wonder how a writer of Jussieu's learning could, for a moment, tolerate so faulty a name; especially as his authority leads heedless persons into the adoption of such, for want of reading his preface; where, in a note to p. 24, he declares these rude and barbarous names to be merely borrowed for a time, till the genera to which they belong are better determined.

QUIXOS, in *Geography*, a jurisdiction of South America, attached to the province of Quito, on the east side of the Cordillera of the Andes. Quixos on the north side borders on the jurisdiction of Popayan; reaching eastward to the river Aguarico, and towards the west separated from the jurisdictions of Quito, Latacunga, and the town of San Miguel de Ibarra, by the Cordilleras of Cotopaxi and Cayamburo. This country was first discovered, in 1536, by Gonzalo de Pineda, one of the officers sent from Popayan by Sebastian de Belalcazar (or Benalcazar), to trace the course of the river Magdalena; and in consequence of his report, Gonzalo Pizarro, in 1539, reconnoitred its whole extent, and established settlements in it. But upon the failure of his expedition, the conquest of this country was suspended till the year 1549, when the marquis de Canete, viceroy of Peru, gave a commission to Gil Ramirez Davalos, a man of undaunted courage, for reducing the Indians, and making settlements in the country. This object he accomplished, and founded the town of Baeza, the capital of the government, in the year 1559; and this was soon followed by other towns and villages, the principal of which are Archidona and Avila. The temperature of this country is hot and moist, the rains being almost continual. It is covered with thick woods, some trees being of a prodigious magnitude. In the S.W. part of the jurisdiction of Quixos is the canela or cinnamon tree, which led Gonzalo de Pineda to call the country Canelos, a name which it still retains. The other products of Quixos are the same with those in all the other lands under the same climate as this government. Adjoining to this is the district of Macas and Maynas. See **MACAS** and **MAYNAS**.

QUIZA, in *Ancient Geography*, a town of Africa, in Mauritania Caesariensis. This was a fortress, according to Pomponius Mela and Pliny. Antonine makes it a municipium, and places it between Portus Magnus and Arfenaria.

QUIZAMA, in *Geography*, a province of Africa, in the southern part of Angola; the country is extensive, mountainous, and badly cultivated; but it produces abundance of honey, wax, and salt. The inhabitants are warlike, and have not submitted to the Portuguese.

QUIZIBA, a small island in the Indian sea, near the coast of Africa. S. lat. 12° 30'.

QUIZIMAJUGO, a river of Africa, which discharges itself into the Indian sea, S. lat. 8° 50'.

QUIZINA, or **TEUSIN**, a chain of mountains in Fez, 90 miles in extent.

QUIZUMGO, a river of Africa, which runs into the straits of Mozambique, S. lat. 17° 20'.

QUO JURE, in *Law*, a writ that lies for him who has land, wherein another challengeth common of pasture time out of mind: its design is to compel the party to shew by what right or title he challengeth it. This is now out of use, as, on the claimant's putting his cattle in, the owner may bring trespass, when the claimant must plead and prove his title.

Quo Minus is also a writ which lies for the king's farmer or debtor in the court of exchequer, against him to whom he selleth any thing by way of bargain, touching his farm, or against whom he hath any cause of personal action; because by the vendee's detaining any due from him, the farmer is less able to pay the king's rent. This was formerly allowed only to such persons as were tenants or debtors to the king: at this day the practice is become general for the plaintiff to surmise, that, for the wrong which the defendant doth him, he is less able to satisfy his debt to his majesty; which surmise gives jurisdiction to the court of exchequer to hear and determine the cause. Finch. 66. Old N.B. 148.

Quo minus is also a writ that lies for him who has a grant of house-bote and hay-bote in another man's woods, against the grantor making such waste, as that the grantee cannot enjoy his grant.

Quo Warranto, a writ that lies against any person or corporation (which see) who usurps any franchise, or liberty, against the king; as to have waife, stray, fair, market, court baron, leet, or such like, without good title; to inquire by what authority he supports his claim, in order to determine the right. Finch. L. 322. 2 Inst. 282.

It also lies for mis-user or non-user of privileges granted; and even, according to Braeton, against him that intrudeth himself as heir into land. See **INTRUSION**.

This writ was originally returnable before the king's justices at Westminster; but afterwards only before the justices in eyre, by virtue of the statutes of "quo warranto," 6 Edw. I. c. 1. and 18 Edw. I. st. 2. (2 Inst. 498. Raft. Entr. 540.); but since those justices have given place to the king's temporary commissioners of assize, the judges on the several circuits, this branch of the statutes hath lost its effect: and writs of "quo warranto" (if brought at all) must now be prosecuted and determined before the king's justices at Westminster. And in case of judgment for the defendant, he shall have an allowance of his franchise; but in case of judgment for the king, for that the party is entitled to no such franchise, or hath disused or abused it, the franchise is either seized into the king's hands, to be granted out again to whomever he shall please; or, if it be not such a franchise as may subsist in the hands of the crown, there is merely judgment of "ousting," to turn out the party who usurped it. Cro. Jac. 259. 1 Show. 280.

The judgment on a writ of *quo warranto* (being in the nature of a writ of right) is final and conclusive even against the crown. (1 Sidd. 86. 2 Show. 47. 12 Mod. 225.) This

circumstance, together with the length of its process, probably occasioned that diffuse into which it is now fallen, and introduced a more modern method of prosecution, by information filed in the court of king's bench by the attorney general, in the nature of a writ of "quo warranto," in which the process is speedier, and the judgment not quite so decisive. This is properly a criminal method of prosecution, as well to punish the usurper by a fine for the usurpation of the franchise, as to oust him, or seize it for the crown; but hath long been applied to the mere purposes of trying the actual right, seizing the franchise, or ousting the wrongful possessor; the fine being nominal only. Blackst. Com. b. iii. See **INFORMATION**.

QUOAD HOC, a term often used in law reports to signify, "as to the thing named" the law is so, &c.

QUOCOLOS, the name of a stone found in Tuscany, as hard as a flint, somewhat transparent, and, in some measure, resembling marble. In the fire it loses its transparency, and becomes less ponderous, and white; and a strong fire readily converts it into glass. It has no medicinal virtues, but is used at some glass-houses.

QUOD CAPE, or **Quada**, a cape on the coast of Patagonia, in the straits of Magellan. S. lat. 53° 33'. W. long. 74° 6'.

Quod clericus beneficiatus de cancellaria, in *Law*, a writ to exempt a clerk of the chancery from the contribution towards the proctors of the clergy in parliament. Rep. Orig. 261.

Quod clericus non eligatur in officio ballivi, &c. is a writ that lies for a clerk, who, by reason of some land he hath, is made, or like to be made, a bailiff, beadle, reeve, or such like officer.

Quod cum, that whereas, being by way of recital, and not positively, is not good in indictments. 3 Salk. 188. See **INDICTMENT**.

Quod ei deforceat, a writ for tenant in tail, tenant in dower, by the courtesy, or for term of life, having lost their lands by default, against him that recovers, or his heir. Reg. Orig. 171. Stat. Westm. 2. cap. 4.

This, though not strictly a writ of right, so far partakes of the nature of one, as that it will restore the right to him who has been thus unwarily deforced by his own default. (F.N.B. 155.) But in case the recovery were not had by his own default, but upon defence in the inferior possessory action, this still remains final with regard to these particular estates, as at the common law: and hence it is, that a common recovery (on a writ of entry in the *poss*) had, not by default of the tenant himself, but (after his defence made, and voucher of a third person to warranty) by default of such voucher, is now the usual bar to cut off an estate-tail.

This writ may be brought against a stranger to the recovery; as if a man recover by default, and maketh a feoffment, this writ may be had against the feoffee.

Quod medium. See **MEDIUM**.

Quod permittat, in *Law*, a writ that lies where a man is disseised of his common of pasture, and the disseisor aliens or dies seized, and his heir enters; then if the disseisee die, his heir shall have this writ. See **DISTURBANCE of Common**.

Quod permittat prosternere. See **Assize of NUSANCE**.

Quod persona nec prebendarii, &c. a writ that lies for spiritual persons, when distrained in their spiritual possessions, for the payment of a fifteenth, with the rest of the parish. F.N.B. 176.

QUODLIBETICAL QUESTION, *Quaestio quodlibetica*, a college term for a thesis, or problem, anciently proposed to be debated in the schools, out of curiosity and entertainment, rather than for the settling of any useful point.

The term is formed from the Latin *quodlibet*, any thing, what you please: and so well satisfied were the public of the impertinences of these questions, that the term *quodlibet* has been since retained, to signify any little ridiculous quibble.

QUOJA, in *Geography*, a country of Africa, situated above 100 miles from the coast of the Atlantic, between the 8th and 10th degrees of W. longitude, and between the 7th and 9th degrees of N. latitude.

QUOIF, in *Ship-Building*, a piece of oak thickstuff on the deck-hook, to which the deck water-way on each side is butted, otherwise the butt would come in the middle, and could not be caulked.

QUOIL, QUOYL, or *Coile*, in the *Sea Language*. A cable is said to be quailed, when it is laid round in a ring, one turn over another, on the deck of a ship.

The middle of such ring, or quail, is a good place to lay shot in: they are more safe there, than in lockers along the side, where the enemy's shot may fall into them.

QUOIL, *Weather*. See WEATHER Quail.

QUOIN, or COIN, formed from the French *coin*, of the Latin *cuneus*, wedge, aboard a ship, is a wedge fastened on the deck, close to the breech of the carriage of a gun, to keep it firm up to the ship's side, and prevent its rolling; and also to raise or depress it.

QUOINS, *Cantic*, are short three-legged quoins, put between casks to keep them steady. See COIN.

QUOINS, in *Architecture*, denote the corners of brick or stone walls.

The word is particularly used for the stones in the corners of brick buildings. When these stand out beyond the brick-work (their edges being chamfered off) they are called *russic* quoins.

QUOIN, in *Geography*, a small island in the Indian sea, near the W. coast of Madagascar. S. lat. 14°. E. long. 48° 14'.—Also, an island in the East Indian sea, N. of the Nicobar islands. N. lat. 9° 56'. E. long. 93° 20'.

QUOITS, a kind of exercise or game, known among the ancients under the name of the *discus*. See DISC.

QUOLL, in *Zoology*, a name given by the natives of New Holland to an animal resembling a pole-cat, with a brown back, spotted with white, and the belly of a pure white, in which it differs from others of these fetid animals. Cook's Voy. 1770. vol. iii. p. 626.

QUONDANGA, in *Geography*, a town of the Birman empire; 32 miles N. of Prone.

QUORUM, a term frequently mentioned in our statutes, and often used in commissions, both of peace, and others. A justice of the quorum is thus called from the words in the commission, *Quorum C. D. or A. B. aliquem vestrum unum esse volumus*.

For an example: where a commission is directed to seven persons, or to any three of them, of which A. B. and C. D. are to be two; there A. B. and C. D. are said to be of the quorum, because the rest cannot proceed without them.

So a justice of the peace and quorum is one without whom the rest of the justices, in some cases, cannot proceed. See JUSTICES of the Peace.

QUORUM Nomina. In the reign of king Henry VI. the king's collectors, and other accountants, were much perplexed in passing their accounts, by new extorted fees, and forced to procure a then late-invented writ of *quorum nomina*, for the allowance and suing out their quietus, without the allowance of the king.

QUOTA, in *Law*, a tax to be levied in an equal manner.

QUOTATION, in *Literature*, a citation; or a passage rehearsed expressly in one author from another.

Quotations are usually distinguished by inverted commas.

The manner of quoting by book, and chapter, or section, is chiefly affected by men of erudition; but it is abused: this method ought only to obtain where the whole chapter or section is expressly on the subject. On other occasions, quoting by page is more commodious; except in classics, and other ancient writings, of which there are many editions in different forms; where this method is of little use, unless the edition be also specified.

The quotations from the Old Testament, found in the New, have occasioned great doubt, dispute, and criticism. The apostles are frequently referring to the Old Testament, and quoting passages and prophecies thence, as fulfilled in our Saviour; yet these passages, thus quoted, are frequently either not found in the Old Testament at all, or they are not urged in the New, according to the literal and obvious sense they seem to bear in the Old.

A late ingenious author, in an "Essay upon the Truth of the Christian Religion," frankly owns, that the evangelists sometimes apply to the Messiah passages of the Old Testament, which, as they lie in our present copies, plainly relate to some other person, or thing. This is evident, *e. gr.* in the passage, Matthew, ii. 15. *Out of Egypt have I called my son*; which is quoted from Hosea, xi. where it is plainly understood of the coming of the Israelites out of Egypt.

This circumstance has been urged as a great objection to Christianity, which the divines, commentators, critics, &c. have long laboured to remove, though by very different means.

Some have recourse to a double completion; and imagine, that though the prophecies were primarily accomplished in other events, yet they might have a secondary accomplishment in the Messiah: but others set aside a double completion, except where the prophet himself declares as much, this otherwise making all prophecy useless. See PROPHECY.

The generality choose, therefore, to have recourse to an allegorical, typical, or spiritual meaning in the prophecies, &c. and suppose them to have been thus understood among the ancient Jews, thus fulfilled in our Saviour, and thus applied by the apostles.

In effect, the Jewish rabbins, it is allowed, took great liberty in quoting and interpreting scripture; and it is supposed the apostles might follow these rules in their quotations.

Accordingly, M. Surenhusius, Hebrew professor at Amsterdam, has endeavoured to retrieve these rules, long since lost, in an express treatise on this subject, published in 1713. This author observes a great deal of difference applied in the different forms of quoting used by the sacred writers: as, *It has been said; it is written; that it might be fulfilled which was spoken by the prophets; the Scripture says; see what is said; the Scripture foreseeing; it is not written, &c.* He adds that the books of the Old Testament having been disposed in a different order at different times, and having had different names, it is thence, that one book or writer is sometimes confounded with another.

For the rules of quoting and interpreting practised among the rabbins, he gives us ten; recovered with much study from the Talmud, and the ancient Jewish doctors: instances of which he gives us in the writings of the apostles; and by those rules he endeavours to explain and justify all the quotations made from the Old Testament in the New.

The rules are, 1. Reading the words not according to

QUOTATION.

the points placed under them, but according to others substituted in their stead; as is done by St. Peter, Acts, iii. 23. by Stephen, Acts, vii. 43. and by Paul, 1 Cor. xv. 54. 2 Cor. viii. 15, &c. The second is by changing the letters; as is done by Paul, Rom. ix. 33. 1 Cor. xi. 9 Heb. viii. 9. and x. 5. and by Stephen, Acts, vii. 43. The third is by changing both letters and points; as is done by Paul, Acts, xiii. 41. and 2 Cor. viii. 15. The fourth is by adding some letters and taking away others. The fifth is by transposing words and letters. The sixth is by dividing one word into two. The seventh, adding other words to make the sense more clear. The eighth, changing the order of the words. The ninth, changing the order of the words and adding other words. Both of which are done by the apostles. And lastly, changing the order of words, adding words, and retrenching words; which is a method often used by St. Paul.

Other authors, as bishop Kidder, M. le Clerc, Mr. Sykes, &c. solve the difficulty another way. That usual form of quotation among the evangelists, "That it might be fulfilled which was spoken by the prophets," according to these authors, means no more than an accommodation of the prophet's words to the case in hand.

The word *ἰσχυρῶς*, fulfilled, does not necessarily determine us to such a sense, as if the evangelists designed to speak of a prediction of future events *accomplished*; but may barely express an accommodation of borrowed words. In effect, says bishop Kidder, a scripture may be said to be fulfilled two ways; *properly*, as when that which was foretold comes to pass; and *improperly*, by way of accommodation, as when an event happens to any place or people like to what fell out some time before. And thus it is that St. Matthew says, on occasion of the murder of the innocents, that "then was fulfilled what was spoken by the prophet Jeremy, *In Rama was a voice heard,*" &c.

This interpretation is confirmed by M. le Clerc, who observes that the Jews, in their language, used to say, that a passage of scripture was fulfilled, as often as any thing happened to which it might be applied; so that the evangelist Matthew, who was a Hebrew, and wrote, as is commonly supposed, in that language, intended no more in the passage just cited, but that a thing happened, to which one might apply what Jeremy had formerly said on another occasion.

Accordingly, says Mr. Sykes, the evangelists, in citing that passage of Isaiah, *Behold, a virgin shall be with child,* &c. only use it as words of that prophet remarkably agreeing to the miraculous birth of Jesus, and not as a prophecy of his birth.

It may be added that this way of speaking was not unknown among the heathen writers. Thus in Ælian, Digenes Sinopenis used continually to say of himself, that he fulfilled and underwent all the curses of tragedy.

The difficulty stated in this article has been already the subject of discussion under the terms ACCOMMODATION and PROPHECY. Whilst it is allowed, that many passages in the New Testament, and also in the writings of the Christian fathers, are very different from the correspondent passages as they now stand in the Hebrew text; and that some words are introduced as quotations which are no where to be found: those who urge the objection should be disposed to pay due attention to the various modes of replying to it, which biblical critics have proposed. Some have supposed, with Whiston, that those early Christian writers quoted from the LXX: others have alleged that they sometimes quoted from their memory; and this, it is said, is the more probable, because the same passage is quoted in some cases by different authors

in very different words, even where the sense agrees. It is moreover alleged, that the *sense* of the passages supposed to be lost is still to be found in the Old Testament, though the words be not; such especially are Matt. ii. ult. and John, vii. 38. But if it were granted, that some of the verses originally belonging to the Old Testament are lost, or materially corrupted, no objection could be justly alleged against the authenticity and divine authority of the sacred writings in general. As for the quotations that occur in the New Testament, the most probable opinion is, that some of them are made from the Greek version and some from the Hebrew text. To those who assume, that though such quotations are made from the Greek version, where that differs from the Hebrew, yet both the text and the version are in such places always the same in sense, we reply with Dr. Kennicott, that this is not the case: and he thinks, that the only way of doing justice to our Saviour and his apostles in their references to the Old Testament, is to say, that for whatever purpose such quotations were made (whether by way of express prophecy, or only of allusion and accommodation) they were always consonant to the true sense of the Hebrew text. For he says, it is scarcely possible to conceive, how any speaker or writer can quote justly such and such words, as (*e. g.*) from Moses or from Isaiah, when the words quoted are not the words of Moses or Isaiah, and do not express even the sense of Moses or Isaiah; but are only taken from some version, which (upon the present supposition) was no version at all in these instances, because it did not agree here in sense with its original. The foundation of this mistake, as this learned writer adds, is the notion that has prevailed of the integrity of the modern Hebrew text; for the writers who have held this to be perfect, have never been able and never will be able to vindicate the prophetic quotations. Passages quoted from the several Jewish writers by inspired men must (he thinks) have been quoted agreeably to the sense of the Hebrew text; but such quotations do not agree in sense with the printed Hebrew text. Therefore some alterations have happened, either in the Greek text of the New Testament, or the Hebrew text of the Old. Collins says that the Hebrew text has been delivered down perfect, and therefore that the quotations are either forged or falsified in the New Testament. To this it is replied, that as it appears from a collation of the Greek MSS. of the New Testament, that the words of the quotations are not corrupted in the Greek text, so it appears from a collation of the Hebrew MSS. that the words have been corrupted in the Hebrew. And this is an answer which should approve itself to all Christians. See Kennicott's State of the Hebrew Text, vol. ii. p. 345—347, &c.

Upon the whole we observe, that the writers of the New Testament did not make it a constant rule to quote from the Greek version, because there are many places where their quotations differ from that version and agree with the Hebrew. And as the quotations now agree with the Hebrew, frequently in the express words, generally in the sense; so it is most probable, that they always agreed at first, and that where the Hebrew was expressed properly in the Greek version, they used the words of that version; and where the version was not proper, they translated for themselves.

With regard to Matt. ii. ult. the first of the passages above cited, Dr. Doddridge (Fam. Expof. in loc.) observes, that Nazareth was a little city on the confines of Zabulon and Issachar; so contemptible among the Jews, that it was a proverb among them, No good thing can be expected from thence. Thus was fulfilled what was spoken in effect by many of the prophets, "he shall be called a Nazarene;" *i. e.* he shall

shall appear in mean and despicable circumstances, and be treated as the mark of public contempt and reproach. If this sense be not approved, Dr. Doddridge professes to acquiesce in Chrysofom's opinion, that the passage referred to is lost, avouching his dissatisfaction with other interpretations of this passage. The second passage, viz. John, vii. 38, our learned expositor thus explains. "He that believeth in me, as the scripture hath said, out of his belly shall flow rivers of living water, i. e. as the scripture has in many places said and promised, he shall receive those supplies in so great an abundance, that he shall not only be refreshed himself, but out of his belly, or from within him shall flow vital streams, and as it were rivers of living water for the refreshment and comfort of others." Chrysofom, and after him many other eminent writers, Castalio, Zegerus, and I. Capellus, refer the words "as the scripture hath said," to the former clause, and understand them, as if our Lord had said, "He that hath faith in me," which the scripture requires, and thus they avoid the difficulty, which arises from our not finding the following words in scripture. But Grotius, with whom Dr. Doddridge agrees, supposes, that here is a general reference to the several prophecies which refer to the effusion of the spirit by the Messiah, under the

similitude of pouring out water. See Isaiah, lii. 15. xlv. 3. lviii. 11. Joel, ii. 28.

QUOTIDIAN, in *Medicine*, signifying literally *daily*, is applied to all intermitting diseases, which return once in twenty-four hours. As the most remarkable of these is the *ague*, or intermitting fever of marshy countries; so the term *quotidian* signifies emphatically a quotidian *ague*. The *paroxysm* usually returns in the morning. See *AGUE*.

QUOTIDIAN, *Double*, returns twice in twenty-four hours. QUOTIENT, QUOTIENS, formed from the Latin *quoties*, q. d. *how often is such a number contained in such another*, in *Arithmetic*, the number resulting from the division of a greater number by a smaller; and which shews how often the smaller is contained in the greater, or how oft the divisor is contained in the dividend.

In division, as the divisor is to the dividend, so is unity to the quotient. Thus the quotient of 12 divided by 3 is 4; which is thus disposed, 3) 12 (4 quotient.

QUOVEDO, in *Geography*, a town of Istria; six miles E. of Capo d'Istria.

QUOUSQUE. *Execution with a Quousque*. See EXECUTION.

QUOYL. See QUOIL.

R.

R, A liquid consonant, and the seventeenth letter of the alphabet.

The grammarians hold it a semi-vowel; especially in the Greek, where, in common with the other vowels, it admits an aspirate, &c. though whether the aspirate should be sounded before or after it, is some doubt. We find instances of each.

Thus ρῆδν the Latins wrote *rheda*; and ῥῆδον the Ætoliens wrote *rhodon*; and in English words derived from the Greek it is followed by an *h*, as *rhapsody*. The ancient Goths, and Teutones, Littleton observes, always prefixed *h* to *r*. See *H*.

The sound is formed by a guttural extrusion of the breath, vibrated through the mouth, with a sort of quivering motion of the tongue drawn from the teeth, with the tip a little elevated towards the palate.

In some words, as *Rome*, *rape*, and *river*, it has a rough sound; in others, as *bard*, *card*, *regard*, its sound is smooth. *Re* at the end of many words is pronounced like a mute *er*, as in *theatre*, *sepulchre*, and *massacre*. *Rh* is used in words derived from the Greek, as *myrrh*, *rheum*, and *rhyme*.

The Hebrews allow the *r*, or ר, the privilege of a guttural; that is, they never double it, which yet is done by the Arabs, Greeks, and Latins, &c.

Persius calls the *r*, *litera canina*, because the dogs seem to pronounce it in snarling; yet it should seem to have had a softer sound among the Romans than among us, by its being frequently interposed to prevent the clashing of vowels; as in *rarus*, ἀρῶν; *nurus* from νύξ; *murex* from μύρξ; *mus muris* from μύ; μύρις; and this softness was such as frequently oc-

caioned its being dropt as useless in writing. Thus for *Hetrusci* they frequently wrote *Thusci*, and even *Tusci*; and for *fursum*, *rursus*, *prorsus*; *susum*, *rusus*, *profus*.

In effect, there was that agreement between the sound of the *s* and *r*, that as the Romans avoided the doubling of their consonants, it was no wonder they here dropped the *r* in such words; the *s* supplying the place of both. Hence too it came to pass, that what they at first pronounced *asa*, *asena*, *casmen*, was afterwards *ara*, *arena*, *carmen*; and those first named *Fusii* and *Valesii*, were afterwards called *Furii* and *Valerii*. Cicero tells us, the *Papirii* were first called *Papifii*; and even fixes the time when the change was made, viz. in the year of Rome 415. Festus adds, that *olera*, *pinora*, *plurima*, were anciently written *olefa*, *pinofa*, *plufima*.

From the same softness of the sound of the *r*, it came to be used indifferently with the *l*, in many words; e. gr. *Latianis* and *Latialis*, *Palilia* and *Parilia*, &c.

Though the *r* more frequently degenerated into *l*; thus *remures* became changed into *lemures*; *interlego*, *perluceo*, into *intelligo* and *pelluceo*; *frater* into *fratellus*, &c.; and the same is sometimes done between *n* and *r*, as *areus*, and *encus*, &c.

In the notes of the ancients, *R*. or *RO*. signified *Roma*; *R. C. Romana civitas*; *R. G. C. rei gerendæ causa*; *R. F. E. D. ree factum et dictum*; *R. G. F. regis filius*; *R. P. res publica*, or *Romani principes*; and *R. R. R. F. F. F. res Romana ruet ferro, fame, flamma*.

R was anciently a numeral letter, signifying 80; according to the verse,

"Octoginta dabit tibi R, siquis numerabit."

When a dash was added at top, as \overline{R} , it signified eighty thousand.

The Greek ρ , ρ , with a small mark over it, signified a hundred; with the same mark under it, it denoted 1000×100 ; thus ρ signified 100,000.

In the Hebrew numeration, γ denoted 200; and with two horizontal points over it, 1000×200 ; thus $\ddot{\gamma} = 200,000$.

R on the French coins, denotes their being struck at Orleans.

R, or \mathcal{R} , in *Medicinal Prescription*, stands for *recipe, take*.

RAA, in *Geography*, a town of Norway; 10 miles N.E. of Frederickstadt.

RAAB, GYOR, or *Javarin*, a town and fortrefs of Hungary, situated in a pleasant level country, at the conflux of the Danube, the Raab, and Rabnitz, which furround it. Its houses are constructed of stone, and its streets are large and straight. It is the see of a bishop. Its fortification consists of seven bastions, and it has always a strong garrison, provided with military stores. The fortifications of the city and castle are chiefly the works of the emperors Ferdinand I. and Maximilian II. In this place are seen some Roman antiquities; 56 miles S.E. of Vienna. N. lat. $47^{\circ} 42'$. E. long. $18^{\circ} 45'$.

RAAB, a river of Stiria, which rises near mount Rettlein, and runs into the Danube, near Raab in Hungary.

RAAF, or RAFF, ANTHONY, in *Biography*, the most exquisite and celebrated tenor singer of the last century, was born at Bonn in 1710. He was a scholar of Bernacchi, and equally admired for his taste, expression, and style of singing, by the Italians and Germans. In 1729 his voice was settled from a high treble to a sweet and firm tenor, sufficiently for him to perform a capital part in an opera at Naples. After singing in all the great cities of Italy, he returned to Germany, where he was courted and caressed by all the princes of the empire. He was knighted by the elector of Bavaria, and appointed his chamber musician. In 1751 he performed again at Naples in Metastasio's "Attilio Rigolo," with the Mingotti, and in the letters of Metastasio of that period, we have the poet's opinion of his performance. (Mem. of the Life and Writings of Metastasio, vol. i. p. 403.) He performed in an opera composed by Christian Bach at Manheim in 1770, when the celebrated air "Non so donde viene" was in his part, and which was afterwards sung on our opera stage with such effect by Ciprandi. Raff was at Paris more than once; for in 1780, his 70th year, Laborde speaks of him with great respect. "This celebrated tenor has acquired great reputation, and though at present d'un certain age, he obliges us still to admire his taste, and regret all that he has lost." According to Gerber, Musical Lexicon, vol. ii. he sung at Manheim in 1783, and was living in 1792.

RAAGOE, in *Geography*, a small island of Denmark, near the N. coast of the island of Laland. N. lat. $54^{\circ} 58'$. E. long. $11^{\circ} 19'$.

RAAJAGUR, a town of Hindoostan, in the country of Malwa, near the river Niennoudge; 74 miles N.E. of Ougein. N. lat. $24^{\circ} 2'$. E. long. $76^{\circ} 56'$.

RAALBRANN, a town of Austria; seven miles S.E. of Meissau.

RAAN, a town of Austria; four miles E.S.E. of Hooren.

RAASAY, an island of the Hebrides, or Western Islands, Scotland, is situated between the main land and the Isle of Skye, and is included within the parish of Portree and

shire of Inverness. It is about fifteen miles in length, and from two to five in breadth. On all sides the coast rises to a great height above the level of the sea; and on the east side its ascent is peculiarly bold, and almost perpendicular. The interior is throughout its whole extent mountainous; and hence is better adapted for pasturage than for tillage, but there are nevertheless several spots of very fertile and well cultivated land. The supply of free-stone is almost inexhaustible, and there is likewise plenty of lime-stone. Formerly there were in Raafay several ancient chapels, but these are now ruinous and only used as places of burial. Here are likewise remains of two forts, the highest of which was situated at the southern extremity of the island, and is called Dunn-Cann, as tradition records, from Canne, cousin to one of the ancient kings of Denmark. The other fort, called Caille-Broichin, is a well-known land-mark among sailors. The rock on which it is situated is nearly round, covering an area of little more than seventy feet square; is forty feet high, except at the spot where the stair leads up to it; and is sixty feet above the level of the sea at its base. The castle is built of stone and lime, and seems to have been no less strongly fortified by art than by nature. It was anciently the chief seat of the lairds of Raafay. Now, however, the family residence is at Clachan, or Kirk-town, near the opposite extremity of the island. One of the old Highland alliances has continued for more than two hundred years, and is still subsisting between Macleod of Raafay, and Macdonald of Skye, in consequence of which the survivor always inherits the arms of the deceased; a natural memorial of military friendship. At the death of the late sir James Macdonald, his sword was delivered to James Macleod, esq. the present laird of Raafay. Dr. Johnson, in his Tour to the Hebrides, speaks in warm terms of the elegance and hospitality with which he was entertained by this truly respectable family. Carlisle's Topographical Dictionary of Scotland, 2 vols. 4to. 1813. Pennant's Tour through Scotland, vol. ii.

RAASS, a town of the duchy of Stiria; five miles W. of Marburg.

RAASTORF, a town of Austria; four miles N. of Entzerstorff.

RAAT, a town of Hindoostan, in the country of Agra; 128 miles S.S.E. of Agra. N. lat. $25^{\circ} 37'$. E. long. $79^{\circ} 58'$.

RABAÇAL, a town of Portugal, in the province of Beira; 12 miles S. of Coimbra.

RABANUS, MAURUS MAGNENTIUS, in *Biography*, a celebrated German prelate in the ninth century, was born at Fulda in the year 785. He was educated partly at Fulda, and partly at Tours, under the famous Alcuin. In the latter situation he distinguished himself by an unwearied application to his studies, and his almost unequalled proficiency in all the learning of the times, both profane and sacred. Not long before the death of Alcuin he returned to Fulda, and embraced the religious profession in its abbey. In the year 810 he was placed at the head of a school belonging to the abbot Ratgarius, and the fame of his superior learning soon raised the seminary into great reputation, and filled it with pupils, many of whom were afterwards promoted to the highest ecclesiastical dignities, and proved the brightest ornaments of the age. In 815 he was ordained priest, and in 822 he was elected abbot of Fulda. About 830 he was, by his prudence and good conduct, the means of effecting a reconciliation between the emperor Lewis le Debonnaire and his sons. Shortly after this, Ebbo, archbishop of Rheims, who had been condemned for high treason, was committed to his custody. In 838, at the request

of count Erlafrid, he sent a colony of monks from Fulda, to occupy a monastery lately founded by him at Hirschau; and at the same time, in order that he might be enabled to pursue his studies with less interruption, he devolved upon another person the care of governing the abbey. In the following year the monks expelled him from his post, complaining, that in consequence of his devoting himself to his studies, the necessary affairs of the monastery were neglected, and its estates suffered to be much dilapidated. He now retired either to St. Peter's Mount, or, as others report, to an humble apartment in the outer court of the abbey, where he spent his time in devotion, the study of sacred literature, and the composition of his various writings, deaf to the repeated entreaties of the monks who exhorted him to resume his authority. In 847 he was elected to the archbishopric of Mentz, and in the following year he summoned a council, in which he procured the condemnation of Godeschale, for maintaining the doctrine of St. Augustine respecting predestination and grace. Rabanus died in 856, at the age of 71. He is described by Dupin as "having excelled all his contemporaries in the learning of those times, in explaining the principles of the liberal arts and sciences, and the rules of grammar and rhetoric; in a readiness in collecting from the fathers of the church common places upon the sacred scriptures; in allegorizing the historical parts of the bible; in an exposition of the mystical reasons of the ceremonies; in a facility at turning prose into verse, and in the manner of reducing all common places in precepts and instructions." And Mosheim says "he is deservedly placed at the head of the Latin writers of this age; the force of his genius, the extent of his knowledge, and the multitude of productions that flowed from his pen, entitle him to this distinguished rank, and render improper all comparison between him and his contemporaries." He was denominated the great light of Germany and France, because from his fund of knowledge those nations derived principally their religious instructions. His writings were every where in the hands of the learned, and were held in so much veneration, that during four centuries, the most eminent Latin divines appealed to them as authority in religious matters. His writings consist of Commentaries on the Scriptures; Homilies on the Epistles and Gospels; Scripture Allegories, and a great many theological and literary pieces. Of which the most considerable number were collected and published at Cologne in 1627, in six vols. folio. Some other pieces of this author, not to be found in that collection, may be found in Baluze's "Miscellanea," among Father Sirmond's publications, and in the eighth vol. of the Collect. Concil. Mosheim. Dupin.

RABASTENS, in *Geography*, a town of France, in the department of the Upper Pyrenées, and chief place of a canton, in the district of Tarbes; 10 miles N.N.E. of Tarbes. The place contains 750, and the canton 7422 inhabitants, on a territory of 150 kilometres, in 25 communes.

RABASTENS, or *Rabastens*, a town of France, in the department of the Tarn, and chief place of a canton, in the district of Gaillac; 21 miles S.S.W. of Alby. The place contains 6076, and the canton 8124 inhabitants, on a territory of 152½ kilometres, in five communes. The principal article of its trade is wine.

RABAT, a town of Africa, in the empire of Morocco, situated on the S. side of the river Sallee. Rabat had formerly, at intervals, a number of European factories; but the difficulty of navigating the river, the obstacles arising from the arbitrary power of the sovereign, and the disposition and prejudices of the Moors, have disgusted the Euro-

peans. Nevertheless, Rabat is the most proper place for trade of any upon this coast, both for its vicinity to Europe, and the quantity of wool, leather, and wax, which it is capable of furnishing. From its central situation in the empire, it is also better adapted for the conveying the commodities imported to every part of the country; but a despotic government acknowledges no principle but the convenience of the moment; it commands, judges, and executes, without considering either cause or consequence. At Rabat, near the mouth of the river, are the ruins of a castle, built in the twelfth century by Jacob Almanzor, but entirely destroyed by the late emperor. The walls, which still remain, are near two miles round, and fortified by square towers. They enclose the castle, the town of Rabat, and a large space of ground where J. Almanzor built beautiful palaces, and laid out delightful gardens, watered by plentiful streams, which he brought from the neighbouring spring. These walls, as well as the palace and the town, were built by Spanish slaves, whom he took prisoners in his first campaign. Within the same inclosure he also built a very large mosque, of which the ruins still remain. The roof was supported by 360 columns of rough marble. Near it was a handsome square tower, strongly built with cut stone, near 200 feet high, and called the tower of Hassan. From this tower may be had an extensive view over the sea, and ships may be discovered at a prodigious distance. This monument is in almost perfect preservation. There are some docks for building ships both at Sallee and Rabat; but the difficulty of navigating the channel, and the probability that the sand will continue to accumulate, give ground for apprehending, that very soon, only vessels with oars will be able to enter the river. Chenier's Morocco, vol. i.

RABAT Affarmacan, a town of Persia, in Farsistan; 120 miles E. of Schiras.

RABAT Arvab, a town of Persia, in the province of Kerman; 40 miles E. of Kelvah.

RABAT el Cadi, a town of Persia, in the province of Kerman; 40 miles E. of Maitih.

RABAT Maabad, a town of Persia, in the province of Kerman; 60 miles N. of Kabis.

RABAT al Nassi, a town of Persia, in the province of Kerman; 60 miles N.E. of Mastih.

RABAT Shebaristan, a town of Persia, in the province of Chorasan; 260 miles N.E. of Ispahan.

RABATE, in *Falconry*. A hawk is sometimes said to rabate, when, by the motion of the hand of the bearer, the lure, call, &c. she leaves pursuing her prey, or quarry, and recovers the fit.

RABATE, in *Commerce*. See **REBATE**.

RABBA, in *Ancient Geography*, a town of Judea, which belonged to the tribe of Gad; situated upon the torrent of Jaba; it was besieged by Joab, after he had defeated the Ammonites. Here was seen the head of Og, king of Bashan, who alone remained of the race of giants.—Also, a town of Palestine, in the tribe of Judah. See **RAHABAH**.

RABBATH-AMMON, or **PHILADELPHIA**, a town of Asia, situated in the mountains of the southern part of Palestine; S.E. of Tiberias, and S. of Bosra.

RABBATH-MOAB, or **ARCOPOLIS**, a town of Asia, situated at some distance to the east of the lake into which the river Jordan discharges itself.

RABBEN, in *Geography*, a small island in the gulf of Bothnia. N. lat. 63° 14'. E. long. 22° 14'.

RABBET, in *Carpentry*, is a deep groove or channel, cut in a piece of timber longitudinally, to receive the edge of a plank, or the ends of a number of planks, which are to be securely fastened in it. The depth of this channel

is equal to the thickness of the plank, so that when the end of the latter is let into the rabbet, it will be level with the outside of the piece. Thus, in ship-carpentry, the ends of the lower planks of a ship's bottom terminate upon the stem afore, and the stern-port abaft, with whose sides their surfaces are even. The surface of the garboard streak, whose edge is let into the keel, is, in the same manner, level with the side of the keel at the extremities of the vessel.

RABBET-Plane. See PLANE.

RABBETING, the planing or cutting of channels, or grooves, in boards.

RABBI, or RABBIN, a doctor of the Jewish law.

The word in its original, רַבִּי, signifies *master*.

The words *rabbi* and *rabbīn* have the same signification; yet is there some difference in their use. When we speak absolutely, and without applying the term to any proper name, we say *rabbīn*, not *rabbi*. Thus we say, it would be unjust to attribute to the ancient rabbins all the notions of the modern ones.

On the other hand, when we prefix the term to the proper name of some Jewish doctor, we say *rabbi*, not *rabbīn*; *rabbi* Salomon Jarchi is of this opinion.

Yet *rabbi* having no plural, we say, the rabbins Juda Chiug, and Juda ben Chabin, are the authors of two ancient Hebrew grammars.

The title *rabbi* is said to have been first assumed, as a distinguishing title of honour, by men of learning, about the time of the birth of Christ; though it had been anciently given to several magistrates and officers of state, and to those who were of superior rank and condition in life. See Esther, i. 8. Jer. xli. 1. Job, xxxii. 9.

The first Jewish *rabbi* said to have been distinguished with any title of honour, was Simeon, the son of Hillel, who succeeded his father as president of the sanhedrim; and his title was that of *rabban*. The later rabbins tell us, that this title was conferred with much ceremony. When a person had gone through the schools, and was thought worthy of this degree, he was placed in a chair raised above the company; and then were delivered to him a key and a table-book; the key as a symbol of the authority conferred on him to communicate the knowledge he had acquired, which key he wore as a badge of honour, and when he died, it was buried with him; and the table-book was a symbol of his diligence in his studies, and desire of farther improvement. To these ceremonies were added the imposition of hands by the delegates of the sanhedrim, and the proclamation of his title. It has been disputed, chiefly between Vitrina and Selden, whether our Lord had taken the degree and title of *rabbi* in the Jewish schools; Vitrina maintains the affirmative, and Selden the negative. See Jennings's Jewish Ant. vol. i. p. 400, &c.

The Jewish writers distinguish betwixt the titles *rab*, *rabbi*, and *rabban*.

In the Old Testament we find the term רַב, *rab*, in composition with some other words, employed as a name of office and dignity, but not till the people became acquainted with the Chaldeans, concerning whom only it is used. The word, both in Hebrew and in Chaldee, signifies sometimes *great*, sometimes *many*, and when used substantively, denotes one who is at the head of any business, of whatever kind it be. Thus רַב הַחֵבֶל, *rab hachebel*, is, in the LXX, πρῶτος, רַב טַבָּחִים, *rab tabachim*, ἀρχιμαγειρος, *chief cook*. (Jonah, i. 6. Jer. xxxix. 11, see also Dan. i. 3.) It is used in the plural also for *chief men* in general, superintendents, or those at the head of affairs. Thus רַבֵּי הַבַּיִת, *rabbi hammoteb*, are

the chief men employed by the king over the different departments of the state. (Jer. xxxix. 13.) The original term suits entirely the import of the Latin word *princeps*, but not of the English word *prince*, at least in its most common acceptation; for they are not the king's sons, or nobles of any order, who are so denominated among the Chaldeans. The word evidently appears to have been equivalent to the term רַב, *rab*, among the Hebrews. Accordingly, he who is styled by Daniel, in the above cited passage, כְּרִיסִים רַב, *rab serisim*, is four times, in the same chapter, called יֵשֶׁר הַסְּרִיסִים, *rab haserisim*. (Dan. i. 7, 8, 9. 18.) And this use of the name *rab* seems to have continued long in Syria, as well as in Chaldea. Thus in the Syriac New Testament, it is found in the same manner, united with the common appellation of any sort of officer, in order to denote the principal person in that office: thus, *rab-cobana*, (Matt. xxvi. 51.) is the high priest, *rab-machsa* (Luke, xix. 2.) is chief of the publicans, and *rab-ragbatha* (1 Pet. v. 4.) is chief shepherd. *Rab*, construed in this manner, is equivalent to the Greek ἀρχι, as used in composition. The preceding titles are accordingly thus expressed in Greek, ἀρχιερευ, ἀρχιτελωνης, and ἀρχιποιμην.

Again, the word *rab* is sometimes found in that version, combined not with the title of any sort of officer, but with a term denoting the office or charge itself; in which case it always means the person who is principally entrusted with the business. Thus, *rabbeth* (Matt. xx. 8.) is the steward, ἐπιτροπος, he who is over the household; and *rab-consoththa* (Mark, v. 35.) is the ruler of the synagogue, ἀρχισυναγωγος. It is not unlikely, though no example occurs in scripture, that the term has at first been similarly compounded with some word signifying a school, or, perhaps, with the name of the art or science taught, in order to denote the overseer of such a seminary, or the teacher of such an art. When the term *rab* came to be peculiarly applied, as an honourable compellation of the learned, the word with which it was, at first, for distinction's sake, compounded, would be superseded as unnecessary. It is, at least, certain, that the Jewish doctors, who resided at Babylon about the time of our Saviour, were called simply *rab*. But in the Old Testament there is no trace of such a title as *rab*, *rabbi*, or *rabban*, given to a man of letters; nor is any one of the old prophets, or scribes, or indeed any other person, distinguished by this mark of respect prefixed to his name. Although the introduction of titles is always occasioned by the erection of useful important offices, it is commonly in the decline of merit that pompous titles are most affected. At first, without doubt, vain-glory has led many to assume them, to whom they did not belong, in right of office, and an interested adulation has induced others to give them. Some of them, however, came soon, among the Jews, to be converted into a kind of academical distinctions, which, in order to give them more weight, are said to have been conferred solemnly in their schools or colleges, accompanied with certain religious ceremonies. From this practice sprung literary degrees in Christian universities, to which there is nothing similar in all Pagan antiquity, either Greek or Roman, but to which the Jewish custom above-mentioned bears an evident and close analogy.

As for *rab* and *rabbi*, the only difference, it hath been said, betwixt them is, that *rab* was the title of such as had had their education, and taken their degree in some foreign school, *e. gr.* at Babylon; whereas *rabbi* was the title of such as were educated in the land of Judea, and more honourable than the other. But the highest and most honourable title was *rabban*; which, they say, was never conferred on more than seven persons; *viz.* on R. Simeon, five of his

his descendants, and R. Jochanan, who was of a different family.

Those who belonged to the Jewish schools were divided into three classes or orders. The lowest was that of the disciples or learners; the second, that of the fellows, or companions, who, having made considerable progress in learning, were occasionally employed by the masters in teaching the young students: and the highest was that of the preceptors, or teachers, to whom they appropriated the respectful title of *doṣor*, or *rabbi*, differing, as some have said, from *rab* only by the addition of the affix pronoun of the first person. This title *rabbi* was the highest academical honour. In the gospels, *διδασκαλος*: is given as the Greek translation of the Syriac *rabbi*. (John, i. 38.) Yet this word does not, as the Greek, literally signify *teacher*; but, having been conferred at first, as a mark of respect on actual teachers, and afterwards on other learned men, was justly accounted as apposite a version as the Greek language afforded.

In process of time, the term *rabbi* was used with great latitude; being bestowed on those who were not actual teachers; and yet it always retained, ever since it had been appropriated to the learned, a relation to learning, and denoted that the person who enjoyed it, though not actually employed in teaching, was well qualified for the office. *Rabban*, as some have asserted, is not the name of a degree superior to *rabbi*, though it seems intended for heightening the signification, and may be understood to denote eminent or learned *rabbi*, but it was very seldom used. The title *rabbani*, which we find to have been twice given to our Lord, (Mark, x. 51. John, xx. 16.) is *rabban*, with the addition of the affix of the first person, and accommodated to the pronunciation of Judea. The use of the term *rabban* does not seem to have extended far beyond Palestine, as we may conclude from the following circumstance. Although the word *rabbi* is very common in the Syriac translation, the Greek *διδασκαλος*: being generally so rendered; yet in the only place where that translator introduces the word *rabbani*, which is that quoted from John, he prefixes in *Hebrew*, that is, in the dialect of Palestine, which was then so called, adding the explanation given by the evangelist, *that is, teacher*; which plainly shews that the word *rabbani* was not Syriac. This is the more remarkable, as in the other passage, where the historian interprets, in the same manner, the word *rabbi*, adding (John, i. 38) “ὁ λεγόμενος ἐμπροσθεν διδασκαλος;” that interpreter omits this explanatory clause as intended only for the Grecian reader, and of no use to those who understood Syriac. In the passage in Mark, where *rabbani* occurs, as the evangelist had added no explanation, his interpreter has not thought it necessary to change their own word *rabbi*; thus regarding the difference in signification between the two words as inconsiderable, to which we may add, that the apostle John explains both by the same Greek word. It may be here observed that it was customary to enhance the import of a title by doubling it. Thus our Lord, speaking of the Pharisees, says, (Matt. xxiii. 7.) “they love to be called of men, *rabbi, rabbi*.” In this manner he was himself addressed by Judas, at the time when that disciple chose to assume the appearance of more than ordinary regard. (Mark, xiv. 45.) The title *κυριε* seems to have been used in the same manner. (Matt. vii. 21.) The words Jewish *rabbies* and Jewish *doṣors* were commonly used synonymously. In Justin Martyr’s dialogue with Trypho the Jew, the rabbies are always called *διδασκαλοι*. But some may object that this does not account for the application of the title to our Lord. As he did not derive his doctrine from any of those learned seminaries, frequented by such of the youth as were reckoned

the flower of the nation, the name *doṣor* could not, with propriety, be applied to him. To this objection it may be replied, that as in Judea at that time they spoke not Greek, but a dialect of Chaldee, not differing considerably from what is called Syriac, it is evident that the actual compellation by which our Saviour was addressed, was *rabbi*, equivalent to the Greek *διδασκαλος*. Besides, though the title *rabbi* could regularly be conferred only by those who had the superintendency of their schools, yet the people would be disposed to give the compellation through courtesy, and on the presumption that it had been conferred, wherever they saw or supposed distinguished abilities in teaching; and this probably was the reason why it was given to John the Baptist. (John, iii. 26.) Moreover, in the Jewish state, a divine commission was conceived to confer all sorts of dignities and honours, in an eminent manner, and thus superfered all ordinary rules and human destinations. Accordingly, some of those who gave the title of *rabbi* to our Saviour, were willing, either sincerely or pretendedly, thus to account for their doing so. Thus Nicodemus assigns the reason why he saluted him *rabbi* (John, iii. 1. &c.), although he knew that he had not been educated in human literature, and had not received from man any literary honours. Upon the whole we may remark, that the term *διδασκαλος* may be fitly expressed, either by the English term *doṣor*, or by the Syriac *rabbi*, which is now so much naturalized among us, that its meaning, as a Jewish title of literary honour, can hardly be mistaken. It must also be allowed, that the *rabbi* among the Jews of our Saviour’s age, was a title in the highest degree respectful; and on that account it was interdicted by their master, even to the apostles themselves. Campbell’s Seventh Preliminary Dissertation.

The modern rabbins are entitled to a considerable respect among the Jews: they have the first places in the synagogues; they determine all matters and controversies of religion, and very frequently pronounce upon civil affairs. They have even a power to excommunicate the disobedient.

They retain a vast number of superstitious traditions, from the writings of their predecessors; which they observe as scrupulously as they do the law of Moses.

The ancient rabbins were infinite dealers in allegories. Their writings are almost wholly allegorical, particularly their comments and interpretations of the scripture.

They had a great number of rules, and forms of interpreting and quoting, which some modern writers suppose to have been followed by the apostles, in their interpretation and quotation of the prophecies of the Old Testament, in the New. See QUOTATION.

RABBINICAL Character. See HEBREW.

RABBINICAL Hebrew. See HEBREW.

RABBINIST, a follower of the doctrine of the rabbins; a term used in contradistinction to Caraites.

Father Simon contends for *Rabbanist*, or *Rabbanite*, instead of *Rabbinist*: in effect, the former readings are apparently preferable to the latter; the word being derived from the Hebrew *Rabbanim*, which is the name of the sect, and which the Jews use to distinguish their doctors from those of the Caraites Jews.

Rabbinist, then, signifies a Jewish doctor who adheres to the traditions of his fathers; not simply a rabbin or doctor; for the Caraites, who oppose those traditions, have their rabbins as well as the other Jews.

RABBIT, CUNICULUS, in Zoology, a well-known animal of the hare kind, or the lepus cuniculus of Linnæus, with a short tail and naked ears. In the wild state the colour of the fur is brown; but in a tame state it varies to a black,

RABBIT.

pied, and quite white; the eyes are of a fine red. In their wild state they inhabit the temperate and hot parts of Europe, and the hottest parts of Asia and Africa. See *LEPUS Cuniculus*.

The female, or doe rabbit, goes with young thirty days, and then she kindles; and if she take not buck presently she loses her month, or at least a fortnight, and often kills her young and eats them.

In England they begin to breed at a year old, but in some places much sooner; and they continue breeding very fast from the time when they begin, four, five, six, or seven times a year being common with them. They have usually from four to eight in a litter, and hence it is that a small number at first will soon stock a whole warren, if left to breed a little while undisturbed. The does cannot suckle their young till they have been at buck again; this therefore is to be done presently, else there is a fortnight lost of the time for the next brood, and the present brood also probably lost. When the buck goes to the doe, he always first beats and stamps very hard with his feet, and when he has copulated with her, he falls backwards, and lies, as it were, in a trance; in this state it is easy to take him, but he soon recovers from it.

The buck-rabbits, like our boar-cats, will kill the young ones, if they can get at them; and the does in the warrens prevent this, by covering their stocks, or nests, with gravel or earth, which they close so artificially up with the hinder part of their bodies, that it is hard to find them out. They never suckle the young ones at any other time than early in the morning, and late at night; and always, for eight or ten days, close up the hole at the mouth of the nest, in this careful manner, when they go out. After this they begin to leave a small opening, which they increase by degrees, till at length, when they are about three weeks old, the mouth of the hole is left wholly open, that they may go out; for they are at that time grown big enough to take care of themselves, and to feed on grass.

People who keep rabbits tame for profit, breed them in hutches; but these must be kept very neat and clean, else they will be always subject to diseases. Care must be taken also to keep the bucks and does apart till the latter have just kindled; then they are to be turned to the bucks again, and to remain with them till they shun and run from them.

The general direction for the choosing of tame rabbits is, to pick the largest and fairest; but the breeder should remember, that the skins of the silver-haired ones sell better than any other. The food of the tame rabbits may be colewort and cabbage-leaves, carrots, parsneps, apple-rinds, green corn, and vetches, in the time of the year; also vine-leaves, grass, fruits, oats, and oatmeal, milk-thistles, sow-thistles, and the like: but with these moist foods they must always have a proportionable quantity of the dry foods, as hay, bread, oats, bran, and the like, otherwise they will grow pot-bellied, and die. Bran and grains mixed together have been also found to be very good food. In winter they will eat hay, oats, and chaff; and these may be given three times a day: but when they eat green things, it must be observed, that they are not to drink at all, for it would throw them into a dropy. At all other times, a very little drink serves their turn, but that must always be fresh. When any green herbs or grass are cut for their food, care must be taken that there is no hemlock among it; for though they will eat this greedily among other things, when offered to them, yet it is sudden poison to them.

Rabbits are subject to two principal infirmities. First, the rot, which is caused by the giving them too large a quantity of greens, or from the giving them fresh gathered,

with the dew or rain hanging in drops upon them. It is excess of moisture that always causes this disease; the greens, therefore, are always to be given dry, and a sufficient quantity of hay, or other dry food, intermixed with them, to take up the abundant moisture of their juices. On this account, the very best food that can be given them is the shortest and sweetest hay that can be got, of which one load will serve two hundred couples a year; and out of this stock of two hundred, two hundred may be eat in the family, two hundred fold to the markets, and a sufficient number kept in case of accidents.

The other general disease of these creatures is a sort of madness: this may be known by their wallowing and tumbling about with their heels upwards, and hopping in an odd manner into their boxes. This distemper is supposed to be owing to the rankness of their feeding; and the general cure is the keeping them low, and giving them the prickly herb, called *tare-thistle*, to eat.

The general computation of males and females is, that one buck rabbit will serve for nine does; some allow ten to one buck: but those who go beyond this always suffer for it in their breed.

The wild rabbits are to be taken either by small cur dogs, or by spaniels bred up to the sport; and the places of hunting those who straggle from their burrows is under close hedges or bushes, or among corn-fields and fresh pastures. The owners use to course them with small greyhounds; and though they are seldom killed this way, yet they are driven back to their burrows, and are prevented from being a prey to others. The common method of taking them is by nets, called purse-nets, and ferrets. The ferret is sent into the hole to force them out, and the purse-net being spread over the hole, takes them as they come out. The ferret's mouth must be muffled, and then the rabbit gets no harm. For the more certain taking of them, it may not be improper to pitch up a hay-net or two, at a small distance from the burrows that are intended to be hunted: thus very few of the number that are attempted will escape. The method by the dog, called the lurcher and tumbler, is also a very good one.

Some, who have no ferrets, smother the rabbits out of their holes with burning brimstone and orpiment. This certainly brings them out into the nets, but then it is a very troublesome and offensive method, and is very detrimental to the place, as no rabbit will for a long time afterwards come near the burrows, which have been fumed with these stinking ingredients.

The testicle of a rabbit is a very good object for examining the structure of this part of generation in animals. The testicles of various animals are very variously composed, but all, in general, of vessels variously rolled and folded together; and even the human testicles are of the same sort, being composed solely of rolls of vessels, without any intermediate substance, only consisting of vessels and their liquors. Phil. Trans. N^o 52.

The skins of rabbits are a great article of commerce, numbers being exported to China: the fur is of great use in the hat-manufactory.

RABBIT, in *Agriculture*, is sometimes employed as farming stock. It is sufficiently evident, however, that this is a description of farming stock that can only be attended to with advantage under particular favourable circumstances of soil and situation.

Situations proper for Rabbits.—The practice of forming rabbit warrens, can only be beneficially introduced where the lands are not capable of affording crops of tolerable grain or grass. The great uncertainty of this sort of husbandry

RABBIT.

husbandry renders it much more advantageous for the farmer to depend upon such crops, than on it. In hilly tracts of land, where the plough cannot be introduced, and where the soil is of such a light sandy porous nature, as to afford little or no grafs for the pasturage of sheep, or in rocky situations, this system of management may take place with profit to the farmer.

And it has been observed by the author of the Rural Economy of Norfolk, that this sort of animal is there confined to the heathlets, and the barren hills upon the coast. A level country is unfit for rabbit-warrens, but convenient for the plough; on the contrary, rabbits delight in the sides of sandy hills; which, where turn-wrist ploughs are not in use, are extremely inconvenient for tillage; and, when cultivated, are generally unproductive. For the rabbit, on level ground, finds it difficult to make its burrow; the excavated mould is all to be dragged upward to the surface; hence a piece of ground altogether level, can seldom be stocked successfully with rabbits; unless it be first laid up by art, at a great expence, into inequalities. While, on the contrary, against the side of a steep hill, the rabbit has no difficulty to encounter; the declivity affords him a ready vent for his mould; his work is all down hill; and, unless the soil be too stubborn, or too rocky, for the rabbits to work freely among, a broken hilly country may generally be stocked with advantage; provided a tolerable market for the carcases can be had within reach. He thinks there are, perhaps, few sandy or other loose-soiled hills, which would not pay better in rabbit-warrens, than under any other course of husbandry that could be introduced on them. And it is afterwards stated, in a minute, that on a considerable part of a farm which lies towards the coast, being hilly and very badly soiled,—more especially the tops and sides of the hills, which have always been full of rabbits in spite of all endeavours to destroy them,—the tenants last year (1782) applied for leave to convert this part, about ninety acres, into a rabbit-warren. Leave was given, and an allowance made them of half the estimated expence of raising a fodd-wall fence round these ninety acres. He adds, that the fence was nearly finished, and the warren had, that year, turned out beyond expectation; it was valued by one who ought to be the best judge of its worth, at forty pounds a year; which is nine shillings an acre. And that, as the part of a farm, these ninety acres were not worth five shillings an acre; at the then present price of barley, they were not worth more than four shillings an acre. It is, therefore, observed, that for ten pounds a real improvement of twenty pounds a-year has been made and secured; for the warrener will, through necessity, hereafter keep the fence in repair for his own advantage. He remarks, that the fence is made about four feet high, and three feet thick; faced with greensward; and capped with furze, so as to project eight or ten inches over the face. Some of it was done for a shilling a rod; but the spring putting in, fourteen or fifteen pence a rod of seven yards was obliged to be given. And a neighbouring warrener, that winter, gave ninepence for the wall without the capping; which he does not mean to put on till the wall be thoroughly settled. This is very judicious; as several rods of that above-mentioned shot down in different places, as is often the case in such sort of work. It is further observed, that there are several patches in the vallies, and some on the tops of the hills which have usually been tilled. Some of these were last year (1781), and some of them ought to be every year, cultivated for the rabbits; thus, when the grafs gets foul or mossy it should be ploughed up; fallowed, sowing turnip-feed for present feed, (they will not let rape get up,) and to prepare the soil for barley

and grafs-feed the ensuing year. Thus a regular succession of feedage might be kept up for the use of these animals. And in the Rural Economy of Yorkshire it is stated, that at Dalby there are two pretty large warrens. At Lockton there is one now (the time of writing) planting. And there are other parts of these heights which might be profitably stocked with rabbits. In general, however, property is too much intermixed to admit of an improvement, which is singularly adapted to the nature of these high grounds. And, that in situations where the ground, as well as the soil, is suitable to rabbit-warrens, and where an extent of it, sufficiently large, can be collected together in one property, there is a very strong reason why it may be profitably stocked with rabbits. It is added, that one of the warrens of this district contains eighteen hundred acres of surface; most of it covered with a black moreland soil; part of it a barren gravel; some little of it a thin lime-stone loam; not worth perhaps, on a par, for the common purposes of husbandry, a shilling an acre; nevertheless, these eighteen hundred acres are let, as a rabbit-warren, for three hundred pounds a-year! He will not pretend to say, that this warren is worth three hundred pounds a-year, nor assert that it is not worth a shilling an acre to a husbandman. If it be worth two hundred and fifty pounds, as a warren, and supposing it to be worth even two shillings an acre, as a farm, it still is sufficient evidence of the profitableness of rabbit-warrens, in proper situations.

And in speaking of the wolds, he observes, that the warrens are numerous, and some of them very extensive. Coldham warren is at present, he believes, the largest upon the wolds; and, probably, the most valuable warren in the island. The Coldham farm contains about nineteen hundred acres; and, speaking generally, it is all warren; not, however, wholly appropriated to rabbits, a flock of from six to eight hundred sheep being kept within the warren walls; principally, however, on one side of the warren, away from the burrowing grounds. And this appears to be a practice peculiar to the wolds of Yorkshire and Lincolnshire, whose hills likewise abound much with rabbit-warrens, and where better soil is appropriated to rabbit-warrens, than is perhaps in any other part of the island. The Coldham warren, in point of soil, is most of it worth from ten to twelve shillings an acre; some of it fifteen or sixteen shillings. But the present bleakness of the situation renders it of little more than half the value. As these better parts become mossy, they are inclosed by a fodd-wall, the surface pared and burnt, and the soil broken up for arable crops. Having afforded a succession of crops of corn, turnips, &c. they are sown with grafs-seeds, and again thrown open to the rabbits and sheep. In 1783, there were about two hundred acres of this farm under the plough, besides some little sheep-walk which lay without the warren walls. The warren therefore, at that time, contained from fifteen to sixteen hundred acres; and, adjoining to Coldham, are two more considerable warrens; so that there are, perhaps, three or four thousand acres of tolerably good land, lying together, and appropriated principally to rabbits.

But it is remarked in respect to soil, that there is a disadvantage in stocking a rich soil with rabbits; a flush of grafs, after a dry season, is found to produce a scouring; which sometimes carries off great numbers. With regard to the burrows on the high wolds, they are mostly on the sides of hills; at Coldham, principally in one deep valley; whose sides are steep; giving the rabbits great freedom in working. The soil, in this case, is about eight or ten inches deep, under this a chalky rubble, of some inches thick, lying on a chalk-stone rock. The burrows are in the sub-soil.

between the soil and the rock, and chiefly towards the tops of the hills. And thousands of daws build their nests in the burrows, to the great annoyance of the rabbits. But at Driffeldgreets, near Driffeld, where there are two large warrens, the surface is a dead flat; nevertheless, the warrens are well stocked and productive; a proof that a flat surface may, in some cases, be profitably stocked with rabbits. The soil, in this case, is a light sand or gravelly loam, which is very proper for the purpose to which it is applied.

In some of the very southern districts, rabbits occupy the different sandy hillocks, and many of the rocky waldes; but there is nothing of any great importance in the management of them. Both the grey and black sorts prevail in some instances. The writer of the *Suffex Report on Agriculture* thinks, that this sort of stock is the nuisance of a county: it increases and flourishes in proportion to the size of the waldes, and is, of course, productive in this county. From Horsham forest, Ashdown, and other parts, very considerable quantities of rabbits are sent to be disposed of in London.

In some of the midland counties they are found to be sufficiently abundant upon the sandy parts of waste lands; in inclosed level land, it is thought that they are no better than vermin, and that should the commons be pretty generally inclosed, they must be in a great measure exterminated to make way for a better sort of stock; in inclosed land, they can only be kept with propriety, either in small warrens near the house, well fenced in, for family consumption; or on sandy or rocky precipices, impracticable to the plough, where they should also be fenced in. It is well known, that in the neighbourhood of commons abounding with them, great pains and expence are often used to fence the inclosed adjoining lands from their depredations. Rabbits are certainly a sort of stock unworthy of being cultivated, or bred in any considerable numbers, on inclosed and cultivated land; yet doubtless deserving considerable attention on impracticable sandy or rocky keeps, which may at the same time be planted; and when properly fenced in, and thus stocked, such land seems in a system of the highest improvement of which it is capable.

In Cheshire many doubts have been entertained as to the advantages of encouraging the breed of rabbits, and many farmers are so utterly averse to them, that they would with the whole race to be entirely exterminated. Where land is inclosed, and applied to arable purposes, it seems agreed that by the injury they do to the fences, by the interfering with the cultivated land, and by the destroying of its produce, they are much more detrimental than profitable. It is, however, thought to be a question for consideration, whether, if a portion of weak sand, or dry heath land, was set apart for a rabbit-warren, well fenced, and kept distinct for this purpose; it might not, in some situations, be more profitably employed in this than in any other manner.

By some it is supposed, that it may be occasionally necessary to restrain them, on account of their astonishing fecundity; but that to attempt to exterminate them, if it were possible, could not be politic or advisable, as they furnish food for foxes, which would otherwise prey on game and poultry.

This sort of stock is frequently met with in many other districts on tracts and spots of similar kinds of barren and uncultivable sorts of land, and is probably the most convenient, appropriate, and beneficial description of any by which they can possibly be occupied and managed.

Stocking.—In the second of the above districts, it is stated, that in stocking a warren, whether the surface be flat or hilly, artificial burrows are made, to reconcile the rabbits

to the ground, and to preserve them from vermin, until they have time to make their own burrows. And that in making these burrows, an improvement has lately, it is observed, been hit upon. They are bored with an auger, of a diameter large enough to make a burrow of a sufficient width. In a level warren, these augers may, from time to time, be found useful in forming such holes. They, however, in most cases, are capable of making burrows for themselves without any difficulty.

But in regard to stocking in Lincolnshire, according to the agricultural survey of that district, some of the warren lands are stocked in the proportion of three couple only to the acre; while in others, it is in a considerably larger proportion. And one buck or male rabbit is said to be there sufficient for one hundred does, or females; but this is certainly a much larger proportion of the latter sort, than is allowed in most other districts. On the wold warrens of Yorkshire, according to Mr. Marshall, one male is considered as sufficient for only six or seven females, and the nearer they can be brought to that proportion, the greater the stock of young ones that may be expected, it being the nature or economy of the males to destroy their young, especially when the proportional number is too great.

Fencing.—The fencing in these situations is sod-wall, capped with furze, or of late with stiff straw, forming a kind of thatch. And it is supposed, that reed would be found admirable in this intention. The warrens near Driffeld are fenced with paling; an expensive fence in the outset, and always under repairs. A brook, though ever so deep, is found to be insufficient as a fence against rabbits; one side of Driffeldgreets warren is bounded by a brook; but it is nevertheless fenced with paling. When the rabbits can evade this, they readily swim the brook. The necessity of good fences is of course sufficiently evident in this view, as well as that of preserving them from the destruction of vermin, and birds of prey, such as eagles, kites, &c. which are taken in steel traps, placed on elevated mounds of earth, where they delight to sit. It is this kind of fencing and coping, or kidding the top, together with food in winter, nets, traps, and other things for taking them, with charcoal for drying the skins, warreners' men for killing and carrying, horses for carrying them to market, &c. that constitute the great expence of this sort of management.

Different Breeds.—There are many different breeds or varieties of these animals, but those that are employed as stock for warrens are the common grey and silver-grey breeds: the former of which is found to be considerably more hardy and much better for the purposes of food; but the latter has greatly the advantage in the value of the skin. In the above warrens, till lately the common grey rabbit, probably the native wild rabbit of the island, was the only species. At present, the silver-haired rabbit is sought after, and has, within the few last years, been introduced into most warrens. The skin of the grey rabbit is cut; that is, the wool is pared off the pelt, as a material of hats; whereas, that of the silver-haired rabbit is dressed as fur; which, the writer understands, goes principally to the East Indies. The colour is a black ground, thickly interperfed with single white hairs. The skins of this variety sell for about four shillings a dozen more than those of the common sort; a sufficient inducement for propagating it in preference to the grey sort in most cases. If the white sorts could be introduced they might be still more valuable.

Management, Expences, Profits, &c.—This is a sort of stock that on the whole only requires a slight attention; it is, however, necessary to supply the rabbits with additional food in the winter season, when the weather is severe,
such

RABBIT.

such as fine green hay, sainfoin, clover, turnips, and others of the same sort, which must be distributed over the warrens. It is supposed that turnips answer the best in deep snows, as the rabbits can discover them by the scent. This sort of food is given in the quantity of two or three large cartfuls to a thousand couple *per* day, and one load of hay in the same time during a storm. It is likewise sometimes the practice to distribute billets of new cut ash-boughs, gorse or whins, and other similar woods in the warrens, the bark and other parts of which is eaten, by which the proportion of hay is lessened in a considerable degree. In great snows, it is necessary to clear them away from the ditches or fences, to prevent the rabbits from getting over them.

It may be observed, that the rabbit is a sort of stock that begins to breed at an early age, as at eight, ten, or twelve months, going only about thirty days with young, the young being a little more than three weeks old before they appear from the burrows, during which time they are suckled twice in the day by the mother. It is therefore evident, that they may breed three or four times in the course of the year under good keep, as the does take buck almost immediately after producing their young. In warrens that are inclosed, it is however said, that they seldom breed more than two or three times in the year. The annual produce *per* acre, is mostly estimated at from three or four, to eight or ten couple, yielding a profit of from eight, ten, or even fifteen shillings, where they are conducted under a good system of management. And the produce is, as has been seen, the largest on new lands; however, much of the profit must always depend on situation, so as to be near good markets.

These animals are in what is termed season from the end of October to the beginning of January, in which period the best skins are produced: of course a large proportion of them is killed in this short time. The farmer often sustains great loss in what by the purchasers are called *half* skins, *quarter* skins, and *racks*, sixteen of which are only considered as a whole skin. The rabbits are disposed of by the hundred, six score couple being considered as an hundred.

The following statements are given in the Agricultural Survey of Lincolnshire, on this sort of management. On the authority of Mr. Chaplin, it is stated that on 1000 acres it is fair to kill 2000 couple, which are sold by the hundred, as above; which have sold at 10*l.* on an average of ten years; last year 13*l.*; killing and looking after, 60*l.* for 1000 acres. And on the warrens between Gayton and Tathwell, silver skins have been from 15*s.* even to 21*s.* a dozen; but the common grey rabbit is so much harder, that if a warren be stocked with both, there will, in a few years, be nothing but greys. It is added, that from Louth to Caistor, 18 miles, 10 of them are warrens, chiefly silvers; rent 2*s.* to 3*s.* an acre. They plough a part every year for corn and turnips; and laying down again with seeds, let down the fences for the rabbits to enter. Warrens are reckoned profitable, so that some fortunes have been made on them. It is further stated, that in point of skins, those bred about May-day undergo no change from their white colour, but from a white rack become a whole skin; bred at Lady-day, become black; in June, white; in July, black; in November, white again: then in full season, as the carcases are also. The skins ought to have those colours on the inside, when flayed, or stripped off from the rabbits. The writer further states, that from 250 acres of land, that were sainfoin worn out, and planted with rabbits, the following was the account many years ago; but all prices, rent, &c. &c. are calculated at the present rates; and it is to be noted, that the ground being thus new to rabbits

was much more productive than old warren land is found to be, as they breed much better on such new than on old land. Used to kill about 2000 couple; stock left about 700 couple. Sod banks that cost, thirty-five years ago, 1*s.* 2*d.* a rood of seven yards, would now cost 2*s.*; furze faggots were 7*s.* a hundred, that is, 5*s.* for the furze, and 2*s.* kidding, now doubled. Banks will last about seven years, in a middling way; from three to twenty: want facing once in seven years, at half the first expence; want capping in three years with the furze. Laying on, or capping, 3*d.* a rood now. It was then reckoned that 250 acres would clear 100*l.*, besides rent, which then was 1*s.* an acre. Fencing annually half a mile 800 yards 133 roods at 1*s.*, 6*l.* 13*s.*; for facing furze, a kidd will do a yard; 2½ miles kidding, at a kidd a yard, 4400 yards and kidds, at 15*s.* now, for 120 or 27*l.* 10*s.*, or *per annum* 9*l.* 3*s.* 4*d.* add 6*l.* 13*s.*, it is 15*l.* 16*s.* 4*d.* *per annum*. A warrener 35*l.*, a cow, fuel, and house: in all 40*l.* Extra labour, killing 18*s.* a-week for sixteen weeks, 14*l.* 8*s.* Also for a month 18*s.* a-week, 3*l.* 12*s.*: in all 18*l.* Besides nets and thread, 12 at 60 yards each; last six or seven years; would cost 1*l.* 11*s.* 6*d.* Traps 5*s.* a-year. The men who kill will carry. Four horses for six weeks, 1*l.* 4*s.* a-week, 7*l.* 4*s.* Charcoal for drying skins, 5*s.* A person to order skins, that is, clear from fat, and drying, five weeks; a useful woman will do it, 1*l.* Winter food (after three days snow they must be served) cannot be less than 10*l.* a year on 250 acres.

But it is, notwithstanding this statement, suggested, that if he had a warren of his own, he would plough it up for corn, &c.; thinking tillage now more profitable than rabbits. And the author adds, that at Partney fair, meeting with Mr. Grant of Withgull, and discoursing with him upon warrens, he informed him that a common stock in winter was three couple *per* acre, and the produce five or six couple

RABBIT.

couple killed; that killing, carrying, &c. might amount to something more than 1*s.* an acre: the sort *silver sprig*, which will not do well in other counties, where they have been tried. He has now 1000 acres of warren; and upon 1000 acres the stock is 2600 couple, and kill 5000 couple annually. New land is the most productive. On such a warren, the rabbits must have two loads of hay a day in a storm, or two or three large waggon loads a day of turnips. The warrener has 20*l.* a-year, and two cows; the killers 8*s.* or 9*s.* a-week, and board for ten weeks. Silver skins now are 10*s.* a dozen; have been 14*s.* to 15*s.* Fences 60 a-year; no crops ones; no buildings. The immense occupation of Mr. Grant and his sons, being much the most considerable in the county, with the circumstance of making an ample fortune, made him desirous of seeing him. It is added, that 20 years ago, Driby had a warren of 12 or 1300 acres; and the rent of the farm including it, 300*l.* a-year, which rent has been doubled by ploughing. And Mr. Kerhew observed, that the community received next to nothing from warrens; which is probably the case, as has been seen above, where the land is capable of being managed under the plough, or the system of grass.

And the calculation of Mr. Parkinson, of a warren of 700 acres under rabbits, in the same district, stands thus: rent 5*s.*; standing stock 2000 couple of silver hair, valued to the incoming tenant at 2*s.* 6*d.* a couple ten years ago, and demanding a capital of 1400*l.*; and carefully *typed* to

catch all extra bucks, so as to leave only one-fourth of the total number of bucks.

	£ s. d.
Produce 3000 couples for sale, worth, on an average of seven years past, 15 <i>l.</i> a hundred	450 0 0
But as some are greys, the price 10 <i>l.</i>	300 0 0
	750 0 0

Take the average of the two, that is, silver hair of the Wolds, and greys of Lincoln Heath, it will be on a medium

Or about 10*s.* 10*d.* an acre. And add to these, 350 sheep, kept by a course of tillage; that is, ploughing up 50 acres annually for paring and burning for turnips; then spring corn and feeds, which feeds sheep-fed one year, and thrown open to the rabbits: the sheep at 2*d.* per week for 25 weeks, will amount to 72*l.* 10*s.* This is inferior to the common produce of sheep; but the rabbits will demand hay, &c. to the amount of the difference; and also a team of horses must be kept for the cultivation of 100 acres of land, and carrying the rabbits to market. Hence,

It is noticed, that as the family is maintained out of the farm, the interest of the capital of about 1400*l.* is not charged, because the interest would be only 70*l.* per year, when they are maintained out of the farm, with a profit of 294*l.* 3*s.* 10*d.*

It is stated by the writer of the above agricultural survey, that the warren of North Ormsby, occupied by the late Mr. Ansell, is supposed to be one of the best managed in the county. The rabbits chiefly consist of silver-greys; the land of the yearly value from 2*s.* 6*d.* to 8*s.*, and some little of it 10*s.* the statute acre. The occupier was of opinion, that lately his warren lands would have paid him

better, had they been applied to the purpose of growing corn, and grass feeds for keeping sheep. The rabbit produce he supposed to be from 8*s.* to 10*s.*; in some particular years they have paid from 15*s.* to 21*s.* an acre; but to obtain any extraordinary profit, very great care must, he thinks, be taken in killing the many different kinds of vermin which depredate, and, without the utmost vigilance, will

R ABBIT.

will quite depopulate the warrens. A considerable expence also attends the necessity there is for night-watchers, to protect them from the infinitely worse vermin, the poachers. With him the silver-grey skins have been sold from $8\frac{1}{2}d.$ to $15d.$ and $16d.$ per skin: the last two years they have only brought from $10d.$ to $11d.$ per skin; but to obtain even these prices, they must be what is called full seasoned, whole skins, and of the choicest colours, with respect to which the fashion varies very greatly. The carcases, of late years, have not averaged net into pocket more than $4d.$ per couple, after the expence of drying them, and by means of light diligence carts, having them carried to markets 30, and sometimes more than 60, miles to obtain even that sum. This inconvenience is occasioned partly by its being necessary to kill eight or ten parts of a year's slaughter in so short a time, as between the second week in November and Christmas, on account of their skins being then only in full prime, and as they are also very soon subject to become putrid, much more so than hares; and their being obliged to be packed close together, very greatly increases the mischief.

The estimate of the warren on the estate at Thoresway of 1700 acres, as given by the tenant Mr. Holdgate, with the silver sort of rabbits, is this:

	£	s.	d.
Labour, three regular warreners, with extra assistants at killing	85	0	0
Fences	42	10	0
Winter food	42	10	0
Nets, traps, &c. &c.	14	3	4
Delivery	21	5	0
Rent is said to be 7s. an acre	595	0	0
	800	8	4

The capital employed is that sum with the addition of stock paid for; suppose this as stated about three couple an acre at $2s. 4d.$

	1395	8	4
Interest on that sum one year at 5 per cent.	69	15	5
	1465	3	9

Annual Account.

	£	s.	d.
Expences as above	800	8	4
Interest	69	15	5
	870	3	9
Produce 10,000 couple, at $2s. 4d.$	1166	13	4
Expences	870	3	9
Profit	296	9	7

Or about $22l.$ per cent. (the 5 per cent. included) on capital employed. This the writer observes is very great, reckoned on the capital, but small reckoned by rent, as it amounts to only half a rent. But suppose the gross produce of 1500, which he takes to be nearer the fact; then the account will stand thus:

	£	s.	d.
Produce	1500	0	0
Expences	870	3	9
Profit	629	16	3

or 45 per cent. on the capital.

But it is supposed that, in whatever way it is taken, it explains the reason of so many of these nuisances remaining. The investment of a small capital affords a profit or interest that nothing else will, and of course the proprietor will be sure never to convert them to better use. But, it is asked, what says the public interest? Here are only 200*l.* expences to 600*l.* rent, what is the population, the industry, the improvement! The landlord gets the lowest of rents, the tenant makes a good profit, they divide all, and the rest of the world is little or no better for them.

Rabbit-warrens are met with in most other districts of the kingdom, both towards the southern and northern parts of it; but more abundantly in those of the north. In the south they have in most places been got quit of from any tolerable sort of land which is capable of affording any other better kind of useful produce, but in some parts of the north they still occupy spaces of ground which are of a good quality, and which might be converted to better purposes with great advantage to the proprietors, as well as farmers. Warrens of this nature, in some cases, in both these situations, however, still continue to be well stocked, and in the latter, are in particular instances of pretty considerable extents.

In Cheshire, the principal rabbit-warrens are on Delamere forest, though on several of the heaths and sand-lands these animals are frequently met with, but not in such numbers together as to constitute warrens.

In the north riding of Yorkshire, also, a few rabbit-warrens are met with on the detached moors, as well as on the skirts of the higher moors; but they are not so extensive as to make them an object of much attention. The kind of rabbits here are mostly the common grey, with the exception of the stock on a warren at Nappa, in Wensleydale, of about one hundred and fifty or two hundred acres, which consists of silver-greys, and is the only warren which is known, in this district, to be entirely stocked with this sort: they are said to have been brought some years since from a warren in the above noticed district of Lincolnshire, to which they had been originally introduced from Ireland. The skins of this kind of rabbits are supposed to be worth double those of the grey; they are not used for felts, as the last, but dressed as furs, and ultimately exported in that state for the China market, where they are worn by the principal people; an use which has been already noticed and considered in regard to the demand which it creates.

But in the northern parts of Lancashire, warrens of this kind are more frequent. At Rossall-hall, in the tract called the Fild, one of great extent has existed for a very great length of time; but the present proprietor, B. F. Hisketh, esq. has, with great propriety, lately reduced it very considerably, by taking two large fine farms from it, so that it now consists only of about a hundred acres of the most sandy barren part.

This warren formerly supplied a great number of rabbits for sale in the markets and hat manufactories of the neighbourhood, and of course became a source of profit to the owner, though the management was very imperfect. The farms taken from it will, however, become far more advantageous to him.

The stock here was formerly of the grey rabbit kind, and it is still the same on the warren which remains, which is however far from being sufficiently stocked.

There was formerly no sort of green food ever cultivated for this sort of stock; nor has it been yet attempted on the present warren, but the proprietor intends to have it done in an effectual manner. Nor have the rabbits ever been fed in the winter season with either hay, bark, or any other sort of

RABBIT.

of food; their being so near to the sea-coast perhaps renders it unnecessary.

The only mode of taking the rabbits here has hitherto been in nets, by what is termed *running* them by means of dogs.

At Heysham the Rev. Mr. Clarkson has a tract of coarse stony land above his house, of about twenty acres, which has a great number of grey rabbits in it, and is well suited for a rabbit-warren, as it is incapable of being converted to any better purpose on account of the severity of the west winds, and the effects of the sea-spray thrown up by them, as well as its rocky, whiny nature.

The principal rabbit-warrens in this county are, however, those in the sandy tracts in the south and north ends of the isle of Walney, and in the neck of land from which it seems to have been separated. The rabbit-warren at the north end of this little island occupies a considerable space of ground of this barren sandy quality, as well as that at the southern point. The former is stocked wholly with rabbits of the grey kind, this sort being in most demand. There is much expence attending these warrens in many cases.

The expence of stocking in order to keep them up is sometimes very considerable. In this instance the farmer has upwards of two miles of dike fence composed of sod and stone to keep up and in repair, which costs from five to six shillings the rod of seven yards. The expence of a man constantly to look after the rabbits, and keep the dike fences in proper order and repair. That of the purchase of the traps or types, which cost 3*l.* a-piece, and eighteen are required; but they last long, and cost little in repairs.

The providing net and dogs, which is annually about 10*l.* The charge of taking the rabbits to Ulverston, twice in the week, during ten weeks, which is 5*s.* each time.

The sale of rabbits is annually from one hundred and fifty couple upwards, at the rate of 2*s.* 6*d.* each couple. They are usually sold to Lyons of Preston, who takes the charge of them after they have been delivered at the above-named place.

Not any sort of dry or green food is ever given to the rabbits in this warren during the winter season; but there is not any snow, and very little frost taking place; in consequence of the situation being so surrounded by the sea.

The warren at the south end of the same little island is of similar extent, and exactly under the same sort of management; but it is said to be earlier, by a month at least, in the breeding of the rabbits, and the quality of their fur; which is supposed to arise from its being more fully exposed to the influence of the morning sun, in which the rabbit delights, and by which it is greatly benefited.

The rabbits are here likewise asserted to sell for a higher price, as 3*s.* the couple, than in the warren at the north end of it.

The rabbit-warren at Sand Scale is another farm of this sort in this neighbourhood, under similar regulations, but somewhat smaller than those in the isle of Walney; and there is a still smaller one attached to a farm at Roanhead, the property of Miles Sandyses, esq. of Graythwate, which is conducted in much the same manner, and with the same results as in the above case.

It may be noticed that this sort of stock is mostly taken by nets or traps, set in the form of a fold between the places where they run, and those where they feed, the rabbits being hunted into them as they return from feeding. But the wold warreners, Mr. Marshall says, have three ways of catching their rabbits: with fold-nets, with spring-nets, and with "types;" a species of trap. The fold-nets are set about midnight, between the burrows and the feeding-

grounds; the rabbits being driven in with dogs, and kept inclosed in the fold until morning. But the spring-net, when used, is, he believes, generally laid round a hay-stack, or other place, where rabbits collect in numbers. It is added that the trap is a more modern invention. It consists of a large pit or cistern, formed within the ground, and covered in with a floor: or with one large falling door, having a small trap-door towards its centre, into which the rabbits are led by a narrow muce. And this trap, on its first introduction, was set mostly by a hay-stack; hay being, at that time, the chief winter food of rabbits; or on the outside of the warren wall, where rabbits were observed to scratch much, in order to make their escape. Since the cultivation of turnips, as a winter food for this species of stock, has become a practice, the situation of the trap has been changed. Turnips being cultivated in an inclosure within the warren, a trap is placed within the wall of this inclosure. For a night or two, the muce is left open, and the trap kept covered (with a board or triangular rail), in order to give the rabbits the requisite haunt of the turnips: which having got, the trap is barred, and the required number taken. He adds, that in emptying the cistern, the rabbits are sorted; those which are fat, and in season, are slaughtered; those which are lean, or out of condition, are turned upon the turnips to improve. And that, at the close of the season, the bucks and the does are sorted, in a similar way; the bucks are slaughtered, the does turned loose to breed. Mr. Marshall also remarks, that great caution is requisite in the use of these traps. If too many rabbits be admitted at once, and the cistern be kept close covered only for a few hours, suffocating and inordinate heat takes place, and the carcasses, at least, are spoiled. Many thousand carcasses have been wasted through this means. The traps are therefore watched; and when the required number is caught, the muce is stopped, or the trap covered in a proper manner.

And it is observed, that some notion may be formed of the produce of the wold warrens, from the great numbers which are frequently slaughtered at once; five or six hundred couple having not infrequently been slaughtered in one night: and, it is said, that when the two Driffild warrens lay together, there was once an instance of fifteen hundred couple being killed at one time.

There is often much inconvenience in this sort of stock, from their getting out of their inclosures, and destroying the young corn-crops, new sown grasses, young turnips, and the quick hedges as well as young plantations of apple-trees that may be in the neighbourhood. This forms a material objection to this sort of stock by the farmer.

Tame Rabbits.—In respect to breeding and rearing tame rabbits with the view of profit, those who are engaged in the business perform it in hutches, which must be kept very neat and clean, otherwise the rabbits will be subject to disease. Care must be taken also to keep the buck and does apart, till the latter have just kindled, then they are to be turned to the bucks again, and to remain with them till they shun and run from them.

And the general direction for the choosing of tame rabbits, is to pick the largest and sleekest: but the breeder should remember, that the skins of the silver-haired and white sorts sell better than any other. The food of the tame rabbits may be colewort and cabbage-leaves, carrots, parsnips, green corn, and vetches in the time of year; also parsley, grass, green leaves, milk, and fow-thistles, and other similar plants, but with these moist foods they must constantly have a proportionable quantity of dry food, as hay, bread, oats, bran, and other similar matters, otherwise they grow pot-bellied, and die. Bran and grain mixed together have been found

RABBIT.

to be very good food. In winter they eat hay, oats, and chaff, and these may be given them three times a day; but when they eat green things, it must be observed that they are not to drink at all, as it throws them into a dropsy. At all other times a very little drink serves, but it should always be fresh. When any green herbs or grafs are cut for their food, care must be taken that there is no hemlock among it, for, though they will eat this greedily among other things, when offered to them, it is a sudden poison to them. In this mode of breeding, one male to eight or ten females is sufficient.

It is remarked, that the author of the Treatise on Agriculture and Gardening, has bred these animals with much success and ornamental effect in a small artificial warren, in a lawn in the garden, made in the following manner. "Pare off the turf of a circle, about forty feet diameter, and lay it on the outside; then dig a ditch within this circle, the outside perpendicular, the inner sloping, and throw earth sufficient into the middle to form a little hill, two or three feet higher than the level of the lawn; the rest must be carried away. Then lay down the turf on the hill, and beat it well to settle. The ditch at bottom should be about three feet wide, and three and a half deep, with two or three drains at the bottom, covered with an iron grate, or a stone with holes, to carry off the hasty rains, in order to keep the rabbits dry. In the outside bank should be six alcoves, the sides and top supported, either by boards or brick-work, to give the rabbits their dry food in; by their different situations, some will always be dry; six boxes, or old tea-chests, let into the bank, will do very well. If the ground be very light, the outside circle should have a wall built round it, or some stakes driven into the ground, and boards or hurdles nailed to them, within a foot of the bottom, to prevent the bank from falling in. The entrance must be either by a board to turn occasionally across the ditch, or by a ladder. The turf being settled, and the grafs beginning to grow, turn in the rabbits, and they will immediately go to work to make themselves burrows in the sides, and in the hill. By way of inducing them rather to build in the sides, to keep the turf the neater, make a score of holes about a foot deep, and they will finish them to their own mind; and if there be a brick-wall round it, it should be built on pillars, with an arch from each, to leave a vacancy for a burrow." But there is, he says, another way that may be practised, which is, "to dig the ditch only about two feet deep, which will yield about earth enough to make the hill; put some pales, about a foot high, on the outside, for that will be a sufficient height to keep the rabbits in. Feed them as other tame rabbits are fed; and in wet weather sprinkle saw-dust at the bottom, by which means the quantity of manure will be increased; once a week is often enough to take it away: the quantity will be surprising, nor will the smell be in the least offensive, even though it be quite close to the house. In a very large lawn, two or three of these hills, with the rabbits feeding on the tops, will not be unpleasing objects. If the bucks happen to be mischievous in killing the young ones, they must be chained in an alcove; or else have their liberty as in a warren. After a great snow they will want some assistance early next morning; because the ditch will be nearly filled, and perhaps the alcove, where the lay is, will be blocked up."

He adds, that "it is a great improvement to castrate the young bucks, and keep them till they are full grown, before you kill them; the flesh will be amazingly finer, whiter, and tenderer. But then it will be best to take them away, and keep them in another warren, lest they

should be too numerous, and disturb the breeding does; or else have a few hutches in the alcove to fatten them in."

It is suggested, that "as oil-cakes are found of great use in fattening cattle, it is probable they would be useful in fattening rabbits: and it is asserted, that some of the oil mixed with the pollard or buck-wheat, is cheaper than the cakes; but having never made the experiment, he cannot ascertain its superior advantages."

In this mode, attention should be had to the breeding those sorts of rabbits whose skins are in the greatest esteem with the furriers and hatters. These skins are generally of more value than the flesh, especially in the winter, against which time contrive to have the greatest quantity of these fattened bucks.

Profit.—It is remarked, in respect to profit in this way, that where does are kept in hutches, they are supposed to breed six times a-year, and only five young ones are left to each, which is thirty from each doe: but as these are in a more natural way, and the young ones difficult to be gotten at, let us suppose about thirty-six to be produced from each doe, reckoning only seven-pence for each; there is a guinea profit from each doe; as the additional value of the skins in winter, and the dung, will more than pay the expence of food and attendance on them. And it is quite necessary that those who keep many rabbits in this way, should cultivate some lucern, parsley, and carrots, as no other vegetables are such proper food for them as these; they should also be fed upon some of the best upland pasture-hay; for if it be coarse, so far from eating, they will waste it. Lucern hay is very proper for them in these cases.

In some districts very considerable profits and advantages are derived from the breeding and keeping of white tame rabbits. The skins of this sort having lately been much employed in trimmings, have sold at a much higher price than those of the common kinds. Their dung is also found of very great utility in the cultivation of large farms.

Diseases.—When kept in this way, rabbits are subject to several diseases, as the *rot*, which is caused by the giving them too large a quantity of green food, or the giving it fresh gathered, with the dew or rain hanging in drops upon it, as it is over-moisture that always causes the disease; the green food should, therefore, always be given dry, and a sufficient quantity of hay, or other dry food, intermixed with it, to counteract the bad effects of it. And a sort of *madness* often seizes them; this may be known by their tumbling about; their heels upwards, and hopping in an odd manner into the boxes. This distemper is supposed to be owing to the rankness of their feeding; and the general cure is the keeping them low, and giving them the prickly herb called tare-thistle to eat as much as possible. They are also subject to a sort of scabby eruption, which is seldom removed. These should, however, be directly separated from the rest of the stock.

It is noticed that the profit in this mode of management cannot, however, be well ascertained, as much will depend on the care which is taken in the feeding, and other management.

Rabbit-Warren, the place where these animals breed and rear their young. The land for this purpose should be of a light sandy quality, and it is best to have a hilly situation, with a sunny exposure, being well inclosed by means of sod-walls, or paling-fences: any sort of waite, craggy, or rocky land, on which nothing else can be cultivated, answers very well for this purpose. See RABBIT.

RABBIT-Warren Farm, that sort which is chiefly managed under the rabbit system. These sorts of farms are now much less common than formerly, but in some instances, as has been seen, they afford the best and most advantageous means by which lands can be turned to any account in the way of cultivation. They, however, in most cases require no little capital, exertion, and attention, to manage them in the best and most profitable methods. See **RABBIT**.

RABBIT Manure, that which is collected from the dung of those animals, and which is said to be very valuable. See **MANURE**.

It is found beneficial in different modes of application, as by being intimately mixed and blended with the main particles of the soil or mould in arable lands, and by being sown by the hand, only over the surface of it, in the way of a top-dressing, when they are in a state of crop. When used in this last manner, it is likewise highly advantageous on most sorts of grass land; and in both these cases of top-dressing with it, there is a very quick and powerful state of vegetation produced in the crops, which can hardly be gained in any other way. See **Quick Manure**, and **Top-dressing**.

In Oxfordshire, Mr. Fane has raised a small building for keeping rabbits in hutches, for the sake of the manure; he is said to have some hundreds, and to meditate the erection of a second building for keeping double the number; the present quantity make a load of manure in the course of the week; and as two loads manure an acre, they are the means of fully dressing twenty-six acres annually: it is not conceived by him that they produce any other profit, nor is it necessary; for to be able to sell so much food at home, and pay attendance, the profit of manuring such a breadth of land, it is supposed, must be considerable. Three dozen of rabbits in the week are mostly sent to the London market during the season in which they can be used.

This is a sort of dung or manure, which has yet been but little subjected to chemical examination, consequently its real properties, or constituent principles, are very imperfectly known or understood; it would appear, however, from the effects which it produces, that it may be employed with the most advantage, when laid upon the land, in its more raw, crude, or fresh state, before it has undergone much decomposition by the process of fermentation or putrefaction. It has, perhaps, never yet been kept dry and reduced into a powdery condition, so as to be put in along with the seed, in the manner of rape-dust, though it seems probable that it would go farther, and be more beneficial, in some cases, if used in this way. See **DUNG**.

RABCHORCADO, in *Ornithology*, the name of an American bird, described by Nieremberg with many fabulous circumstances. All that seems certainly known is, that its tail is very remarkably forked.

RABDA, in *Geography*, a town of Arabia, in the province of Yemen; 30 miles N.W. of Sana.

RABDIUM, in *Ancient Geography*, *Tur-Rabdin*, a town of Asia, upon a mountain, at some distance from the Tigris, south of Tigranocerta, and east of Nisibis.

RABDOIDES. See **RHABDOIDES**.

RABDOLOGY. See **RHABDOLOGY**.

RABDOMANCY. See **RHABDOMANCY**.

RABEOIA, a name given by some to the roots of the flammula major.

RABELAIS, FRANCIS, in *Biography*, was born about the end of the fifteenth century at Chinon, in Touraine. At an early period he entered himself among the Cordeliers, and became well skilled in the learned languages, and the

literature of the age. He acquired a good share of popularity as a preacher; and what he gained by his sermons, he expended in the purchase of a small library. His private life was not so exemplary as his public discourses were edifying; and for some misconduct, which caused scandal in the monastery, he was imprisoned in his cloister. By his wit and facetiousness he obtained his liberation, with the pope's permission to quit his order, and remove to that of St. Benedict. Not being able, however, to bear any kind of restraint, he laid aside his religious habit, and, in 1530, went to Montpellier to study medicine. After some time he repaired to Lyons, where he printed a collection of pieces of Hippocrates and Galen. Here he likewise published several other works, among which were some of the books of his *History of Pantagruel*, which gave him so distinguished a place among burlesque writers. In 1535 he went to Paris, and waited on cardinal John du Bellay, to whom he had been known when they resided in the same convent; and he now made himself so agreeable to his old friend, that he was taken into his house in the several capacities of physician, reader, librarian, and steward. Du Bellay, in the following year, going out as ambassador to the court of Rome, took Rabelais with him, where his wit so much interested the pope and cardinals, that he very readily obtained a full absolution for the crime of apostacy. In 1537 he took his doctor's degree in physic at Montpellier; and returning to Paris soon after, his friend the cardinal presented him with a prebend in the chapter of St. Maur. He was afterwards made the curé of Meudon, which office he held from 1545 to his death, in 1553, being, according to one of his biographers, in the 63d, and according to another, in the 70th year of his age. His *Pantagruel*, which was finished about the time that he accepted the curé of Meudon, brought upon him the hostility of the monks, whom he had severely satirized, and who procured its condemnation by the Sorbonne and the parliament; but it caused his company to be much sought after, as the wittiest writer of his time. The want of decency was easily pardoned at that period, and Rabelais had some estimable qualities, and possessed extensive and various erudition, with a ready elocution, and an inexhaustible store of ludicrous ideas. "The *Pantagruel* and *Gargantua* of Rabelais," says a critic, "are to be regarded as comic satires, often concealing, under a whimsical extravagance, attacks upon follies which it would not have been safe seriously to expose. It is in vain, however, that commentators have attempted to find out the meaning in much that is mere ribaldry and nonsense, and even to discover real history veiled in the allegory of burlesque, where the author meant nothing more than to make his reader laugh or wonder. His satire, where it is intelligible, is often just and ingenious; but the obscurity of his language, and eccentricity of his conceptions, render the perusal of his works, to a modern at least, rather a task than an amusement." The most complete editions of his works is that published in Holland, in 5 vols. 8vo., 1715, with notes by Duchat; and that at Amsterdam, in 3 vols. 4to., 1741, with plates by Picart. The letters of Rabelais were published in an octavo volume, with notes by St. Marthe. The memory of Rabelais is perpetuated in the medical school of Montpellier, where bachelors are invested with a scarlet robe, said to have been the very robe which that wit himself wore.

RABELHORST, in *Geography*, a town of the duchy of Holstein; 5 miles W.N.W. of Cismar.

RABENAU, a town of Saxony, in the margraviate of Meissen;

Meissen; 8 miles S.S.W. of Dresden. N. lat. $50^{\circ} 52'$. E. long. $13^{\circ} 36'$.

RABENECK, a town of Bavaria, in the bishopric of Bamberg; 3 miles S.W. of Weifchenfeld.

RABENER, THEOPHILUS WILLIAM, in *Biography*, a celebrated German writer, was the son of an advocate at Leipzig, and born at Wachau in 1714. He was educated at home, by tutors employed for the purpose; but when he was 14 years of age, he was sent to the college of Meissen, where he had for fellow-students Grabener, Gärtner, and Gellert, with whom, and particularly with the last, he formed a friendship which continued through life. In 1735 he went to the university of Leipzig, where he applied himself chiefly to the study of jurisprudence, without entirely neglecting the Muses. In 1741, professor Schwabe having begun a journal in the German language, entitled "Amusements of Reason and Wit," Rabener became one of his principal coadjutors, and continued to assist him by his contributions till the year 1744. He is chiefly known as a writer in the first volume, by a humorous piece entitled "Proofs of the Necessity of employing Rhyme in German Poetry." This periodical work was, for some time, carried on with spirit and success; but at length it became degraded by literary disputes, which finally put an end to it; and another was established, under the title of "Contributions of Bremen." The writers engaged in this were all the most celebrated persons who flourished at that period, among whom were Gärtner, Schmidt, and Rabener, to whom were united Gellert, Klopstock, and others. The Journal of Bremen forms an epoch in the history of the German literature, as it introduced into the country a better taste, and tended greatly to improve the language, which, previously to this, had been much neglected. Rabener had before this been appointed controller of the taxes in the circle of Leipzig, a place of great labour, and which required an exact knowledge of the laws of the country, and the most inflexible integrity. Notwithstanding, however, the attention which the duties of this office required, he found leisure to continue his literary pursuits; and towards the end of 1751, composed his satirical letters, in which he introduces persons of every state and character, all of whom speak in the language suited to their condition. In 1753 he was appointed chief secretary to the directors of the taxes at Dresden; and two years afterwards he published the fourth and last volume of his satires, which contains "A burlesque Explanation of the Proverbs of Sancho Panza," the "First of April," and "The Excuse and Reparation." After this he began to write for the stage, and composed a comedy in four acts, entitled "The Free-thinker," which, with many other papers and letters, were burnt, together with his house, during the siege of Dresden, in 1760. He now abandoned his literary labours, but his friends obtained from him a collection of letters, which were afterwards published by Weifs. These were never intended for the public, but they are written with so much truth and sincerity, and exhibit a more correct picture of the author than any pen could have drawn. His health began to decline soon after his loss in 1760, and in 1767 he experienced a paralytic stroke, which was repeated in 1769; but he lingered out till March 1771, when he died. "He was," says his biographer, "among the small number of those privileged men, whom nature has endowed with every quality necessary to their state. He thought and spoke in a manner peculiar to himself: his pleasantries flowed as from an abundant source; he never fought for them; and they appeared so natural, pleasant, and lively, that it was impossible not to be struck by them. But he displayed his

wit only among his friends: he never lavished it on the rich and great; on the contrary, he concealed it, when invited merely for the purpose of being heard. He always spoke the truth, without regard to persons or rank." Rabener, says he, was the favourite author of Germany, who wrote poetically in prose, whose satirical, sportive genius possessed salt without gall. Rabener's works are generally known throughout Europe, having been translated into the French, English, Dutch, and Swedish languages. Gen. Biog.

RABENSPURG, in *Geography*, a town of Austria; 8 miles N.E. of Lifterdorff.

RABENSTAIN, a town of Austria, on the river Bielach; 8 miles S. of St. Polten.

RABENSTEIN, a town of Bohemia, in the circle of Leitmeritz; 40 miles E. of Prague. N. lat. 50° . E. long. $13^{\circ} 26'$.—Also, a town of the duchy of Stiria; 11 miles N.N.W. of Gratz.—Also, a town of Bavaria, in the bishopric of Bamberg; 2 miles S. of Weifchenfeld.

RABIA PRIOR, in *Chronology*, is the name of the third month of the Arabic year, consisting of thirty days; and *Rabia posterior* is the name of the fourth month, consisting of twenty-nine days.

RABICH, a name given by Leo Africanus to a tree or shrub growing very plentifully in many parts of Africa, the fruit of which is much esteemed by the natives. He says that the tree rabich is prickly, and that the fruit is round, and like a cherry, but smaller, and of the taste of the jujube.

RABIEL, a name given by some authors to dragon's blood.

RABIES, in *Medicine*, that peculiar state of the nervous system, which is produced by the bite of a rabid animal, and which is commonly, but improperly, called *madness*. As the dog is the principal source of this disease, the word rabies is commonly united with the epithet *canina*. See HYDROPHOBIA.

RABINAL, in *Geography*, a town of Mexico, in the province of Vera Paz; 40 miles S.S.W. of Vera Paz.

RABINET, a name formerly given to a small piece of ordnance, between a falconet and a base. Its dimensions, &c. see under CANNON.

RABIRA, a word used by some of the chemical writers to express tin.

RABISHI, in *Geography*, a river of the island of St. Vincent, forming a bay on the eastern coast, near the southern extremity, where it runs into the sea. N. lat. $13^{\circ} 5'$. W. long. $61^{\circ} 11'$.

RABLAY, a town of France, in the department of the Mayne and Loire; 9 miles N. of Villiers.

RABLES, *Isles aux*, a cluster of small islands at the entrance of lake Superior, in Upper Canada, and at the east end of it, east of White-Fish island, and pretty close to the main land.

RABNABAD, a town of Hindoostan, in Bengal, at the mouth of the Ganges; 90 miles S.S.E. of Mahmudpour.—Also, a small island on the coast of Bengal, at the mouth of the Ganges. N. lat. 22° . E. long. $90^{\circ} 30'$.—Also, one of the mouths of the Ganges, which opens into the bay of Bengal. N. lat. 22° . E. long. $90^{\circ} 26'$.

RABNITZ, a river of Hungary, which runs into the Danube, a little below Raab.

RABOGH, a town of Arabia, in the province of Yemen, near the coast of the Red sea, where the Arabs live in huts; 105 miles S.W. of Medina.

RABOLANE, in *Ornithology*, a name given by many to the lagopus, a bird found on the snowy mountains, and called by some the white partridge.

RABRI, a name given by some authors to bole armenic.

RABUEL, CLAUDE, in *Biography*, a French Jesuit and able mathematician, was born at Pont-de-Vele, in the county of Bresse, in the year 1668. About the age of 18 he was entered into the society of Jesus, and principally distinguished himself by his proficiency in mathematical learning, of which he became the professor in Trinity college at Lyons, performing its duties with great reputation and success. He died in 1728, in the 60th year of his age. His chief work was "A Commentary on the Geometry of Descartes," which was published after his death in 1730, under the care of father l'Espinaffe. This was the first illustration of the whole of that work, which had been given to the public. The labours of Fermat, De Witt, and others, extended only to particular parts of it. Rabuel left behind him other works on algebra, the conic sections, and the geometrical loci of the differential calculus, and of the integral calculus; and he was one of the few instances of persons who, with a passion for the mathematics, had a fine taste for polite literature.

RABUTAH, in *Geography*, a town of Africa, in the kingdom of Sennar; 35 miles S.S.W. of Sennar.

RABUTIN, FRANCIS DE, in *Biography*, who flourished in the sixteenth century, was of an ancient and noble family in Burgundy, and served in the army with the duke de Nevers, under Henry II. and Charles IX., with a high reputation for valour and fidelity. He was living in 1581, but nothing is known of him beyond that period. He was author of "Commentaires de dernières Guerres du Roi Henri II. et de l'Empereur Charles Quint," first printed in 1555; a continuation was printed afterwards, in 1558; and the whole work together in 11 books, in 1574. It contains a history of the wars in the Low Countries, from 1550 to 1558, and is said to be written in a simple style, with a great appearance of vivacity.

RABUTIN, ROGER DE, count of Buffi, a very distinguished character in the reign of Lewis XIV., was born at Epiry, in the Nivernois, in 1618. He entered very young into the army, in his father's (Léonor Baron of Buffi) regiment, of which he became colonel. After serving in a number of battles and sieges, he rose to the rank of mestre-de-camp of the light horse, and lieutenant-general of the Nivernois. He looked for still higher honours, and being disappointed, engaged in lampoons upon persons about the court, which drew upon him the king's displeasure; and in 1665, in which year he was admitted a member of the French academy, a manuscript history of the amours of two court ladies, of which he was the writer, being handed about, under the title of "Histoire Amoureuse des Gaules," a complaint was laid before his majesty, in consequence of which he was sent to the Bastille. Imprisonment had nearly proved fatal to him, and he was liberated, but was obliged to resign the office which he held under government. After this he was exiled to his country-seat, where he remained 17 years, during which he did not cease to importune the king to be allowed to return, by letters conceived in terms of abject humility and base adulation. In 1682 he was allowed to return to court, but finding himself generally neglected, he retired of his own accord to his estates. He died at Autun in 1693, at the age of 75. He was author of several works, among which were "Discours a ses Enfants, sur le bon Usage des Adversités;" "Memoires," published first at Paris in two, and afterwards at Amsterdam in three volumes, 4to.; "Lettres," 7 vols. 12mo.; and "Histoire Abregée de Louis le Grand." His son the abbé de Buffi became bishop of Luçon in 1723, and was a learned and ingenious member of the French academy.

The sister of the bishop, a nun, published an abridgment of the life of Madame de Chantal, and of the life of St. Francis de Sales.

RABY, in *Geography*, a small township of America, in New Hampshire, in Hillsborough county; about 65 miles W. by S. of Portsmouth; incorporated in 1790. Its name has been since changed.—Also, a town of Bohemia, in the circle of Prachatitz, containing a citadel, at the siege of which, Zilca, general of the Hussites, lost his only remaining eye; 4 miles S. of Horazdiowitz.—Also, a town of Sweden, in Sudermanland; 7 miles N. of Nyköping.

RACA, or RACHA, a Syriac term, found in the Gospel of St. Matthew, chap. v. 22. and preserved in most translations.

Father Simon observes, that the Greek translator of St. Matthew's Gospel retained the Syriac raca, which he found in the original, because it was very common among the Jews. And St. Jerom, Luther, the English translators, those of Geneva, Louvain, Port-royal, &c. still preserve it in their respective languages.

F. Bouhours chooses rather to express the sense of it in a sort of paraphrase, thus: he that says to his brother, *homme de peu de sens, man of little understanding*, shall deserve to be condemned by the tribunal of the council, &c.

Most translators, except the English, and F. Simon, for raca write racha; but the former orthography seems the best founded; all the Latin copies having raca, and all the Greek ones *ρακα*, or, with Hesychius, *ρακαα*, which is the same; all, we mean, but St. Irenæus, and Beza's copy, now at Cambridge, which have *ρακα*. In effect, the origin of the word shews it should be raca; as coming from the Syriac *רַקָּה*, raca, of the Hebrew *רק*, *רק*, empty, *shallow*.

RACAISSONE, in *Geography*, a town of Hindoostan, in Aurungabad; 30 miles S. of Aurungabad.

RACAM, a town of New Mexico, in the province of Hiaqui; 60 miles S.W. of Riochico.

RACAN, HONORAT DE BUEIL, *Marquis of*, in *Biography*, a French poet, was born in 1589, of a noble family, in Touraine. When very young, he had a place in the king's bed-chamber, under the duke of Bellegarde. From Malherbe, who was at that time domesticated with the duke, he acquired a fondness for poetry, and obtained instructions in the art of versifying. He at first bore arms, as a profession; but after a time he devoted himself to a life of leisure. He was one of the earliest members of the French academy, and though almost wholly without the advantages of education, he obtained reputation as a writer. His most popular work was entitled "Bergeries." He composed in various styles, and wrote translations of Psalms, and many sacred odes taken from the Psalms, and other scriptural poems. In prose he published "The Life of Malherbe;" "A Discourse pronounced before the Academy;" and some "Letters." He died in 1670, at the age of 81. Of his works a new edition was given at Paris, in 1724, in 2 vols. 12mo.

RACCA, RACAH, *Rika*, or *Racka-Rica*, in *Geography*, a town of the Persian empire, in the province of Diarbekir, and pashalic of Orfu, the capital of the district named Diar Modzar. It is situated on the eastern bank of the river Euphrates, at the mouth of a small river named Beles, (the ancient Billicha,) and was founded, according to Pliny, by Alexander the Great. It was first called Nicephorium, and afterwards Callinicum and Leontopolis, from Seleucus Callinicus and the Greek emperor Leo. It was the favourite residence of Haroun al Raschid, the ruins

ruins of whose palace, it is said, are still visible. The position of Racca, in the parallel of 36° N., was ascertained by the celebrated oriental astronomer Mahomed Ben Jaber, surnamed Al Batani, who passed many years of his life at this place. The town and adjoining country are inhabited by different tribes of wandering Arabs. N. lat. $36^{\circ} 1'$. E. long. $38^{\circ} 50'$.

RACCAN, a river on the north coast of Sumatra, which runs into the sea, N. lat. $2^{\circ} 30'$. E. long. $100^{\circ} 15'$.

RACCANATTO, a river of Naples, which runs into the gulf of Tarento, N. lat. $39^{\circ} 47'$. E. long. $16^{\circ} 42'$.

RACCOON, in *Zoology*. See RACKOON.

RACCOON, in *Geography*, an island in the Atlantic, near the coast of South Carolina, nine miles long and one wide. N. lat. $33^{\circ} 3'$. W. long. $79^{\circ} 22'$.

RACCOON Creek, a river of Pennsylvania, which runs into the Ohio, N. lat. $40^{\circ} 38'$. W. long. $80^{\circ} 25'$.

RACCOON Island, a small island in Ossabaw sound, belonging to the state of Georgia. N. lat. $31^{\circ} 47'$. W. long. $81^{\circ} 12'$.

RACCOON Key, a small island or rock in the gulf of Mexico, near the fourth coast of West Florida. N. lat. $29^{\circ} 46'$. W. long. $89^{\circ} 21'$.

RACCOON Keys, a cluster of small islands near the coast of South Carolina. N. lat. $24^{\circ} 8'$. W. long. $79^{\circ} 15'$.

RACCOURCY, in *Heraldry*, signifies the same as *coupe*, that is, *cut off*, or *shortened*; and denotes a cross, or other ordinary, when it does not extend to the edges of the escutcheon, as they always do when absolutely named, without such distinction.

RACE, in general, signifies running with others, in order to obtain a prize, either on foot, or by riding on horseback, in chariots, &c.

Racing was one of the exercises among the ancient Grecian games, which was performed in a course, containing one hundred and twenty-five paces; and those who contended in these foot-races were frequently clothed in armour. For a particular account of these races, see STADIUM.

There were properly but two kinds of horse-races at Olympia, namely, the *chariot-race*, introduced into those games in the 25th olympiad (for an account of which see CHARIOT), and the race of riding-horses, which was not admitted till the 33d. Although chariots were in use before riding-horses, as we may conclude from the testimony of Homer, among all whose heroes, Greek and Trojan, no one makes his appearance on horseback, except Diomedes and Ulysses mounted upon the horses of Rhesus (Il. x.), it is nevertheless plain, from this instance, that neither the heroes nor the horses were utter strangers to the art of riding; and it is also evident, from another passage in the 15th Iliad, that horsemanship was carried even to some degree of perfection, at least in the time of that poet, who lived but in the next generation after the siege of Troy, according to sir Isaac Newton. This passage, extracted from Pope's Homer (Il. xv. v. 822.) is as follows:

“ So when a horseman from the wat'ry mead
(Skill'd in the manage of the bounding steed)
Drives four fair couriers, practis'd to obey,
To some great city, thro' the public way:
Safe in his art, as side by side they run,
He shifts his feat, and vaults from one to one:
And now to this, and now to that he flies:
Admiring numbers follow with their eyes.”

Some authors (see Rollin's Anc. Hist. tom. v. p. 72. ed. Amst.) have introduced an exercise like this into the

Olympic games, though Mr. West professes himself dissatisfied with the authority upon which they depend: and says that in the books which he has consulted, he can find no mention of any other race of riding-horses, besides those of the *Celes* and the *Calpe*. As to that particular branch of horsemanship, above described, Eustathius, in his comment upon Homer, tells us, that in the old scholia it is written, that Demetrius says he had seen a man, vaulting in the manner described by the poet, from the back of one horse to another, holding the bridles at the same time, and keeping the horses to their speed, without any interruption or incumbrance. This assertion implies that such a sight was very uncommon, and consequently that no such exercise could ever have been admitted into any of the games of Greece. The word *Κελύζω*, used by the poet in the beginning of this simile, says Mr. West, may possibly have induced some people to imagine, that the riders of the horses called *Κελύζες*, *celetes*, were accustomed to leap from one horse to another, as if that word was a term of the manege, of which the verses that follow were merely an explanation. It is certain, however, from a passage in the *Odyssey* (E. v. 371.) that by *ἵππος Κέλης*, Homer meant to signify no more than a riding-horse, and consequently that by the word *Κελύζω*, which is derived from *Κέλης*, no more is to be understood in this place than simply to ride. This interpretation of *Κέλης*, *celes*, may be farther confirmed by the authorities of Pindar and Pausanias, and particularly by a story related by the last mentioned author (lib. vi. c. 13.) of a mare, named Aura, belonging to one Phidolas, a Corinthian. This mare, says the historian, having accidentally thrown her rider soon after she had started from the barrier, continued the race of her own accord, and turned round the pillar as if the rider had been still upon her back; upon hearing the trumpet, she mended her pace, till coming in before her antagonists, she stopped short over-against the judges of the games, as conscious of having gained the victory. The victory was accordingly adjudged to her master Phidolas, who, by erecting in return a statue to her honour, intimated to whom the merit of that victory was due. In this story, there is no mention of any other horse or mare, that shared the victory with Aura, and consequently that, in the race called *Celes*, each competitor made use of but one single horse. Moreover, the victorious Aura was of the feminine gender, and hence we may infer, that in all the races, as well of riding horses as of chariots, mares or horses were indifferently used; excepting in the race named *Calpe*, in which mares only were employed. And further it appears, that though the rider was thrown off in the very beginning of the race, yet the crown was awarded to Phidolas, the master of Aura; to whom certainly no less was due, than if his mare had conquered under the conduct and discretion of her rider. It appears also, by the circumstance of Aura's mending her pace upon hearing the trumpet, that the trumpet either did not sound during the whole race, but at the last round only, or that it sounded differently in different periods of the course. There was, however, a meaning in the sound of the trumpet, which Aura, probably an old stager, understood.

The race of full-aged riding-horses was instituted in the 33d olympiad, and that of the *Παλός Κέλης*, or under-aged riding-horses, in the 131st. It is a well-known fact that chariots were used in war above 1000 years before cavalry was introduced among the ancients. They seem to have had a terrible notion of being mounted upon the back of a horse, and have accordingly made monsters of those whom they first beheld in that attitude, to which they were not very speedily reconciled. Their amazement gradually diminished: and their intercourse with other nations not only

rendered riding-horses familiar to them, but convinced them likewise of the advantages accruing from the use of cavalry. Hence it came to pass, that an order of equites, or horsemen, was instituted in most of their commonwealths; to whom, as in Athens, was allotted the second rank in the state. Upon the same principle, perhaps, the ἵππος κελύς, or riding-horse, was admitted into the Olympic hippodrome, and held in such estimation, that although the race of riding-horses was neither so magnificent nor so expensive, and consequently not so royal, as the chariot-race, yet we find, among the competitors in this exercise, the names of Philip, king of Macedon, and Hiero, king of Syracuse. To the latter is inscribed the first Olympic ode of Pindar, in which honourable mention is made of the horse Pherenicus, whose fleetness gained for his master the Olympic crown. The race of the Calpé was performed by mares. (See CALPÉ.) The length of this race, and also that of the Celes, are not ascertained; but it is reasonable to suppose, that the latter, distinguished, as we have already observed, into two classes, one of full-aged, and the other of under-aged horses, consisted of the same number of rounds as those of the chariots, distinguished in like manner into two classes. Mr. West has not been able to determine the different ages that ranked the horses in one or the other class; nor whether the weight of the riders, or the sizes of the horses, were taken into consideration. These points seem to have been left to the discretion of the Hellanodicks, who were appointed to examine the young horses that were entered to run for any of the equestrian crowns (Paus. l. iv. c. 24.), and who were sworn before the statue of Jupiter Horcius, to give a true and impartial judgment upon the matters left to their examination, without taking any reward; and not to discover the reasons which disposed them to reject some, and admit others. West's Dissertation on the Olympic Games. Sect. 14. See HIPPODROME.

RACE, in *Genealogy*, a lineage, or extraction, continued from father to son.

The word is French, formed from the Latin *radix*, root; as intimating the root of the genealogical tree.

In several orders of knighthood, as in that of Malta, &c. the candidates must prove a nobility of four races or descents.

In some republics the magistrates are to prove themselves of plebeian race, to be qualified.

The French reckon their kings by races; as, the first race, the second race, the third race. We also say the race of the Ottomans, the Arfacidæ, the Ptolemies, &c.

RACE, in *Natural History*. See CIBDELOPLACIA.

RACE, the mark made on timber, &c. by a tool called a racing-knife.

RACE, *Cape*, in *Geography*, a cape on the S.E. coast of Newfoundland. N. lat. 46° 40'. W. long. 53° 3' 30".

RACE Point, a cape on the coast of America, W. of cape Cod. N. lat. 42° 4'. W. long. 78° 12'.

RACEME, in *Gardening*, the long mode of cluster-flowering and fruiting which takes place in some sorts of plants and fruit-trees, as in the grape vine, and the different kinds of currants. See RACEMUS.

RACEMIFEROUS, in *Botany*, denotes bearing in clusters.

RACEMUS, in *Botany* and *Vegetable Physiology*, a cluster, is a mode of inflorescence, in which several flowers, each supported on its own proper stalk, are connected by one common stalk, either simple or compound. A bunch of Currants is a simple racemus; the inflorescence of the Woody Nightshade, *Solanum Dulcamara*, is a compound one. In the American plant called *Abies racemosa*, the clusters are

simple, but aggregate. A racemus differs from a spica, or spike, in having a partial stalk, as above described, to each flower; it is moreover generally understood to be drooping or pendulous, and to have the flowers expand all nearly at one time. On the contrary, a spike is most frequently erect; the flowers open in very gradual succession, inasmuch that the lowermost may have partly perfected their seeds, before the uppermost expand; and especially, they are individually fertile, at least at the time of their expansion. To these characters may be added, that a spike is crowded or dense; a cluster lax or scattered. It must be allowed that botanists, even of the first rank, are incorrect in the application of these terms. The male inflorescence of *Quercus*, the Oak genus, because drooping and loosely disposed, with all the flowers in perfection nearly at the same time, is termed a racemus; though it possesses the most essential character of a spica, fertile flowers. On the other hand, *Veronica spicata*, having a dense upright series of flowers, expanding gradually, is said to be spiked, though each separate flower has a partial stalk. A little latitude must necessarily be allowed, though it is very desirable that botanists should be more exact in the use of these and other terms, than they sometimes are. See SPICA and INFLORESCENCE.

RACER, in *Gardening*, a name applied to a sort of sward-cutter, or cutting implement, used in racing out or cutting through the surface of grass sward, and dividing it into proper widths, lengths, and thickness, for turf intended to be cut up for laying in pleasure-grounds, or other places, and always necessary preparatory to the work of flaying or cutting up the turf with the turfing-iron. It is also useful for cutting and straightening the edges of grass verges in such grounds, as well as for many other purposes.

It is a tool which is very simple in its construction, merely consisting of a strong wooden handle, about four feet long, having the cutter fixed at the lower end, in the form of a half moon, with the edge downward, to cut into the sward; the handle should be about an inch and a half thick, growing gradually thicker towards the lower end.

In using the tool, it is pushed forward so as to cut or race out the sward in an expeditious manner. And in cutting turfs with it, it is necessary first to mark out on the sward the width of the turf intended, which should generally be a foot wide, and a yard long, and about an inch or inch and a half deep; then strain a line tight, first lengthways, striking the racer into the sward close to the line, running it along expeditiously, so as to cut its way, and divide the sward to a proper depth, afterwards placing a line a foot farther, and racing it out as before, and so on, to as many widths as may be wanted; and then, with the line placed cross-ways, to race out the sward accordingly in yard lengths. The sward being thus raced out, the turf-cutter with the turfing-iron should proceed to cut them up and flay them off from the ground. This small implement is likewise very convenient for many other little purposes about pleasure grounds and gardens, as those of cutting the edges of the verges which are laid with turf, and straightening the edges of the borders in different parts. See TURF.

RACHA. See RACA.

RACHA, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; 8 miles E. of Leitmeritz.

RACHELSDORF, a town of Bavaria, in the bishopric of Bamberg; 15 miles N. of Bamberg.

RACHETUM, from the Fr. *racheter*, *redimere*, the compensation or redemption of a thief.

RACHIA,

RACHIA, in *Geography*, a town of Itria; 7 miles N.E. of Pedena.

RACHIALGIA, in *Medicine*, a term given by Astruc, and adopted by the nosologists, to denote certain colicky pains in the bowels, which were supposed to originate from the nerves of the spine, and especially the colic from the poison of lead, or COLICA *Pistonum*; which see. The word is from $\rho\alpha\chi\iota\varsigma$, the spine, and $\alpha\lambda\gamma\iota\alpha$, pain. See Sauvages Nosol. Meth. class vii. gen. 29.

RACHIS, or rather *Rachis*, in *Botany*, from $\rho\alpha\chi\iota\varsigma$, the back-bone, is the common stalk, or receptacle, of the florets, in the spikelets of grasses; or of the spikelets themselves in *Lolium*, *Triticum*, *Secale*, *Hordeum*, *Rottböllia*, &c. The same term is applied to the rib, or leaf-stalk, of ferns, which is often winged or bordered. The *Rachis* in both these instances is frequently jointed; by which in the former, the ripe seeds of such grasses, wrapped up in their hulks, are the more readily dispersed. The part in question being in some cases smooth, in others variously hairy or bearded, affords excellent specific distinctions; witness the genus *Avena*.

RACHISAGRA, a term used by some physicians for the gout in the spine of the back.

RACHITIS, in *Medicine*, from $\rho\alpha\chi\iota\varsigma$, the spine, (because the spinal marrow was supposed to be the seat of the disease,) a malady corruptly termed in English the *Rickets*; which see.

RACH-KOKE, in *Geography*, one of the Kurilskoi or Kurilly islands in the Eastern or Pacific ocean: distant from Musfy, another of the said islands, about 120 versts. Its length is about 20 versts, and its breadth the same, and it presents the appearance of a solitary mountain rising upwards from the sea. It was formerly covered with verdure, with shelves of rocks, where sea-fowl in great number made their nests: but these rocky shelves have been demolished by the eruption of subterraneous fires, which split the summit of the mountain, throwing up vast quantities of stones and ashes; and since that time, the island has always continued burning. At this eruption those places on the shore where formerly they had thirteen fathom water, were filled up with rubbish and ashes into shoals and banks.

RACHLIN, in *Ancient Geography*, the *Ricina* of Ptolemy, near the N.E. coast of Ireland, memorable as the retreat of Robert I. of Scotland.

RACHOL, in *Geography*, a town of Hindoostan, in Soonda; 16 miles S.S.E. of Goa.

RACHORE, a district or province of Hindoostan, in Golconda, bounded on the N. by the Kistnah, on the E. by Canoul, on the S. by Adoni, and on the W. by Sanore.—Also, a town of Hindoostan, and capital of the above-mentioned province, on the S. side of the Kistnah, and not far above the conflux of the Toombuddra with it, and below that of the Beemah; belonging to the Nizam. It is four days' journey from Adoni, reckoning a day's journey at 22 British miles in road distance, and 17 or 18 geographical miles; 91 miles S.W. of Hydrabad. N. lat. $16^{\circ} 24'$. E. long. $78^{\circ} 2'$.

RACHOSIS, from $\rho\alpha\chi\omega\varsigma$, *lacero*, a disease, in which the scrotum is relaxed and excoriated.

RACHOUR, in *Geography*, a town of Hindoostan, in the circar of Gurry Mundella; 20 miles S.S.W. of Gurrah.

RACHOURE, a town of Hindoostan, in Myfore; 20 miles S. of Gurramconda.

RACHOW, a town of Poland; 36 miles S.S.W. of Lublin.

RACINE, JOHN, in *Biography*, an eminent French poet,

was born in 1639. He was educated at the convent of Port-Royal, near Paris; after this he went through a course of philosophy at the college of Harcourt, and then made his appearance before the public in an ode on the king's marriage. This effort was, through the interest of Colbert, rewarded with a present and a small pension. Elated with the success that crowned his first effort, he determined to follow poetry as a profession; and, rejecting the offer of an uncle, a prior, who offered to resign his benefice to him, provided he would enter into holy orders, he fixed his residence at Paris. In 1664 he brought upon the stage his first tragedy, entitled "La Thebaïde ou les Frères ennemis." It was written in the manner of Corneille, which he soon after quitted for one of his own; a judicious change, says a critic, since the characteristics of these two masters of the French drama were extremely different. He next published his "Alexandre," which was followed by his "Andromaque." About this time he was presented to the priory of Epinay, but not being in orders, he was, after a law-suit, obliged to quit. His "Andromaque," which established his character as a tragedian, was soon followed by the comedy "Les Plaideurs," which, though it obtained for him the praise of Moliere, and was well received at court, was his only attempt in that walk. Between the years 1670 and 1678, he published his "Britannicus," "Berenice," "Bajazet," "Mithridate," "Ephigene," and "Phædre." His popularity and well-earned reputation excited a strong party against him: the chagrin which he underwent from the artifices of his enemies, and the over-sensibility to criticism, which led him to confess, in the confidence of friendship, that the worst critique made upon his works caused him more uneasiness than the greatest plaudits had given him pleasure, inspired him with the resolution of renouncing poetry and turning Carthusian. He was, however, persuaded to change his plan, and to marry: he accordingly formed an alliance with the daughter of a gentleman in the treasury of Amiens, by whom he had several children. At the same time he ceased to write for the stage, and thereby reconciled himself with his old friends of the Port-Royal. Racine now became a courtier, and obtained the situation of gentleman in ordinary to the king, to whom he made himself very useful. He was also appointed to the office of historiographer-royal, in conjunction with his friend Boileau, which they made a complete sinecure. He was prevailed upon by madame Maintenon to write a dramatic piece on a scriptural subject, for the ladies of her foundation of St. Cyr, and his "Ether" was performed by them in 1689, with great applause, in the presence of the whole court. He followed it with "Athalie," acted by the same ladies in 1691. Madame Maintenon, deeply affected by the miseries of the people in the latter years of Lewis's reign, engaged Racine to draw up a memoir on the subject. This he did in so free a manner, as to give great offence to the king, who happened to obtain a sight of it from a lady to whom it had been lent. Racine was excluded from the court, a circumstance that so preyed upon his mind, that he fell into a state of melancholy, of which he died in 1699, at the age of 60. For a character of this writer we shall be indebted chiefly to the General Biography. He was polite in his manners, with the affected softness of a courtier, which was, however, a mask to his actual disposition, for, in reality, he had much gall and spleen in his character. Religion, however, corrected, in a good measure, these defects, and in all the relations of domestic life he was exemplary. As a dramatic writer he is supposed to have ranked with Corneille, though in many points he even surpassed him. His characteristics are tender-

ness, elegance, correctness, good taste, refined sentiments, and the art of verifying in a supreme degree, so that his countrymen find a charm in his lines, which distinguishes them from other French poetry. The criticisms of Boileau contributed much to his excellence in this particular, and he is said to have taught him, as a great secret, to write the second line of a couplet first. With respect to the proper dramatic merit, Racine must be judged by those who are formed to the French school, and are not readily wearied with long speeches, rather descriptive of feeling than expressing it, and all refinements of the tender passion, often applied to characters, to which it is historically unsuitable. Many parts of his best pieces, however, prove that his mind was well furnished with elevated and dignified sentiments, which he probably derived from an assiduous study of the ancients. Besides his dramatic works, Racine was author of "Cantiques," replete with the unctious of tender devotion; "L'Histoire de Port-Royal;" "Idylle sur la Paix;" "Epigrams;" Letters;" and some "Opuscules." He was member of the French academy from 1673, and as director of that institution he pronounced the eulogy of Corneille. The best edition of his works is in seven vols. 8vo. 1768.

RACINE, LOUIS, son of the preceding, also a distinguished poet, was born at Paris in 1692. He was, however, not more distinguished for his poetry than for his piety, and adopted the ecclesiastical habit. In a state of retirement, in 1720, he published his poem "On Grace." The chancellor d'Augéseau, during his own exile at Fresnes, brought Racine again into the world, and cardinal Fleury afterwards gave him a place in the finances. He married, and lived very happily in his family, till the loss of an only son threw him into a deep melancholy. His religious sentiments took full possession of his soul, the fervour of which may be estimated by the line from Tibullus which he inscribed on the crucifix which ever accompanied him:

"Te spectem suprema mihi cum venerit hora,
Te teneam moriens deficiente manu."

He died in 1763, at the age of 71. His poetical writings are "Poems on Religion and Grace;" "Odes," of which the diction is splendid, and the sentiments elevated; "Epistles," and a "Translation of Milton's Paradise Lost." In prose he wrote "Reflexions sur la Poésie;" "Memoires sur la Vie de Jean Racine;" "Remarques sur les Tragedies de J. Racine:" besides these he contributed several dissertations to the Memoires of the Academy of Inscriptions, of which he was a member. His works were collected and published in 6 vols. 12mo.

RACINE, BONAVENTURE, a learned French priest and ecclesiastical historian, was born at Chauny, in the diocese of Noyon, in the year 1708. He received an excellent education at the Mazarin college at Paris, where he not only studied the ancient languages, but entered pretty fully into the different branches of philosophy, divinity, and the studies connected with ecclesiastical history. At the age of twenty-one he was entrusted by the archbishop of Alby, as a fit person, to re-establish the college of Rabastens, a town in his diocese. To this design he devoted his talents with unwearied zeal and assiduity, and was abundantly compensated by the success which attended his labours. The institution was, in a short time, crowded with students, who imbibed from his lectures a taste for science and literature. Thus usefully engaged, he became an object of the jealousy of the witty Jesuits, who caused him to be banished from Rabastens. He retired to Montpellier, where M. Colbert engaged him to undertake the direction of the college of Lunel: from this place he was also driven by the same per-

secutors, and he found it necessary to withdraw secretly to Paris, where he was invited to undertake the education of certain young persons at the college of Harcourt, in connection with some other ecclesiastics. Here his old enemies the Jesuits pursued him, and an order was obtained from cardinal Fleury, in 1734, to deprive him of his office of tutor. In the following year M. de Caylus, bishop of Auxerre, nominated him to a canonry in his cathedral, and ordained him priest; but his new dignity produced no alteration in his manner of living, nor in the distribution of his time, which was almost wholly spent in devotion and study. From this time he set about preparing to publish the collections that he had made in ecclesiastical history, and in 1748 he sent into the world the first volumes of an "Abridgment of Universal History, containing the principal Events in every Century, with Reflections," in 12mo. These were followed by others, to the number of thirteen, the last making its appearance in the year 1754. This work, written in a neat, perspicuous, and simple style, was well received, and became extremely popular. The labour which it cost him his weak constitution was unable to sustain; he sunk under his exertions in the 47th year of his age. He was characterized by the excellence of his manners and the amiableness of his temper, and he had an ardent zeal for what he regarded as truth, which approached to enthusiasm. Two other volumes have been added since his death to the History, but they are the work of an inferior hand, and unworthy of being placed in conjunction with those of Racine. Moreri.

RACING, the riding of heats for a plate or other premium. Horses for this use should be as light as possible, large, long, and well-shaped, nervous, of great mettle, and good wind, with small legs, and neat small-shaped feet.

The first thing to be considered in this sort of gaming is the choice of a rider; for it is not only necessary that he should be very expert and able, but he must also be very honest.

He must have a very close seat, his knees being turned close to the saddle skirts, and held firmly there, and the toes turned inwards, so that the spurs may be turned outward to the horse's belly; his left hand governing the horse's mouth, and his right the whip. During the whole time of the race, he must take care to sit firm in the saddle, without waving or standing up in the stirrups. Some jockies fancy this is a becoming seat, but it is certain, that all motions of this kind do really incommode the horse. In spurring the horse, it is not to be done by sticking the calves of the legs close to the horse's sides, as if it were intended to press the wind out of his body; but, on the contrary, the toes are to be turned a little outwards, that the heels being brought in, the spurs may just be brought to touch the sides. A sharp touch of this kind will be of more service toward the quickening of a horse's pace, and will sooner draw blood than one of the common coarse kicks. The expert jockey will never spur his horse until there is great occasion, and then he will avoid striking him under the fore-bowels between the shoulders and the girth; this is the tenderest part of a horse, and a touch there is to be reserved for the greatest extremity.

As to whipping the horse, it ought always to be done over the shoulder, on the near side, except in very hard running, and on the point of victory; then the horse is to be struck on the flank with a strong jerk; for the skin is the most tender of all there, and most sensible of the lash.

When a horse is whipped and spurred, and is at the top of his speed; if he claps his ears in his pole, or whisks his tail, it is a proof that the jockey heats him hard, and then he ought to give him as much comfort as he can, by saw-

RACING.

ing the snaffle backwards and forwards in his mouth, and by that means forcing him to open his mouth, which will give him wind, and be of great service. If there be any high wind stirring in the time of riding, the artful jockey will let his adversary lead, holding hard behind him, till he sees an opportunity of giving a loose; yet in this case, he must keep so close behind, that the other horse may keep the wind from him; and that he, sitting low, may at once shelter himself under him, and assist the strength of the horse. If the wind happen to be in their back, a just contrary method is to be taken with it; the expert jockey is to keep directly behind the adversary that he may have all the advantage of the wind to blow his horse along, as it were, and at the same time intercept it in regard to his adversary.

When running on level carpet-ground, the jockey is to bear his horse as much as the adversary will give him leave, because the horse is naturally more inclined to spend himself on this ground: on the contrary, on deep earths he may have more liberty, as he will there spare himself.

In riding up hill the horse is always to be favoured, by bearing him hard, for fear of running him out of wind; but in running down hill, if the horse's feet and shoulders will bear it, and the rider dares venture his neck, he may have a full loose. If the horse have the heels of the rest, the jockey must always spare him a little, that he may have a reserve of strength, to make a push at the last post.

A great deal depends on the jockey's knowing the nature of the horse that is to run against him; for by managing accordingly, great advantages are to be obtained: thus, if the opposite horse is of a hot and fiery disposition, the jockey is either to run just behind him, or cheek by jowl with him, making a noise with the whip, and by that means forcing him on faster than his rider would have him, and consequently spending him so much the sooner; or else keep just before him, in such a slow gallop, that he may either over-reach, or by treading on the heels of the fore horse, endanger tumbling over.

Whatever be the ground that the adversary's horse runs worst on, the cunning jockey is to ride the most violently over; that by this means it will often happen, that in following he either stumbles or claps on the back sinews. The several corrections of the hand, the whip, and the spur, are also to be observed in the adversary, and in what manner he makes use of them: and when it is perceived, by any of the symptoms, of holding down the ears, or whisking the tail, or stretching out the nose like a pig, that the horse is almost blown, the business is to keep him on to this speed, and he will be soon thrown out, or distanced. If the horse of the opponent looks dull, it is a sign his strength fails him; and if his flanks beat much, it is a sign that his wind begins to fail him, and his strength will soon do so too.

After every heat for a plate, there must be dry straw, and dry cloths, both linen and woollen, ready to rub him down all over, after taking off the sweat with what is called a sweat-knife; that is, a piece of an old sword-blade, or some such thing. Some advise the steeping of the cloths in urine and saltpetre the day before, and letting them be dried in the sun for this occasion. After the horse has been well rubbed with these, he should be chased all over, with cloths wetted in common water, till the time of starting again. When it is certainly known that the horse is good at the bottom, and will stick at the mark, he should be rid every heat to the best of his performance; and the jockey is, as much as possible, to avoid riding at any particular horse, or staying for any, but to ride out the whole heat with the

best speed he can. If, on the contrary, he has a fiery horse to ride, and one that is hard to manage, hard-mouthed, and difficult to be held, he is to be started behind the rest of the horses with all imaginable coolness and gentleness; and when he begins to ride at some command, then the jockey is to put up to the other horses; and if they ride at their ease, and are hard held, they are to be drawn on faster; and if it be perceived that their wind begins to rake hot, and they want a sob, the business is to keep them up to that speed; and when they are all come within three quarters of a mile of the post, then is the time to push for it, and use the utmost speed in the creature's power.

When the race is over, the horse is immediately to be clothed up, and rode home; and immediately on his coming into the stable, the following drink is to be given him. Beat up the yolks of three eggs, and put them into a pint and a half of new milk made warm; let there be added to this three pennyworth of saffron, and three spoonfuls of fallad-oil, and let the whole be given with a horn. After this he is to be rubbed well down, and the saddle-place rubbed over with warm sack, and the places where the spurs have touched, with a mixture of urine and salt, and afterwards with a mixture of powder of jet and Venice turpentine; after this he should have a feed of rye-bread, then a good mash, and at some time after these as much hay and oats as he will eat. His legs, after this, should be bathed some time with a mixture of urine and saltpetre.

For the preparation of the horse before running, &c. see PLATE.

We shall here observe, that horse-races were a species of amusement known in England in very early times. Fitz-Stephen, who wrote in the days of Henry II. records the great delight which the citizens of London took in the diversion. Races appear likewise to have been in vogue in the reign of queen Elizabeth, and to have been carried to such excess as to have injured the fortunes of the nobility. Lord Herbert of Chesham (see his Life by Mr. Walpole, p. 51.) enumerates these among the sports which he thought unworthy of a man of honour. "The exercise," says he, "I do not approve of in running of horses, there being much cheating in that kind; neither do I see why a brave man should delight in a creature whose chief use is to help him to run away." Jarvis Markham, who wrote on the management of horses in 1599, mentions running horses; but at this time there were only private matches made between gentlemen, who were their own jockies, and rode their own horses. However, in the following reign of James I., public races were established; and Garterly, in Yorkshire, Croydon, near London, and sometimes Theobald's, near Enfield-chace, where the king resided, were the courses in which they were performed. The horses at this time were prepared for running by the discipline of food, physic, airing, and sweats and clothing, which compose the present system. The weight also which each horse was to carry was rigidly adjusted; the usual weight of the riders being stated at ten stones, who were put into scales, and weighed before they started. Most of the celebrated races in the kingdom were called bell-courses, the prize and reward of the conquering horses being a bell. To this purpose, Camden says, that in 1607 there were races near York, and the prize was a little golden bell. Upon this Berenger offers a conjecture, whether the phrase of *bearing the bell*, which implies being comparatively the best or most excellent, and corresponds with the expression of bearing the palm among the ancients, as a reward decreed to the swiftest horse in a race, is not more aptly deduced from this custom,

custom, than from the method of tying a bell round the neck of the sheep, which leads the flock, and is, therefore, counted the best.

About the latter end of the reign of Charles I. it was customary to have races performed in Hyde Park. See the Comedy of the Merry Beggars, or Jovial Crew, written in 1641, in Doddsley's Collection of Old Plays.

Racing was much encouraged by Charles II. after his restoration: he gave public rewards and prizes, and appointed races for his own amusement at Datchet Mead, when he resided at Windsor. But the most distinguished spot for these exercises was Newmarket, which was at first frequented for the purpose of hunting, and seems not to have been destined to be a horse-course till some time before the troubles of the reign of Charles I., when races were discontinued; but they were revived soon after the Restoration. The king attended in person, and established a house for his accommodation, and kept and entered horses in his own name. Instead of bells, a silver bowl or cup, of the value of a hundred guineas, was allotted for a prize; and upon this royal gift the exploits of the successful horse, and his pedigree, were generally engraved. The sum of a hundred guineas is now given in lieu of the silver bowl.

When William III. was advanced to the throne, he not only added to the plates given to different places in the kingdom, but founded an academy for riding. Queen Anne continued the bounty of her predecessors, with the addition of several plates. George I., towards the end of his reign, discontinued the plates, and gave the sum of a hundred guineas in their room.

In the thirteenth year of George II. an act was passed for the suppression of races by ponies, and other small and weak horses, by which all matches for any prize under the value of 50*l.* are prohibited, under a penalty of 200*l.*, to be paid by the owner of each horse running, and 100*l.* by such as advertise the plate; and by which each horse entered to run, if five years old, is obliged to carry ten stone; if six, eleven; and if seven, twelve. It is also ordained, that no person shall run any horse at a course, unless it be his own, nor enter more than one horse for the same plate, upon pain of forfeiting the horses: and also every horse-race must be begun and ended in the same day. Horses may run for the value of 50*l.* with any weight, and at any place. 13 Geo. II. cap. 19. 18 Geo. II. cap. 34. Pennant's Brit. Zool. vol. i. p. 6, &c. Berenger's Hist. and Art of Horsemanship, vol. i. p. 185, &c.

We shall here add, that at Newmarket there are two courses, the long and the round: the first is exactly four miles, and about three hundred and eighty yards, *i. e.* seven thousand four hundred and twenty yards. The second is six thousand six hundred and forty yards. Childers, the swiftest horse ever known, has run the first course in seven minutes and a half, and the second in six minutes forty seconds; which is at the rate of more than forty-nine feet in a second. But all other horses take up at least seven minutes and fifty seconds in completing the first and longest course, and seven minutes only in the shortest, which is at the rate of more than forty-seven feet in a second, and it is commonly supposed that these courses cover, at every bound, a space of ground in length about twenty-four English feet.

RACITZA, in *Geography*, a town of Bukovina; 7 miles N. of Czernaucii.

RACK, a small island near the coast of Virginia. N. lat. 37° 19'. W. long. 75° 51'.

RACK, *Lower and Upper*, two small islands near the coast

of Virginia; the former in N. lat. 37° 20'. W. long. 75° 50', and the latter in N. lat. 37° 26'. W. long. 75° 45'.

RACK, an engine of torture furnished with cords, &c. for extorting confession from criminals.

The duke of Exeter, constable of the Tower under Henry VI., with the duke of Suffolk, and others, having a design to introduce the civil law into England; for a beginning, the *rack*, or *brake*, allowed in many cases by the civil law, was first brought to the Tower, where it is still preserved; in those days the rack was called the duke of Exeter's daughter. 3 Inst. 35.

It was occasionally used as an engine of state, not of law, more than once in the reign of queen Elizabeth. (Barr. 92. 496.) But when, upon the assassination of Villiers, duke of Buckingham, by Felton, it was proposed in the privy-council to put the assassin to the rack, in order to discover his accomplices; the judges being consulted, declared unanimously, to their own honour, and the honour of the English law, that no such proceeding was allowable by the laws of England. The uncertainty of this punishment, as a test and criterion of truth, was long ago very elegantly pointed out by Tully (pro Sulla, 28.); though he lived in a state in which it was usual to torture slaves, in order to furnish evidence. "Tamen," says he, "illa tormenta gubernat dolor, moderatur natura cunisque tum animi tum corporis, regit quefitor, flecit libido, corruptit spes, infirmat metus; ut in tot rerum angustiis nihil veritati loci relinquatur."

The marquis Beccaria (ch. 16.), in an exquisite piece of raiillery, has proposed this problem, with a gravity and precision that are truly mathematical: "the force of the muscles, and the sensibility of the nerves of an innocent person being given, it is required to find the degree of pain necessary to make him confess himself guilty of a given crime."

RACK, in the *Manege*, a pace in which a horse neither trots nor ambles, but shuffles, as it were, between both.

The racking pace is much the same as the *amble* (which see); only that it is a swifter time, and a shorter tread.

RACK is also a wooden frame, made to hold hay or fodder for cattle. There has lately been much improvement made in the forming of all sorts of racks, both for the stable, cattle-sheds, and field. See *CATTLE-sheds*, *STABLE*, and *SHEEP-house*.

RACK, in *Rigging*, a short thin plank, with holes made through it, containing a number of belaying-pins, used instead of cleats; it is seized to the shrouds, and nailed over the bowsprit or windlafs.—Also, a long shell, containing a number of sheaves, formerly fixed over the bowsprit to lead in the running rigging. At present, wooden saddles, with holes in them, are nailed on the bowsprit for this purpose, being more out of the way, and less liable to be out of order. See *SHOT-rack*, and *SHROUD-rack*.

To RACK Wines, &c. is to draw them from off their lees, after their having stood long enough to clear and settle. Hence,

RACK-*Vintage*, is frequently used for the second voyage our wine-merchants used to make into France for racked wines; whence they used to return about the end of December.

RACK-*Holders*, such tenants as hold their lands under such leases.

RACK-*Leases*, are such sorts of leases as are granted for one or more lives, at the full rack rents, as in Cornwall, and some other counties. See *LEASES of Land*.

RACK-*Rent*, is the full yearly value of land let by lease, payable by tenant for life or years, &c. See *RENT*.

RACK-

RACK, *Sheep*, a sort of long narrow crib, fixed upon wheels, for containing hay for sheep, having a lid or covering on the top. It is very useful in bad weather, in the winter season, as preventing the hay from being wasted, and admitting the sheep to feed conveniently.

RACKAMA, in *Geography*, a lake of Syria, south of Hella and the ancient Babylon, is about 30 miles long, and flows into the Euphrates.

RACKEBY, a town of Sweden, in West Gothland; 40 miles N.E. of Uddevalla.

RACKET, a kind of bat for striking the ball at tennis; consisting usually of a lattice, or net-work, of cat-gut, strained very tight over a circle of wood, with a handle or shaft of a moderate length.

The word is formed from the French *raquette*, which Menage derives from the Latin *retetta*, a diminutive of *rete*, net; whence also *reticum*, and *reticulum*.

Pafquier observes, that anciently they used no rackets at tennis, but played with the palm of the hand: and hence he conjectures it is that the French call tennis play, *jeu de paume*. He adds, that rackets were not introduced till a little before his time.

RACKET is also a machine which the savages of Canada bind to their feet, to enable them to walk more commodiously over the snow; made much in the manner of a tennis-racket.

Its figure is a lozenge, of which the two obtuse angles are rounded off. It is bound about with very fine thongs of leather, and the meshes of it are much smaller and closer than those of our rackets.

In the middle is fitted a kind of shoe, lined with wool, or hair; to be tied on to the ankle: by which means the feet are prevented from sinking in the snow. Rackets oblige the person to take very long steps, and, as we say, to walk a great pace, to keep them from knocking against each other.

RACKET, in *Geography*, a river of New York, which runs into the St. Lawrence, N. lat. 45° 13'. W. long. 74° 42'.

RACKIBIRN, the name of a small island on the N.W. coast of Ireland, situated near Tiellen head, in the county of Donegal. N. lat. 54° 39'. W. long. 8° 44'.

RACKING, in *Sea Language*, denotes the fastening of two opposite parts of a tackle together, so as that any weighty body suspended by it shall not fall down, although the rope, which forms the tackle, should be loosened by accident or neglect. This expedient is chiefly practised when the boats are hung up to the ship's side in the night, in an open road or bay, lest the rope of the tackle should be untied by the inattention of some of the crew, by which accident the boat might be considerably damaged, and probably lost or dashed to pieces. Falconer.

RACKING Fruit Liquor, the operations of fining and drawing it off. See **CYDER**.

RACKLIA, in *Geography*, a small rocky island in the Grecian Archipelago, inhabited by two or three poor monks, who take care of a few sheep and goats. N. lat. 36° 53'. E. long. 25° 38'.

RACKNITZ, a town of the duchy of Carinthia; 3 miles S. of Saxenburg.

RACKOON, or **RACCOON**, the *urus lotor* of Linnæus, in *Zoology*, the name by which we commonly know an American animal, called *coati* by the Brasilians. It is something smaller than the beaver, and is of the shape of the beaver in the body, and its legs are as short as in that creature. The face, cheeks, and chin are white; the upper

part of the body is covered with hair, long, soft, and thick; black at the ends, whitish in the middle, and ash-coloured at the root. Sometimes from this mixture of colour the back appears plainly grey; and Maregrave mentions another species, which is of a deep yellow or ochre colour.

The head is very like that of the fox in shape; but that the ears are shorter, roundish, and naked, and it has from the forehead to the nose a dusky line. The eyes are large, and surrounded with two broad patches of black; the nose is black and sharp-pointed; its tail is very bushy, and annulated with black. Its feet are each divided into five slender toes; by the help of which it climbs trees as expertly as a monkey, and uses the fore-feet as hands, to reach up its food to its mouth. It is a very cleanly animal; and if there be water near, it always washes its food, be it what it will, before it eats it. It feeds on vegetables, but is also very fond of eggs, and will even seize birds if it can catch them. It is also very fond of sweet things and strong liquors, and will get excessively drunk: at low-water it feeds much on oysters, watching their opening, and with its paw snatching out the fish, and is sometimes caught in the shell. It is very common in the warm and temperate parts of America, in the mountains of Jamaica, and in the isles of Maria in the South sea, and is a creature easily tamed. It is hunted for its skin; the fur, next to that of the beaver, being excellent for making hats. Ray and Pennant.

RACLER, Fr., to scrape, to rasp, or file a hard body. It is said, in derision of a bad performer on the violin, or any other instrument played with a bow, that he scrapes or rasps the strings; because, in fact, he draws a harsh and disagreeable tone from his instrument, which resembles that produced by scraping or filing a hard body. Even good players on the violin sometimes scrape a little in the *forte* parts of their performance. Suppl. to Encycl., 1st edit.

RACLERGUNGE, in *Geography*, a town of Bengal; 50 miles N.W. of Burdwan.

RACONIGI, a town of France, in the department of the Stura, containing four gates, with as many fauxbourgs, well peopled. The king of Sardinia had a palace here. The police is conducted by fifteen counsellors, from whom two syndics are chosen every four months, who act as bailiffs or mayors of the town. It has two parishes, and several religious houses. The inhabitants are industrious, and much employed in making gauzes and silk stuffs; 6 miles N. of Savigliano.

RACOPILUM, in *Botany, from *ρηκος*, a rent in a garment, or a wrinkle, and *τιδος*; a hat or cap, the name of one of Palissot de Beauvois's genera of mosses, whose veil is torn at the side. It ought to be written *Rhacopilum*.*

RACUBEA, a name of Aublet's, of which we find no explanation. See **HOMALIUM**.

RACOW, *Catechism of*, in *Ecclesiastical History*, a system of theology compiled by the most eminent Socinian doctors, and first published at Racow, or Rakow, in Poland, in the year 1609, with a dedication to our king James I. This catechism, or a translation of it, was committed to the flames in England, in the year 1653, by order of parliament. A new edition of it, corrected and enlarged, was published at Stauropolis, in 1684. The Socinians consider this catechism as the great standard of Socinianism, and an accurate summary of the doctrine of that sect. However, Mosheim observes, that it is, in reality, no more than a collection of the popular tenets of the Socinians, and by no means a just representation of the secret opinions and sentiments of their doctors. Hence he says it never obtained among them the authority of a public confession or rule of faith; and hence the doctors of that sect were authorized to correct and con-

tradict it, and to substitute another form of doctrine in its place. But to this account it has been replied, that it would have been inconsistent with the liberty, for which they argue in the preface to this catechism, to have limited their religious inquiries to this standard; and by treating it as a rule of faith, they would have violated their exprefs declarations, that they dictated to no one, and assumed no authority. *Mosh. Eccl. Hist.* See RAKOW.

RACSON-COMPON, in *Geography*, a mountain of Thibet. N. lat. $31^{\circ} 50'$. E. long. $86^{\circ} 14'$.

RADA, a town of Sweden, in Warmeland; 33 miles N. of Carlstadt.—Also, a town of Sweden, in Warmeland; 35 miles S.E. of Carlstadt.—Also, a town of Sweden, in West Gothland; 5 miles W. of Gothenburg.—Also, a river of Westphalia, which runs into the Ocker, 5 miles N.E. of Goslar.

RADANAGUR, a town of Hindoostan, in Bahar; 32 miles E. of Ramgur.

RADANT, a town of Sweden, in West Gothland; 16 miles N. of Uddevalla.

RADAR, a town of Persia, in the province of Chorasan; 48 miles N. of Meshid.

RADASALMI, a town of Sweden, in the province of Savolax; 20 miles N.N.W. of Nyflot.

RADAVITZA, a town of Prussia, in the palatinate of Culm; 22 miles E.S.E. of Culm.

RADAUN, a town of Aultria; 6 miles W.S.W. of Vienna.

RADAUTZ, or RADENTZ, a town of Bukovina; 22 miles W.S.W. of Saczava.

RADAWAIR, a town of Hindoostan, in Candeish; 14 miles S.W. of Burhanpour.

RADBUZA, a river of Bohemia, that rises in the S.W. part of the circle of Pilsen, and runs into the Miza, near the town of Pilsen.

RADCLIFFE, JOHN, in *Biography*, an eminent and eccentric physician, was born at Wakefield, in Yorkshire, where his father possessed a moderate estate, in the year 1650. He received the rudiments of his classical education at a school in that town; and at the age of 15, was sent to complete his studies at University college, in Oxford. He took his bachelor's degree in arts in 1669, and removed to Lincoln college, where he was elected to a fellowship. Having determined upon the profession of physic, he went through the courses of botany, chemistry, and anatomy, and was distinguished by the rapidity of his attainments in all these pursuits. Nevertheless he did not apply with zeal or industry to the studies of the closet, and recommended himself rather by his vivacity, acuteness, and wit, than by any extraordinary acquisitions in any department of knowledge. In the prosecution of his medical inquiries, he contented himself with looking into the works of Dr. Willis, who was at that time practising in London with much reputation. He was possessed, indeed, of very few books; insomuch that when Dr. Bathurst, head of Trinity college, asked him once with surprise where his study was? he pointed to a few vials, a skeleton, and a herbal, and said, "Sir, this is Radcliffe's library." He took the degree of master of arts in 1672, and in 1675 he proceeded bachelor of medicine, and immediately began to practise in Oxford. He professed to pay very little regard to the rules which were generally followed, but censured them on many occasions with great freedom and acrimony; a conduct which did not fail to draw upon him the enmity of all the old practitioners. Nevertheless his reputation and his practice rapidly increased; and before he had been two years in the world, he was very generally consulted, even by those of

the highest rank. About this time, in consequence of some witticisms, which he had launched with his accustomed freedom against Dr. Marshall, rector of Lincoln college, the latter unkindly opposed his application for a dispensation for taking holy orders, which the statutes required, if he retained his fellowship, and shewed other tokens of incivility; which induced Radcliffe to resign his fellowship, quit the college, and take lodgings in the town. He continued to practise at Oxford, increasing alike in wealth and reputation, until 1684, having taken the degree of doctor in 1682; and he then determined to remove to London, and settled himself in Bow-street, Covent Garden.

His success in the metropolis was unusually rapid; and doubtless his wit and pleasantry, which rendered him a most entertaining companion, contributed scarcely less than his reputed skill in his profession to forward his progress. In less than a year he was in full practice; and in the second year, he was appointed physician to the princess Anne of Denmark. In 1688, when prince George of Denmark joined the prince of Orange, and the princess retired to Nottingham, in a state of pregnancy, he was pressed by bishop Compton to attend her, in quality of his office; but he excused himself on account of the multiplicity of his patients. After the revolution, he was consulted by king William and the nobility about his court; an honour which he must have owed entirely to his high reputation, for he never shewed any inclination to be a courtier. By his rough independence of spirit and freedom of language, indeed, he ultimately lost all favour at court. In 1699, when king William returned from Holland in a state of severe indisposition, he sent for Radcliffe, and shewing him his swollen ankles, while the rest of his body was emaciated, said, "What think you of these?"—"Why truly," replied the physician, "I would not have your majesty's two legs for your three kingdoms." This freedom was never forgiven by the king, and no intercessions could ever recover his favour towards Radcliffe. In 1694, when queen Mary caught the small-pox, and died, Radcliffe was accused, bishop Burnet says, of negligence and unskilfulness. He soon afterwards lost the favour of princess Anne, by neglecting to obey her call from his too great attachment to the bottle, and another physician was appointed in his place. When queen Anne came to the throne, the earl of Godolphin exerted all his endeavours to reinstate him in his former post of chief physician; but she refused, alleging that Radcliffe would send her word again, "that her ailments were nothing but the vapours." Nevertheless he is said to have been consulted in all cases of emergency, in a private way. In 1703 Dr. Radcliffe had an alarming and dangerous attack of pleurisy, which he neglected, and increased in the outset by drinking a bottle of wine: he had, however, 100 ounces of blood taken from him by Mr. Bernard, the serjeant surgeon; and the next day, in spite of all intreaties, was carried to Kensington. His escape was almost miraculous. The queen asked Mr. Bernard how he did? and when he told her that he was ungovernable, and would observe no rules, she answered, that then nobody had reason to take any thing ill from him, since it was plain he used other people no worse than he used himself. During this illness he made a will, by which he disposed of the greater part of his property for charitable purposes, appropriating particularly several thousand pounds for the relief of sick women set on shore. He recovered, however, and continued in full occupation in his profession, increasing in wealth and inscience to the end of his days, and waging a perpetual war with his brethren; who, in their turn, represented him as an active, ingenious, adventuring empiric, whom constant practice

practice had brought at length to some skill in his profession. His caprice in the performance of his professional duties appears to have been unbounded; and many anecdotes are related of his refusal to attend on persons of distinction, if he happened to be engaged in pleasant company, or had any personal pique against the individuals, or if he conceived himself in any way affronted. Thus he set off suddenly for Bath in 1704, while attending the lady of sir John Trevor, because that gentleman sent to Oxford for Dr. Breach to consult with him; which he had done as a compliment to Radcliffe, rather than join any of the London physicians with him. When Mr. Harley was stabbed by Guiseard, Swift complains, that by the caprice of Radcliffe, who would allow none but his own surgeon to be admitted, "he had not been well looked after;" and adds in another place, "Mr. Harley has had an ill surgeon, by the caprice of that puppy Dr. Radcliffe, which kept him back so long." On the other hand, he attended the lady of sir John Holt in a bad illness, with unusual diligence, out of pique to the husband, who was not supposed to be over fond of her. In the last illness of queen Anne, he was sent for to his country-house at Carshalton about noon, by order, as one account affirms, of the privy council; but he returned an answer, that "he had taken physic, and could not come." It has been stated, however, on the other hand, that he was only sent for on this occasion by lady Marham, without any order from the queen or the council; which is countenanced by the following circumstances. On the 5th of August, four days after the queen's death, a friend of the doctor's moved in the house of commons, that he might be summoned to attend in his place, (Dr. Radcliffe had been elected a member for Buckingham in 1713,) in order to be censured for not attending on her majesty. A letter is preserved, said to have been written by the doctor to one of his friends, on this occasion, in which he says, "I know the nature of attending crowned heads in their last moments too well, to be fond of waiting upon them, without being sent for by a proper authority. You have heard of pardons being signed for physicians before a sovereign's demise; however, ill as I was, I would have went to the queen in a horse-litter, had either her majesty, or those in the commission next to her, commanded me to do so." Whatever was the true state of the case, it is certain that Dr. Radcliffe became so much the object of popular resentment, that he was apprehensive of being assassinated, as appears from a letter addressed by him to Dr. Mead, which is extant. "Nor shall I be at any time from home," he says, "because I have received several letters, which threaten me with being pulled to pieces, if ever I come to London." He survived the queen but three months, and died at Carshalton, on the 1st of November 1714, at the age of 64. It was believed, that the dread which he had of the populace, and the want of company in his retirement, which he did not dare to leave, contributed to accelerate his death. He was carried to Oxford, and buried in St. Mary's church in that city.

It does not appear that Dr. Radcliffe ever attempted to write, and probably he would not have succeeded as an author. He was believed, indeed, to have been very little conversant with books; which made Dr. Garth humorously say, that "for Radcliffe to institute a library, was as if an eunuch should found a seraglio." He was often the subject of the attacks of ridicule from poets and wits, and even was not spared on the stage; having been severely satirized in a piece acted in 1704, soon after a legal dispute with an apothecary, which was attended by the ladies of the court, and in which the passages affronting the doctor were much applauded. Swift, in Martinus Scriblerus, and Steele in the

Tatler, levelled their ridicule at the doctor; and the following severe portrait of him was drawn by Dr. Mandeville, in his Essay on Charity Schools. "That a man with small skill in physic, and hardly any learning, should by vile arts get into practice, and lay up great wealth, is no mighty wonder; but that he should so deeply work himself into the good opinion of the world as to gain the general esteem of a nation, and establish a reputation beyond all his contemporaries, with no other qualities but a perfect knowledge of mankind, and a capacity of making the most of it, is something extraordinary. If a man arrived to such a height of glory, should be almost distracted with pride, sometimes give his attendance on a servant, or any mean person, for nothing, and at the same time neglect a nobleman that gives exorbitant fees; at other times, refuse to leave his bottle for his business, without any regard to the quality of the persons that sent for him, or the danger they are in:—if he should be surly and morose, affect to be a humourist, treat his patients like dogs, though people of distinction, and value no man but what would deify him, and never call in question the certainty of his oracles:—if he should insult all the world, affront the first nobility, and extend his insolence even to the royal family:—if, to maintain as well as to increase the fame of his sufficiency, he should scorn to consult with his betters on what emergency soever, look down with contempt on the most deserving of his profession, and never confer with any other physician but what will pay homage to his superior genius, creep to his humour, and never approach him but with all the slavish obsequiousness a court flatterer can treat a prince with:—if a man in his life-time should discover, on the one hand, such manifest symptoms of superlative pride, and an insatiable greediness after wealth at the same time; and on the other, no regard to religion, or affection to his kindred, no compassion to the poor, and hardly any humanity to his fellow-creatures:—if he gave no proofs that he loved his country, had a public spirit, or was a lover of arts, of books, or of literature:—what must we judge of his motive, the principle he acted from, when after his death we find that he has left a trifle among his relations, who stood in need of it, and an immense treasure to an university that did not want it."

Whatever may be the motives of the endowers of splendid institutions for the public use, the nation is at all events benefited for ages, by such noble establishments as the library and infirmary which he founded at Oxford, and which bear his name. He also endowed two travelling fellowships, with an annual income of 300*l.* attached to each. He had previously caused the beautiful east window, over the altar, in University college, to be put up at his own expence; and likewise given the money, which was paid for the erection of the master's lodge there, making one side of the eastern quadrangle. He was certainly avaricious to the extent almost of spunging, and never could be induced to pay bills without much following and importunity. A piece of waggery would sometimes conquer this disposition. A pavior, after long and fruitless attempts, once caught him just getting out of his chariot, at his own door, in Bloomsbury square, and set upon him. "Why, you rascal," said the doctor, "do you pretend to be paid for such a piece of work? Why, you have spoiled my pavement, and then covered it over with earth to hide your bad work."—"Doctor," said the pavior, "mine is not the only bad work the earth hides."—"You dog you," said the doctor, "are you a wit? You must be poor; come in:" and he paid him. He told Dr. Mead, that the great secret by which he might make his fortune was to "use all mankind ill." Dr. Mead, however, adopted the

contrary axiom, and succeeded even beyond his adviser. Notwithstanding that Radcliffe seems to have literally practised this principle, in his dealings both with his patients and his brethren; and notwithstanding the severe accusations of ignorance and empiricism, which were every where levelled against him; the universal reputation, which he acquired and maintained, seems to sanction the testimony of Dr. Mead, that "he was deservedly at the head of his profession, on account of his great medical penetration and experience." See Atterbury's Epistolary Correspondence. The Richardsoniana. Pope's Works, vol. vii. Swift's Works, vol. xix. Hutchinso's Biographia Medica.

RADDELE, in *Geography*, a town of Ceylon, on the east coast; 5 miles N.E. of Trincolee.

RADDINSDORP, a town of the duchy of Holstein; 6 miles E.S.E. of Eutyn.

RADDLE, in *Agriculture*, a red ochre of iron, which, according to Dr. Darwin, has been found useful as a manure in the northern parts of Staffordshire. Its properties have not, however, been yet chemically examined as they relate to manure. See REDDLE.

RADEBURG, in *Geography*, a town of Saxony, in the margraviate of Meissen; 10 miles N.E. of Dresden. N. lat. 51° 8'. E. long. 13° 53'.

RADECHAU, a town of Bohemia, in the circle of Koniggratz; 9 miles S.E. of Trautenau.

RADEGATZ, a town of Germany, in the principality of Anhalt-Deffau; 13 miles S.S.W. of Deffau.

RADEGURRY, a town of Hindoostan, in Canara; 24 miles S.S.E. of Mangalore.

RADENTHAL, a town of the duchy of Carinthia; 13 miles E. of Saxenburg.

RADERAN, a town of Bohemia, in the circle of Kaurzim; 3 miles N.E. of Kaurzim.

RADERMACHIA, in *Botany*, a name originally given to the Bread-fruit, (see *ARTOCARPUS*,) by Thunberg, in honour of one of his great patrons, Joachim Cornelius Matthew Radermacher, a member of the Dutch council, and President of the Society of Sciences, at Batavia. The author, in his *Nova Genera*, p. 25, represents this gentleman as a most distinguished Mæcenas, and encourager of Natural History. Nevertheless, the above name has, by common consent, given way to the expressive one of Forster, *Artocarpus*, which is precisely synonymous with Bread-fruit.

RADERSBERG, in *Geography*, a town of Germany, in the principality of Culmbach; 7 miles E. of Bayreuth.

RADES, a town of Tunis, on the N.E. coast; 5 miles S.E. of Tunis.

RADESCHE, or **RATSCHACH**, a town of Lower Carniola, on the Save; 10 miles N.W. of Gurckfeld.

RADHA, in *Mythology*, is the name of the consort of the Hindoo deity Krishna. As Krishna was an avatara, or incarnation of Vishnu, so Radha is understood to be similarly an avatara of Vishnu's consort Lakshmi; thus incarnated to accompany her lord in this, his most splendid terrestrial manifestation. Under the articles **KRISHNA** and **LAKSHMI** some notice will be found on the subject of this. Radha is seen very frequently portrayed and alluded to in the paintings and writings of India: Krishna is, indeed, seldom seen without her. She is represented of perfect beauty, and is warmly celebrated in the amatory poetics of Hindoostan. In the elegant work of Jayadeva, entitled *Gita Govinda*, a pastoral drama exhibiting the loves of Krishna and Radha, the lovely nymph is thus described after a quarrel with her frolicsome and fickle lord, in the morning after the night of reconciliation, when affliction ceased, and ecstacy crowned the recol-

lection of past sorrows. "In the morning she awoke, disarrayed, and her eyes betrayed a night without slumber, when the yellow-robed god, who gazed on her with transport, thus, in his heavenly mind, meditated on her charms: 'Though her locks be diffused at random; though the lustre of her lips be faded; though her garland and zone be fallen from their enchanting stations; and though she hides their places with her hands, looking towards me with bashful silence; yet, even thus disarrayed, she fills me with ecstatic delight.' But Radha, preparing to array herself before the company of nymphs could see her confusion, spake thus with exultation to her obsequious lover.

'Place, O son of Yadu! with fingers cooler than sandal wood, place a circlet of musk on this breast, which resembles a vase of consecrated water, crowned with fresh leaves, and fixed near a vernal bower to propitiate the god of love. Place, my darling! the glossy powder, which would make the blackest bee envious, on this eye, whose glances are keener than arrows darted by the husband of Reti. (See **RETI**.) Fix, O accomplished youth! the two gems, which form part of love's chain, in these ears, whence the antelopes of thine eyes may run downwards and sport at pleasure. Place now a fresh circlet of musk, black as the lunar spots, on the moon of my forehead; and mix gay flowers on my tresses with peacock's feathers, in graceful order, that they may wave like the banners of Kama. Now replace, O tender hearted! the loose ornaments of my vesture; and refix the golden bells of my girdle on their destined station, which resembles those hills where the god with five shafts, who destroyed Sambara, keeps his elephant ready for battle.' While she spake, the heart of Yadava triumphed; and obeying her sportive behests, he placed musky spots on her bosom and forehead; dyed her temples with radiant hues; embellished her eyes with additional blackness; decked her braided hair, and her neck, with fresh garlands; and tied on her wrists the loosened bracelets, on her ankles the beamy rings, and round her waist the zone of bells, that sounded with ravishing melody."

But we must recollect, says the author of the Hindu Pantheon, whence this article is chiefly taken, that the seemingly amorous conflicts of these ardent lovers are mere mystical descriptions of "the reciprocal attraction between the divine goodness and the human soul." This is the emblematical theology that Pythagoras admired and adopted; that the Sufi poets, Hafez, Sadi, and many others among the Persians, and Solomon also, in his fine Song, so beautifully inculcates. Like the enthusiasts of other days, and in a manner not easily comprehended by the unenlightened, nor believed by them to be permanently chaste, however innocent its commencement, "they profess eager desire, but without carnal affection; and circulate the cup, but no material goblet: in their sect, all things are spiritual, all is mystery within mystery." See sir W. Jones's admirable Essay on the Mystical Poetry of the Persians and Hindoos, in the third volume of the Asiatic Researches, in which a translation of the *Gita Govinda* of Jayadeva is introduced. Under the article **JAYADEVA** of this work is a brief notice of his poem; and under **MAHESA** is an extract from it, descriptive of the persons and loves of this interesting couple. (See also **PRABHA**.) The reader desirous of seeing what has been said and believed on the curious subject of mystical or emblematical theology, may consult our articles under **MYSTERY**, **MYSTICS**, and those thence referred to.

Returning to Radha, we have to observe that among the sect of Gokalatha (see *SECTS of Hindoos*) she is deemed a personification of religion, and sometimes called *Rakmeni*.

(See that article.) There is a sect said to worship her exclusively, and called Radha-ballabhi: they consider her as the Sakti, or active power of Vishnu or Krishna. (See SAKTI.) The followers of this sect have ascribed to them the singular practice of making their own wives personate Radha, and of presenting to or through them the oblations propitiating the goddess, or Lakshmi, of whom, as before said, she is an incarnation. There is no end to the whimsicalities in the modes of human worship, to give them no harsher name, wherever, to use an oriental expression, we suffer our necks to slip out of the collar of reason. Thus in India, as hath been the case in other countries, there is, with several sects, a *right-handed* and a *left-handed* mode of worship; one meaning a decent, the other an indecent mode. Those among the sect in question, who follow the left-handed path, require their wives to be naked, when attending them at their devotional abominations. She is sometimes called Radhika, and Krishna, Radhikeswara, or lord of Radhika; and sometimes the name of Kantamati is given both to her and Rukmeni. See RUKMENI and YONI.

In Radha may be recognized the Grecian Juno, and of course in her husband Krishna, or Vishnu, the amorous Jove of that imitative race. On this point we shall quote a paragraph from the Edinburgh Review, N^o xxxiv.

"We translate a passage from the Purana, entitled Bralma Vaivartica, to demonstrate the identity of character ascribed to Jupiter and Vishnu; only premising, that in conformity to the peculiar tenets of its author, Vishnu is here stiled Krishna, and his goddess, Rādhā. Gangā (the Ganges) was originally a nymph of wonderful beauty, who inhabited Paradise. She became enamoured of Krishna, and, concealing her face with her robe, stood immovable in his presence, her eyes fixed on his radiant countenance. The jealousy of Rādhā (Juno) was excited. Followed by her innumerable attendants, she repaired to the presence of the god, and seated herself on her throne of gems. The timid Gangā trembled at her aspect, and dissolved with terror. The goddess speaks: "Who is this nymph, lord of the universe, who, with half concealed visage, and eyes sparkling desire, thus gazes on thy sacred person? This is not the first time the skies have witnessed the infidelity of their lord. When I detected thee dallying in a grove of sandal with Viraja, the figure of a quadruped concealed thy shame, and she was changed into a river. Still pursued by thee she became the mother of the mighty ocean. The same forest was the scene of thy amours with the nymph Sobhā, (beauty). Again thou assumedst the form of an animal; whilst her spirit fled to the moon, and thou dividest her body amongst gems, flowers, and black-eyed damsels. The woods of Vrindavan afforded thee a retreat with the shepherds Prabha (lustre.) On my arrival, her spirit transmigrated to the solar orb; of her body thou madest a distribution: the god of fire obtained a part; and some, as gold, give brightness to the crowns of the kings of the earth. When I found thee, unexpectedly, on a bed of vernal buds, reclined in company with the fair Xamā (patience), alarmed at my voice, thou gatheredst as they lay dispersed, thy yellow robes, thy lyre, thy necklace of flowers, and thy crest of gems. Thee I forgave when thou bestowedst a portion of her body on the pious anchoress, a portion on the sick, and a portion on the studious."

Such of our readers as have obtained a share in the latter portion, may, in the endeavour to expound this solar allegory, be repaid perhaps for their pains; in perusing the Gita Govinda and the article in which it is comprised, above referred to, they assuredly will.

RADHIKA, a name of *Radha*, consort of the Hin-

deo deity *Krishna*, as sufficiently noticed under those articles.

RADHOST, in *Geography*, a mountain of Moravia, in the circle of Prerau; 12 miles E. of Meferitch.

RADHUA, a mountain of Arabia; 30 miles W. of Medina.

RADIÆUS, in *Anatomy*, an epithet applied to parts about the radius, and equivalent to *radialis*; which see.

RADIAL CURVES. See CURVES.

RADIALIS, in *Anatomy*, a name given to parts in the fore-arm, situated near the radius. The adjective *radial* is also employed to denote the edge, surface, or aspect of any part, which is towards the radius; and in this way, with the term *ulnar*, affords the means of describing the organs much more accurately and intelligibly, than the indefinite expressions of *outer* and *inner*, which vary constantly in the changing attitudes of the limb.

RADIALIS Arteria, is the artery of the wrist, in which the pulse is commonly felt. See ARTERY.

RADIALIS Carpi Extensor, Longior & Brevior. See CARPI.

RADIALIS Carpi Flexor. See CARPI.

RADIALIS Externus, Longior & Brevior, synonyms of the extensores carpi radiales, longior & brevior. See CARPI.

RADIALIS Internus, a synonym of the flexor carpi radialis. See CARPI.

RADIALIS Nervus. The large nerve which goes behind the humerus, between two heads of the triceps, is called radial by some anatomists: others give this name to the nerve which lies parallel to and over the brachial artery. The first of these is called also the muscular spiral nerve, the second the median. See NERVE.

RADIALIS Vena, the vein corresponding to the radial artery. See VEIN.

RADIANT HEAT. See HEAT.

RADIANT Point, or Radiating Point, is any point of a visible object, whence rays proceed.

Every radiant point diffuses innumerable rays all round; but only those radiants are visible, from which right lines may be drawn to the pupil; because the rays are all right lines.

All the rays proceeding from the same radiant continually diverge; the crystalline collects or reunites them again.

RADIATED, in *Botany*, an epithet applied to round flat flowers, consisting of a disk, and a single row of longish pointed leaves, ranged all around it in manner of rays, or spokes.

Radiated flowers are properly such as have several semi-florets set round a disk, so as to resemble a radiant star: such are daisies, chamomile-flowers, sun-flowers, &c. These are sometimes also called *radiated discous flowers*.

A radiated flower has two parts; its middle part, which is called the disk, and which is wholly made up of floscules; and the other part, which is called the circle or border, which is wholly made up of semi-floscules, or else of plain flat leaves; but that is less common. The floscules and semi-floscules both usually adhere to the embryos, and to the thalamus of the flower, being contained in one general cup. These embryos finally ripen into seeds; sometimes furnished with down, sometimes with foliaceous heads, and sometimes without either, and sometimes marginated. Of these seeds some are wrapped round with a kind of case or capsule, others are separated from one another by small perpendicular leaves.

RADIATED Leaf. See LEAF.

The word is also used in speaking of medals, and in heraldry,

heraldry, where the ancient crowns are called radiated crowns, coronæ radiatæ. See CROWN.

RADIATION, in *Physics*, the action of a body diffusing rays of light as from a centre.

Every visible body is a radiating body; it being only by means of its rays that it affects the eye.

The surface of a radiating body may be conceived as consisting of radiant points.

RADIATION, *Place of*. See PLACE.

RADIATION, or *Irradiation*, is also used by some authors to express the manner of the motion of the animal spirits; on a supposition that they are diffused from the brain towards all parts of the body, through the little canals of the nerves, as light is from a lucid body. But in lieu of a radiation, the moderns rather incline to the opinion of the circulation of the spirits.

RADICAL, RADICALIS, in *Physic*, &c. something serving as a basis or foundation; or which, like a *root*, is the source or principle whence any thing arises.

The schools talk much of a radical moisture inherent in the feeds of all animals, which nourishes and preserves the vital heat or flame, as oil does a lamp; and which, when exhausted, life is extinguished.

Dr. Quincy observes, that this radical moisture is a mere chimera; unless we thereby mean the mass of blood, which is the promptuary whence all the other juices and humours are derived; and which, while it circulates, sustains life, &c.

In grammar, we use the term, radical words, for roots and primitives; in opposition to compounds and derivatives. In the Hebrew language, the letters of the alphabet are divided into *radical* and *servile*. The first constitute primitive or original words, which, by a significant metaphor, are called roots, $\sqrt{\text{א ב ג ד ה ו ז ח ט י כ ל מ נ ס ע פ צ ק ר ש ת}}$. All the 22 letters of the alphabet may be radicals; *i. e.* primitive words may consist of any of these letters; but the following 11 letters properly claim this title, because they can never be *serviles*; *viz.* $\text{א ב ג ד ה ו ז ח ט י כ ל מ נ ס ע פ צ ק ר ש ת}$. Of whatever letters any word consists, it must at least contain one of a radical character. (See ROOT.) For an account of the servile letters, see SERVILE.

RADICAL Numbers, *Numeri Radicales*, in the Italian music, are 2, 3, 4, 5, 6, 7, 8, 9, and sometimes 10, which are often met with in musical compositions, to denote the accords of the thorough basses: 2 stands for the second and its duplicates; 3 for the third; 4 for the fourth, &c.

RADICAL Leaf, among *Botanists*. See LEAF.

RADICAL Sign, in *Algebra*, the sign or character of the root of a quantity.

$\sqrt{\quad}$ is the character of radicality, and expresses the square root;

$\sqrt[3]{\quad}$ the cube root, &c.

RADICANS, in *Botany*, rooting, a term applied to a stem which throws out fibres as it extends itself, whether those fibres be true radicles, by which the plant imbibes nourishment, and is generally increased; or whether they serve only for the support of the stem against walls, rocks, or neighbouring trees. Of the first kind, the Strawberry affords a familiar example; of the latter, the Ivy, the Virginian Creeper (*Hedera*, or rather *Vitis, quinquefolia*), and the *Bignonia radicans*, are instances.

RADICATION, the action by which plants take root, or shoot out roots.

The French Royal Academy of Sciences have made a great number of curious observations on the germination and radication of plants.

RADICLE, in *Agriculture*, that part of the feeds of plants which, upon vegetating, becomes their nascent roots.

It is, in fact, the main organ or medium of nutrition, and the means by which food is imbibed or drank up from the surrounding soil or earth. The radicles, together with the leaves, therefore, constitute the *absorbent* organ of plants. See RADICULA, and ROOT.

RADICOFANI, in *Geography*, a town of Etruria, near which are two castles, one built by Didier, last king of the Lombards, and the other by Cosmo I.; 55 miles S. of Florence.

RADICONDOLI, a town of Etruria; 24 miles N.E. of Florence.

RADICULA, in *Botany* and *Vegetable Physiology*, the radicle, or fibre of the root. (See ROOT.) This term is used by Dillenius, in his *Nova Genera*, 121. t. 6, as a generic name, for a set of plants referred by Linnæus to SISYMBRIUM. See that article.

RADII *Pronator Quadratus*, in *Anatomy*, a muscle of the fore-arm. See PRONATOR.

RADII *Pronator Teres*. See PRONATOR.

RADII *Supinator Brevis*, } muscles of the fore-arm. See
RADII *Supinator Longus*, } SUPINATOR.

RADII *Pinnarum*, in *Ichthyology*, the little slender bones supporting the membrane, forming the fins in fishes, and called by Artedi *ossicula radiata pinnarum*, from their running from the base to the summit in the form of rays. See FIN, and *Anatomy of FISH*.

RADIMPOUR, in *Geography*. See RADUNPOUR.

RADIOLA, in *Botany*, so called by Dillenius, because the cells of the ripe capsule spread like the rays of a little wheel. The plant having been referred by Linnæus to the genus *Linum*, the above became its specific name; but it is now restored to the rank of a genus by the late professor Gmelin of Gottingen, as well as by the author of *Flora Britannica*.—Dill. *Nov. Gen.* 126. t. 7. Gmel. *Syst. Nat.* Linn. v. 2. 289. Sm. *Fl. Brit.* 201. Prod. *Fl. Græc.* Sibth. v. 1. 110. Ait. *Hort. Kew.* v. 1. 282.—Class and order, *Tetrandria Tetragynia*. Nat. Ord. *Gruinales*, Linn. *Caryophyllaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, cut about half down into four equal, permanent, wedge-shaped segments, each of which is three-cleft. *Cor.* Petals four, obovate, about the length of the calyx, alternate, with its principal segments. *Stam.* Filaments four, awl-shaped, erect, the length of the calyx; anthers roundish, of two lobes. *Pist.* Germen superior, roundish, with four grooves; styles four, terminal, very short; stigmas capitate. *Peric.* Capsule roundish, bluntly five-sided, of eight cells and eight valves. *Seeds* solitary, elliptical, compressed, very smooth.

Ess. Ch. Calyx in many segments. Petals four. Capsule superior, with eight valves and eight cells. Seeds solitary.

1. *R. millegrana*. Thyme-leaved Flax-seed. *Engl. Bot.* t. 893. (*R. vulgaris serpyllifolia*; Dill. in *Raii Syn.* 345. t. 15. f. 3. Jacob. *Faverish.* 92. *Linum Radiola*; Linn. *Sp. Pl.* 402. *Fl. Dan.* t. 178. *Linocarpum Serpylli folio*, *multicaule et multiflorum*; Mich. *Gen.* 23. t. 21. *Millegrana minima*; *Raii Syn.* ed. 2. 207. *Ger. Em.* 569. *Chamelinum vulgare*; *Vail.* *Parif.* t. 4. f. 6.)—Native of sandy ground, overspread by clean fresh water, throughout Europe, flowering in July and August; but not a very general English plant. The root is annual, small, and fibrous. *Stem* an inch or two high, repeatedly forked, corymbose, spreading, leafy, round, nearly smooth, many-flowered, often reddish. *Leaves* opposite, sessile, ovate, entire, smooth, scarcely a quarter of an inch long. *Flowers* small, white, on short, simple, solitary stalks from the forks of the stem.—Gmelin has erred considerably in the

the generic character and name, as well as in his reference to Linnæus. The *calyx* is many-cleft, not composed of four distinct leaves; the plant has hardly any thing of the aspect of a *Linum*, and therefore cannot properly be called *linoides*; neither has it been published as a genus, under the name of *Radiola*, by Linnæus, as Gmelin's reference to the 12th edition of Syst. Nat. indicates.

RADIOMETER, a name which some writers give to the *radius astronomicus*, or Jacob's staff. See FORE-STAFF.

RADISH, in *Botany*. (See RAPHANUS.) The radish is much grown, according to the author of the Agricultural Survey of the County of Kent, on the best rich loamy soils of the Isle of Thanet, and in East Kent, for the supply of the London seedsmen. The sorts usually cultivated for this use are, the early short top, the salmon, and the turnip-rooted radish.

The land for the growth of this sort of crop should be in a fine state of preparation, by being ploughed to a great depth in the early part of the winter, and broken well down by harrowing, so as to render it perfectly clean from weeds, being previously filled with well reduced manure. The ground being brought into this fine condition, the seed is sown on furrows about ten inches apart, in a dry time in the month of March, about two or three gallons *per* acre. And as soon as the plants appear, every other row is cut up with a horse-hoe, leaving the rows twenty inches apart. When the plants get two or three rough leaves, they are hoed out in rows, and are then kept clean by repeated horse and hand-hoeing, when necessary, leaving the plants at about eighteen inches distance. It is added, in the above Report, that the crop is seldom fit to reap till October, and sometimes is out in the fields till Christmas, without receiving injury from wet weather; it being necessary that it should have much rain to rot the pods, that it may thrash well. In respect to the produce, it is from eight to twenty-four bushels *per* acre: and it is sold to the London seedsmen, who send it to all parts of the kingdom for retailing to the gardeners.

It is probable that this sort of crop might be grown in many other districts near the metropolis, or other large towns, with equal success, where the soil is of a rich loamy nature, as it is very easy in its culture, and requires but little labour or trouble. As it is necessary for it to remain out such a length of time, however, it will be proper, especially in wet seasons, to keep the stems from falling too much upon the ground, as they and the seed may be injured by being too much in contact with it. If kept up in this way, the stalks, seed-husks, and other offal parts, may also form a good cut food for some sorts of live-stock, as is the case with some other similar sorts of crops.

RADISH, *Horse*. See COCHLEARIA *Armoracia*.

RADIUS, in *Anatomy*, that bone of the fore-arm which extends from the humerus to the wrist, in the line carried from the external condyle of the former bone to the thumb. See EXTREMITIES.

RADIUS, *Dislocations and Fractures of*. See FRACTURE and LUXATION.

RADIUS, in *Botany and Vegetable Physiology*, means the aggregate marginal florets, of compound flowers, each generally of an oblong form, and all spreading from the centre, or disk, like rays. Such are the white florets of the Daisy, and blue, purple or red ones, for the most part, of the *Aster*. The usual shape of the limb or border of such florets is ligulate; either linear, or elliptical; rarely, as in *Achillea*, short and roundish; the extremity having three or five teeth. In some compound flowers the *radius* consists of tubular florets, as in *Centaurea*; and those are neuter, destitute of organs of fructification. The ligulate radiant florets above-mentioned

are either female, producing perfect seed; or they are abortive, with more or less imperfect traces of a pistil. Many of them have no signs of a style or stigma, but none is without so much of a germen, as serves for the basis, that supports the petal itself.

A radius is occasionally assumed by some flowers, naturally destitute of one, as in the genus *Bidens*, each species of which, by such an acquisition, becomes a *Coreopsis*, and changes its order in the *Syngenesia*, from *Polygamia equalis*, to *P. superflua*. This change is an approach towards a double flower, in that class; being a transformation of a certain number of the perfect, or united, florets into female ones. If such a transformation be total, and all the tubular florets become ligulate, the whole flower is double, and unproductive of seed, like the double Chamomile.

RADIUS, *Ray*, in *Geometry*, the semidiameter of a circle; or a right line drawn from the centre to the circumference.

The word is derived from the Greek $\rho\acute{\alpha}\delta\iota\varsigma$, *rod*. Fleta uses the word radius, for a furrow.

The radius is also called, especially in trigonometry, *sinus totus*; the whole sine.

It is implied in the definition of a circle, and it is apparent from its construction, that all the radii of the same circle are equal.

RADIUS, in the *Higher Geometry*, *Radius of the evolute*, *Radius curvædinis*, or *Radius osculi*, called also the radius of concavity and the radius of curvature, is a right line representing a thread, by whose evolution from off the curve on which it was wound, the curve is formed: or it is the radius of a circle that has the same curvature in a given point of a curve with that of the curve in that point. See CURVATURE and EVOLUTE, under which articles the method of finding this radius may be seen.

RADIUS *Astronomicus*, an instrument usually called Jacob's staff, the cross-staff, or fore-staff.

RADIUS, in *Optics*. See RAY.

RADIUS, in *Mechanics*, is applied to the spokes of a wheel; because issuing like rays from its centre.

RADIUS *Vector*, is also used for a right line drawn from the centre of force in any curve in which a body is supposed to move by a centripetal force, to that point of the curve where the body is supposed to be. See CENTRAL Force.

RADIUS, among the Romans, a name given to the iron rod with which the boys rolled the trochus.

RADIUS *Articulatus*, in *Natural History*, a name given by Mellius, Gmelin, and some other authors, to a kind of figured fossils, of which there are a great many very different species, some of which have been described by authors among the belemnites, under the names of *alveoli belemnitarum*. Mr. Gmelin, who has taken great pains to inform himself, as well of the nature and figure of these stones, from the subjects themselves, as of their history, and the various accounts of them from other authors, observes, that the place where they are most frequent is Sweden, and that there they are no where so common as in the isle of Oeland. Volkman figures some also which he found in Silesia, and Helwing others which he collected in Prussia: he also found great numbers of them himself in Russia.

They are usually immersed in lime-stone, and though at first sight they may all appear alike, yet, on a careful examination, they will be found to differ very greatly. The most obvious general distinction, established by Gmelin, is that some of them are straight, and others crooked. The straight ones may be divided into two genera. The first of these comprehend, according to this gentleman, two specks; the first smooth, and with a converging alveolus.

The

The regular and nice configuration of these bodies shews very plainly that they cannot be of mineral origin; but the several patellæ of which each is composed, the siphunculus of communication, obvious in several, and the shelly matter yet found remaining on many, prove them to have been once shell-fish of the univalve or tubular concamerated kind; the description of which, so far as it can be gathered from these remains, must have been this. The shell must have been either cylindric or conic in figure, of a smooth surface, and divided into several chambers or cells; but this so that the septa which form the concamerations are not continued and whole, but in some part of the periphery are cut in, in the shape of a crescent. Through these crescents, which, standing all together, make a continued canal, there has passed another shelly body of a cylindric or conic figure, also divided into concamerations, and that in such a manner, that the septa which form the cells are pierced with a small aperture on one side, which grows gradually smaller as the shell extends in length; and finally, through these apertures, in the concamerations, there passes another shell pointed at the end, and, like the rest, divided into its concamerations, and pierces along its middle with a siphunculus. Mem. Acad. Petrop. vol. iii. p. 263.

This shell is, therefore, a compage of three shelly bodies, enclosed one within another; and, it must be supposed, in order to carry an analogy with other shell-fish, these three shelly bodies have communication with one another, by means of certain slips or perforations. The communication of these, one with another, seems all evident, from their being all found in their fossile state, filled with the same stony matter; this has, doubtless, been all received in at the siphunculus of the inner shell, and thence has been thrown into the second, and from this into the third shell, so as to fill up all the concamerations of the outer, as well as of the inner parts. This must have been the case with these; and the several various species that are at this day found fossile, must have owed their origin to as many different species of the shells. The crooked and twisted, or wreathed kinds, which have the siphunculus usually placed near the side, greatly approach in their structure to some of the cornu ammonis.

RADIX, in *Botany and Vegetable Physiology*. See **ROOT**.

RADIX is used among some anatomists for the sole of the foot.

RADIX Carlo Sancto; this root is found in temperate soils, in Mechoacan, a province of America. Its bark is easily separated from it, is of an aromatic smell, and of a bitter and somewhat acrid taste. The root itself consists of very slender fibrils, which are easily separated from each other. The bark is accounted sudorific, and corroborates the stomach and gums: if chewed, it procures an agreeable breath. It is good for scurvies, catarrhs, epilepsies, hastening deliveries, and removing hernias, and the small-pox, if taken either in powder or in the form of a decoction. The Spaniards have called it by the name of St. Charles, on account of its uncommon virtues.

RADIX Entrochorum, the root of the entrochi, a name given by some authors to a fossile substance, usually found among the entrochi, and seeming to have been the basis from which they have grown. It is plainly a part of the *Itella marina arborescens* petrified, as those stones also are. This fossile is rarely found whole, but the fragments of it are very common. When entire, it is about the size of a walnut; the top of it being flat, and in some degree resembling the end of an entrochus, with a central hollow, but not having the least appearance of the rays of those stones. These fossils, though

not properly judged of as to their origin, have yet been described by a great number of authors. Agricola, in particular, compares the form of them to a wheel. The body of this kind well resembles indeed the nave of a wheel, the shape of it being conical toward one end, till you come to the top, and then a little flattened, with a hole in it. There is also a like hole in the opposite broad end of the same fossil, seeming fit for an axle to pass through; and there are five hollow fillets, or feet, issuing sideways, at equal distances from the broad bottom, and equally carried on in the same direction, so as not amiss to represent the spokes. At the end of each of these rays or spokes, there is a hollow, of the same nature with those in the middle of the common entrochi, but this is cut across, by a seam, or streak of the same stone, which passes directly over its centre, and covers about a third part of it; this goes no farther than the mouth of the hole, but it cuts it into two, and shews it in the form of two eyes. These radii or spokes are very seldom found so perfect as here described. Lister mentions them as being formed like crescents at the end, which may very easily happen from the breaking off a part of the terminating portion. Phil. Trans. N^o 129.

RADIX Alba, a word used by Dioscorides, to express the root of the dracunculus.

RADIX, among *Grammarians*. See **RADICAL**, and **ROOT**.

RADIX, in *Mathematics*, the same as **root**; but used in a different sense by different authors: we say the *root* of an equation, but the *radix* of a system of logarithms, the *radix* of a series, the *radix* of notation, &c. meaning in all these cases the fundamental quantity on which the system is constructed, or that whence it has been derived, or that by means of which all other things of a like kind are compared.

RADIX of a System of Logarithms, is that number which involved to the power denoted by the logarithm, is equal to that number. Thus, under the article **LOGARITHMS** it is shewn, that if $r^x = a$, then x is the logarithm of a , and r is called the radix of the system. This radix in the common or Briggs's logarithms, is 10, and in the Neperian or hyperbolic logarithms, it is 2.71828128, &c. and generally the radix of any system of logarithms, is that number whose logarithm in that system is unity.

RADIX of a System of Notation, is that number which indicates the local value of the figures, and is in all systems represented by a unit and cipher (10), which is *ten* in the common system, *two* in the binary system, *three* in the ternary, *twelve* in the duodenary, and so on. See **NOTATION**.

RADIX of a Series is used, by some authors, as a term of comparison between any finite function, and its expansion or development: thus, the radix

of $1 - r + r^2 - r^3 + r^4$ &c.	is $\frac{1}{1+r}$
of $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \frac{1}{16}$ &c.	is $\frac{1}{1+\frac{1}{2}}$
of $1 - 1 + 1 - 1 + 1$ &c.	is $\frac{1}{1+1}$
of $1 - 2 + 4 - 8 + 16$ &c.	is $\frac{1}{1+2}$
of $\frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} + \frac{1}{32}$ &c.	is $\frac{1}{2+1}$
of $1 + x + x^2 + x^3 + x^4$ &c.	is $\frac{1}{1+x}$

of $1 + 2x + 3x^2 + 4x^3 + 5x^4$ &c. is $\frac{1}{(1-x)^2}$

of $1 + \frac{x^2}{2} + \frac{3x^4}{8} + \frac{5x^6}{16} +$ &c. $\sqrt{\frac{1}{1-x^2}}$

See Dr. Hutton's Tracts, vol. i. p. 9. See also our article SERIES.

RAD-KNIGHTS. See REDMANS.

RADL, in *Geography*, a mountain of Stiria; eight miles S.S.W. of Landfperg.

RADLER SEE, a lake of Carinthia; six miles N. of Saxenburg.

RADLSTEIN, a town of the duchy of Carnolia; six miles W. of Landtrafs.

RADLSTHAL, a town of Austria; nine miles E. of Krottau.

RADMANS. See REDMANS.

RADMANSO, in *Geography*, a small island in the Baltic, near the coast of Sweden. N. lat. $59^{\circ} 45'$. E. long. $18^{\circ} 44'$.

RADNAGUR, a town of Bengal; 32 miles S. of Burdwan.

RADNITZ, a town of Bohemia, in the circle of Pilsen; 10 miles N.E. of Pilsen.

RADNOR, NEW, or *Maes-Yfed*, a borough and market-town in the cwmwd of Swydd Wynogion, Cantref y Clawdd, (now called the liberties of the town of New Radnor,) county of Radnor, South Wales, is situated near the river Somergill, at the distance of seven miles N.W. from Kington, and 156 miles W.N.W. from London. In remote times, this town was a place of great importance, as appears from its having given name to the county, but it has now dwindled into comparative poverty and insignificance. Caradog informs us, that about the year 990, Meredydd ab Owain destroyed Radnor, in a ferocious contest with his nephew, who had been assisting the English to ravage South Wales. It recovered, however, from this disaster, and continued to flourish till the union of Wales with England, when it began to decline, in consequence of its ceasing to be fortified and garrisoned as a frontier town. Before that period, it was surrounded by a lofty wall, and a deep moat, some remains of which are distinctly visible on the west and south sides. The walls, when standing, are traditionally said to have been of great height. The area inclosed by them was an oblong square, containing about twenty-six acres of ground, laid out into three longitudinal streets, which were intersected by five transverse ones. Of these at present several have no buildings; and others are only foot paths. But though thus decayed, Radnor still preserves its privileges as a borough. The corporation consists of a bailiff, twenty-five capital burgesses, two aldermen, a recorder, a coroner, a town-clerk, and other inferior officers. The bailiff and aldermen are chosen annually from among the capital burgesses, and are justices of the peace. The bailiff of the preceding year is also a justice of the peace; and there are besides three additional persons nominated out of the capital burgesses, who are invested with similar authority. The district over which they preside, and supersede the jurisdiction of the county magistrates, is considerable; comprehending a circle round the town nearly ten miles in diameter. The bailiff's courts and the petty sessions are regularly held every Monday, when the bailiff, aldermen, and town-clerk attend to transact business relating to the borough, and have power to determine all suits for sums under forty shillings. The quarter-sessions for the borough are held on the Mondays after the county quarter-sessions at Presteigne; and the sheriff's county courts for the recovery of small debts, are

held every alternate month here, and at the town last mentioned. The representative for the borough is chosen by the burgesses of New Radnor, in conjunction with those of the boroughs of Knighton, Rhaiadar, Cefn Lllys, and Cnwclas; the bailiff being the returning officer. As nothing but the circumstance of receiving parochial relief disqualifies any person from becoming a burgess, the number of voters is considerable; those of New Radnor are supposed to exceed 300, and the whole number, including those of the contributory boroughs, is estimated to be about 1300. To be a capital burgess of New Radnor, however, actual residence within the jurisdiction is essential, which is not the case as to the contributory boroughs: and if a capital burgess becomes non-resident he loses his privileges as such. A benefit society, established here in 1778, at present consists of above 100 members, who hold their annual meetings on the 6th of January.

Weekly markets were formerly held here on Tuesdays, but these are, at present, only nominal, notwithstanding some late attempts to restore them. There are still, however, five annual fairs, and there is also an annual wake on the third Sunday in the month of August. The parish of Radnor is divided into three portions, of which the town of New Radnor is the principal, containing, according to the parliamentary returns of 1811, 75 houses, and 380 inhabitants. The public buildings here are the town-hall, the prison, and the church. The last consists of a nave, south aisle, and chancel, with a tower at the west end.

Radnor castle stood on an eminence commanding the town. Of this once majestic pile, a few fragments of walls only remain, but the entrenchments are still entire; the outer ward, called Baili-Glas, or the Green Court-Yard, is yet distinct from the inner one, or keep, and is nearly in its original form. In 1773, on digging within the area of this castle, six or seven small "Gothic arches of good masonry were discovered," besides a variety of ancient instruments. The forest of Radnor extends several miles to the north of the town, covering the slope of a lofty eminence, from the summit of which are very extensive prospects. The principal seats in the vicinity are Downton-hall, the seat of Percival Lewis, esq. and Harpton-court, a seat belonging to Thomas Frankland Lewis, esq. Both these mansions are surrounded by beautiful scenery, and are highly ornamental to this district. About two miles westward from the town is a celebrated water-fall, called Water-break-its-neck, seventy feet in perpendicular height; but it is extremely defective in water, except during the time of floods, when the effect produced is truly grand. At the western extremity of the parish is an entrenched dyke, which formerly extended across the whole vale of Radnor. War-cloze, a field to the eastward of the town, is traditionally said to have been the scene of some military contest, but no particulars respecting it are preserved.

Old Radnor, or *Pen-y-Craig*, is a small village, situated about three miles to the south of New Radnor. Camden supposes it to have been the *Magnos* of Antoninus, which was garrisoned by the Phacienian regiment in the reign of Theodosius the younger; and there seems every reason to believe that it was a place of note in the Romo-British period. The Roman road passed close to the base of the hill upon which the village stands. The church here is a venerable old edifice of stone, with a massive square tower at one end. A curious screen, richly carved in wood, extends across the nave and side aisles. Here are various monuments to the memory of members of the Lewis family of Harpton. Carlisle's Topographical Dictionary of Wales, 4to. 1813. Lipscomb's Tour through Wales.

RADNOR, a small pleasant town of America, in Delaware county, Pennsylvania. The place was originally called "Amstel" by the Dutch, who began to build here. The number of inhabitants is 925.

RADNOR, a town of South Carolina; 10 miles S.W. of Edmondsbury.

RADNORSHIRE, an inland county of South Wales, is bounded on the north by the counties of Montgomery and Salop, on the east by the county of Hereford, and on the south and west by the counties of Brecknock and Cardigan. According to Mr. Clark, it contains 510 square miles, or 346,000 acres, and is politically divided into six hundreds, and fifty parishes; some of which are within the diocese of Hereford, and the remainder within that of St. David's. The parliamentary returns of 1811, state the number of its houses at 4194, and of its inhabitants at 20,900. It sends two members to parliament; one for the county, and one for the borough of New Radnor, with its contributory boroughs. The face of the country is extremely mountainous and bleak in every part of it, but it is intersected by several vallies, which are watered by the Wye, the Teme, the Lugg, the Ithan, the Eddow, and their respective subsidiary streams. These vallies afford a considerable extent both of meadow and arable land; especially the Vale of Wye-Side, and the Vale of Radnor, some portions of which are very fertile, and have a good soil and a congenial climature. In the other parts of the county, however, a barren soil, and a chilly atmosphere, are the predominant characteristics. Nearly two-thirds of its whole extent being either in a state of commonage, or lying wholly waste, agriculture has hitherto made little comparative progress here. Cattle and sheep consequently constitute the chief produce of the county. The number of the latter is indeed very great. Hence Radnorshire is famed for its supply of wool; but notwithstanding this circumstance, singular to say, the manufacture of woollen goods is totally disregarded. The raw material is sold to the manufacturers of the north, by whom the inhabitants of this county are in return furnished with cloth.

Radnorshire contains three market-towns; Presteigne, Rhaiadar, and New-Radnor. The market at the last, however, is only nominal. The county courts are held at Presteigne, which is now the most important and flourishing town in the county. (See PRESTEIGNE.) The chief remain of antiquity within its limits is Offa's Dyke, which commencing at the river Wye, near Hay, skirts the counties of Radnor and Hereford, and passes into Montgomeryshire at Pwll-y-Pyod, a hamlet on the road between Bishop's-castle and Newtown. The only religious house in the county was the abbey of Cwm Hir, founded in 1143, for monks of the Cistercian order, by Cadwathelan-ap-Madoc, which, at the dissolution, was valued at 28*l.* 17*s.* 4*d.* per annum. Of this monastery a considerable part of the buildings is yet standing, though in a very ruinous and dilapidated condition. Leland, in his Itinerary, (vol. v. p. 13.) speaks of its church as the longest in Wales, and informs us, that it was "spoiled and defaced by Owen Glendower." The principal castles in Radnorshire were those of Colewine, Tynbont, Aberhedow or Aber-Edwy, Ewenlles, Radnor, Rhaiadar, and Pain's-castle. Several antiquaries, among whom are Camden, Gale, and Ward, place the Roman station Magnos, or Magna, at Old Radnor, as is mentioned above; but Baxter contends that it should be fixed at Ledbury, in Herefordshire, and Harris at Gaer, near Brecknock. In this county, particularly on the summit of Gwaistedin hill, are several of those collections of stones called in South Wales *karneu*, in North Wales, *kar-nebue*, in Scotland, *cairns*, and in Ireland, *duns*.

Radnor was erected into an earldom by Charles II., in the person of John Robarts, lord Robarts of Truro, but that title became extinct in 1757. It was revived, however, in 1765, in the person of William Bouverie, baron Longford, and viscount Falkstone, whose son Jacob, now earl of Radnor, enjoys his privileges. General View of the Agriculture of the County of Radnor, by John Clark, 4to. Skrine's Tours in Wales. Camden's Britannia. Pennant's Tour in Wales, 8vo.

RADNOTH, a town of Transylvania, on the river Maros; 23 miles W. of Scherburg.

RADOE, a small island in the North sea, near the coast of Norway. N. lat. 60° 35'.

RADOFFIN, a town of Moravia, in the circle of Iglau; 21 miles E. of Iglau.

RADOLFZELL, or **RATOLFZELL**, or *Zell*, a town of Germany, in Aulrian Swabia; situated on the Untersee, or lake of Lille; 10 miles N.W. of Constance.

RADOM, a town of Poland, in the palatinate of Sandomirz; 50 miles N.N.W. of Sandomirz.

RADOMISCHL, a town of Bohemia, in the circle of Prachatitz; four miles N. of Strakonitz.

RADOMISL, a town of Poland, in the palatinate of Lublin; 45 miles S. of Lublin.—Also, a town of Poland, in the palatinate of Kiev; 56 miles N.W. of Kiev.

RADOMSK, or **RADOMSKI**, a town of Poland, in the palatinate of Siradia; 32 miles S.E. of Siradia.

RADONITZ, a town of Bohemia, in the circle of Saatz; 13 miles W.S.W. of Saatz.

RADOSCHITSCH, a town of Poland, in the palatinate of Sandomirz; 20 miles N.E. of Malogocz.

RADOSKU, a town of Prussia, in the palatinate of Culm; 10 miles W. of Lautenburg.

RADSTADT, a town of the archbishopric of Salzburg; 36 miles S.S.E. of Salzburg.

RADT *vor dem Walde*, a town of the duchy of Berg, where Roman Catholics, Lutherans, and Calvinists, have, each of them, a church; 25 miles E. of Daffeldorp.

RADULA. See RASPARTORY.

RADUNPOUR, or **RADIMPOUR**, in *Geography*, a town of Hindoostan, in the country of Agimere, on the river Puddar, or Butlafs; 171 miles N. of Surat. N. lat. 23° 58'. E. long. 71° 48'.

RADZANOW, a town of the duchy of Warsaw; 30 miles N.E. of Ploezko.

RADZIECZOW, a town of Poland, in the palatinate of Belcz; 24 miles W. of Belcz.

RADZIEJOW, or **RODSHOWA**, a town of Poland, in the palatinate of Brzeslye; 25 miles W. of Brzeslye.

RADZIVILOW, a town of Lithuania; 50 miles E.N.E. of Minsk.

RADZYMIN, a town of the duchy of Warsaw; 12 miles N. of Warsaw.

RAEMSDONCK, or **RAMSDONCK**, a small but strong place of Brabant; three miles E. of Gertrudenberg.

RAEPOUR, a town of Hindoostan, in the circar of Gohud, on the Jumnah; 38 miles E.N.E. of Lahaar.

RAERDORP, a town of Holland; five miles N.E. of Amsterdam.

RÆTVIK, a calcareous mountain of Sweden, the height of which is estimated by Bergman at 6000 feet above the sea, observing also, as a singularity, that upon this mountain, and that of Rodaberg, are found vast blocks of reddish felspar, mingled with quartz and brown mica.

RAFAEL, CAPE, a cape on the E. coast of the island of Hispaniola. N. lat. 19° 2'. E. long. 69° 46'.

RAFAEL, *St.*, a town of South America, in the province of

of Caraccas; 40 miles S. of Caraccas.—Alfo, a town of South America, in the province of Moxes; 210 miles E. of Santa Cruz de la Sierra la Nueva.—Alfo, a town of New Navarre; 105 miles S.W. of Casa Grande.

RAFAH, a town of Egypt; 57 miles N.E. of Catieh.

RAFALSO, a small island in the gulf of Finland. N. lat. 60° 20'. E. long. 26° 12'.

RAFFAELLE DA URBINO, in *Biography*. See RAPHAEL.

RAFFLING, a sort of game with three dice, in which he who throws the greatest pair, or pair royal, in three casts, wins the prize or stake.

The word probably comes from the base Latin, *rieflare*, to rifle, plunder, take all away.

The raffle is properly the doublet or triplet: a raffle of aces, or duces, carries it against mere points.

RAFFLING is also used when a company of persons club to the purchase of a commodity, or make small deposits, amounting in the whole to its full value; and he that throws the highest on three dice, or who has the highest number by means of balls thrown on a bagatelle or porto-bello table, takes it.

RAFICA, in *Geography*, a town of Asiatic Turkey, in the government of Diarbekir; three miles S. of Raca.

RAFLUNDA, a town of Sweden, in the province of Skone; 17 miles S. of Christianstadt.

RAFANIA, in *Botany*, a genus of plants, separated from the Linnæan *Crotalaria* and *Liparia*, augmented with several new species from the Cape, and named by its author, professor Thunberg, in the second part of the preface to his *Prodromus Plantarum Capensium*. De Theis is completely in the dark as to the person commemorated in this name, who can be no other than Mr. C. G. Rafn of Copenhagen, author of a *Flora of Denmark and Holstein*, in the Danish language, published in the years 1796 and 1800, in octavo, making two volumes, which include the first ten classes of the Linnæan system. We know not whether any more has appeared. The same botanist has written a work on the physiology of plants; and several papers for the Academy of Sciences at Copenhagen. See Sims and König's *Ann. of Bot.* v. 1. 6.—Thunb. *Prodr.* 123. præf. n. 48. Willd. *Sp. Pl.* v. 3. 949. Ait. *Hort. Kew.* v. 4. 261.—Clafs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, five-cleft, ringent; the upper lip in two broadish distant segments; lower divaricated, in three acute ones, the middle one smallest. *Cor.* Papilionaceous. Standard large, heart-shaped, acute, spreading, depressed at the sides. Wings ovate, about half as long as the standard. Keel acute, the length of the wings. *Stam.* Filaments ten, all united into a linear tube, split along the base; five of them rather the shortest; anthers simple. *Pist.* Germen stalked, linear; style simple, bent upwards at nearly a right angle; stigma obtuse. *Peric.* Legume stalked, oblong-lanceolate, compressed, of one cell and two valves. *Seeds* several, stalked, roundish-kidney-shaped.

Ess. Ch. Stamens all united. Calyx ringent; upper lip divided; lower divaricated, in three segments, the middle one smallest. Legume stalked, lanceolate, compressed.

Obs. The first species in Willdenow, *perfoliata*, *Crotalaria perfoliata* of Linnæus, figured in Smith's *Insects of Georgia*, v. 2. t. 67, is *Baptisia perfoliata* of Brown, in Ait. *Hort. Kew.* v. 3. 5, a genus adopted from Ventenat, and belonging to the *Decandria Monogynia*.

1. *R. amplexicaulis*. Orbicular Rafnia. Thunb. *Prodr.* 123. Willd. n. 2. (*Crotalaria amplexicaulis*; Linn. *Sp.*

Pl. 1003. *Genista perfoliata*, orbiculatis foliis; Seb. *Thefaur.* v. 1. t. 24. f. 5. Linn.)—Leaves reticulated, orbicular, clasping the stem, alternate; the floral ones opposite, coloured.—Native of the Cape of Good Hope. A smooth, handsome, branched shrub, clothed with entire leaves, from one to two inches across, finely reticulated with innumerable veins; the upper ones, which accompany the flowers, smaller, and pale yellowish. Flowers solitary, nearly sessile, yellow, smaller than the floral leaves.

2. *R. elliptica*. Elliptical Rafnia. Thunb. *ibid.* Willd. n. 3, excluding the reference to Andrews.—Leaves slightly veined, elliptic-ovate, acute, alternate; the floral ones opposite, not longer than the flowers.—Native of the Cape. Confounded by Linnæus with the foregoing, from which it differs in having much smaller leaves, sessile, not clasping the stem, quite destitute of reticulated veins. Flowers of a deeper yellow, as long as the floral leaves.

3. *R. cuneifolia*. Wedge-leaved Rafnia. Thunb. *ib.* Willd. n. 4. (*Spartium ovatum*; Berg. *Cap.* 197.)—Leaves obovate, somewhat wedge-shaped. Branches angular. Flowers racemose, terminal.—From the same country. Stem arborescent. Branches rather angular, striated, smooth. Leaves numerous, alternate, ovate, pointed, succulent, smooth, above an inch long; contracted at the base, and tapering down into broad footstalks. Flowers purplish-yellow, in terminal, corymbose clusters. Bergius.

4. *R. triflora*. Three-flowered Rafnia. Thunb. *ib.* Willd. n. 5. Ait. n. 1. Venten. *Malmaif.* t. 48. (*Crotalaria triflora*; Linn. *Sp. Pl.* 1004. *Curt. Mag.* t. 482. *Borbonia cordata*; Andr. *Repos.* t. 31, excluding the synonym.)—Leaves ovate, smooth. Branches angular. Stalks single-flowered, three together.—Native of the Cape, where it was gathered by Sparrmann and Thunberg, and from whence its seeds were sent to Kew garden, in 1786, by Mr. Francis Masson. The plant is biennial, requiring to be sheltered in winter, and flowering in June and July. Stem branched, about a yard high, most leafy in the upper part, smooth, and of a glaucous green, as well as the leaves, which are numerous, alternate, almost sessile, more or less ovate, but varying in size and breadth. Flowers abundant at the summits of the branches, large, yellow, axillary, stalked, three together, the floral leaves smaller than the rest, and often tinged with purple.

5. *R. opposita*. Opposite-leaved Rafnia. Thunb. *ib.* Willd. n. 6. (*Crotalaria opposita*; Linn. *Suppl.* 322. *Liparia opposita*; Linn. *Syst. Veg.* ed. 13. 554. *Spartium capense*; *Sp. Pl.* 995. *Cytisus capensis*; Berg. *Cap.* 217.)—Leaves elliptic-lanceolate; the upper ones mostly opposite. Flowers lateral, on short solitary stalks.—Native of the Cape, apparently unknown in our gardens. Linnæus and his son confounded many different things under this species, some of which being marked in their herbarium as having been gathered by Thunberg, we presume to be among those he has defined; yet it is not possible to determine them all by his short characters, several of which unfortunately contradict the specific names: The stem of the present is described by the younger Linnæus as simple, he considering as *flower-stalks* the copious, alternate, leafy branches, three or four inches long, on which one or two pair of the lower leaves are opposite; the proper floral leaves, like those of the stem, being alternate: all the leaves are elliptic-lanceolate, or somewhat obovate, acute, entire, single-ribbed, an inch or more in length. Flowers either lateral or axillary, among the uppermost leaves, solitary, each on a simple stalk about the length of its calyx. Corolla yellow, not half so large as the last species.

6. *R. axillaris*. Axillary Rafnia. Thunb. *ib.* Willd.

n. 7.—“Leaves lanceolate, alternate or opposite. Flowers terminal.”—This and all the following were gathered by professor Thunberg, at the Cape. In the Linnæan herbarium is a specimen, by whom gathered does not appear, which seems to answer to the above character, (except the leaves being linear-lanceolate,) and which may perhaps explain the paradoxical contrariety between the specific name and character. In this specimen the flowers are really terminal, being solitary at the ends of copious, short, leafy, lateral branches, which are axillary. The whole foliage has a Hyssop-like aspect.

7. *R. angulata*. Angular Rafnia. Thunb. ib. Willd.

n. 8.—“Leaves lanceolate, alternate. Flower-stalks lateral. Stem angular.”

8. *R. spicata*. Spiked Rafnia. Thunb. ib. Willd.

n. 9.—“Leaves lanceolate, alternate. Flowers axillary, racemose.”—Of this species alone, it seems, Willdenow had seen a dried specimen, and we regret that he did not give us some account of it.

9. *R. angustifolia*. Narrow-leaved Rafnia. Thunb. ib. Willd. n. 10.—“Leaves lanceolate, alternate. Flower-stalks lateral. Stem round.”

10. *R. filifolia*. Thread-leaved Rafnia. Thunb. ib. Willd. n. 11.—“Leaves linear-lanceolate, alternate. Flowers axillary.”—The Linnæan herbarium contains two specimens, specifically different, which we presume belong to this and the last, but no human sagacity can appropriate them; except that one of them, with large and seemingly purplish flowers, having rather the narrowest leaves, may be taken for *filifolia*. This is marked as gathered by Thunberg. The other has much smaller and yellow flowers. The stem is round in both.

11. *R. retroflexa*. Bent Rafnia. Thunb. ib. Willd.

n. 12.—“Leaves obovate. Branches reflexed backwards and forwards.”—A specimen from Thunberg answers to the above name and character, except the leaves being rather linear-lanceolate than obovate. Their colour is somewhat glaucous. Flowers mostly terminal, solitary, on short stalks, with an awl-shaped bractea, or abortive leaf, at the base of each stalk.

12. *R. erecta*. Upright Rafnia. Thunb. ib. Willd.

n. 13.—“Leaves oblong. Flowers lateral. Stem erect.”

13. *R. diffusa*. Prostrate Rafnia. Thunb. ib. Willd.

n. 14.—“Leaves ovate, smooth. Stem decumbent.”

All the species turn more or less black in drying. For *Rafnia retusa* of Ventenat, Malmaison. t. 53, see TEMPLETONIA hereafter, and Ait. Hort. Kew. v. 4. 269.

RAFSO, in *Geography*, a small island on the E. side of the gulf of Bothnia. N. lat. $61^{\circ} 37'$. E. long. $21^{\circ} 12'$.

RAFSUND, a town of Sweden, in the province of Jamptland; 28 miles S.E. of Frosön.

RAFT, in *Sea Language*, a sort of float formed by an assemblage of various planks, or pieces of timber, fastened together side by side, so as to be conveyed more commodiously to any short distance in a harbour or road, than if they were separate. The timber and planks, with which merchant-ships are laden in the different parts of the Baltic sea, are attached together in this manner, in order to float them off to the shipping.

This means of conveying timber to navigable situations may be advantageously practised in many places. It is found of great utility in many of the northern parts of the island as well as others, near canals and waters, where a cheap conveyance for such articles is required.

The balsa or catamaran used by the Indians and Spaniards in South America, is only a raft made of the trunks of the balsa; for an account of which, see the article BOAT.

They have one mast, on which is hoisted a large square sail; and a pair of sheers, whose heels rest on each side the raft. When a fore-stay sail is set, a pair of sheers is rigged forward. These rafts were the first conveyance by water, no doubt, long before vessels of a better construction were thought of; and what is rather surprising, they are made to sail with foul winds, and steer, as well as any other kind of vessel, by means of an invention similar to, and perhaps the original of, that which is now called “a sliding-keel.” They have for this purpose planks about ten feet long, and fifteen to eighteen inches wide, which slide vertically in the spaces between the trunks which form the raft. It is only necessary to immerge them more or less, and put down a greater or less number at the fore or after part of the raft, to make it either luff-to, or fall-off from the wind, tack, veer, lie-to, and perform every necessary manœuvre. The number of these planks is five or six, and if one of these planks be drawn up forward, the raft will keep away; and, if one is raised abaft, it will come to the wind. This sort of raft, from the simplicity of its construction, might perhaps be well adapted to many cases of emergency, after shipwreck upon coasts, destitute of all other materials for ship-building.

RAFT-Port, in a *Ship*, a square hole cut through the futtocks of some ships, immediately under the counter, to receive the planks or pieces of timber which are brought to lade her for transportation; and which, on account of their great length, could not be received aboard otherwise.

RAFTERING, in *Agriculture*, a provincial term used for a sort of ploughing in narrow ridges, or small ridglets. It is useful for exposing a large surface of earth to the influence of the atmosphere.

RAFTERS, in *Building*, are pieces of timber, which, standing by pairs on the reason-piece or raising-piece, meet in an angle at the top, and form the roof of a building.

It is a rule in architecture, that no rafters should stand farther than twelve inches from one another.

For the sizes or scantlings of rafters, it is provided by act of parliament, that principal rafters from 12 feet 6 inches to 14 feet 6 inches long, be 5 inches broad a-top, and 8 at the bottom, and 6 inches thick. Those from 14, 6, to 18, 6 long, to be 9 inches broad at the foot, 7 a-top, and 7 thick. And those from 18, 6, to 21, 6, to be 10 inches broad at the foot, 8 a-top, and 8 thick.

Single rafters, 6 feet 6 inches long, to be 4 and 3 inches in their square.

RAFTY, a provincial term signifying damp and musty, as corn or hay in a wet season.

RAG, or RAKE, among *Hunters*, denotes a company or herd of young colts.

RAG, or Ragg, Rowley, in *Mineralogy*. See FERRILITE.

RAG, a torn piece of cloth of any sort. See the next article.

RAGS, *Woollen*, as well as the clippings of pitch marks upon sheep, are good manure. The rags should be chopped small, about an inch or two square, and scattered on the earth at the second ploughing; for being thereby covered they will begin to rot by seed-time. They imbibe the moisture of dews and rain, retain it long, and, according to Dr. Home, keep loose dry soils in a moist state. They formerly cost about fourpence a bushel at London, from whence many loads were sent every year to Dunstable, which is thirty-three miles, where they are laid on even stiff lands, just after the sowing of the corn, allowing to the acre four sacks, of six bushels each; they are much higher now, at more than double

double this price, and no quantity of any great account to be procured. See MANURE, and TOP-dressing.

The farmers in Oxfordshire make use of rags of this sort, procuring them from London and other places, at the rate of from eight to nine pounds the ton, which, with the carriage, stand them in upon the farms from nine pounds ten shillings to ten pounds. By some they are spread upon the clover lands, lays or layers for wheat, in the proportions of from three or four to six hundred weight to the acre. Tried with dung in this way, in the quantity of seven hundred weight to the acre, the dung is found the better dressing. They are also applied for turnips, for which crop they are ploughed in before the winter, as soon as the wheat-fowing is over: if ploughed in at the time of fowing turnips, they will not work for that crop. Some for this crop give half a coat of rags, and half a coat of sheep-fold. When applied on the clovers they seldom last longer than two years. Others think that half a coat of rags, and half a coat of dung, is the most beneficial method of applying this sort of manure. Some think rags are more durable than any other manure. Rags are occasionally brought from Whitney to this district, at from seven shillings and sixpence to eight shillings and sixpence the hundred weight, and five hundred weight spread upon the acre: they commonly last only one crop, but sometimes for two, and are found superior to any thing for wheat. They are ploughed in; and if the season be very dry, do not answer so well. They are supposed to do best on a summer fallow for that crop.

In Suffex rags are chiefly of service in the hop grounds, for which they are thought an excellent manure. Very great benefit is said to have been derived from the application of these rags, in contributing to preserve this sort of plantation in a state of constant moisture and vegetation in the driest seasons, when grounds which have been manured with dung, have been dried up, and the hop crops have failed. Rags have likewise been found very useful on the mowing grounds in some parts of Lancashire, when laid upon them in a pretty full proportion. When cut or chopped sufficiently small, they readily sink down upon the surface of the land, and do not afford any sort of interruption to the scythe, while they absorb and keep in the moisture, which is of material benefit to such grass lands as are inclined to be dry.

RAG, in a *Ship*. See BOLTS.

RAGAL, in *Geography*, a town of Germany, in the county of Pludentz; 10 miles E. of Pludentz.

RAGALBUTO, a town of Sicily, in the valley of Demona; 23 miles S. of Cefalu.

RAGALMATO, a town of Sicily, in the valley of Mazara; 8 miles N. of Naro.

RAGAMMEE, a town of Ceylon, near the W. coast; 58 miles S. of Columbo.

RAGANELLO, a river of Naples, which runs into the gulf of Tarento, near Civita Mandonia.

RAGAPILLY, a town of Hindoostan, in Golconda, near the left bank of the Godavery; 5 miles S.E. of Badrachillum.

RAGATZ, a town of Switzerland, in the county of Sargans; 5 miles S.S.E. of Sargans.

RAGAY, a town on the S. coast of the island of Luzon. N. lat. $13^{\circ} 50'$. E. long. $122^{\circ} 40'$.

RAGGED, in *Heraldry*. See RAGULED.

RAGGED *Hawk*, in *Falconry*, is a hawk that hath its feathers broken.

RAGGED *Robin*, in *Botany*. See LYCHNIS.

RAGGED *Harbour*, in *Geography*, a bay on the E. coast of Newfoundland, being a part of Catalina bay; 2 leagues

N. of Catalina harbour. N. lat. $49^{\circ} 45'$. W. long. $53^{\circ} 40'$.

RAGGED *Helmet*, a small island in the Mergui Archipelago. N. lat. $10^{\circ} 9'$.

RAGGED *Island*, a small island in the East Indian sea, near the island of Paraguay. N. lat. $11^{\circ} 24'$. E. long. $119^{\circ} 30'$.

—Also, a small island among the Bahamas. N. lat. $22^{\circ} 27'$. W. long. $77^{\circ} 16'$.

RAGGED *Point*, a cape on the E. coast of the island of Borneo. S. lat. $2^{\circ} 13'$. E. long. $116^{\circ} 40'$.—Also, a cape on the N. coast of the island of St. Christopher. N. lat. $17^{\circ} 30'$. W. long. $62^{\circ} 42'$.

RAGGIVOLO, a town of Italy, in the department of the Mincio; 19 miles S. of Mantua.

RAGHU, in *Hindoo Mythology*, is the name of the ancestor of Rama, one of their deified heroes, who is hence sometimes called Raghava, or son of Raghu. Budha, or Boodha, another of the Indian deities, is said to have had a son also of this name.

RAGHUVA, a name of the Hindoo deified hero Rama, signifying a descendant of Raghu, a warlike character. All these names are still very common among Hindoos: whether confined to the sect who, as chiefly worshipping Rama, are called Ramanuj, or more extensively given, we are not informed. See RAMA.

RAGIAN, in *Geography*, a town of Persia, in the province of Faristan; 130 miles N.W. of Schiras. N. lat. $30^{\circ} 40'$. E. long. $50^{\circ} 8'$.

RAGLAND, a small village of Monmouthshire, here mentioned on account of its castle, the ruins of which evincing its grandeur and magnificence, command the attention of travellers. During the rebellion it was held for the king, and defended to the last extremity by the marquis of Worcester; 8 miles W. of Monmouth.

RAGMAN'S ROLL, or *Ragimund's Roll*. See ROLL.

RAGNIT, in *Geography*, a town of Prussian Lithuania, on the river Memel, endowed with the privileges of a town in the year 1722. Its ancient castle was famous even in the times of Paganism. The knights of the Teutonic order rebuilt it, with additional works, in 1255; but being destroyed in 1355, it was rebuilt a second time, and called Landshuth; but afterwards it obtained the name of Ragnit from the river which passes by it; 56 miles E.N.E. of Königsberg. N. lat. $55^{\circ} 5'$. E. long. $22^{\circ} 18'$.

RAGOGNA, a town of Italy, in Friuli; 16 miles N.W. of Udina.

RAGOOGUR, a town of Hindoostan, in the Malwa country, and circar of Kitchwana; 116 miles N.E. of Ougein. N. lat. $24^{\circ} 23'$. E. long. $77^{\circ} 30'$.

RAGOTSKI, FRANCIS, in *Biography*, the second of the name, prince of Transylvania, distinguished by his courage and patriotism, was born in 1676, at the castle of Borsih, in Hungary. When he was only a year old he lost his father, prince Francis, and was left to the care of his mother, Helena Sereni, who afterwards married count Tekeli. During his education he was carefully watched by the house of Aultria, and his correspondence with his mother, who had retired to Constantinople, was entirely broken off. He was now suffered to travel to most of the courts of Europe, and to contract a marriage with the princess of Hesse Rhinfelds. Zealously attached to the independence or his country, which was kept in a state of great degradation by the Imperialists, he secretly entered into a negotiation with the French king, Lewis XIV., but being betrayed by one of his confidants, he was arrested, and a charge of treason was preferred against him. The sentence of guilty was soon pronounced, and he was committed to the custody of an officer,

officer, who, however, connived at his escape, and he arrived in a dragoon's habit at the frontiers of Poland. Here he received assurances of assistance from France, and immediately published an eloquent manifesto, calling upon the nation to free itself from the Austrian yoke. Numbers joined him; being, however, but half armed, he was fearful of trusting his cause in their hands, and withdrew to the frontiers of Poland, where he was joined by fresh recruits. With these he ventured to make some progress; stormed several fortresses; and took a severe revenge upon the Imperialists, who had given no quarter to the Hungarian insurgents.

At this period the crown of Poland was vacant, through the deposition of Augustus by Charles XII. of Sweden, and the Polish chiefs were desirous of placing it upon the head of Ragotzki. But he had no such ambitious views: his great object was to liberate his country, and he refused to desert its cause for any other prospects. He accordingly pursued his successes, and by the reduction of Tokay, obtained the submission of almost the whole of Lower Hungary. So high was his reputation, that the diet of Alba Julia, in 1704, proclaimed him prince of Transylvania, with which dignity he was afterwards solemnly invested. He obtained likewise the title of protector of Hungary, and Lewis XIV. sent to him a public embassy. He soon began to feel the difficulty of supporting a popular insurrection against the arms and policy of a powerful sovereign, as well by the abandonment of some of his allies, as by the desertion of his troops. He had another opportunity of giving a refusal to the crown of Poland, which was offered him by the czar Peter, shewing thereby his sincere attachment to the cause of his country, and he employed all the resources of valour and good conduct to support a declining cause. In 1711, a treaty was concluded between the Hungarian states and the emperor, into which he refused to enter, although the first article secured his life and property, with the title of prince of Transylvania. Mortified by the failure of his patriotic exertions, he withdrew to Turkey, renouncing his great estates, and preferring an honourable poverty to a splendid servitude. He afterwards passed some time in France, then returning to Turkey, he fixed his final residence at the castle of Rodosto, on the sea of Marmora. "There," says his biographer, "a Christian among Mahometans, and a philosopher among barbarians, he tranquilly closed his life in 1733, at the age of 61." He left "Memoirs of his Life," which were published in the "Revolutions de Hongrie," printed at the Hague in 1739. In 1751 there appeared a work, entitled "Testament politique et moral du Prince Ragotzki," the authenticity of which is doubted. Moreri.

RAGOUT, or RAGO, a sauce or seasoning, intended to increase or recover the appetite when languishing, or lost.

The term is French, but naturalized. It is also used for any high-seasoned dish, prepared of flesh, fish, greens, or the like, by stewing them with the addition of bacon, salt, pepper, cloves, and the like high-flavoured ingredients.

We have ragoos of beef, of cray-fish, of giblets, of asparagus, of endive, of cocks-combs, of gammon, of celery, &c.

The ancients had a ragout, called *garum*.

RAG-PAVING. See PAVING.

RAG-STONE, a name given by our artificers to a kind of stone, which they use for setting an edge upon knives, chisels, and other tools. It is a greyish-coloured stone, containing a large quantity of talcky particles, and splits easily into thin flakes. It is a soft stone, and is used only to finish the setting an instrument after the edge has been prepared by

grinding or rubbing the tool upon some other stone of a coarser texture. We have this from Newcastle and many other parts of the north of England, where there are very large rocks of it in the hills. This kind of stone is in some districts considerably blended and intermixed with the subsoil, rendering it of a more barren and unfertile quality.

RAGUENET, L'ABBE, in *Biography*. In 1702 the publication of a pamphlet, entitled "Parallele des Italiens et des François en ce qui regarde la Musique et les Operas," by this author, a man of taste and intelligence, who had resided some time at Rome, gave birth to a long, but ineffectual controversy, concerning the degrees of perfection, and superiority of French and Italian music. The book was licensed by Fontenelle, who said in his testimony, that "he thought it would be very agreeable to the public, provided they were capable of equity." This declaration, however, did not prevent Freneuse, the continuator of Bonnet's "Histoire de la Musique," from attacking the author and Italian music in a most furious manner, treating both with equal contempt and obloquy.

The French, after this period, seem to have enjoyed their lyric *sommeils* in great comfort and tranquillity till 1752; when the performance of Pergolesi's "Serva Padrona" at Paris, by a company of burletta singers from Italy, set the musical republic in a flame which has not yet been extinguished.

There had, indeed, been a *sensation* excited, that was rather turbulent, and tending to a civil war, on the first appearance of Rameau as a dramatic composer in 1733, who, by new harmonies and accompaniments, had given offence to the true believers in the worship of Lull; but this soon subsided, and the nation not only heard his compositions with rapture, but revered him as "a theorist, to whom music was as much indebted as physics and philosophy to Newton."

This little work was published in English in 1709, and has been said to be translated by Galliard. If this worthy professor was the translator, it was before he had made himself so completely master of the English language, as he appeared to be afterwards, in his translation of "Tosi on florid Song." The English of this *parallele* is feeble and inaccurate; many of the notes, however, are good, and manifest a person who had been in Italy, and well knew the state of music in that country, as well as in England, at the beginning of the last century, during our first attempts at operas, before the arrival of Handel.

RAGUIER, LE, the name given by the French sailors to a wind peculiar to the gulf of Alexandretta or Scanderoon, which, rushing from the snowy summits of the mountains, frequently forces ships to drag their anchors several leagues.

RAGULED, or RAGGED, in *Heraldry*, is applied to an ordinary, *e. gr.* a cross, whose outlines are jagged or knotted.

He beareth fable, a cross raguled, or, by the name of *Sloway*.

Ragged differs from indented, as the latter is regular, and the former not.

The bearing is very ancient: Julius Cæsar gave for his badge, a boar's head, on a ragged staff.

RAGULED is sometimes also used in the sense of truncated, or couped, and applied to a branch that is sawed from the tree; or a stock sawed from its root.

RAGUN, in *Geography*, a town of Germany, in the principality of Anhalt-Deßlau, on the Mulda; 9 miles S. of Deßlau.

RAGUNDA, a river of Sweden, which rises in the lake

lake Storfio, and in the province of Medelpadia, changes its name to Indal.

RAGUSA, a small republic, situated on the eastern shore of the Adriatic, and nevertheless regarded as an Italian state. It has a population of about 56,000 persons, on an extent of 352 square miles. As this state is adjacent to the territory formerly belonging to the Venetians in Dalmatia, its government was formed on the model of the Venetian aristocracy. Its religion is the Catholic; and its language the Slavonic, though most of the inhabitants speak Italian. The see is archiepiscopal, with six suffragans, and its commerce is considerable. The chief magistrate of the aristocracy in this island, called the "rector," is changed every month. Here is also a council of ten, and a great council composed of all the nobles above twenty years of age, and these nominate the "Pregadi," a senate of sixty, which superintends all state affairs, receives and deposes ambassadors, and confers offices. The revenue of Ragusa was formerly estimated at a ton of gold, or about 10,000*l.* sterling. This small republic has found it necessary to engage the protection of the Turks, for which it pays a tribute of about 20,000 sequins; though the commerce is beneficial to the Ottomans, in supplying them with ammunition. Jealousy of their neighbours induces the Ragusans to shut the gates of their city, except for a few hours in the day. The capital is Ragusa; and it has been lately annexed, together with Dalmatia, to the kingdom of Italy. It now (1814) probably waits for a new allotment. The Ragusans have many country-houses at Gravosa, another sea-port town. Stagno is another little town, subject to Ragusa. Of the Ragusan isles, the chief is Milet, or Melada, fertile in oranges, lemons, and good wine. On the north there is a tolerable haven, with a town of the same name. Three or four little isles in that neighbourhood also acknowledge the sovereignty of Ragusa.

RAGUSA, the capital of the above-mentioned island, is an ancient city, being the Ragusium of the Romans, and in the tenth century it became the metropolis of Dalmatia. In the 13th century it was conquered by the Venetians, and afterwards for a time subject to the crown of Hungary. It is a well-built city, and its commerce is not inconsiderable. The harbour might be rendered capable of a firm defence; and the circumjacent isles are beautified by nature and art. Earthquakes, however, have been terrible; and that of 1667 destroyed 6000 persons; 248 miles N.W. of Saloniki. N. lat. 42° 58'. E. long. 18° 18'.

Ragusa keeps accounts in ducats of 40 grossetti, each grossetto being divided into 6 foldi; but at the public offices accounts are mostly kept in perperi of 12 grossetti. Formerly the ducat represented a real coin struck at Ragusa, and had a fixed value; but since it has become a money of account, it is always equivalent to the Turkish piastre, and therefore liable to a change of value. At Ragusa no gold coins are struck; its silver are the old tallari or dollars, commonly called Vissini or Ragusine, weighing 1 oz. 7 car. (Ragusa wt.), containing 17 parts of pure silver to 13 of alloy, and reckoned at 1½ ducat, or 60 grossetti; but on account of the depreciation of the ducat, the value of the tallari has been proportionably raised in weight. The new tallari, called libertine, weighing 1 oz. 10 car. and containing 9 parts of pure silver to 6 of alloy, was valued at 80 grossetti. But since the year 1796, ducats have been coined of 40 grossetti, weighing ½ an ounce; also perperi of 12 grossetti, weighing 20 carats, and half perperi in proportion: these three coins contain 9 parts of pure silver, and 11 of alloy. The grossetti, none of which have been lately coined, are still in circulation: they weigh the 6th

part of an ounce, and bear the same value with the paras of Constantinople. The ducat of 1796 is worth 13¼*d.* sterling, which is nearly the value of the Turkish piastre. The tallaro, or Ragusina of 1759, is worse than the English standard 4 oz. 2 dwt.; its weight is 18 dwt. 7½ gr., content in pure silver 256.4 gr., and its value in sterling 2*s.* 11¾*d.* That of 1794 is worse 3 oz. 19 dwt., its weight 18 dwt. 17¼ gr.; its content in pure silver 267.6 gr., and value in sterling 3*s.* 1¼*d.* The ducat of 1797 worse 5 oz. 11 dwt.; its weight 8 dwt. 17¾ gr., content in pure silver 97 gr.; and value in sterling 1*s.* 1½*d.* The tallaro or Ragusina has upon it the head of the chief magistrate, or rector; legend RECTOR REIP. RHACUSIN: reverse, arms of the city, legend, DUCAT. ET SEM. REIP. RAC., i. e. ducat and half of the republic of Ragusa. Pieces of 1794, &c. bear the head of a woman, with RESPUBL. RHACUS., reverse, a shield, with the word LIBERTAS, inclosed by two branches, over which is a crown, legend, DUCE DEO FIDE ET JUST. The ducat bears the whole length of a bishop, legend, AUSPICIS TUIS A DEO: reverse, arms of the city, legend, DUCAT REIP. RHACUSINÆ.

The pound with which gold and silver are weighed at Ragusa consists of 12 ounces; the ounce is divided into 6 faggi; the faggio into 22 carats, and the carat into 4 grains. But the pound of commercial weight is equal to 5607 English grains, or 12 oz. 13 dr. avoirdupois; the former being 5062½ English grains. The ell of Ragusa measures 227½ French lines, or 20½ English inches. Kelly's Un. Cambiit.

RAGWORT, in *Botany*. See OTHONNA, SENECIO, and SOLIDAGO.

RAGWORT, in *Agriculture*, a very pernicious plant of the weed kind, which is sometimes termed seagrim. It has a green stalk in its early state, but, as it advances in age, inclining to violet or purple, especially downwards. Its flowers are yellow, and thick-set, and composed each of a number of small pointed leaves. It runs to seed in the latter end of summer. The smell, both of the stalk and leaves, which are jagged, as well as the flower itself, are so offensive to animals, as that hardly any will feed upon it, except when almost starved.

It has been proposed to destroy it by picking out the roots, and feeding the land close with sheep. It mostly affects meadows and pasture lands when the soils are good.

RAHA, in *Geography*. See JERICHO.

RAHABAH, or RABBA, town of Arabia Deserta, near the Euphrates, on the road by which caravans travel from Syria to the Arabian Irak; 110 miles S.W. of Moful. N. lat. 35° 5'. E. long. 40° 21'.

RAHABAH Melik Ben Tawk, a town of Asiatic Turkey, in the province of Diarbekir, on the Euphrates; 50 miles S. of Kerkiiseh.

RAHABY, a town of the desert of Syria, containing about five or six thousand inhabitants, situated on a plain, surrounded with date-trees; 70 miles N. of Mesghid Ali.

RAHANPOUR, a town of Bengal; 42 miles N.W. of Nattore.

RAHAPPA, a small island in the East Indian sea, near the E. coast of Borneo. N. lat. 4° 58'. E. long. 114° 4'.

RAHAS, in *Ichthyology*, a name given by some authors to the torpedo, or cramp-fish.

RAHEINA, in *Geography*, a bay on the W. coast of Mowhee, one of the Sandwich islands. N. lat. 20° 50'. E. long. 203° 19'.

RAHEMAT, a large lake in the Arabian Irak, 90 miles in circuit, near Mesghid Ali.

RAHENSTEIN, a town of Bohemia, in the circle of Saatz; 19 miles S.W. of Saatz.

RAHMANIE, a town, or rather village, of Egypt, built

built on the W. bank, at the entrance of the canal of Damankour, which is navigable only at the rise of the Nile; 9 miles S. of *Faoué*; which see.

RAHMETABAD, a town of Persia, in the province of Irak; 20 miles N.E. of Confar.

RAHNIS, or **RAKIS**, a town of Saxony, in the circle of Neustadt; 10 miles S.W. of Neustadt. N. lat. $50^{\circ} 33'$. E. long. $11^{\circ} 40'$.

RAHNY, a town of Bengal; 25 miles N.W. of Dinagepour.

RAHON, a town of France, in the department of the Jura; 6 miles S. of Dôle.

RAHOON, a town of Hindoostan, in the subah of Lahore; 108 miles S.E. of Lahore. N. lat. $31^{\circ} 7'$. E. long. $75^{\circ} 42'$.

RAHU, in *Astronomy*, is the Hindoo name of the planet of the ascending node, or dragon's head. Ketu is the name of the other node; and a fable, in the usual style of mythological allegory, is given under that article, of their origin and mishap. The malignant Rahu was decapitated, and Ketu was his head. In one painting of the Hindoo zodiac, the headless Rahu is represented of a black colour, in red clothing, mounted on an owl, and holding a lotus in his hand: in another, he holds a spear, and stands on a tortoise. In the fable given under Ketu it is related that Vishnu was the decapitator of Rahu: other accounts assign that office to Narayana. Among the Hindoos, as we have had occasion to remark in several articles, their sciences, as well as their history and religion, are enveloped in a mass of mythological allegory: a farther instance of which, connected with the subject of this article, is seen under **ECLIPSE** (*Note*. A reference being made from the article **KETU** to this, we take the opportunity of correcting two typographical errors in that article. In its early part, for *Karyapa*, read *Kasyapa*; and in the fourth line of the second column, for *or read a.*)

RAHWAY, in *Geography*. See **RAWA**.

RAI, or **RAE**, an ancient town of Persia, in the province of Irak, before Ispahan the capital of Persia. This was once a grand and proud city; and its ruins still cover a great extent of country. It holds a distinguished place in the annals of Persia: it is mentioned by Arrian and Diodorus Siculus, as the capital of the province of Rhages, so called from the calamities brought upon this part of the empire by the earthquakes to which it formerly was, and is still subject. It is frequently mentioned in the wars of the renowned Haroun al Rashid; it was the capital of this part of Persia, in the reign of Alp-Arslan, and continued to flourish until it was sacked by the generals of Jenghis Khan. Its ruins are situated five miles S. of Tehraun, the present capital of Persia; and in the centre of them is a village, called Sheik Abdul Azzeem, from a son of the seventh Imam, to whose memory a noble mosque and mausoleum have been erected.

RAJA, denoting *king*, an appellation given in Hindoostan, or the empire of the Mogul, to princes descended from those that ruled there before the conquest of the Moguls; who exercised all rights of sovereignty, only paying a tribute to the Great Mogul, and observing the treaties by which their ancestors recognized his superiority.

There are some rajahs who still retain a more independent sovereignty in the mountains: the Indians call them *rai*; the Persians, plurally, *raian*: our travellers call them *rajahs*, or *rajahs*. These have under their command soldiers, called *rajahs*, or persons descended from rajahs, who are a robust and brave people, and who enter into the service of those

who will pay them. The Great Mogul has several of these rajahs in his service.

The chief lords of the Moguls, *viz.* the vice-roys, governors of provinces, and chief ministers of state, F. Catterow observes, are called *ombras*; and the idolatrous rajahs, or Indian lords who governed petty states before the conquest of their country, held the same rank at court with the *ombras*.

All the difference was, that the children of the rajahs succeeded their fathers in the show of the sovereignty left them; whereas the children of the Mahometan lords lose all in losing their fathers.

The Indians account four ages from the beginning of the world: and in the second, which lasted 1,296,000 years, they hold the rajahs or kchatrys had their rise; a noble cast, though inferior to the Bramins. Vice then, they say, began to creep into the world; men only lived to 300 years, and their stature was reduced, &c.

RAIA, the *Ray*, in *Ichthyology*, a genus of fishes of the order Chondropterygia, of which the generic character is, that it has five oblique spiracles on each side, placed beneath the neck; the head is small, pointed, and not distinct from the body; the mouth is beneath transverse, toothed; the body is broad, thin, and flat.

The individuals of this genus are all inhabitants of the sea only: they keep at the bottom, and in winter cover themselves with sand and mud: they feed on testaceous animals, fish, or any animal substances which they may happen to meet with. They grow to a large size, sometimes exceeding 200lbs. in weight. The females are the larger, and produce their young alive, only one at a time, which, like the shark tribe, are enclosed in a quadrangular, black, horny shell, the corners of which end in slender incurved points, but not extending into long filaments, like those of the shark: the eyes are half covered with a thin membrane, oblong, placed on the upper part of the head: above these, in the place of nostrils, is a broad sulcus or groove, divided by a reticulate membrane, consisting of crested folds, and closed with a valve: behind this sulcus are two small femilunar orifices: the tongue is very broad, short, and smooth. The ventral fins are covered with a thick skin, and surrounding the body; the ventral at the base are connected with the anal; the flesh is generally eatable; the liver is large, and producing a great quantity of pure oil.

Of this genus there are nineteen species, divided into three sections: *viz.* A, comprising the electric ray, or torpedo and skates: these have sharp teeth. B, including the sting-ray and thornbacks, having obtuse teeth. And C, which are denominated uncertain, comprising five species, which inhabit the Red sea, or about the Cape of Good Hope, but which have not yet been sufficiently examined.

Section A.—*With sharp Teeth.*

Species.

* **TORPEDO**; Electric Ray. The body of this fish is entirely smooth and flat. The species inhabits the Mediterranean, and grows to a large size: some have been taken that have weighed from 60 to 80lbs. each, but the average weight is less than 20lbs. It is of a dirty clayish colour; the head and body are round, and but indistinctly separated. The body is extremely thin; behind the eyes are two wide foramina, which have been supposed to be intended by nature for conveying sound; they are beset with six cutaneous fingers on their inner circumference, and communicate with the mouth. The torpedo can live about twenty-four hours out of the sea, and a short time longer, if put into fresh water;

water; it inhabits those places where the bottom is sandy, and buries itself superficially by flinging the sand over its back with a sort of vibration, which it gives to its extremities. It is in this situation that the torpedo astonishes and terrifies the unwary passenger, who inadvertently treads upon it, by the exertion of its electrical or benumbing faculty. This power is serviceable to the animal in two important respects; as a means of defence against voracious fishes, and as a method by which he is enabled to procure his subsistence from among the smaller tribes; for the former, when electrified, are deprived of all possibility of seizing their prey; and the latter, after having unwarily approached the torpedo, and received the shock, are incapable of making their escape. (See TORPEDO.) The food of the torpedo is furmulletts and plaice; the former are so swift, that it is impossible for the torpedo to take them by pursuit, and as this fish has been found in its stomach, it is presumed that it was taken by means of the electrical shock. The torpedo has been taken off Pembroke, at Torbay, and near Waterford in Ireland. It is caught like other flat fish, with the trawl, and is commonly found in water forty fathom deep, in company with other species of this genus.

* **BATIS**; the Skate. This species is varied; the middle of the back is smooth; the tail is beset with a single row of spines. It inhabits the European ocean, and is thought to be the largest fish of the genus: the body above is cinereous, sometimes with a few black lines, beneath white, with wavy lines of black dots; round the eyes are numerous small, hooked spines; in the males the fins are full of spines. Of all the larger fishes, the skates are the most numerous, and their numbers are in a great measure owing to their size, and to the protection afforded them by those frightful spines which nature has afforded them. There is not one of the rapacious tribes, excepting, perhaps, the cachalot and white shark, that has a swallow sufficiently large to receive them, and even these are probably deterred from their purposes of destruction by the armour with which their prey is covered. Of some the size is such as to defy all powers of destruction which even the shark himself possesses. In England some of the species have been taken, weighing upwards of two hundred weight, but even this is far inferior to their enormous bulk in other parts of the world. Near the island Guadalupe, a ray was killed more than twenty-five feet long, and almost fourteen broad. After all, the fishes of this tribe probably attain a much larger size than that of any individual which has ever yet been examined. It is only the smallest of the kind that approach the shores; the largest continue for ever prowling at the bottom in the unfathomable caverns of the ocean, where they continue perhaps to grow for a century.

The fishes generate in March and April, at which time they swim near the surface of the water, several males pursuing one female. The females cast their *purfes*, as they are called, in May, and continue to produce till September: they are very prolific, not less than three hundred eggs having been found in the body of a single female. The rays generally frequent those parts of the sea where the bottom is black and muddy, where they devour every thing indiscriminately, but they are more delicate with regard to a baited hook. They devour any putrid substances whatever, but if the bait has been taken up and suffered to lie for any time in the open air, they will not touch it; they appear to perceive the line, and to dread it; but the impulse of hunger overcomes their caution, and even though they perceive the danger, if thoroughly hungry, they devour the bait, as if regardless of the consequences. See SKATE.

OXYRINCHUS; Sharp-nosed Raia. Varied; middle of

the back with ten spinous tubercles. This is similar in shape to the skate, but with a longer and sharper snout: the colour of the whole upper part is cinereous, with several pale or whitish spots, intermixed with a few slight dusky streaks or variegations; beneath it is white, with dusky or blueish streaks; down the back and tail runs a single row of spines, and a few others are placed about the region of the eyes: the sides of the tail are also sometimes furnished with a row of smaller or weaker spines than those on the upper part; the eyes are large, as is also the mouth. This species, like the skate, sometimes, but not often, is taken of a very considerable size. It is a native of the Mediterranean and Northern seas.

MIRALETUS. This species has a smooth belly and back: it has spines near the eyes, and a triple row of them on the tail. It inhabits the Mediterranean; the body above is marked with an ocellate spot.

* **FULLONICA**; the Fuller Ray. The back is covered with spines; the eyes with a single row; pectoral fins and tail with a triple row. It inhabits the European seas; grows to a large size; the body above is cinereous, with numerous black spots; beneath it is white. The snout of this fish is short and pointed; the nictitant membrane is fringed; the teeth are small and sharp; and the tail is slender. It has been thought by some authors that this is only a variety of the next species.

* **RUBUS**; Rough Ray. The back of this species has a single spine; and the tail is beset with a triple row of spines. This is greatly allied to the thornback, but covered with more numerous spines, every part of the skin on the upper surface being mucronated with sharp curved aculei of different sizes: of these, one row of the largest runs down the middle of the back, and three, or sometimes five, along the tail; others are dispersed about the eyes and the flaps of the pectoral fins: the general colour is a yellowish or whitish-grey, sometimes variegated with dusky or brownish clouds and streaks; the under side is white, and beset with very numerous scattered spines, but less strong than those on the upper side. It is about the size of a thornback. Mr. Pennant mentions one that measured nearly three feet from the nose to the tip of the tail. It is a native of the Mediterranean and other seas.

B.—Teeth obtuse.

Species.

SEPHEN. Body nearly round; tail twice as long as the body, winged beneath, and with two long spines above, serrate on each side. It inhabits the Red sea, and is sometimes so large, as to reach three yards across; body above brown, with three rows of large hemispherical tubercles down the middle of the back; beneath it is quite flat and smooth, and it is of a reddish-white. It is from the skin of this species that the beautiful substance called *Guluchat* is prepared by the French, and which, being coloured with blue, green, or red, according to the fancy of the article, and afterwards polished, is so frequently used for various kinds of cases, telescope tubes, &c. For this purpose the smaller or younger specimens are preferred; the tubercles in the more advanced or full-grown animals being too large.

There is a variety of this species: the length of the specimen described by Dr. Russell was about $9\frac{1}{2}$ inches; the tail is about two feet nine inches long; the colour of the whole animal is a dull leaden above, with a deep blue tail; beneath it is dusky white; on the middle of the back there are only two pearl-formed tubercles instead of three; the tail is furnished with a sharp spine and a fin beneath. It is a native of the Indian seas.

AQUILA. The body is smooth; the tail is pinnate, with a long ferrate spine. This species is of a rhomboidal shape, but with a considerable dilatation: the pectoral fins approach to a subfalcated form: the colour is cinereous above; pale or whitish beneath: the head is rather large, and the snout produced: the eyes are large and prominent, with yellow irides: the tail is long, slender, sharp-pointed, and furnished about the middle with a spine similar to that of the sting-ray. This species grows to a very great size, sometimes measuring ten, twelve, or even fifteen feet in length, and weighing upwards of three hundred pounds. It is found in the Mediterranean, Atlantic, and Indian seas, and is said to swim in a slower manner than most other rays; it preys on smaller fishes, and is supposed to strike and kill, or at least disable its prey with the caudal spine: when taken, it is observed to vibrate the tail with great strength and rapidity in all directions. It is not reckoned among the edible fishes; but the liver, which is very large, is said sometimes to be eaten, though it is more frequently used for the purpose of preparing from it a clear oil, which it affords in great plenty.

* **PASTINACA;** Sting-ray. The body of this species is smooth; its tail has a long sharp spine, ferrate on the fore part, and another on the back: there are two other varieties, of which the one has a smooth body; the back is beset with two spines, ferrate on the fore part; the body of the other is covered with spots.

This species is described as having a body somewhat approaching to the ovate, the pectoral fins less pointed than in some other species of this division. The snout is pointed; the body more convex than usual; the colour of the whole animal above of a yellowish-olive, but the back is sometimes found to approach to a blueish-brown; beneath it is whitish; the tail is of a considerable length, and without a fin, very thick at the base, and gradually tapering to the extremity, which is very slender: near the middle it is armed, on the upper part, with a very long, flattened, and sharp-pointed bone or spine, finely ferrated in a reversed direction on both sides: with this the animal is capable of inflicting very severe wounds on such as incautiously attempt to handle it; and it answers the purpose both of an offensive and defensive weapon. This weapon is annually cast, and as it frequently happens that the new spine has arrived at a considerable size before the old one has been cast, the animal is occasionally found with two, in which state it has been sometimes erroneously considered as a distinct species. This fish is said not to grow to a very large size. It is found in the Mediterranean, Atlantic, and Indian seas, and is numbered among the edible rays. On account of the danger attending the wounds inflicted by the spine, it is usual with the fishermen to cut off the tail as soon as the fish is taken. In some countries it is said to be illegal to sell the fish with the tail adhering to it.

It was formerly thought that the spine of the fish possessed a venomous quality, by infusing into a wound made by it some very active poison; this is now proved to be completely erroneous, and the effects sometimes produced by it arise entirely from the deepness of the puncture and laceration, which, if taking place in a tendinous part, or among the larger nerves and blood-vessels, have often proved fatal. It may not be amiss to observe, that some ancient writers have descanted upon the effects of this animal's powerful weapon in terms of considerable luxuriance; it was supposed to be not only poisonous in the living animal, but to preserve its poison when taken from the fish, and affixed to the head of an arrow or a spear; it was said even to destroy the most healthy and flourishing plant by its touch, and

even to cause trees to die by striking the bark with its point. It formed the head of the fatal spear presented by Circe to her son Telegonus, by which he was rendered superior to his enemies, and with which he, at length, unconsciously, slew his father Ulysses. The general habits of this species are similar to those of the rest of the genus, often lying flat, and in ambush on the soft mud at the bottom of the shores which it frequents, and seizing its prey by surprise; at other times it will pursue it through the depths of the ocean.

* **CLAVATA;** Thornback. The body of this species is spinous; the teeth tuberculate; across the belly is a strong femular cartilage. This species grows to a very considerable size, though rarely equal in magnitude to the skate already described; in its general appearance it resembles that fish, but is somewhat broader in proportion, and is readily distinguished from the skate by the very strong, curved spines with which its upper surface is covered; these are most conspicuous down the middle and on each side of the back, where four or six, of much larger size than the rest, are generally seen; the remaining parts being furnished with many scattered spines of a smaller size, intermixed with still more minute ones, and the whole skin is of a rough, or shagreen-like surface; the back is marked with an uncertain number of pale or whitish round spots of different sizes, and which are commonly surrounded with a blackish or dark coloured edge; these spots are said to be caused by the shedding of the spines at different intervals; along the middle of the back runs a single row of strong spines, continued to the tip of the tail; the colour of the skin is a brownish-grey, with irregular blackish or dusky variegations; the under part is white, with a light cast of flesh-colour, and about the middle of the body, as well as on the fins, are disposed several spines similar to those on the upper side, but less strong. The thornback is an inhabitant of the Mediterranean and other seas, and is held in some esteem as food, though not considered equal to the skate in goodness.

RHINOBATOS. Body long, tapering; snout lengthened. This is reckoned a very remarkable species, and is thought to connect in some degree the genera of raia and squalus, the body being much longer than in the preceding kinds of ray; the snout is lengthened, but not very sharp; and the body, which is moderately convex above, and flat beneath, gradually tapers from the shoulder to the tail, which is furnished above with two fins, of an oblong shape, and situated at a considerable distance from each other: the tip of the tail is also dilated into an oblong fin. The colour of the whole fish is of a dull earthy brown, paler beneath, and the skin is every where roughened by minute tubercles. This fish is said to grow to the length of about four feet, and is a native of the European seas. It is very frequently seen about the coasts of Naples.

DJIDDENSIS. Tail-fin two-lobed; spines in a triple row at the beginning of the back, and afterwards in a single row; the first dorsal fin is above the ventral. It inhabits the Red sea, and is about two yards long. The body is a little rough, and of a pale ash colour; above it is varied with whitish spots; beneath it is whitish; behind the vent are a few brown and white stripes.

LYMMA. Body oval, smooth, testaceous, with blue spots; pinnate tail with a single spine. It inhabits the Red sea; is hardly a foot long; the spots oval, unequal, beneath whitish. It is much allied to the eagle-ray, and is of a reddish-brown colour above; the tail is somewhat longer than the body, marked above, for half its length, with two longitudinal blue stripes, and is furnished about the middle with one, and sometimes with two, large and ferrated spines, which

which are covered at their base by a blueish-brown skin; the under part of the body is pale or whitish.

ARNAK. Body orbicular, silvery; tail round, without a fin, and furnished with two spines. It inhabits the Red sea; the teeth are granulate.

C. Uncertain.

OMMESSCHERIT. Tail round and spotted. It inhabits the Red sea, and very much resembles the *R. pastinaca*.

TAJARA. Tail round; body beneath snowy. It inhabits the Red sea. When just taken, it beats violently with its fins.

SCIOUKIE. Body with a few remote spines. It inhabits the Red sea. The Arabians make scabbards for their swords out of its skin.

MULA. Beneath snowy; tail round, variegated. It inhabits the Red sea, and approaches the shores by night. The spine on its tail inflicts a dangerous wound.

RAPENSIS. Back with a single fin; the tail is short, pinnate at the end; the body is smooth and unarmed; and the snout is a little obtuse. It inhabits near the Cape of Good Hope, is shaped something like the torpedo, except that it has a fin on the back. The body is small and orbicular; above it is convex, beneath flat.

RAJABARRY, in *Geography*, a town of Bengal; 10 miles S. of Dacca. N. lat. 23° 24'. E. long. 90° 36'.

RAJACOTTY, a town of Thibet; 60 miles N.N.W. of Sirinagur.

RAJĀGUNGE, a town of Affam; 16 miles S. of Gentiah.

RAJAGUR, a town of Hindoostan, in Bahar; 35 miles W.S.W. of Gayah.—Also, a town of Hindoostan, in Guzerat; 10 miles N.E. of Champaneer.

RAJAHUN, a town of Hindoostan, in the circar of Cicacole; 12 miles W. of Cicacole.

RAJAKERA, a town of Hindoostan, in the province of Agra.

RAJAMUNDRY, a circar of Hindoostan, bounded on the N. by the circar of Cicacole and Golconda, on the E. by the bay of Bengal, on the S. by the circar of Ellore, and on the W. by Golconda. It is crossed by the Bain Gongra from N. to S.—Also, the capital of the above-mentioned circar, situated between Ellore and Cicacole, on the Godavery. Its principal riches consist of forests of teak-wood. N. lat. 17°. E. long. 81° 57'.

RAJANAGUR, a town of Bengal; 25 miles S. of Dacca.—Also, a town of Hindoostan, in the circar of Rajamundry; 7 miles N.E. of Rajamundry.

RAIANIA, in *Botany*, so called in honour of our immortal naturalist, the Rev. John Ray, the most accurate in observation, the most philosophical in contemplation, and the most faithful in description, amongst all the botanists of his own, or perhaps any other, time. His life will be given hereafter, in its proper place. Plumier, who established this genus, finding the name *Raia* preoccupied by zoologists, contrived to call the plant *Jan-Raia*; which Linnæus turned about into *Rajania*, still retaining the idea of the Christian name, combined with the other. But such an idea is ludicrous to English ears, and is happily not, in general, perceived. We presume to alter the orthography in one letter, writing the word as it is always pronounced, and deducing it regularly from the Latin *Raius*, by which name the person commemorated is known all over the literary world.—Plum. Gen. 33. t. 29. Linn. Gen. 525. Schreb. 692. Willd. Sp. Pl. v. 4. 788. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 391. Juss. 43. Lamarck Illustr. t. 818. Gærtn. t. 14.—Class and order,

Dioecia Hexandria. Nat. Ord. *Sarmentacea*, Linn. *Aspiragi*, Juss.

Gen. Ch. Male, *Cal.* Perianth bell-shaped, in six deep, oblong, pointed segments, most spreading in their upper part. *Cor.* none. *Stam.* Filaments six, bristle-shaped, shorter than the calyx; anthers simple.

Female, *Cal.* Perianth superior, of one leaf, bell-shaped, in six deep segments, permanent, withering. *Cor.* none. *Pist.* Germen inferior, compressed, with a prominent border at one side, three-celled; styles three, the length of the calyx; stigmas obtuse. *Peric.* Capsule membranous, of three cells, without valves, crowned by the calyx; two of the cells barren, almost obliterated, without wings; the third fertile, compressed, extended into a very large, half-ovate, membranous wing. *Seed* solitary, nearly elliptical, compressed.

Eff. Ch. Male, Calyx in six deep segments. Corolla none. Female, Calyx in six deep segments. Corolla none. Styles three. Capsule membranous, with one wing. Seed solitary.

Section 1. Leaves simple.

1. *R. hastata.* Halberd-leaved Raiania. Linn. Sp. Pl. 1461. (*Jan-Raia scandens, folio oblongo, angusto et auriculato; Plum. Gen. 33. Bryonia fructu alato, foliis auriculatis; Plum. Amer. 84. t. 98.*)—Leaves hastate; somewhat heart-shaped at the base.—Gathered by Plumier, about Port-de-peace in the island of Hispaniola. *Root* perennial, sometimes large and ovate; sometimes four or five inches long, and two thick, round at each end, like a saffage. Its substance resembles that of a radish, without any internal fibres; the bark thin, ash-coloured, a little rugged and warty; the flesh very white, tasting like a bean. This root throws up only one very slender, long, climbing, smooth, knotty stem, thickest at the base, where it is accompanied by several fibrous radicles. We presume it to be annual. *Leaves* scattered, spreading, on short stalks, smooth and membranous, about three inches long; heart-shaped, dilated, abrupt, and seven-ribbed at the base; then suddenly elongated into a nearly linear, entire, central, three-ribbed lobe, bluntish, with a small point; the under side paler, and rather downy. *Stipulas* in pairs, awl-shaped, minute. *Flowers* small, whitish, in simple, axillary, drooping clusters. *Braçteas* minute, ovate, acute, solitary at the base of each partial stalk. *Fruit*, as Plumier says, like half that of a maple-tree, of a silvery blue when young, but afterwards tawny.

2. *R. cordata.* Heart-leaved Raiania. Linn. Sp. Pl. 1461. Ait. n. 1. (*Jan-Raia scandens, foliis tamni; Plum. Ic. 148. t. 155. f. 1.*)—Leaves ovate; somewhat heart-shaped at the base; seven-ribbed.—Native of the West Indies, from whence it was sent to Kew garden, in 1786, by Mr. Alexander Anderson. It flowers in the stove in July, and we cannot but wish some accurate botanist would publish a good figure and description of the plant, out of respect to its name. Plumier represents the habit of the root, stem, &c. much like the foregoing; but the leaves are regularly ovate, pointed, more or less heart-shaped at their base, and furnished with seven ribs continued from that part to the point. These ribs are connected by numerous transverse veins. *Inflorescence, flowers, and fruit*, much as in *R. hastata*, but having seen no specimen, we can say nothing respecting the *stipulas* or *braçteas*, none of which are noticed in the plate.

3. *R. ovata.* Ovate-leaved Raiania. Swartz Ind. Occ. v. 1. 638. Mart. Mill. Dict. n. 4.—“Leaves ovate, pointed, three-ribbed.”—Native of bushy places, on the hills of Hispaniola. *Stem* shrubby, twining, thread-shaped, subdivided;

subdivided; with slender, smooth, leafy branches. Leaves rather distant, stalked, smooth on both sides, pointed, entire, three-ribbed, veiny; ovate at the base. Footstalks round, smooth, often as long as the leaves. Clusters axillary, numerous, longer than the leaves, slender, many-flowered, rather zigzag. Flowers digecious; the males in compound clusters; females in simple ones, all stalked, and turned toward one side. Corolla very minute, yellowish-green in the male, reddish in the female blossoms. Capsule compressed, with an ovate, falcate, membranous wing. Swartz.

4. *R. angustifolia*. Narrow-leaved Raiania. Swartz Ind. Occ. v. 1. 639. Mart. n. 3.—Leaves linear-lanceolate; rounded at the base, three-ribbed.—Native of extremely dry bushy places, in the west part of Hispaniola, where it climbs upon high trees, flowering in May. Root annual. Stem thread-shaped, round, twining, flaccid, subdivided, smooth. Leaves nearly a span long, entire, three-ribbed, veiny, smooth. Footstalks smooth, red, twisted according to the direction of the stem. Clusters axillary, in pairs, the length of the leaves, pendulous, slender, many-flowered; the flowers very minute, nearly sessile, red, polygamous, five or six on each of the alternate partial stalks, all leaning one way. Bractees very minute, acute, blood-red, under the flowers. On some plants the latter are entirely male, with six nearly sessile anthers; on others all hermaphrodite, with six perfect stamens, a triangular oblique germen, no style, but three minute stigmas. Capsule as in the rest of the species. Swartz.

5. *R. quinquefolia*. Five-leaved Clustered Raiania. Linn. Sp. Pl. 1462. (Jan-Raia scandens quinquefolia; Plum. Ic. 149. t. 155. f. 2.)—Leaves five together at each joint, elliptic-oblong. Clusters lateral, between the joints.—Native of the West Indies, but hitherto observed by Plumier only. This seems to have the habit of all the foregoing, except that the stem has tumid joints, at each of which stand five elliptic-oblong, obtuse, entire, three-ribbed leaves, about three inches long, on short footstalks. The clusters are represented not axillary, as in the others, but lateral and alternate, from the spaces of the stem between the joints.

Section 2. Leaves compound.

6. *R. quinata*. Five-leaved Umbellate Raiania. Thunb. Jap. 148. Mart. n. 6.—Leaves five on a common stalk, emarginate. Umbels axillary.—Observed by Thunberg about Nagasaki and in Kofido, in Japan, flowering in April and May. The Japanese call this plant *Fagi Kadzura*, and *Akeli*. Stem twining, round, smooth, ash-coloured, branched. Leaves several together, axillary, stalked, smooth, of five separately stalked, umbellate, ovate, entire leaflets, each from three-quarters of an inch to an inch and a half long, emarginate with a point. Common footstalks thread-shaped, smooth, two inches or more in length; partial half as long as the finger nail. Flowers in umbels, from the same buds as the leaves, on slender stalks as long as the footstalks; partial stalks capillary, the length of the nail. This species differs from the last in having compound leaves, and umbellate flowers. Thunberg.

7. *R. hexaphylla*. Six-leaved Clustered Raiania. Thunb. Jap. 149. Mart. n. 7.—Leaves six on a common stalk, oblong, acute. Flowers racemose.—Native of the country of Fokonia, in Japan, among bushes, flowering in April. Its vernacular names are *Akeli*, *Mbe Kadzura*, and *Tsu So*. The stem is round, striated, smooth, climbing. Leaves alternate, smooth, six on a stalk, umbellate, on slender partial stalks, oblong, acute, entire, veiny, two inches long; pale at the back. Common footstalks round, bent, three or four

inches long, swelling at each extremity. Flowers in axillary clusters, snow-white. Differs from *R. quinata* in having mostly six leaflets on a stalk, which are acute, reticulated with veins at the back, and larger than in that species. The flowers moreover grow in clusters, not umbels.

RAJAPILLA, in Geography, a town of Hindoostan, in Mysoor; 16 miles N.N.E. of Anantpour.

RAJAPORUM, a town of Hindoostan, in Barramaul; 35 miles S. of Darempoury.

RAJAPOUR, a town of Hindoostan, in the circar of Hissar; 48 miles W. of Hissar.—Also, a town of Hindoostan, in the circar of Gohud; 10 miles W. of Janfi.—Also, a sea-port of Hindoostan, in Concan, where the English and French had formerly factories. The place has a good harbour, but it is not now frequented; 6 miles N. of Geriah.—Also, a town of Bengal; 16 miles S. of Silhet.—Also, a town of Bengal; 50 miles N.W. of Burdwan.—Also, a town of Hindoostan, in Bahar; 27 miles W. of Arrah.

RAJARAJESWARI, in Mythology, a name of the Hindoo goddess Parvati. It means, in Sanscrit, consort of the lord of the king of kings. In the masculine it is Rajrajswara, and is then a name of her lord Siva. See that article.

RAJARSHI, is one description of faint or sage, of whom four sorts are comprehended in the more general term of Rishi. Rajarshi means a royal sage, and is the lowest of the four; the Devarshi, or divine sage, being, as may be supposed, where Brahmans are the givers of dignity, the first. See more hereon under MAHARSHI and RISHI.

RAJASEE, in Geography, a town of Hindoostan, in the circar of Gohud; 10 miles S.W. of Datteah.

RAJASERAI, a town of Hindoostan, in the circar of Sirhind; 17 miles E.S.E. of Sirhind.

RAIBACH, a town of Bavaria, in the territory of Rothenburg; 7 miles S. of Rothenburg.

RAIBAUG, a town and circar of Hindoostan, in Viapour; 23 miles S. of Masritch. N. lat. 16° 35'. E. long. 74° 52'.

RAIBOLINI, FRANCESCO, in Biography. See FRANCIA, IL.

RAJBULHAUT, in Geography, a town of Bengal; 30 miles S. of Burdwan. N. lat. 22° 45'. E. long. 88° 7'.

RAICAN, a town of Persia, in the province of Irak; 15 miles N.E. of Hamadan.

RAICZ, a town of Hungary; 6 miles S.S.E. of Bolesko.

RAIDURGAM, a town of Hindoostan, in the Carnatic; 15 miles W. of Tricolore.

RAIDY, a town of Bengal; 25 miles S.W. of Doefa.

RAIE, a town of Asiatic Turkey, in the province of Diarbekir; 118 miles S.W. of Diarbekir.

RAJEEATA, a town of Hindoostan, in Guzerat; 78 miles W. of Gogo.

RAJEE-BEDUROO, a town of Hindoostan, in Lahore; 27 miles E. of Jummo.

RAJEGAUT, a town of Bengal; 24 miles S.S.E. of Islamabad.

RAJEGUR, a town of Bengal; 26 miles S. of Burdwan.—Also, a town of Hindoostan, in the circar of Gangpur; 23 miles S.W. of Gangpur.—Also, a town of Hindoostan, in Mewat; 20 miles E. of Cotputly.—Also, a town of Hindoostan, in the circar of Gohud; 27 miles S.W. of Narwa.—Also, a town of Hindoostan, in the circar of Bundeledund; 22 miles S.E. of Chatterpour.—Also,

a town

a town of Hindoostan; 20 miles E.S.E. of Allahabad. N. lat. 24° 49'. E. long. 80° 17'.

RAJEGUSDAR, a town of Hindoostan, in Lahore; 35 miles E.N.E. of Behnbur.

RAJEHAUT, a town of Bengal; 16 miles N.W. of Biffanpour. N. lat. 23° 13'. E. long. 86° 40'.

RAJEMAL, a circar of Bengal, bounded on the N. by Purneah, on the E. by Purneah, Mauldah, Dinagepour, and Rajefly, on the S. by Sultanabad, and on the W. by Hindooa and Boglipour.—Also, the capital of the above circar, lying on the W. bank of the Ganges, nearly in the parallel of Mauldah, and about 20 miles from it; at the foot of the chain of hills which projects into the river at Sielygully and Terriagully. It is in a ruinous state, although not above 1½ century ago the residence of the viceroy; and has hardly the population of an ordinary market-town at present. Its situation is romantic, but not pleasant; for in Hindoostan, the hills and eminences being always covered with wood, that beautiful swelling of the ground, which is so justly admired in European landscapes, is lost; and the fancy is presented at best with nothing beyond a wild scene; which can only be relished by being contrasted with soft and beautiful ones. It is more than thirty miles above the head of the delta of the Ganges, and therefore M. d'Anville placed it erroneously by assigning its situation at this place. N. lat. 25° 2'. E. long. 87° 56'.

RAJEMATCHY, a town of Hindoostan, in Vifiapour; 37 miles N.W. of Poonah.

RAJEMUNGALUM, a town of Hindoostan; 16 miles S. of Tinevelly.

RAJETEA, one of the South-sea islands, named also *Ulietea*; which see.

RAJETPOUR, a town of Bengal; 15 miles S. of Rogonatpour.

RAJEWICE, a town of Lithuania; 42 miles S.S.E. of Brzesc.

RAIGIRI, a town of Hindoostan, in Golconda; 10 miles S.E. of Beder.

RAIGUR, a town of Hindoostan, in the circar of Sumbulpour; 15 miles N. of Sumbulpour.

RAJK, a town of Syria, on the Euphrates; 18 miles S. of Bembig.

RAIL, in *Architecture*, is applied variously; particularly to those pieces of timber which lie horizontally between the pannels of wainscot, and over and under them.

The word is also applied to those pieces of timber which lie over and under ballusters in balconies, staircases, &c.

Also, to the pieces of timber that lie horizontally from post to post in fences, with pales or without. See FENCE.

RAILS, in a *Ship*, are long narrow pieces of fir, or oak, with mouldings of regular members of architecture struck on them, which are fastened, or sometimes wrought from the solid plank, as ornaments to the ship's sides. The former are now discontinued in the navy, as they were found to rot the sides very much; the latter, wrought from the solid plank, are used in merchant ships. The rails of the head and stern are pieces of oak timber handfomely wrought with mouldings. The lower rail along the side is named the *waist-rail*, and the next above it the *sheer-rail*, which are generally placed parallel to the top timber line, the *sheer-rail* with the top of the side amidships, and the *waist-rail* about twenty inches below it; the rails next above and parallel to the *sheer-rail* are called *drift-rails*, and the rails above the plank-sheer, if any, the *stee-rails*. The rails of the head are distinguished by the *upper* or *main-rail*, the *middle* and the *lower-rail*; and the rails of the stern take their names from the parts to which they are fixed, as the *tuck-rail*, *lower*

counter-rail, *upper counter-rail*, *foot space-rail*, *breast-rail*, *taffarel-rail*, and *taffarel stee-rail*. (See *Plate I. Ship-building*.) To these may be added the thwartship pieces of the framing of the great cabin bulk-heads.

RAILS of the *head* are certain curved pieces of timber, extending from the bows on each side to the continuation of the ship's stem, to support the knee of the head, and the ornamental figure fixed upon it.

RAIL, or *Water-Rail*, in *Ornithology*, the name of the *rallus aquaticus* of authors, which is a bird of a long slender body, with short concave wings. The bill is slender, slightly incurvated, and one inch three quarters long: the upper mandible black, edged with red, the lower orange-coloured; the irides red; the head, hind-part of the neck, the back and covert of the wings and tail are black, edged with an olive-brown; the base of the wing is white; the quill-feathers and secondaries dusky; the throat, breast, and upper part of the belly, are ash-coloured; the sides under the wings, as far as the rump, finely varied with black and white bars; the tail is very short, consisting of twelve black feathers; the ends of the two middle tips with rust colour; the feathers immediately beneath the tail white; the legs are placed far behind, and are of a dusky flesh colour; the toes very long, and divided to their origin: though the feet are not webbed, it takes the water, will swim on it with much ease, but is often observed to run along the surface. It delights less in flying than in running, which it does very swiftly along the edges of brooks covered with rushes. When it runs, it every now and then flirts up its tail, and in flying hangs down its legs. Pennant.

This bird, says Mr. Pennant, is properly *sui generis*, agreeing with no other, but forming a separate tribe; though M. Brisson and Linnæus place it with the land-rail, and Mr. Ray with the water-hens. It is a well-tasted bird.

RAIL, *Land*, the *rallus crex* of Linnæus, is a migrating bird, with a short, strong, thick bill; always found among corn, grafs, broom, or furze. It leaves this kingdom before winter. They have long legs, and a singular note, resembling the word *crex*, often repeated. The feathers on the crown of the head, hind part of the neck, and the back, are black edged with bay colour; the coverts of the wings of the same colour, but not spotted; the tail is short and of a deep bay, the belly white, and the legs ash-coloured. They are in greatest plenty in Anglesea, where they appear about the 20th of April, supposed to pass over from Ireland, where they abound. They are found in most of the Hebrides, and the Orkneys. Pennant.

RAILING, in *Rural Economy*, a sort of fence constructed with posts and rails. It is often made use of in protecting young hedge fences, from the cropping of cattle or other animals. Any sort of coarse timber does very well for this last purpose, such as outside planks, and the boughs or loppings of timber plantations. See FENCE.

RAILLERY, as Dr. Johnson hath defined it, denotes slight satire, or satirical merriment; and a beautiful writer compares it to a light which dazzles, and which does not burn. It is sometimes, what it always ought to be, innocent and pleasant, but it is too frequently offensive. Railery is of various kinds; serious, severe, and good-humoured; there is a kind which perplexes, a kind which offends, and a kind which pleases.

It has been justly observed, that in order to rally well, kindness should prevail in every thing that is said, as the character of a friend should be maintained to warrant freedom with a person who is addressed, especially in this way. Allusions to past follies, and hints that tend to revive what a person wishes for ever to forget, should never be introduced

as subjects of raillery. It is below the character of persons of humanity and good breeding, to indulge mirth, while any one in the company is suffering, as the effect of that mirth, pain and mortification.

RAILWAY, *Tram or Dram-road, or Waggon-way*, in *Rural Economy*, a track constructed of iron, stone, timber, or other material, upon the level surface of an inclined plane, or other situation, for the purpose of diminishing friction, and thus serving for the easy conveyance of heavy loads of any kind of articles. See *Plate IV. Canals, figs. 31 to 35.* See also **CANAL**.

It has been remarked, that railways have hitherto been confined, almost exclusively, to coal-works, and other mines; and that inventions, whose only recommendations are simplicity and usefulness, are often suffered to lie long in a state of public neglect; while others, perhaps, of no real utility, but of more imposing aspect, and being pertinaciously blazoned forth by interested or blinded partisans, are readily adopted; and bask, for a while, in the sunshine of public favour. The time has, however, at length arrived, when carriages moving on level surfaces, or on gently inclining planes, with little friction, and *without* obstructions, are fast spreading over the face of the country. It has been observed that there may be many lime-works, as well as other forts, from which railways may be laid, in different directions, with great benefit to their proprietors and the surrounding neighbourhoods in general.

With the view of diminishing horse labour, it has been suggested by Dr. Anderson, in his *Recreations in Agriculture*, that where internal canals cannot be established, this may be effected, and intercourse facilitated, by means of railways, which have not yet been introduced into general practice. It is further stated, that they were first solely employed for transporting coals to a moderate distance from the pits, to the places where they could be shipped, being universally made of wood. And long, says he, had they been applied to this use, without any idea having been entertained that they could be employed for more general purposes. By degrees they were, however, carried to a farther extent; the scarcity of wood, and the expence of their repairs, suggested the idea of employing iron for the purpose of improving these roads. At the first, flat rods of bar-iron were nailed upon the original wooden rails, or as they were technically called, *sleepers*; and this, though an expensive process, was found to be a great improvement. But the wood on which these rested being liable to rot and give way, some imperfect attempts were made to make them of cast iron, but these were found to be liable to many objections, until the business was taken in hand by Mr. Outram, engineer, at Butterly Hall, Derbyshire, who contrived at the same time, so far to diminish the expence, and improve the strength of the road, as to bring them to a degree of perfection, that no one who has not seen them can easily conceive could have been done. And it is added, that this having been carried into execution in a few cases, and found to answer, has been improved upon and simplified by practice, till it is now brought to such a state of perfection as to have given proofs, that it admits of being carried much beyond the limits of what was for many years conceived to be possible, and to afford demonstrative evidence, that it may be in future employed to a wider extent still, to which no limits can be at present assigned or foreseen.

There are a great number of railways in Derbyshire, Shropshire, Lancashire, and many other parts of the country.

In the first of the above counties, there are railways of very different lengths; one of five miles in length, leading from the town of Derby to the collieries in the vicinity;

another, from the lime-stone rocks on the Cranford canal, called the Crick railway, which is about one mile and a half in length; a third from the Beggarlee colliery to the same canal, denominated Barber and Walker's railway, of similar length; a fourth from the lime-works in the neighbourhood of Boston, to the canal near Whaley bridge, termed the Peak-forest railway, which is about six miles in length; a fifth called the Marple railway, of about one mile and a half long, on the Peak-forest canal; sixthly, railways over Blisworth-hill near Nottingham, on the Grand Junction canal, which are three miles and a half in length, and constructed in a double manner; a seventh, which has the name of the Ashby de la Zouch railway, has four miles of double and eight miles of single rails. Some of these railways are formed in a very complete manner, especially those which have been made since the various improvements of them were introduced. They have been of prodigious utility and advantage to the county, both in regard to its agricultural improvements and its manufacturing interests and concerns.

These sorts of railway roads have likewise been introduced into many parts of the county of Salop, with vast benefit and success to the different interests of the district. They have here had a new application, in being employed for the purpose of conveying heavy weights from different levels on canals.

Speaking of the great utility of canals in the carriage of various articles in this county, it is observed by Mr. Telford, an able engineer, that another mode of conveyance has frequently been adopted to a considerable extent; which is that of forming roads by means of iron rails laid along them, upon which materials are carried in waggons, which contain from six to thirty hundred weight; experience, he thinks, has now convinced us, that in countries the surfaces of which are rugged, or where it is difficult to obtain water for lockage, where the weight of the articles of the produce is great in comparison with their bulk, and where they are moitly to be conveyed from a higher to a lower level, that in those cases, iron railways are in general preferable to canal navigation.

It is supposed, that on a railway well constructed, and laid with a declivity of fifty-five feet in a mile, one horse will readily take down waggons containing from twelve to fifteen tons, and bring back the same waggons with four tons in them. This declivity, therefore, suits well, when the imports are only one-fourth part of what is to be exported. If the empty waggons only are to be brought back, the declivity may be made greater; or an additional horse applied on the returning journey will balance the increase of declivity. If the length of the railway were to be considered, it may, it is supposed, without much inconvenience, be varied from being level to a declivity of one inch in a yard, and by dividing the whole distance into separate stages, and providing the number of horses suitable for each portion of railway, according to the distance and degree of declivity, the whole operation may be carried on with regularity and dispatch.

It is upon the whole believed, that this useful contrivance may be varied so as to suit the surface of many difficult countries, at a comparatively moderate expence. It may be constructed in a much more expeditious manner than navigable canals; it may be introduced into many districts where canals are wholly inapplicable; and in case of any change in the working of mines, pits, or manufactories, the rails may be taken up and laid down again in new situations, at no very great expence or trouble.

It is also further noticed, that some parts of this and the neighbouring counties, in which canals had once been intended

intended to be formed, have since been looked over and examined with the view of having iron railways instead of navigable cuts; and in many cases this may be the most advisable and proper, particularly in all situations where difficulties arise in the constructing of navigable canals, or other sorts of works for water carriage.

The county of Lancaster, too, has a great many of these iron railways for the convenience, accommodation, and advantage of the different collieries, manufactories, and other works, where heavy loads are to be transported. The coal work near St. Helens, in the vicinity of Liverpool, has a double railway some miles in length; and at the iron-works of lord Belcarras, near Wigan, as well as his cannel coal pits near the same place, there are double railways of very considerable length. To the south of the town of Preston, at a small distance from Bamber bridge, there is likewise one communicating with the Lancaster and Kendal canal, which is also double and of great length; serving to convey the coals from the southern parts of the county to that canal, in order to their distribution in the northern parts, and the adjoining districts.

On the east side of the same county they also prevail in many places, and are found of the greatest use, being the means of dispatching much business in a ready manner and without much expence of labour.

The utility of these railways has been found to be extremely great in other coal-works and canals, where they are at present very extensively employed; and it has been suggested, that they may be applicable in other cases, as for shortening the team labour of a farm so as to bring it within one day's journey, where more than one were formerly necessary, by which a great saving in labour and expence may be made. Also, in rendering the business of lime works more easy and expeditious in different instances. It has likewise been hinted by Mr. Beatson, in the first volume of Communications to the Board of Agriculture, that they might be had recourse to on roads where there are unavoidable rises or falls, for taking up or letting down heavy loaded waggons or other carriages. It is observed, that near Colebrook Dale there is one at a small distance from the iron bridge, upon which loaded boats are drawn up to a canal, two hundred and twenty feet above the level of the river Severn, and let down in a similar manner into it, by which means twenty-two locks are saved, and the work executed in an expeditious manner. It is supposed, that this is the greatest inclined plane in Europe, or perhaps in the world, for though they are much used in China in the place of locks, he has never heard of any of them being equal in height to this. The rails are best made of iron. It is added, that they have been found useful in improving soft, mossy, boggy lands, on which horses cannot travel; a rail road of this sort having been formed through a peat moss near Manchester by Mr. Wakefield, while it was under improvement, at the expence only of about three hundred pounds a mile, on which a single horse was capable of drawing with the greatest facility seven waggons at once, each being loaded with about seven hundred weight of marle, bearing in the whole forty-nine hundred weight, and with the weight of the waggons upwards of three tons. This was performed, it is observed, over a place where a few months before a dog could hardly venture without the danger of being *swamped*. On the Ketley and other canals in the county of Shropshire, vast advantages have been derived from laying railways upon inclined planes, and letting down and drawing up the different articles by means of machinery, as may be seen in the very able Agricultural Report of that district, where excellent representations of them are given.

Besides these different cases of railways, another has been suggested by the writer of the Annals of Agriculture, which is that of having them laid from the stack-yards to the thrashing machines, by which the grain may be conveyed to them at any time with ease and convenience, as well as any particular stack that may be wanted.

It is further stated by the ingenious Dr. Anderson, that the best idea he can give of the benefit that may result to the community from the use of this kind of railways, will be from stating some facts respecting them, which were lately communicated to the Society of Arts by Mr. Wilkes, of Measham, near Loughborough, in Leicestershire; a spirited and judicious agriculturist. He had a railway of this sort made, which was about five miles in extent, leading from a coal-mine to a market. He found it so fully to answer his expectations after it was finished, that he communicated to the above society an account of some trials he had made of it, requesting that such of the members of that respectable institution as were desirous of information on that head, would do him the honour to witness some experiments that he wished to make upon it, for the information of the public. A committee of the members was accordingly deputed for that purpose, and before them he shewed that a moderate sized horse, of about twenty pounds value, could draw upon it with ease down hill (the descent being one foot in a hundred) thirty-two tons, and without much difficulty forty-three, and seven tons up hill, independent of the carriages. The doctor concludes from these facts, that upon a perfect level a horse could draw with ease from ten to twenty tons. It is observed, that Mr. Wilkes's railway, on which the experiments were made, was, from local circumstances, laid upon wooden sleepers, and is not so perfect as those done upon stone. But it is added, that twenty tons are the load which such a horse could draw with ease, travelling at the usual waggon rate, in boats upon a canal; so that the number of horses required in this way will not be much, if at all, greater than on a canal. Certain advantages attach to this mode of conveyance, which do not so well apply to a canal, and *vice versa*; but it is not his intention to draw a parallel between these two modes of conveyance. Nobody can entertain any doubt, he thinks, about the utility of canals where they are easily practicable. He only wishes to point out this as an eligible mode of conveyance where canals cannot be conveniently adopted.

It is further remarked, that it was customary at the first, to put the whole load to be drawn by one horse upon railways into one waggon; but now, when the load is so much augmented, it has been found eligible to divide it into many parts, so that no one waggon shall carry more than one or two tons; by this method the weight is so divided, that the pressure is never so great upon one point as to be in danger of too much crushing the road; the carriages can be made much more limber and light in all their parts, and they are much more easily moved, and more manageable in all respects than they otherwise would have been. And another advantage of this arrangement, which deserves to be particularly adverted to, is, that it admits of shifting the carriages so as to leave a load, as it were, in parcels at different places where they may be required, without trouble or expence. This, when it comes to be fully understood and carried into practice, will, he thinks, be a convenience of inestimable value, a thing that has been always wanted, and never yet has been found though it has been diligently sought for. The able writer has here endeavoured to illustrate its importance and utility in transporting goods from the wet docks now forming on the Isle of Dogs to London, and in carrying roads to different distant parts of the country; in which cases,

RAILWAY.

cafes, and in all where there is much buſineſs to be done, they would require to be double, one for going, and the other for coming upon, to prevent interruption and interference.

And he afterwards offers a few remarks, tending to ſhew the practicability of the meaſure, and to guard againſt ſetting out upon a bad plan, which might, he ſuppoſes, in time to come, frustrate the good that might have reſulted from the undertaking; merely premiſing, that he propoſes theſe railways ſolely for the purpoſe of conveying weighty loads, leaving the roads, as at preſent, open for coaches and light carriages.

Alſo with a view to diſcover how far it may be practicable to introduce theſe iron railways into general uſe, he has made ſome inquiries reſpecting the expence of making them; and although this muſt vary according to the abundance and goodneſs of materials, and other circumſtances, the following ſtatement may ſerve to give ſome general notions on that head. In the moſt eligible ſituation, where materials are abundant and good, and circumſtances favourable, the loweſt expence at which a *ſingle* railway of this ſort can be made, will be about one thouſand pounds a mile. But as a ſingle railway muſt be liable to great inconveniencies, unleſs under very particular circumſtances, double railways ought to be conſidered as the only uſeful ſort. Theſe, for public purpoſes, according to the opinion of the inventor, ſhould be very ſubſtantially made. The metal uſed ſhould be of the ſtouteſt ſort, and of ſubſtance enough, not merely to carry the weights propoſed, but to be equal to bear almoſt any blow or ſhock that they may be likely to experience; and, thus made, what they will loſe by ruſt or wear, will be long ere it materially weakens them. Made after ſuch a manner, in favourable ſituations in the country, a double railway may, he thinks, coſt about two thouſand pounds a mile, but in the neighbourhood of London, where the charge of every thing is high, and where they ſhould be of the ſtrongeſt ſort, we ſhould ſuppoſe they might coſt nearly three thouſand pounds a mile. It is bad economy, he thinks, to ſave on articles of this ſort at the firſt; for the little expence thus laid out then will ſave much in repairs: how ſmall theſe repairs are, may be imagined from this circumſtance, that when a road is thus made, the undertaker does not ſcruple to ſupply all that are broken, free of charge, for the firſt three years. Say then that ſuch a road coſt three thouſand pounds a mile, this would bring a charge upon the turnpike of 150*l.* a-year; ſay 50*l.* more for annual repairs; this is, in all, 200*l.* *per annum*. Compare this with the expence of keeping the preſent roads in repair. It has been ſuggeſted to him, that there is annually laid out in repairs upon the road from Hyde Park Corner to Hounſlow, conſiderably above one thouſand pounds a mile; ſo that the difference of expence is, even at the beginning, very much in favour of railways: and were the money thus at firſt expended to be gradually paid off, the tolls might thus be lowered almoſt to nothing. And, he thinks, that a turnpike road cannot be made in almoſt any ſituation for leſs, as he is told, than 1000*l.* *per* mile; but where it is of conſiderable width, as near great towns, it will run from 1500*l.* to 2000*l.* *per* mile; and in annual repairs, including the purchaſe price of materials, carting them on the road, ſpreading, raking off, and carting away again, from 100*l.* to 1000*l.* a mile. Say 1500*l.* prime coſt, the intereſt is 75*l.* and 150*l.* for repairs, the annual charge of ſuch road will be 225*l.* This is an expence of 100*l.* a-year more than the other. But for the preſent, let us ſuppoſe that they will be equal, the extra charge for purchaſing ground for a new waggon-way, &c. being equal to that ſurplus; let us now ſee what

would be the difference of charge to the employers of theſe waggons in the two cafes. Suppoſing the road to be fo much employed, as that 100 waggons (or loaded carriages to the ſame amount) paſs each day, carrying fix tons each, drawn by eight horſes; theſe, at one ſhilling each waggon for toll (or two-pence a ton), would produce 5*l.* a day, or 1825*l.* a-year; which, at the rate of eight miles for each turnpike, would be 228*l.* *per* mile, the ſurplus being produced by road horſes and light carriages. The charge then to the employer, for this ſtage, muſt be 1825*l.* and the keep of 800 horſes, beſides ſervants, incidental charges, and owner's profits for the tranſporting of 600 tons of goods a day. Say that the ſame horſes travel two ſtages a day, the turnpike money would be doubled; that is, 3650*l.* *per annum*; the keep of 800 horſes, at 2*s.* each *per diem*, is 29,200*l.* Theſe ſums added make 32,850*l.*; owner's profit and incidental charges, ſay 10 *per cent.*, 3285*l.*; in all 36,135*l.*, or, on 219,000 tons (being 600 tons a day), about one-fourth *per* ton. And ſuppoſing the ſame quantity of goods carried on the railway, and the ſame turnpike money paid, and that each horſe drew only fifteen tons, this would require only, he thinks, forty horſes; the keep of which, at 2*s.* a day, would be 1460*l.*, add the toll, 1825*l.* is 3285*l.* *per annum*. Owner's profit, &c. upon this ſum 10 *per cent.* as above, 328*l.*; in all 3613*l.*, or about four-pence a ton, juſt one-tenth part of the charge in the other caſe. He thinks, that when the object comes to be conſidered in this point of view, few meaſures that can be propoſed will hold forth ſuch an important national improvement as this would be. Conſidered with regard to the conſumption of the produce of the earth (an object at preſent deſerving the full'eſt attention, as this improvement can be applied to almoſt every part of the country), it would, he ſuppoſes, reduce the number of heavy road horſes to one-eighth part of what they are at preſent, and of courſe augment the number of cattle or other conſumable proviſions in a proportionate degree, ſo as greatly to lower the price of the neceſſaries of life. It would, in the next place, lower the price of the carriage of goods of all kinds to an amazing extent; and laſtly, as a conſequence of that, it would give ſuch encouragement to agriculture, as no other meaſure that can be contrived could ever effect, and that without coſting one ſhilling expence to any one individual, or to the ſtate. On the contrary, by inducing cheapneſs of proviſion, and affording ſuch efficacious encouragement to manufactures and to agriculture, it would produce a general proſperity, which, by augmenting the conſumption of taxable commodities, would augment the public revenue; while, at the ſame time, every individual would feel himſelf relieved from the preſſure of many taxes that prove diſtreſſful to him at preſent. After juſtly reprobating every ſort of gambling ſpeculations by monied men in undertakings of this nature, and ſhewing the numerous evils that attend them, he adviſes it, as highly neceſſary to prevent theſe railways from ever becoming private property, on any account, to keep them open and patent alike, to all who ſhall chooſe to employ them as a king's highway, under ſuch regulations as it ſhall be found neceſſary to ſubject them to by law. In ſhort, they ſhould, he thinks, be put upon the ſame footing, in all reſpects, as public roads are at preſent, only under the direction of a diſtinct ſet of commiſſioners, who ſhould have the ſuperintendance of every thing that concerns this ſpecies of roads only. Theſe commiſſioners ſhould be veſted with authority under an act of parliament, to erect turnpikes upon them, to levy certain ſtipulated tolls, and to mortgage the produce of theſe tolls for the purpoſe of raiſing money to be applied in the neceſſary purchaſes of land, and making the roads. In the act it ſhould

should be expressly stipulated, that the produce of these tolls should be applied solely to keeping the road in repair, paying the interest of sums borrowed, and clearing off the principal as fast as the collections would admit; and when the whole money borrowed was thus paid off, the tolls should be so lowered as only to produce money sufficient to keep the roads in a state of continually good repair. Thus would the expence of transporting goods be annually diminishing, and the prosperity of the country be thereby augmenting from day to day. He adds, that he is particularly earnest in this business, as he has not been an unconcerned observer of the effects that have resulted from the establishment of turnpike roads in Scotland, which were begun within his recollection; and these effects have been such as no man who had not seen it would have believed could ever have taken place. Distance may be said to be thus diminished from place to place; lands that were originally far beyond the influence of the town as a market for any thing else than live-stock, are thus brought, as it were, close to its gates; and the value of the produce of many articles is thus to them augmented fourfold, while they are at the same time diminished to the public. Not only is the value of produce raised, but the quantity also of that produce is augmented exceedingly by means of manures which become then accessible. Fossil manures, such as chalk, lime, and marle, which were formerly confined to a narrow spot, expand themselves as if it were by a magical power, and by that expandible influence diffuse around fertility, riches, and plenty. Coals and other weighty articles that may be useful in arts or manufactures of various kinds, which never were, nor ever could have been of any value to the owners of them, so long as the expence of transportation exceeded a certain sum, find a ready market to any extent as soon as the price falls below that rate, thus contributing not only towards the enriching of the owners, but to the furnishing of employment to the various persons who must be engaged in preparing or transporting them to market, and the universal accommodation of the whole. Around every market you may suppose a number of concentric circles drawn, within each of which certain articles become marketable which were not so before, and thus become the source of wealth and prosperity to many individuals. Diminish the expence of carriage but one farthing, and you widen the circle; you form, as it were, a new creation, not only of stones, and earth, and trees, and plants, but of men also, and what is more, of industry, of happiness, and joy. It is added, that by making these roads the property of the public, and free to every person to bring his own waggons upon them wherever he pleased, farmers, when near them, would make bye roads of the same sort leading into these from their respective parishes; the inhabitants of villages and country districts would join together, and at one common expence make roads of the same sort leading to a greater distance inwards, as they now make bye roads for themselves. Thus would all be accommodated; those who had business enough to furnish a sufficient load for one horse might go to market with it when they pleased: those who had dealings on a smaller scale could have one, two, or more waggons of their own conjoined with those of others to make up a load for one horse: and those of still smaller means could have one wagon loaded with the joint articles belonging to two, three, or more. A ton weight might then be pushed before a man to market for many miles, as a wheelbarrow is now. It is scarcely possible, he supposes, to contemplate an institution from which would result a greater quantum of harmony, peace, and comfort, to persons living in the country, than would naturally result from this arrangement. In fact, he knows, he says, *no one*

measure, that would tend so effectually to lower the price of the necessaries of life, and restore abundance.

In what regards the method of forming and constructing these railways, it is observed by the same writer, that the following has been given by the inventor as the most improved plan: first, that the best line the country affords should be traced out, having regard to the direction of the carriage of articles or trade to be expected; and if such trade be both ways in nearly equal quantities, a line as nearly horizontally level as possible should be chosen. If the trade is all in one direction, as is generally the case between mines and navigation, then the most desirable line is one with a gentle gradual descent, such as shall make it not greater labour for the horses employed to draw the loaded waggons down, than the empty ones back; and this will be found to be the case on a railway descending about one foot vertical in one hundred feet horizontal. Or, if the railway and carriages are of the very best construction, the descent vertical may be to the length horizontal as 1 to 50, where there is little or no upgate loading. In cases between mines and navigations the descents will often be found greater than could be wished. On a railway on the improved plan, where the descent is more than as 1 to 50, six or eight waggons, loaded with thirty or forty hundred weight each, will have such a tendency to run downwards, as would require great labour of one horse to check and regulate, unless that tendency was checked by sledging some of the wheels. On such, and steeper roads, iron sliders are applied, one or more to a gang of waggons, as occasion may require. Each slider being chained to the side of one of the waggons, and, being put under the wheel, forms a sledge. Where the descent is very great, steep inclined planes, with machinery, may, it is observed, be adopted, so as to render the other parts of the railway easy. On such inclined planes the descending loaded waggons being applied to raise the ascending empty, or partly loaded ones, the necessity of sledging the wheels is avoided; and the labour of the horse greatly reduced and lessened.

In order to obtain the desired levels, gentle descents, or steep inclined planes, and to avoid sharp turns, and circuitous tracks, it will often be found prudent to cross valleys by bridges and embankments; to cut through ridges of land; and in very rugged countries short tunnels may, he thinks, sometimes be necessary. The line of railway being fixed, and the plans and sections by which the same is to be executed and settled, the ground for the whole must be formed and effectually drained. The breadth of the bed for a single railway, should be, in general, four yards; and for a double one six yards, exclusive of the fences, side drains, and ramparts.

That the bed of road being so formed to the proper inclination, and the embankments and works thereof made firm, the surface must be covered with a bed of stones broken small, or good gravel, six inches in thickness or depth. On this bed must be laid the sleepers, or blocks to fasten the rails upon. These should be of stone in all places where it can be obtained in blocks of sufficient size. They should be not less than eight, nor more than twelve inches in thickness; and of such breadth (circular, square, or triangular,) as shall make them 150lbs. or 200lbs. weight each. Their shape is not material, so as they have a flat bottom to rest upon, and a small portion of their upper surface level, to form a firm bed for the end of the rails. In the centre of each block should be drilled a hole, an inch and a half diameter, and six inches in depth, to receive an octagonal plug of dry oak, five inches in length; for it should not reach the bottom of the hole; nor should it be larger than so as to put in easily,

easily, and without much driving; for if too tight fitted it might when wet burst the stone. These plugs are each to receive an iron spike or large nail, with a flat point and long head, adapted to fit the counter-sunk notches in the ends of two rails, and thereby to fasten them down in the proper position, or situation in which they are to lie.

With regard to the rails, they should be of the stoutest cast-iron, one yard in length each, formed with a flanch on the inner edge, about two inches and a half high at the ends, and three and a half in the centre; and shaped in the best manner to give strength to the rails, and keep the wheels in their track. The soles of the rails, for general purposes, should not, he thinks, be less than four inches broad; and the thickness proportioned to the work they are intended for. On railways for heavy burdens, great use, and long duration, the rails should be very stout, weighing 40lbs., or, in some cases, nearly half an hundred weight each. For railways of less consequence, less weight of metal will do; but it will not be prudent to use them of less than 30lbs. weight each, in any situation exposed to breakage above ground. But it is observed that in mines, and other works under ground, where very small carriages only can be employed, very light rails are used, forming what are called train roads, on a system introduced by Mr. Carr; and these kinds of light railways have been much used above ground in Shropshire, and other counties where coals and other minerals are obtained.

It is added, that in fixing the blocks and rails great attention is required to make them firm. No earth or soft materials should be used between the blocks and the bed of small stones or gravel, on which the rails must all be fixed by an iron gage, to keep the sides at a regular distance, or parallel to each other. The best width of road for general purposes is four feet two inches between the flanches of the rails; the wheels of the carriages running in tracks about four feet six inches asunder. Rails of particular forms are necessary where roads branch out from or intersect each other; and where carriage roads cross the railways; and, at turnings of the railways, great care is required to make them perfectly easy. The rails of the side forming the inner part of the curve should be fixed a little lower than the other; and the rails should be set a little under the gage, so as to bring the sides nearer together than in the straight parts: these deviations in level and width to be in proportion to the sharpness of the curve. The blocks and rails being fixed and spiked fast, nothing more remains to be done than to fill the horse-path, or space between the blocks, with good gravel, or other proper materials; a little of which must also be put on the outside of the blocks to keep them in their proper places. This gravel should always be kept below the surface of the rails on which the wheels are to run, to keep the tracks of the wheels free from dirt and obstructions. The form of the rails must be such as will free them from dirt if the gravelling is kept below their level.

And in the constructing of the carriages great attention to avoid friction is necessary, particularly in the formation of the wheels and axles, which must be adapted to the sort of railways and kind of loading; but for which general directions cannot be given in a narrow compass. It is probable that this valuable invention may also be applicable to many other purposes in agriculture or manufactures, as it becomes more fully understood, and the facilities which it affords are better known. See CANAL.

RAIMALPOUR in *Geography*, a town of Hindoostan, in Vishapour; 15 miles E. of Sattara.

RAIMONDI, IGNATIUS, in *Biography*. This worthy musical professor, whose performance, character, and private

virtues, are well known to our country, after a residence in it of more than thirty years, is honourably mentioned by Ernst Ludwig Gerber, the continuator of Walther's Musical Lexicon, in 2 vols. 8vo., 1792. He says, that this expressive and pleasing performer on the violin, and agreeable composer for his instrument, was born in Italy, a scholar of Barbella, settled at Amsterdam in 1772, where he remained the principal violin during twelve years, having succeeded the famous Locatelli. He had published nine different works for violins at Berlin and Amsterdam, before the year 1785. About the year 1773 he arrived in London, since which time he has published many pleasing compositions, particularly his "Battaglia," which is the best imitative instrumental music of that kind that has come to our knowledge.

RAIMPOUR, in *Geography*, a town of Hindoostan, in Rohileund; 30 miles S. of Bereilly.

RAIN, a town of Hindoostan, in Guzerat, on the gulf of Cutch; 45 miles W. of Noanagar.—Also, a town of Bavaria; 16 miles N. of Augsburg. N lat. 48° 37'. E. long. 10° 52'.

RAIN, or *Old Rain*, a town of Scotland, in Aberdeenshire, near which are the remains of a palace of the former bishops of Aberdeen; eight miles S.E. of Inverary.

RAIN, the distillation of water which descends from the atmosphere in drops of various sizes. By this circumstance rain is distinguished from dew or fog; in the former of which the drops are so small, that they are quite invisible; and in the latter, though they are of a larger size, they seem to have little more specific gravity than the atmosphere itself, and may therefore be reckoned hollow spherules rather than drops.

Rain is, apparently, a precipitated cloud; as clouds are nothing but vapours raised from moisture, waters, &c.

And vapours are demonstratively nothing else but little bubbles or vesiculæ detached from the surface of the terraqueous globe by the power of the solar or subterraneous heat, or some other cause. These vesiculæ, being specifically lighter than the atmosphere, are buoyed up by it, until they arrive at a region where the air is in a just balance with them; and here they float, till by some new agent they are converted into clouds, and thence either into rain, snow, hail, mist, or the like.

But the agent in this formation of the clouds into rain, and the vapours into clouds, has been much controverted. Some philosophers have supposed that the cold, which constantly occupies the superior regions of the air, chills and condenses the vesiculæ, at their arrival from a warmer quarter; congregates them together, and occasions several of them to coalesce into little masses: and by this means their quantity of matter increasing in a greater proportion than their surface, they become an overbalance to the thin air, and accordingly descend in rain.

Dr. Derham accounts for the precipitation thus; that the vesiculæ being full of air, when they meet with a colder air than that they contain, this internal air is contracted into a less space; and consequently the watery shell, or case, is rendered thicker, so as to become heavier than the air, &c.

It has, however, been objected to this hypothesis, that rain often happens in very warm weather; and though it be allowed, that the condensation may be owing to the cold of the upper regions, yet the drops acquire a considerable increase of size as they descend. E. G. On the summit of a hill they are small and occasion only a drizzling shower; but in descending the hill it becomes more considerable, and at the bottom of the hill the drops are much larger, and the

the rain is impetuous. Hence it appears that the vapours are condensed when the atmosphere is warm as well as when it is cold.

Others only allow the cold a part in the action, and ascribe a share of it to the winds, alleging, that a wind blowing against a cloud will drive its vesiculæ upon one another, by which means several of them, coalescing as before, will be enabled to descend; and the effect will be still more considerable, if two opposite winds blow together toward the same place. To which they add, that clouds already formed, happening to be augmented by fresh accessions of vapour, continually ascending, may on this account be enabled to descend.

Against the above stated hypothesis of Derham, it has been objected that the vesiculæ of vapour, if they be such, are filled, not with air, but fire or heat in a latent state, and till they part with this heat, the vapour cannot be condensed. Cold is not always sufficient to produce this effect, for in the most severe frosts the air is serene, and parts with little or none of its vapours, for a considerable time. It is also alleged, that the winds have no considerable agency, since blowing upon vapour is so far from condensing it, that it unites more closely with the air; and wind is known very much to promote evaporation. See VAPOUR.

Yet the grand cause, according to Robault, still remains: that author conceives it to be the heat of the air, which after continuing for some time near the earth, is at length carried up on high by a wind, and there thawing the snowy villi, or flocks of the half-frozen vesiculæ, reduces them into drops; which coalescing, descend, and have their dissolution perfected in their progress through the lower and warmer stages of the atmosphere. Others, as Dr. Clarke, &c. ascribe this descent of the clouds rather to an alteration of the atmosphere than of the vesiculæ; and suppose it to arise from a diminution of the spring, or elastic force of the air.

This elasticity, which, as they say, depends chiefly or wholly on the dry terrene exhalations, being weakened, the atmosphere sinks under its burden, and the clouds fall, on the common principle of precipitation.

Now, the little vesiculæ, by any or all these means, being once upon the descent, will persist therein, notwithstanding the increase of resistance they every moment meet with in their progress through still denser and denser parts of the atmosphere. For, as they all tend toward the same point, *viz.* the centre of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the same surface; the surface only increasing as the squares; but the solidity as the cubes; and the more matter under the same surface, the less friction or resistance there will be to the same matter.

Thus if the cold, the wind, &c. happen to act early enough to precipitate the ascending vesiculæ, before they are arrived at any considerable height, the coalitions being few in so short a descent, the drops will be proportionably small: and thus is formed what we call *dew*. See DEW.

If the vapours prove more copious, and rise a little higher, we have a *mist* or *fog*; which see respectively.

A little higher still, and they produce a small rain, &c. If they neither meet with cold, nor wind enough to condense or dissipate them, they form a heavy, thick, dark sky; which lasts sometimes several weeks. This hypothesis of the diminution of the atmosphere's elasticity, requires a more satisfactory explication of the cause of this diminution. By ascribing it to terrene exhalations, we only solve one difficulty by introducing another; for we are totally un-

acquainted with the nature and operation of these exhalations. But let the cause be what may be supposed, if it act equally, and at once, upon all the vapour in the air, all that vapour must be at once precipitated; and the consequence must be, that, instead of gentle showers continuing for a considerable time, we must have copious water-spouts, lasting only for a few minutes or seconds, which, instead of refreshing the earth, would drown and lay it waste.

Those who admit either of the above hypotheses, account for many of the phenomena of the weather; *c. gr.* why a cold is always a wet summer, and a warm a dry one; because the principle of precipitation obtains in the one case, and is wanting in the other. Why we have ordinarily most rain about the equinoxes; because the vapours arise more plentifully than ordinary in the spring, as the earth becomes loosened from the brumal consipations; and because, as the sun recedes from us in autumn, the cold increasing, the vapours that had lingered above during the summer heats, are now dispatched down, &c. Why a settled, thick, close sky scarcely ever rains till it have been first clear; because the equally diffused vapours must first be condensed, and congregated into separate clouds, to lay the foundation of rain; by which means the rest of the face of heaven is left open, and pervious to the rays of the sun, &c.

For other phenomena of rain, as they relate to the weather-glass, see BAROMETER, and WEATHER.

It cannot be doubted, that there is a connection between the descent of the barometer and the fall of rain; but no satisfactory reason has yet been assigned for the circumstance; nor is it possible to foretell with certainty that rain will follow any changes in the height of the barometer that have been observed. The immediate dependence of rain, or of any other atmospheric phenomena, on the influence of the moon, appears to be rendered highly improbable, not only by mathematical calculations of the effects of the moon's attraction, but also by the irregularity of the observations which have been adduced in favour of a such a connection. (See *Influence of the MOON*.) But however uncertain the ultimate causes of rain may be in general, their effects in some places are sufficiently constant, to be attributed to permanent local circumstances, and in particular to the periodical recurrence of similar winds.

For a more particular account of other theories, for explaining the ascent of vapours, the formation of clouds, and the fall of rain, see VAPOUR.

Besides the causes of rain, mentioned above, Desaguliers thinks it owing to the loss of electricity in the vapours of which they were formed.

Other writers, in the progress of this part of philosophical science, have considered rain as an electrical phenomenon: or at least they have supposed, that the powers of electricity may concur with other causes in producing it. Signior Beccaria, whose observations on the general state of electricity in the atmosphere have been more extensive and accurate than those of any other person, reckons rain, hail, and snow, among the effects of a moderate electricity in the atmosphere. Clouds that bring rain, he thought, were produced in the same manner as thunder clouds, only by a moderate electricity. He describes them at large, and the resemblance which all their phenomena bear to those of thunder-clouds is very striking. He notes several circumstances attending rain without lightning, which render it probable, that it is produced by the same cause as when it is accompanied with lightning. Light has been seen among the clouds by night in rainy weather; and even by day rainy clouds are sometimes seen to have a brightness evidently independent of the sun. The uniformity with

which the clouds are spread, and with which the rain falls, he thought, were evidences of an uniform cause like that of electricity. The intensity also of electricity in his apparatus generally corresponded very nearly to the quantity of rain that fell in the same time. Sometimes all the phenomena of thunder, lightning, hail, rain, snow, and wind have been observed at one time; which shews the connection they all have with some common cause. Signior Beccaria, therefore, supposes, that, previous to rain, a quantity of electric matter escapes out of the earth, in some place where there was a redundancy of it; and in its ascent to the higher regions of the air, collects and conducts into its path a great quantity of vapours. The same cause that collects, will condense them more and more; till, in the places of the nearest intervals, they come almost into contact, so as to form small drops; which, uniting with others as they fall, come down in rain. The rain will be heavier in proportion as the elasticity is more vigorous, and the cloud approaches more nearly to a thunder-cloud. He imitated the appearance of clouds that bring rain, by insulating himself between the rubber and conductor of his electrical machine; and with one hand dropping colophonia into a spoon fastened to the conductor, and holding a burning coal, while his other hand communicated with the rubber. In these circumstances the smoke spread along his arm, and, by degrees, all over his body, till it came to the other hand that communicated with the rubber. The lower surface of this smoke was every where parallel to his clothes, and the upper surface was swelled and arched like clouds replete with thunder and rain. In this manner, he supposes, the clouds that bring rain diffuse themselves from over those parts of the earth which abound with electric fire, to those parts that are exhausted of it; and by letting fall their rain, restore the equilibrium between them. Signior Beccaria also thought, that the electricity communicated to the air, which both receives and parts with it slowly, would account for the retention of vapours in a clear sky; for small disjointed clouds, not dispersed into rain; for the smaller and lighter clouds in the higher regions of the air, which are but little affected by electricity; and also for the darker, heavy, and sluggish clouds in the lower regions, which retain more of it. He even imagined that some alteration in the weight of the air might be made by this electricity of it: the phenomena of rain, he thought, favoured the supposition, that the electric matter in the air did, in some measure, lessen its pressure: for when the electric matter is actually in the air, collecting and condensing the vapours, the barometer is lowest. When the communication is made between the earth and the clouds by the rain, the quicksilver begins to rise; the electric matter, which supported part of the pressure, being discharged. *Lettere dell'Elettricità*. Priestley's *Hist. &c. of Electricity*, vol. i. p. 427, &c. 8vo.

Dr. James Hutton's theory of rain is stated and amply illustrated in the 1st volume of the *Edinburgh Transactions*, p. 47, &c. It is well known that atmospheric air is capable, with a certain degree of heat, of dissolving a given quantity of water. (See VAPOUR.) Dr. Hutton ascertains the ratio of the dissolving power of air, in relation to water, with different degrees of heat; and thus, by mixing a portion of transparent humid warm air with a portion of cold air, the mixture becomes opaque, and part of the water will be precipitated; or, in other words, the vapour will be condensed into rain. Hence he observes, that since the capacity of air for moisture increases faster than the temperature, there must be a deposition of moisture when two saturated portions of air at different temperatures are

mixed. Dr. Hutton supposes that heat and solution do not increase by equal increments; but that, in reality, if heat be supposed to increase by equal increments along a straight line, solution will be expressed by ordinates to a curve, whose convex side is turned towards that line. That the power of solution is not increased in the same ratio with heat is, however, hypothetical, except when we rise pretty high in the scale, when its proportional increase is somewhat doubtful; nor has our author supported it by experiment. The condensation of the breath in air is not to the purpose, unless we suppose the air to be already saturated with vapour. In any view, it can only amount to this, that to render it visible, the heat must be diminished in a greater proportion than can be compensated by the power of solution in the body of air, in which the portion expired is at first immersed. In order to explain the origin of rain from this cause, we must always suppose a constant diminution of heat to take place at the moment of the condensation of the vapour; but we actually find, that the change from a state of vapour to the fluid state is attended with heat; so that rain must at once oppose its own cause, and continued rains would be impossible without the aid of other causes. Dr. Hutton endeavours, from his own system, to explain the regular and irregular seasons of rain, with regard either to the generality of its appearance, or the regularity of its return. And to obviate the apparent exceptions of the theory, from the generality of rain, he explains the proportional quantities of rain, and adds a comparative estimate of climates, in relation to rain with the meteorological observations made in our own climate. As our limits will not allow our doing full justice to our author's reasoning, we must refer to his own paper on the subject.

Mr. Dalton, in his "*Meteorological Essays*," (Ess. vi.) expresses his approbation of Dr. Hutton's theory in general; to this purpose, he says, "the principles of none appear to me to be more plausible and consistent with facts." Dr. Hutton, as we have above shewn, considers the varieties of heat and cold, affecting the solvent power of the atmosphere, as the sole causes of rain; and Mr. Dalton observes, when we consider that evaporation and the precipitation of vapour are diametrically opposite, it is reasonable to suppose that they should be promoted by opposite causes: and as heat and dry air are favourable to evaporation, so cold, operating upon air replete with vapour, promotes its precipitation. Dr. Hutton, however, seems to consider water as chemically combined with the atmosphere, and that cold produces precipitation in a manner similar to what it does in water saturated with salt, or in other chemical processes; whereas Mr. Dalton supposes, that a portion of the vapour, considered as a distinct and peculiar fluid, is condensed into water by cold; but the effects resulting from the two theories will be the same. See METEOROLOGY, and VAPOUR.

M. de Luc, in the 2d volume of his "*Thoughts on Meteorology*," has directed particular attention to the various circumstances that attend rain. He has also examined the several hypotheses of different authors, and concludes, that they are altogether insufficient to account for the formation of it. In this inquiry the grand question under discussion is, what becomes of the water that rises in vapour into the atmosphere? or what is the state in which it subsists there, between the time of its evaporation, and its falling down in rain? If it continues in the state of watery vapour, or such as is the immediate product of evaporation, it must possess the distinctive characters essential to that fluid; it must make

RAIN.

make the hygrometer move towards humidity, in proportion as the vapour is more or less abundant in the air: on a diminution of heat, the humidity, as shewn by the hygrometer, must increase; and on an increase of the heat, the humidity must diminish; and the introduction of other hygroscopic substances, drier than the air, must have the same effect as an augmentation of heat. These are the properties of vapour, on every hypothesis of evaporation; and, therefore, all the water that exists in the atmosphere, without possessing these properties, is no longer vapour, but must have changed its nature. M. de Luc shews, that the water which forms rain, though it has ever been considered and reasoned upon as producing humidity, does not possess this property, and must, therefore, have passed into another state. As he thinks that the vapour passes into an invisible state in the interval between evaporation and its falling again in rain, and that in this state it is not sensible to the hygrometer, he considers the laws of hydrology as insufficient for explaining the formation of rain; but he does not pretend to have discovered the immediate cause of the formation of clouds and rain. If it is not in the immediate product of evaporation that rain has its source; if the vapours change their nature in the atmosphere, so as no longer to be sensible to the hygrometer, or to the eye; if they do not become vapour again till clouds appear; and if, when the clouds are formed, no alteration is perceived in the quality of the air; we must acknowledge it to be very probable, that the intermediate state of vapour is no other than air, and that the clouds do not proceed from any distinct fluid contained in the atmosphere, but from a decomposition of a part of the air itself, perfectly similar to the rest. For other observations on the ascent and nature of vapour, and the subsequent formation of rain, we refer to the articles METEOROLOGY, and VAPOUR.

As to the general quantity of rain that falls, and its proportion in several places at the same time, and in the same place at several times, we have many observations, journals, &c. in the Memoirs of the French Academy, the Philos. Transf. and many other publications; from which we shall make the following extracts.

Upon measuring the rain falling yearly, its depth, at a medium, is found as in the following table.

Depth of Rain falling yearly, and its Proportion in several Places.

	Inches.
At Townley, in Lancashire, observed by Mr. Townley	42 $\frac{1}{2}$
Upminster, in Essex, by Dr. Derhan	19 $\frac{1}{2}$
Zurich, in Swisserland, by Dr. Scheuchzer	32 $\frac{1}{2}$
Pisa, in Italy, by Dr. Mich. Ang. Tilli	43 $\frac{1}{2}$
Paris, in France, by M. de la Hire	19
Lisle, in Flanders, by M. de Vauban	24

At Upminster.	At Paris.

1700 19.03	21.37
1701 18.69	27.77
1702 20.38	17.45
1703 23.99	18.51
1704 15.80	21.20
1705 16.93	14.82
<hr style="width: 50%; margin: 0 auto;"/> Mediums 19.14	<hr style="width: 50%; margin: 0 auto;"/> 20.19

From the Meteorological Journal of the Royal Society, kept by order of the president and council, it appears that

the whole quantity of rain at London, in each of the years specified below, was as follows: viz.

	Inches.
1774 - - - - -	26.328
1775 - - - - -	24.083
1776 - - - - -	20.354
1777 - - - - -	25.371
1778 - - - - -	20.772
1779 - - - - -	26.785
1780 - - - - -	17.313
Medium of these seven years	<hr style="width: 50%; margin: 0 auto;"/> 23.001 <hr style="width: 50%; margin: 0 auto;"/>

Proportion of the Rain of the several Seasons to one another.

See Philos. Transf. abr. vol. iv. pt. ii. p. 81, &c. and also Meteorological Journal of the Royal Society, published annually in the Phil. Transf.

As rain-gages have been fixed of late years in almost every part of the kingdom, we are enabled to determine, with considerable exactness, the depth of water which the rain yields in any given place. It may be observed, however, that inland counties have less rain than maritime ones, especially those which border on the western seas. But still a greater difference seems to take place between a mountainous country, and a champaign or flat country. In the former there often falls double or triple the quantity of rain in a year that there does in the latter, and never less than an equal quantity. It is also observed, that those winds bring most rain that blow from the quarter in which is the most and nearest sea; as are west and south-west winds. The rain-gage also shews, that more rain is collected in the instrument, as it is placed nearer the ground; without any appearance of a difference, between two places, on account of their difference of level above the sea, provided that the instrument is as far from the ground at the one place, as it is at the other. These effects are noticed in the Phil. Transf. for 1769 and 1771, the former by Dr. Heberden, and the latter by Mr. Daines Barrington. Dr. Heberden says, "A comparison having been made between the quantity of rain which fell in two places in London, about a mile distant from one another, it was found that the rain in one of them constantly exceeded that in the other, not only every month, but almost every time that it rained. The apparatus used in each of them was very exact, and both made by the same artist; and upon examining every probable cause, this unexpected variation did not appear to be owing to

RAIN.

to any mistake, but to the constant effect of some circumstance which, not being supposed to be of any moment, had never been attended to. The rain-gage in one of these places was fixed so high, as to rise above all the neighbouring chimnies; the other was considerably below them; and there appeared reason to believe, that the difference in the quantity of rain in these two places was owing to this difference in the placing of the vessel in which it was received. A funnel was, therefore, placed above the highest chimnies, and another upon the ground of the garden belonging to the same house, and there was found the same difference between these two, though placed so near one another, which had been between them, when placed at similar heights in different parts of the town. After this fact was sufficiently ascertained, it was thought proper to try whether the difference would be greater at a much greater height; and a rain-gage was therefore placed upon the square part of the roof of Westminster Abbey. Here the quantity of rain was observed for a twelvemonth, the rain being measured at the end of every month, and care being taken that none should evaporate by passing a very long tube of the funnel into a bottle through a cork, to which it was exactly fitted. The tube went down very near to the bottom of the bottle, and therefore the rain which fell into it would soon rise above the end of the tube, so that the water was no where open to the air except for the small space of the area of the tube: and by trial it was found that there was no sensible evaporation through the tube thus fitted up.

The following table shews the result of these observations.

From July the 7th, 1766, to July the 7th, 1767, there fell in a Rain-gage, fixed

1766.	Below the top of a house.	Upon the top of a house.	Upon Westminster Abbey.
From the 7th to the end of July	Inches. 3.591	Inches. 3.210	Inches. 2.311
August	0.558	0.479	} 0.508
September	0.421	0.344	
October	2.364	2.061	1.416
November	1.079	0.842	0.632
December	1.612	1.258	0.994
1767, January	2.071	1.455	1.035
February	2.864	2.494	1.335
March	1.807	1.303	0.587
April	1.437	1.213	0.994
May	2.432	1.745	1.142
June	1.997	1.426	} 1.145
July 7	0.395	0.309	
	22.628	18.139	12.099

By this table it appears, that there fell below the top of a house above a fifth part more rain than what fell in the same space above the top of the same house; and that there fell upon Westminster Abbey not much above one-half of what was found to fall in the same space below the tops of the houses. This experiment has been repeated in other cases with the same result. What may be the cause of this extraordinary difference, has not yet been discovered; but it may be useful to give notice of it, in order to prevent that error, which would frequently be committed in comparing the rain of two places without attending to this circumstance."

Such were the observations of Dr. Heberden on first announcing this circumstance, viz. of different quantities of rain falling at different heights above the ground. Two

years afterward, Daines Barrington, esq. made the following experiments and observations, to shew that this effect, with respect to different places, respected only the several heights of the instruments above the ground at those places, without regard to any real difference of level in the ground at those places.

Mr. Barrington caused two other rain-gages, exactly like those of Dr. Heberden, to be placed, the one upon mount Rennig, in Wales, and the other on the plane below, at about half a mile's distance, the perpendicular height of the mountain being 450 yards, or 1350 feet; each gage being at the same height above the surface of the ground at the two stations.

The results of the experiment are as below:

1770.	Bottom of the mountain.	Top of the mountain.
	Inches.	Inches.
From July 6 to 16	0.709	0.648
July 16 to 29	2.185	2.124
July 29 to Aug. 10	0.610	0.656
Sept. 9, both bottles had run over.		
Sept. 9 to 30	3.234	2.464
Oct. 17, both bottles had run over.		
Oct. 17 to 22	0.747	0.885
Oct. 22 to 29	1.281	1.388
Nov. 20, both bottles were broken by the frost.	8.766	8.165

"The inference to be drawn from these experiments, Mr. Barrington observes, seems to be, that the increase of the quantity of rain depends upon its nearer approximation to the earth, and scarcely at all upon the height of places, provided the rain-gages are fixed at about the same distance from the ground.

"Possibly also a much controverted point between the inhabitants of mountains and plains may receive a solution from these experiments; as in an adjacent valley, at least, very nearly the same quantity of rain appears to fall within the same period of time as upon the neighbouring mountains."

Dr. Heberden also adds the following note. "It may not be improper to subjoin to the foregoing account, that, in places where it was first observed, a different quantity of rain would be collected, according as the rain-gages were placed above or below the tops of the neighbouring buildings; the rain-gage below the top of the house into which the greater quantity of rain had for several years been found to fall, was above fifteen feet above the level of the other rain-gage, which, in another part of London, was placed above the top of the house, and into which the lesser quantity always fell. This difference, therefore, does not, as Mr. Barrington justly remarks, depend upon the greater quantity of atmosphere through which the rain descends: though this has been supposed by some, who have thence concluded that this appearance might readily be solved by the accumulation of more drops, in a descent through a great depth of atmosphere."

In the examination of the results from meteorological tables, it should be observed, that several years' account of the rain at any place is required, before a medium yearly quantity can be obtained with sufficient accuracy. The following table, formed by Mr. Dalton, and published in the first part of the fifth volume of Manchester Memoirs, gives us the largest collection of accounts of rain fallen in different places in England that has to our knowledge hitherto appeared. They are chiefly taken from the Transactions of the Royal Society, and of other societies.

RAIN.

Counties (Maritime).	Places.	Mean annual Depth in Inches.
CUMBERLAND	Keswick, 7 years	67.5
	Carlisle, 1 year	20.2
WESTMORELAND	Kendal, 11 years	59.8

General mean		35.2

The general mean of 35.2 inches is, as our author apprehends, a little above the medium for England and Wales, as the greater number of places are those where much rain falls. If we take up a mean for each of the above-mentioned counties, (where more than one place in a county is given,) and then a general mean from the counties, the result is a reduced mean of 31.3. Even then it may be objected, that the greater part of the counties are maritime; but it must be observed, that there is no account of rain in Wales: and we may safely conclude, that the rain in Wales would exceed the last-mentioned mean as much as the inland counties of England, not in the above list, would fall short; because Wales is both a mountainous country, and exposed to the sea.

We will, therefore, conclude, that the mean annual depth of rain in England and Wales, deduced from these twenty counties, is 31 inches: a quantity which subsequent observations, our author is confident, will not diminish, and probably not increase much.

The editors of the Encyclopedia, under the article *Weather*, from 16 places of observation, make the annual mean for Great Britain 32.53 inches; and M. Cotte, in the *Journal de Physique* for 1791, gives a mean derived from 147 places, in different parts of the world, equal to 34.7 inches.

If we take the dew (see *Dew*) at 5 inches annually, we

shall have 36 inches of water at a medium annually, on the surface of the earth, in England and Wales, reckoning 31 for rain and 5 for dew. Admitting the computation of Guthrie, the area of England and Wales is 46,450 square miles. This, reduced to square feet, gives 1,378,586,880,000; which, multiplied by 3 feet, the annual depth of rain and dew, gives 4,135,760,690,000 cubic feet of water, = 153,176,320,000 cubic yards, or 28 cubic miles = 115 thousand millions of tons in weight, nearly. This immense mass of water is disposed of partly by the supply of rivulets, and the soaking into the earth a small way, so as to break out again in lower ground in the form of springs, and thence make its way to some river, by which it is conveyed to the sea; and partly by being raised into the atmosphere in the process of evaporation. The decomposition of water by vegetables is not noticed, because it is presumed, that in the course of nature the principles are combined, and water formed again. See *RIVER, SPRING, EVAPORATION, and VAPOUR.*

As to the use of rain, we may observe that it moistens and softens the earth, and thus fits it for affording nourishment to plants: by falling on high mountains, it carries down with it many particles of loose earth, which serve to fertilize the surrounding vallies, and purifies the air from noxious-exhalations, which tend in their return to the earth to meliorate the soil; it moderates the heat of the air; and is one means of supplying fountains and rivers. However, vehement rains in many countries are found to be attended with barrenness and poorness of the lands, and miscarriage of the crops in the succeeding year: and the reason is plain; for these excessive storms wash away the fine mould into the rivers, which carry it into the sea, and it is a long time before the land recovers itself again. The remedy to the famine, which some countries are subject to from this sort of mischief, is the planting large orchards and groves of such trees as bear esulent fruit; for it is an old observation, that in years, when grain succeeds worst, these trees produce most fruit of all. It may partly be owing to the thorough moistening of the earth, as deep as their roots go, by these rains, and partly to their trunks stopping part of the light mould carried down by the rains, and by this means furnishing themselves with a coat of new earth. Phil. Trans. N^o 90.

The water afforded by rain is found highly refreshing to almost all sorts of vegetable crops, and to promote their growth in a rapid manner, when not produced in too great abundance at a time. This effect, which may often be perceived to take place in a sudden manner, after warm showers in the early spring months, is probably caused by the large proportion of oxygen that is contained in rain-water, as well as from the necessary moisture being afforded to the fibres of the roots of the plants. Too much rain may be injurious, however, by lessening the necessary cohesion and compactness of soils, by which they may not afford proper firmness to the roots of growing vegetables. And another injury may be produced by the too frequent occurrence of hasty showers, by which a large proportion of the decomposing vegetable and animal materials of lands, which are soluble or diffusible in water, may be conveyed away into the ditches, rivers, and ultimately into the sea, and of course prove the cause of infertility. In hilly situations, this effect may arise from even slight showers; on which account, they have been advised to be ploughed in a slanting direction, as by that means the rains may be more perfectly detained in the soils. And it has been suggested by Dr. Darwin, that as the foliage or buds of plants require more moisture for their vigorous growth than their flowers, in this climate, continued rains may be liable not only to wash off the farina from

from the bursting anthers, and in that way prevent the impregnation of the pistillum, but also delay the ripening of the seeds or fruit, from the want of a due evaporation of their perspirable matter, as well as from the less solar light in cloudy seasons. On this account it is, he supposes, that in the north of Scotland the oats are said seldom to ripen till the frost commences, with the dry season which accompanies it.

Thus, as the effects of rain are so very considerable on vegetation, it would be highly useful to ascertain the quantity or depth of rain that falls annually in different districts, and the difference in the effects which are produced by it. See WATER and WEATHER.

The vast quantities of rain which fall in some districts, from the peculiar nature of their situations, especially where they are of the grazing or pasture kind, as those of Cheshire, Lancashire, and some others, are often highly beneficial to their general fertility; the natural grass pastures of which districts, though frequently of inferior qualities to those in many other places, are, in consequence of this circumstance, rendered superior in their abundance of grass, the strength of its vegetation, and the richness of its quality. The former of the above counties may indeed, without any impropriety, be reckoned one of the most productive grass-land districts in the kingdom, as is fully evinced by the great abundance and superiority of its dairy products. The grass lands in this tract of country mostly retain their full verdure during the most sultry and parching seasons, except where they are of a sandy or gravelly nature in their under strata. Where they are near to the sea, however, in this as well as other parts, they are liable to become mossy, or be covered with the moss plant, either in consequence of so much of the spray from it falling in the manner of slight rain, or some other cause of that kind.

The quantity of rain falling upon land has much influence upon its temperature, or state of heat, and, of course, great effect on vegetation in that way; and the nature of its mixture with it, or the manner in which it is distributed through its parts, or combined with its different earthy materials, is another means by which it becomes of great importance, as it relates to the supplying of nourishment and support to vegetables as crops.

Rain falling in large quantities, on particular sorts of retentive soils, is a frequent cause of that kind of injurious wetness, which stands so much in need of surface-draining to remove it. See SURFACE-Draining.

The nature and causes of showers and rain are extremely curious and interesting in several different points of view, both to the agriculturist and the philosophical inquirer.

RAINS, Preternatural. We have numerous accounts in historians of preternatural rains, such as the raining of stones, of dust, of blood, nay, and of living animals, as young frogs, and the like. We are not to doubt the truth of what those who are authors of veracity and credit relate to us of this kind, so far as to suppose that the FALLING of Stones (which see) and dust never happened; the whole mistake (if it be so with regard to the first instance) is the supposing them to have fallen from the clouds; but as to the blood and frogs, it is very certain that they never fall at all, but the opinion has been a mere deception of the eyes. Men are extremely fond of the marvellous in their relations; but the judicious reader is to examine strictly whatever is reported of this kind, and is not to suffer himself to be deceived.

There are two natural methods by which quantities of stones and dust may fall in certain places, without their having been generated in the clouds, or fallen as rain. The one is by means of hurricanes: the wind which we fre-

quently see tearing off the tiles of houses, and carrying them to considerable distances, being equally able to take up a quantity of stones, and drop them again at some other place. But the other, which is much the most powerful, and probably the most usual way, is for the eruptions of volcanos, and burning mountains, to toss up, as they frequently do, a vast quantity of stones, ashes, and cinders, to an immense height in the air; and these being hurried away by the hurricanes and impetuous winds, which usually accompany those eruptions, and being in themselves much lighter than common stones, as being half calcined, may easily be thus carried to vast distances, and their falling in places where the inhabitants know nothing of the occasion, they cannot but be supposed by the vulgar to fall on them from the clouds. It is well known, that in the great eruptions of *Ætna* and *Vesuvius*, showers of ashes, dust, and small cinders, have been seen to obscure the air, and overspread the surface of the sea for a great way, and cover the decks of ships; and this at such a distance, as it should appear scarce conceivable that they should have been carried to; and probably, if the accounts of all the showers of these substances mentioned by authors be collected, they will all be found to have fallen within such distances of volcanos; and if compared, as to the time of their falling, will be found to correspond in that also with the eruptions of those mountains. We have known instances of the ashes from *Vesuvius* having been carried thirty, nay forty leagues, and peculiar accidents may have carried them yet farther.

The raining of blood has been ever accounted a more terrible sight, and a more fatal omen, than the other preternatural rains already mentioned. It is very certain that nature forms blood no where but in the vessels of animals, and therefore showers of it from the clouds are by no means to be credited. Those who suppose that what has been taken for blood, has been actually seen falling through the air, have had recourse to flying insects for its origin, and suppose it the eggs or dung of certain butterflies discharged from them as they were high up in the air. But this seems a very wild conjecture, as we know of no butterfly whose excrements, or eggs, are of such a colour, or whose abode is so high, or their flocks so numerous, as to be the occasion of this.

It is most probable that these bloody waters were never seen falling, but the people seeing the standing waters blood-coloured, were assured, from their not knowing how it should else happen, that it had rained blood into them. A very memorable instance of this there was at the Hague in the year 1670. *Swammerdam*, who relates it, tells us, that one morning the whole town was in an uproar, on finding their lakes and ditches full of blood, as they thought, and having been certainly full of water the night before, they agreed it must have rained blood in the night; but a certain physician went down to one of the canals, and taking home a quantity of this blood-coloured water, he examined it by the microscope, and found that the water was water still, and had not at all changed its colour, but that it was full of prodigious swarms of small red animals, all alive, and very nimble in their motions, whose colour and prodigious number gave a red tinge to the whole body of the water they lived in, on a less accurate inspection. The certainty that this was the case, did not however persuade the *Hollanders* to part with the miracle; they prudently concluded, that the sudden appearance of such a number of animals was as great a prodigy as the raining of blood would have been; and are assured at this day, that this portent foretold the scene of war and devastation which *Lewis XIV.* afterwards brought into that country, which had before enjoyed forty years uninterrupted peace.

The animals, which thus colour the water of lakes and ponds, are the *pulices arborefcetes* of Swammerdam, or the water-fleas with branched horns. These creatures are of a reddish-yellow, or flame colour; they live about the fides of ditches, under weeds, and among the mud, and are therefore the lefs visible, except at a certain time, which is in the end of May or beginning of June: it is at this time that these little animals leave their recesses to float loose about the water, to meet for the propagation of their species, and by that means become visible in the colour they give the water. This is visible, more or less, in one part or other of almost all standing waters at this season; and it is always at this season that the bloody waters have alarmed the ignorant.

The raining of frogs is a thing not less wonderful in the accounts of authors who love the marvellous, than those of blood, or of stones; and this is supposed to happen so often, that there are multitudes who pretend to have been eye-witnesses of it. These rains of frogs always happen after very dry seasons, and are much more frequent in the hotter countries than the cold ones. In Italy they are very frequent; and it is not uncommon to see the streets of Rome swarming both with young frogs and toads in an instant, in a shower of rain; they hopping every where between the people's legs, as they walk, though there was not the least appearance of them before. Nay, they have been seen to fall through the air down upon the pavements. This seems a strong circumstance in favour of their being rained down from the clouds, but when strictly examined, it comes to nothing; for these frogs, that are seen to fall, are always found dead, lamed, or bruised by the fall, and never hop about as the rest; and they are never seen to fall, except close under the walls of houses, from the roofs and gutters of which they have accidentally slipped down.

To the raining of frogs we ought to add the raining of grats-hoppers and locusts, which have sometimes appeared in prodigious numbers, and devoured the fruits of the earth. There has not been the least pretence for supposing that these animals descended from the clouds, but that they appeared on a sudden in prodigious numbers. The naturalist, who knows the many accidents attending the eggs of these, and other the like animals, cannot but know that some seasons will prove particularly favourable to the hatching of them, and the prodigious number of eggs that many insects lay, could not but every year bring us such abundance of the young, were they not liable to many accidents, and had not provident nature taken care, as in many plants, to continue the species by a very numerous stock of seeds, of which perhaps not one in five hundred need take root, in order to continue an equal number of plants.

The raining of fishes has been a prodigy also much talked of in France, where the streets of a town at some distance from Paris, after a terrible hurricane in the night, which tore up trees, blew down houses, &c. were found in a manner covered with fishes of various sizes. Nobody here made any doubt of these having fallen from the clouds; nor did the absurdity of fish, of five or six inches long, being generated in the air, at all startle the people, or shake their belief in the miracle, till they found upon enquiry that a very well-stocked fish-pond, which stood on an eminence in the neighbourhood, had been blown dry by the hurricane, and only the great fish left at the bottom of it, all the smaller fry having been tossed into their streets.

Upon the whole, all the supposed marvellous rains have been owing to substances naturally produced on the earth, and either never having been in the air at all, or only carried thither by accident.

RAIN, *Freezing*. See FREEZING.

RAIN-Bird, in *Ornithology*. See CUCULUS *Pluvialis*.

RAIN-Fowl, an English name given by many to the common green woodpecker, or *picus viridis*, from an observation that it is always most clamorous when rainy weather is coming on. The Latins have, for the same reason, called it the *pluvialis avis*. See PICUS.

RAIN-Gage, called also *Ombrometer* and *Pluviometer*, an instrument for measuring the quantity of rain that falls. That which is mentioned under the article OMBROMETER, consists of a tin funnel *d* (*Plate XXIV. Miscellany, fig. 2.*), whose surface is an inch square, a flat board *aa*, and a glass tube *bb*, set into the middle of it in a groove, and an index with divisions *c, c*; the board and tube being of any length at pleasure. The bore of the tube is about half an inch, which, says Mr. Pickering, the inventor, is the best size. This machine is fixed in some free and open place, as the top of the house, &c.

The rain-gage employed in the house of the Royal Society, is described by Mr. Cavendish in the *Phil. Transf. for 1776, p. 384*. The vessel which receives the rain is a conical funnel, strengthened at the top by a brass ring, twelve inches in diameter. The sides of the funnel, and inner lip of the brass ring, are inclined to the horizon, at an angle of above 65° , and the outer lip at an angle of above 50° , which are such degrees of steepness, that there seems to be no probability either that any rain which falls within the funnel, or on the inner lip of the ring, should dash out, or that any which falls on the outer lip should dash into the funnel. A vertical section of the funnel appears in *Plate XXIV. Miscellany, fig. 3*; *A B C* and *abc* being the brass ring, *B A* and *ba* the inner lip, and *B C* and *bc* the outer. This vessel is placed on some flat leads, on the top of the society's house. It can hardly be screened from any rain by the chimnies, as none of them are elevated above it in an angle of more than 25° , and as it is raised $3\frac{1}{2}$ feet above the roof, there seems no danger of any rain dashing into it by rebounding from the lead.

In fixing rain-gages care should be taken that the rain may have free access to them, without being impeded or overshadowed by buildings, &c. and therefore the tops of houses are to be preferred. Also, when the quantities of rain collected in them, at different places, are compared together, the instruments ought to be fixed at the same height above the ground at both places; because at different heights the quantities are always different, even in the same place. And hence also, any register or account of rain in the gage ought to be accompanied with a note of the height at which the instrument is placed above the ground. Dalton found the rain of a gage 50 yards high, in summer two-thirds, and in winter one-half as much as that of a gage below. Mr. Dalton observes, that a strong funnel, made of sheet iron, tinned and painted, with a perpendicular rim, two or three inches high, fixed horizontally in a convenient frame, with a bottle under it to receive the rain, is sufficient for this purpose.

The rain-gage is an invention which should be in the possession of every correct farmer in every part of the kingdom, and which would thereby have much tendency to the improvement of agriculture as contributing to the knowledge of the degree of moisture which prevails in the soils, after showers or heavy rains, with greater accuracy and correctness than has been hitherto the case.

It is noticed by Mr. Naismith, in his *Agricultural Survey of Clydesdale*, that professor Anderson, of the university of Glasgow, has invented, perhaps, the most ingenious and accurate rain-gage of any that has yet been known. It receives

the rain at a little more than one hundred feet above the level of the sea; accounts of which have been regularly kept since the year 1781; but previously to that period the rain was measured by an old rain-gage. It is to be regretted, however, that the exact nature of this invention is not more fully explained; and that other cheap plain inventions of this nature are not better known to the farmer.

RAIN-Water. See WATER.

RAINS, in the *Sea Language*, denote all that tract of sea to the northward of the equator, between four and ten degrees of latitude; and lying between the meridian of Cape Verde and that of the easternmost islands of the same name.

It takes its name from the almost continual calms, constant rains, and thunder and lightning, to a great degree, always found there. The winds, when they do blow, are only small uncertain gusts, and shift about all round the compass; so that ships are sometimes detained here a long while, and can make but very little way.

RAINANGBONG, in *Geography*, a town of the Birman empire, situated near a river in which there are several wells of petroleum, whence its name signifying a town through which flows a river of earth-oil. N. lat. $20^{\circ} 26'$. E. long. $94^{\circ} 46'$.

RAINBOW, *Iris*, or, simply, the *bow*, a meteor in form of a parti-coloured arch, or semicircle, exhibited in a rainy sky, opposite to the sun, by the refraction of his rays in the drops of falling rain.

There is also a secondary, or fainter bow, usually seen investing the former at some distance. Among naturalists, we also read of *lunar rainbows*, *marine rainbows*, &c.

The rainbow, sir Isaac Newton observes, never appears but where it rains in the sun-shine; and it may be represented artificially by contriving water to fall in little drops, like rain, through which the sun shining, exhibits a bow to a spectator placed between the sun and the drops; especially if a dark body, *e. gr.* a black cloth, be disposed beyond the drops.

That the rainbow is opposite to the sun, has always been observed. It was, therefore, natural to imagine, that the colours of it were produced by some kind of reflection of the rays of light from drops of rain or vapour. The regular order of the clouds was another circumstance that could not have escaped the notice of any person. But though mere reflection had in no other case been observed to produce colours, and it could not but have been observed that refraction is frequently attended with that phenomenon, so that some of the ancients, as we learn from Aristotle's tract on meteors, knew that the rainbow was caused by the refraction of the sun's light in drops of falling rain; yet no person seems to have thought of having recourse to a proper refraction in this case before one Fletcher of Breslaw, who, in a treatise which he published in 1571, endeavoured to account for the colours of the rainbow by means of a double refraction, and one reflection. But he imagined that a ray of light, after entering a drop of rain, and suffering a refraction, both at its entrance and exit, was afterwards reflected from another drop, before it reached the eye of the spectator. He seems to have overlooked the reflection at the farther side of the drop, or to have imagined that all the bendings of the light within the drop would not make a sufficient curvature, to bring the ray of the sun to the eye of the spectator. Antonio de Dominis, bishop of Spalato, whose treatise, "*De Radis Visus et Lucis*," was published by I. Bartolus, in 1611, was the first person who advanced, that the double refraction of Fletcher, with an intervening reflection, was sufficient to produce the colours of the rainbow, and also to

bring the rays that formed them to the eye of the spectator, without any subsequent reflection. He distinctly describes the progress of a ray of light entering the upper part of the drop, where it suffers one refraction, and after being thereby thrown upon the back part of the inner surface, is from thence reflected to the lower part of the drop; at which place undergoing a second refraction, it is thereby bent so as to come directly to the eye. To verify this hypothesis, he procured a small globe of solid glass, and viewing it when it was exposed to the rays of the sun, in the same manner in which he had supposed that the drops of rain were situated with respect to them, he actually observed the same colours which he had seen in the true rainbow, and in the same order. The theory of A. de Dominis was adopted, and in some degree improved, by Descartes. Philosophers were, however, for a long time at a loss when they endeavoured to assign reasons for all the particular colours, and for the order of them. Indeed, nothing but the doctrine of the different refrangibility of the rays of light, which was a discovery reserved for the great sir Isaac Newton, could furnish a complete solution of this difficulty.

Dr. Barrow, in his "*Lectiones Opticæ*," (Lect. 12. n. 14.) says, that a friend of his, meaning Mr. Newton, communicated to him a method of determining the angle of the rainbow, which was hinted to Newton by Slusius, without making a table of the refractions, as Descartes did. The doctor shews the method, with other curious particulars. But the subject was given more perfectly by Newton afterwards, in his "*Optics*," prop. 9; where he makes the breadth of the interior bow to be nearly $2^{\circ} 15'$, that of the exterior $3^{\circ} 40'$, their distance $8^{\circ} 25'$, the greatest semidiameter of the interior bow $42^{\circ} 17'$, and the least of the exterior $50^{\circ} 42'$, when their colours appear strong and perfect.

RAINBOW, *Theory of the*. To conceive the origin of the rainbow, let us consider what will befall rays of light coming from a very remote body, *e. gr.* the sun, and falling on a globe of water, such as we know a drop of rain to be.

Suppose, then, A D K N (*Plate XVIII. Optics, fig. 1.*) to be a drop of rain, and the lines E F, B A, O N, to be rays of light coming from the centre of the sun; which, on account of the immense distance of the sun, we conceive to be parallel.

Now the ray B A being the only one that falls perpendicularly on the surface of the water, and all the rest obliquely, it is easily inferred, that all the other rays will be refracted towards the perpendicular. (See REFRACTION.) Thus the ray E F, and others accompanying it, will not go on straight to G; but as they arrive at H I, they will deflect from F to K; where some of them, probably, escaping into the air, the rest are reflected upon the line K N, so as to make the angles of incidence and reflection equal.

Farther, as the ray K N, and those accompanying it, fall obliquely upon the surface of the globule, they cannot pass out into the air, without being refracted, so as to recede from the perpendicular L M; and, therefore, they will not proceed straight to Y, but will deflect to P.

It may be here observed, that some of the rays, arriving at N, do not pass out into the air, but are again reflected to Q; where being refracted, like the rest, they do not proceed right to Z; but, declining from the perpendicular T V, are carried to R; but since we here only regard the rays as they may affect the eye placed a little below the drop, *e. gr.* at P, those which deflect from N to Q, we set aside, as useless; because they never come to the eye. On the contrary, it is to be observed, that there are other rays,

RAINBOW.

rays, as 2 3, and the like; which, being refracted from 3 to 4, and reflected to 5, and from 5 to 6, may at length, by refraction at 6, arrive at the eye 7, placed beneath the drop.

Thus much is obvious; but to determine precisely the quantities of refraction of each ray, there must be a calculation; by such calculation it appears, that the rays which fall on the quadrant A D, are continued in lines, like those here drawn in the drop A D K N; wherein there are three things very considerable: first, that the two refractions of the rays, in their ingresses and egresses, are both the same way; so that the latter does not destroy the effect of the former. Secondly, that of all the rays passing out of A N, N P, and those adjoining to it, are the only ones capable of affecting the sense, as being sufficiently close and contiguous, and because they come out parallel; whereas the rest are diverging, and dispersed too far to have any sensible effect, at least to produce any thing so vivid as the colours of the bow. Thirdly, that the ray N P has shade or darkness under it; for, since there is no ray comes out of the surface N 4, it is the same thing as if the part were covered with an opaque body. We might add that the same ray N P has darkness above it; since the rays that are above it are ineffectual, and signify no more than if there were none at all.

Add to this, that all the effectual rays have the same point of reflection, *i. e.* the parallel and contiguous rays, which alone are effectual after refraction, will all meet in the same point of the circumference, and be reflected thence to the eyes.

Farther, it appears, that the angle O N P, included between the ray N P, and the line O N drawn from the centre of the sun, is the angle by which the rainbow is distant from the opposite point of the sun, and which makes the semidiameter of the bow. The method of determining it will be seen in the sequel of the article. But since, besides those rays coming from the centre of the sun to the drop of water, there are many more from the several points of its surface; there are a great many other effectual rays to be considered, especially that from the uppermost, and that from the lowest part of the sun's body.

Since, then, the apparent semidiameter of the sun is about 16 minutes, it follows, that an effectual ray from the upper part of the sun will fall higher than the ray E F by 16 minutes: thus does the ray G H (*fig. 2.*) which, being refracted as much as E F, deflects to I, thence to L, and at length emerging equally refracted with the ray N P, proceeds to M; and makes an angle O N M with the line O N. In the like manner, the effectual ray Q R coming from the lowest part of the sun, falls on the point R, 16 minutes lower than the point F on which the ray E F falls; and this, being refracted, declines to S, whence it is reflected to T; where, emerging into the air, it proceeds to V; so that the line T V, and the ray O T, contain an angle whose magnitude will be ascertained. Again, upon computing the deflections of the rays, which like that 23 (*fig. 1.*) coming from the centre of the sun, and being received into the lower part of the drop, we have supposed to be twice reflected, and twice refracted, and to enter the eye by lines like that 67 (*fig. 3.*) we find that which may be accounted effectual, as 67 with the line 86 drawn from the centre of the sun, contains an angle 867; whence it follows, that the effectual ray from the highest part of the sun, with the same line 86, includes an angle less by 16 minutes; and that from the lowest part of the sun, an angle greater by 16 minutes.

Thus, since A B C D E F is the path of the efficacious

ray from the highest part of the sun to the eye in F, the angle 86 F becomes of a certain magnitude ascertained below. In like manner, since G H I K L M is the way of an effectual ray from the lowest part of the sun to the eye, the angle 86 M becomes greater than the former by 16 minutes.

Since, then, we admit several rays to be effectual, besides those from the centre of the sun, what we have said of the shade will need some alteration; for of the three rays described (*figs. 2 and 3.*), only the two extreme ones will have a shadow joined to them, and that only on the outer side. Hence it is evident, that these rays are perfectly disposed to exhibit all the colours of the prism.

For the great quantity of dense or intense light, *i. e.* the bundle of rays collected together in a certain point, *v. gr.* in the point of reflection of the effectual rays, may be accounted as a lucid or radiant body, terminated all around by shade. But the several rays, thus emitted to the eye, are both of different colours; that is, they are fitted to excite in us the ideas of different colours; and are differently refracted out of the water into the air, notwithstanding their falling alike upon the refracting surface.

Hence it follows, that the different or heterogeneous rays will be separated from one another, and will tend separate ways; and the homogeneous rays will be collected, and tend the same way; and, therefore, this lucid point of the drop in which the refraction is effected, will appear fringed or bordered with several colours; that is, red, green, and blue colours will arise from the extremes of the red, green, and blue rays of the sun, transmitted to the eye from several drops, one higher than another, after the same manner as is done in viewing lucid or other bodies through a prism.

Thus, adds sir Isaac Newton, the rays that differ in refrangibility, will emerge at different angles; and, consequently, according to their different degrees of refrangibility, emerging most copiously at different angles, they will exhibit different colours in different places.

A great number, then, of these little globules being diffused in the air, will fill the whole space with these different colours; provided they be so disposed as that effectual rays may come from them to the eye; and thus will the rainbow, at length, arise.

Now, to determine what that *disposition* must be, suppose a right line drawn from the centre of the sun through the eye of the spectator, as the line V X (*fig. 2.*) called the *line of aspect*, or *axis of vision*; being drawn from so remote a point, it may be esteemed parallel to all other lines drawn from the same point; but a right line, falling on two parallels, makes the alternate angles equal.

If, then, an indefinite number of lines be imagined drawn from the spectator's eye to a part opposite to the sun where it rains; which lines make different angles with the line of aspect, equal to the angles of refraction of the differently refrangible rays, these lines, falling on drops of rain illuminated by the sun, will make angles of the same magnitude with rays drawn from the centre of the sun to the same drops. And, therefore, the lines thus drawn from the eye will represent the effectual rays that occasion the sensation of any colour.

Now it is known, that the eye, being placed in the vertex of a cone, sees objects upon its surface, as if they were in a circle; and the eye of our spectator is here in the common vertex of several cones, formed by the several kinds of efficacious rays, with the line of aspect. Now in the surface of that whose angle at the vertex, or eye, is the greatest, and in which the others are included, are those drops, or parts

of drops, which appear red; and in the surface of that cone whose angle is least, are the purple drops; and in the intermediate cones, are the green, blue, &c. drops. Hence, then, several kinds of the drops must appear as if disposed into so many circular coloured fasciæ, or arches, as we see in the rainbow. (Rohault's System of Nat. Phil. vol. ii. part iii. cap. 17.) This part of the solution sir Isaac Newton expresses more precisely, thus: suppose O (*fig. 4.*) the eye, and OP a line parallel to the sun's rays; and let POE, POF, be angles of $40^{\circ} 17'$, and $42^{\circ} 2'$. And suppose the angles to turn about their common side OP, with their other sides OE and OF, they will describe the bounds, or verges, of the rainbow.

For if E, F be drops placed any where in the conical surface described by OE, OF, and be illuminated by the sun's rays SE, SF; the angle SEO being equal to the angle POE, or $40^{\circ} 17'$, shall be the greatest angle in which the most refrangible rays can, after reflection, be refracted to the eye; and, therefore, all the drops in the line OE shall send the most refrangible rays most copiously to the eye, and therefore strike the senses with the deepest violet colour in that region.

And in like manner the angle SFO being = to the angle POF = $42^{\circ} 2'$, shall be the greatest in which the least refrangible rays after one reflection can emerge out of the drops; and these rays shall come most copiously to the eye from the drops in the line OF, and strike the senses with the deepest red colour in that region.

And, by the same argument, the rays which have intermediate degrees of refrangibility, shall come most copiously from drops between E and F, and so strike the senses with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progress from E to F, or from the inside of the bow to the outside, in this order; violet, indigo, blue, green, yellow, orange, red; though the violet, by the mixture of the white light of the clouds, will appear faint, and incline to a purple.

Here it may be observed, that all the rays but the violet in the line SE will emerge from E in a greater angle than SEO made by the violet, and consequently will pass below the eye; and all the rays but the red in the line SF will emerge from F in a less angle than SFO made by the red, and consequently will pass above the eye; by which means only red will appear in the line SF, and only violet in the line SE.

And, since the lines OE, OF, may be situated any where in the above-mentioned conical surface; what is said of the drops and colours of these lines, is to be understood of the drops and colours throughout the whole superficies. Thus is the *primary* or *inner bow* formed.

RAINBOW, *Secondary*, or *Outer*. As to the secondary, or fainter bow, usually surrounding the former, in assigning what drops would appear coloured, we excluded such as lines drawn from the eye, making angles a little greater than $42^{\circ} 2'$, shall fall upon, but not such as should contain angles much greater.

For, if an indefinite number of such lines be drawn from the spectator's eye, some of which make angles of $50^{\circ} 57'$, with the line of aspect, *e. gr.* OG; other angles, of $54^{\circ} 7'$, *e. gr.* OH; those drops on which these lines fall must of necessity exhibit colours; particularly those of $50^{\circ} 57'$.

E. gr. The drop G will appear red; the line GO being the same with an effectual ray; which, after two reflections, and two refractions, exhibits a red colour. Again, those drops which receive lines of $54^{\circ} 7'$, *e. gr.* the drop H, will appear purple; the line OH being the same with an effectual ray; which, after two reflections and two refractions, exhibits purple.

Now there being a sufficient number of these drops, it is evident there must be a second rainbow, formed after the like manner as the first.

Thus, according to sir Isaac Newton, in the least refrangible rays, the least angle at which a drop can send effectual rays after two reflections, is found by computation to be $50^{\circ} 57'$; and in the most refrangible, the least angle is found $54^{\circ} 7'$.

Suppose, then, O the place of the eye, as before, and POG, POH, to be angles of $50^{\circ} 57'$, and $54^{\circ} 7'$; and these angles to be turned about their common side OP; with their other sides OG, OH, they will describe the verges, or borders, of the rainbow CHDG.

For, if G, H be drops placed any where in the conical superficies described by OG, OH, and be illuminated by the sun's rays, the angle SGO, being equal to the angle POG, or $50^{\circ} 57'$, shall be the least angle in which the then least refrangible rays can, after two reflections, emerge out of the drops; and, therefore, the least refrangible rays shall come most copiously to the eye from the drops in the line OG, and strike the senses with the deepest red in that region.

And the angle SHO being equal to POH, $54^{\circ} 7'$, shall be the least angle in which the most refrangible rays, after two reflections, can emerge out of the drops; and, therefore, those rays shall come most copiously to the eye from the drops in the line OH, and so strike the senses with the deepest violet in that region.

And, by the same argument, the drops in the region, between G and H, shall strike the senses with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progress from G to H, or from the inside of the bow to the outer, in this order: red, orange, yellow, green, blue, indigo, violet.

And since the lines OG, OH, may be situated any where in the conical surface; what is said of the drops and colours in these lines is to be understood of the drops and colours every where in this superficies.

Thus are formed two bows, an *interior* and stronger, by one reflection; and an *exterior* and fainter, by two; the light becoming weaker and weaker by every reflection.

Their colours will lie in a contrary order to one another; the first having the red without, and the purple within; and the second, the purple without, and red within; and so of the rest.

RAINBOW, *Artificial*. This doctrine of the rainbow is confirmed by an easy experiment; for upon hanging up a glass globe, full of water, in the sun-shine, and viewing it in such a posture as that the rays, which come from the globe to the eye, may, with the sun's rays, include an angle either of 42° , or 50° ; if, *e. gr.* the angle be about 42° , the spectator, supposed at O, will see a full red colour in that side of the globe opposite to the sun, as at F. And if that angle be made a little less, suppose by depressing the globe to E, the other colours, yellow, green, and blue, will appear successively, in the same side of the globe, also exceedingly bright.

But if the angle be made about 50° , suppose by raising the globe to G, there will appear a red colour in that side of the globe towards the sun, though somewhat faint; and if the angle be made greater, suppose by raising the globe to H, this red will change successively to the other colours, yellow, green, and blue.

The same thing is observed in letting the globe rest, and raising or depressing the eye so as to make the angle of a just magnitude.

magnitude. Newton's Optics, part ii. prop. 9. prob. 4. p. 147, ed. 3.

RAINBOW, *Dimension of the*.—Descartes first determined its diameter by a tentative and indirect method; laying it down, that the magnitude of the bow depends on the degree of refraction of the fluid; and assuming the ratio of the sine of incidence to that of refraction to be in water as 250 to 187.

But Dr. Halley has since, in the Philosophical Transactions, N^o 267, given us a simple direct method of determining the diameter of the rainbow from the ratio of refraction of the fluid being given; or, *vice versa*, the diameter of the rainbow being given, to determine the refractive power of the fluid.

The principles of Dr. Halley's construction for this purpose, illustrated and facilitated by Dr. Morgan, bishop of Ely, will be understood from the following view of them. Let SN, *sn*, (Plate XVIII. Optics, fig. 5.) be two of the efficacious rays incident upon a drop of rain; these, when refracted to the same point F, and thence reflected to G, *g*, will have the parts within the drop on one side NF, *nF*, equal to those on the other side FG, *Fg*, from the nature of the circle, and because the angles of incidence CFN, *CFn*, are equal to the angles of reflection CFG, *CFg*. And since the parts within the drop are equal and alike situated, they will be similarly situated with regard to the drop itself; and, consequently, as the incident rays SN, *Sn*, are supposed to be parallel, the emergent rays GR, *gr*, will be also parallel. From C, the centre, draw the radii CN, *Cn*, CF, then will CNF = CFN be the angle of refraction, and the small arc Nn is the nascent increment of the angle of incidence BCN; and as it measures the angle at the centre NCn, it is double of the angle at the circumference upon the same arc, *viz.* NFn, which is the nascent increment of the angle of refraction NFC. Farther, let the ray SN (fig. 6.) enter the lower part of the drop, and be twice reflected within the drop at F and G; then is the ray NF equal to the ray FG, and the arc NF = the arc FG. Draw *fg* parallel to FG, and it will be the reflected part of some ray *sn*, whose obliquity to the drop makes it cross the ray NF in its refraction; then will the part *nf* = *fg*, and the arc *nf* = *fg*, and the small arc Ff = Gg. Therefore, 2Ff = (Ff + Gg = the arc FG - fg = NF - nf =) Nn - Ff; consequently Nn = 3Ff, *i. e.* the nascent increment of the angle of incidence is equal to three times that of the angle of refraction. After a like manner it may be shewn, that after three, four, five, &c. reflections, the increment of the angle of incidence will be four, five, six, &c. times greater than that of the angle of refraction. Hence, in order to find the angle of incidence of an efficacious ray, after any given number of reflections, we are to find an angle whose nascent increment has the same ratio to the increment of its corresponding angle of refraction, generated in the same time, as the given number of reflections (*n*) increased by unity has to unity; *i. e.* as *n + 1* to 1. But these increments are as the tangents of the respective angles directly. For, let ACD, ABD (fig. 7.) be the angles of incidence and refraction proposed; and if we suppose the line AC to move about the point A in the plane of those angles, the extremity of it, C, will describe the circular arc Cc; and when AC is arrived at the situation Ac, the line BD will be thereby removed into the situation Bd. Draw cD, then is the angle ACD = ABC + CAc, and the angle Acd = ABc + cAc; therefore the excess of Acd above ACD, or the increment of ACD, is equal to both the angles CBc and CAc. But since the angle Acd differs infinitely little

from a right one, a circle described on the diameter AC shall pass through the points D and c; and, therefore, the angles CAc, CDc, (insisting on the same arc Cc of the said circle) will be equal; and, therefore, the increment of the angle ACD is equal to CBc + CDc = Dcd. But the nascent angles Dcd and DBc are as their sines, that is, as their opposite sides BD and Dc = DC, the angle CDc being infinitely small; but BD : CD :: DE : DA (the line BE being parallel to AC) :: tangent of the angle EBD = ACD : tangent of the angle ABD. Therefore the increment Dcd of the angle ACD is to the increment CBc of the angle ABD (generated in the same time) as the tangent of the former to the tangent of the latter directly. Hence the praxis is as follows:

First, *The ratio of the sine of incidence I, to the sine of refraction R, being given; to find the angles of incidence, and refraction of a ray, which becomes effectual after any given number (n) of reflections.*—Suppose any given line, as AC (fig. 8.) which divide in D; so as that AC : AD :: I : R; and again divide it in E, so that AC may be to AE as the given number of reflections, increased by unity, is to unity; *i. e.* as *n + 1* : 1. Upon the diameter CE describe a semicircle CBE, and from the centre A, with the radius AD, describe an arc DB intersecting the semicircle in B; then drawing AB, CB, and letting fall the perpendicular AF on CB produced; ABC, or its complement to two right angles, ABF, will be the angle of incidence; and ACB the angle of refraction required. For, drawing BE parallel to AF, the triangles ACF and ECB are similar. Now, the sine of the angle ABC, or ABF, is to the sine of ACB as AC to AB = AD, *i. e.* as I to R; therefore if ABF be the angle of incidence, ACF will be the angle of refraction. Moreover, the nascent increment of ABF is to that of ACB (generated in the same time) as CF : BF :: CA : AE, on account of the similar triangles; *i. e.* as *n + 1* to 1, by construction. The ratio, therefore, of the nascent increment of the angle of incidence ABF to that of the angle of refraction ACB, is that which is required in the angles of incidence and refraction of an efficacious ray, after a given number of reflections; consequently the angles ABF and ACF are those required. From this construction we may easily deduce Sir Isaac Newton's rule for finding the angle of incidence ABF. See his Optics, p. 148, 149.

For AC : AB :: I : R; whence $AC = \frac{I}{R} \times AB$; and CF : BF :: *n + 1* : 1; therefore CF = $\frac{n+1}{1} \times BF$; or (putting *n + 1* = *m*) CF = *m* × BF; and, on account of the right angle at F, $AC^2 - CF^2 = AB^2 - BF^2$, *i. e.* $\frac{I I}{R R} AB^2 - m^2 BF^2 = AB^2 - BF^2$; and, therefore, $m^2 BF^2 - BF^2 = \frac{I I}{R R} AB^2 - AB^2$; and, consequently, $\frac{BF}{AB} = \sqrt{\frac{I I - R R}{m^2 R^2 - R^2}}$. Hence, because in the first bow, the ray emerges after one reflection, we have *n* = 1, *m* = 2, *m*² = 4, and *m*² - 1 = 3; therefore, $\sqrt{3 R R} : \sqrt{I I - R R} :: AB : BF :: \text{radius} : \text{cotine of the angle of incidence}$. In the second bow, where there are two reflections, *m*² - 1 = 8; whence $\sqrt{8 R R} : \sqrt{I I - R R} :: AB : BF$. In the third bow, after three reflections, *m*² - 1 = 15; and $\sqrt{15 R R} : \sqrt{I I - R R} :: AB$

RAINBOW.

$\propto AB : BF$, and so on for any given number of reflections. Wherefore, supposing the ratio of refraction to be, as fir Isaac Newton has determined it, *viz.* as 108 to 81 in the red rays, and as 109 to 81 in the violet rays; we shall have I (in the least refrangible rays) = 108, $II = 11664$; and $R = 81$, and $RR = 6561$, and $I^2 - R^2 = 5103$,

$\sqrt{3RR} = 140.3$, and $\sqrt{I^2 - R^2} = 71.4$: therefore,
 As $\sqrt{3RR} = 140.3$, whose logarithm is 2.147045
 Is to $\sqrt{I^2 - R^2} = 71.4$ - - - 1.853913
 So is radius - - - 10.000000

To the cosine of the angle of incidence, } 9.706868
 $BAF = 30^\circ 37'$ - - - }

Hence the angle of incidence ABF is $59^\circ 23'$ in the red rays.

Secondly, *Having given the angle of incidence, and the ratio of I to R, or of refraction; to find the angle which a ray of light emerging out of a refracting sphere, after a given number of refractions, makes with the axis of vision, or an incident ray; and, consequently, to find the diameter of the rainbow.* The angle of incidence, and the ratio of refraction, being given, the angle of refraction is given; which angle being multiplied by double the number of reflections increased by 2, and double the angle of incidence subtracted from the product, the angle remaining is the angle sought.

In order to find the angle of refraction, say
 As $I = 108$, whose logarithm is - 2.033424
 Is to $R = 81$ - - - 1.908485
 So is the sine of incidence $59^\circ 23'$ - 9.934798

To the sine of the angle of refraction $40^\circ 12'$ 9.809859

Then, making the angle CNF (*fig. 9.*) = $40^\circ 12'$, NF will be the refracted ray, which at F is reflected into FG , and at G emerges in GR . Produce the incident and emergent rays SN and RG , till they intersect each other at X , and as CF bisects the angle NFG , it will, if produced, bisect the angle SXR . Then $CNF = CXN + FNX$; but $FNX = CNX - CNF$, or CNF ; therefore $CNF = CXN + CNX - CNF$; that is, $2CNF - CNX = CXN$; or $80^\circ 24' - 59^\circ 23' = 21^\circ 1'$ = CXN ; therefore $2CXN = SXR = 42^\circ 2'$, which is the measure of the angle that the incident and emerging rays, which are the least refrangible, contain with each other. If instead of the ratio 108 to 81, we take that of

109 to 81, we shall find the values of $\sqrt{3RR}$, and $\sqrt{I^2 - R^2}$, such as will give the angle of incidence BCN , and the arc $BN = 58^\circ 40'$, and the angle $SXR = 40^\circ 17'$, for the most refrangible, or extreme violet rays.

If the ray be twice reflected, *viz.* at F and G , as in the production of the extreme bow, and emerges at H in the direction HA , intersecting the incident ray SN in Y , we may find the angle AYS thus: produce AH till it meets GX , produced in R ; then in the triangle HGR , the external angle $HGX = HRG + GHR$. But because of equal angles of reflection at F and G , $GHR = FGX$, therefore $HGX - FGX = HGF = HRG = 2CGF$, or CNF . But $SXR = 4CNF - 2CNX$; therefore in the triangle YXR we have the two internal angles $R + X = 6CNF - 2CNX =$ the external angle at Y , *viz.* AYS . In this case, to find the angles

of incidence and refraction, we have $\sqrt{8RR} : \sqrt{I - R^2} ::$ radius : cosine of the angle of incidence; whence the said angle will be found $71^\circ 50' = CNX$. And as 108 : 81 :: sine of $71^\circ 50'$: sine of $45^\circ 27' = CNF$, the angle

of refraction; therefore $6 \times 45^\circ 27' - 2 \times 71^\circ 50' = 120^\circ 3' = AYN$; and, therefore, its complement $AYS = 50^\circ 57'$, the angle required for the least refrangible rays. But for the most refrangible rays, where $I : R :: 109 : 81$, we have the angle of incidence $71^\circ 26'$, and the angle of refraction $44^\circ 47'$; and, therefore, the angle $AYS = 54^\circ 7'$. In the same manner the same angles are calculated after three or four reflections.

From the preceding problems we obtain the following results, *viz.*

I. Rainbow,	{ Red 42° 2' }	}	The spectator's back being turned to the sun.
	{ Violet 40 17 }		
II. Rainbow,	{ Red 50 57 }	}	to the sun.
	{ Violet 54 7 }		

If the angle made by a ray, after three or four reflections, were required, and therefore the diameters of the third and fourth rainbow (which are scarcely ever seen, on account of the great diminution of the rays, by so many repeated reflections) they will be found,

III. Rainbow,	{ Red 41° 37' }	}	The spectator being turned towards the sun.
	{ Violet 37 9 }		
IV. Rainbow,	{ Red 43 52 }	}	wards the sun.
	{ Violet 49 34 }		

Dr. Morgan's Differtation upon the Rainbow, among the notes upon Rohault's System of Philosophy, part iii. chap. xvii.

Hence, the breadth of the rainbows is easily found: for the greatest semi-diameter of the first bow, *i. e.* from red to red, being $42^\circ 2'$, and the least, *viz.* from violet to violet, $40^\circ 17'$, the breadth of the fascia or bow, measured across from red to violet, will be $1^\circ 45'$; and the greatest diameter of the second bow being $54^\circ 7'$, and the least $50^\circ 57'$, the breadth of the fascia will be $3^\circ 10'$. And hence the distance between the two will be found $8^\circ 55'$.

In these measures the sun is only esteemed a point; wherefore, as his diameter is really about $30'$, or $32'$, so much must be added to the breadth of each fascia or bow, from red to violet, and so much must be subtracted from the distance between them.

This will leave the breadth of the primary bow, $2^\circ 15'$; that of the secondary bow, $3^\circ 40'$; and the interval between the bows, $8^\circ 25'$; which dimensions, deduced by calculation, fir Isaac Newton allures us from his own observations, agree very exactly with those found by actual mensuration in the heavens. Optics, p. 153. ed. 3.

RAINBOW, *Particular Phenomena of the.* From this theory of the rainbow, all the particular phenomena of it are easily deduced: hence we see why the iris is always of the same breadth; because the intermediate degrees of refrangibility of the rays between red and violet, which are its extreme colours, are always the same. See *Apparent MAGNITUDE.*

Secondly, Why it is more distinctly terminated on the side of the red than on that of the violet? there being no efficacious rays in the space adjoining to the red drops, *i. e.* to the space between the bows, whence it terminates abruptly; whereas, in the space on the side of the violet ones, there are some rays emitted to the eye, which, though too feeble to affect it strongly, yet have this effect, that they soften the violet edge insensibly, so that it is difficult to determine precisely where it terminates.

Thirdly, Why the bow shifts its situation as the eye does; and, as the popular phrase has it, *flies from those who follow it; and follows those that fly from it?* the coloured drops being disposed under a certain angle about the axis of vision, which

RAINBOW.

is different in different places: whence also it follows, that every different spectator sees a different bow.

Fourthly, Why the bow is sometimes a larger portion of a circle, sometimes a less? its magnitude depending on the greater or less part of the surface of the cone, above the surface of the earth, at the time of its appearance; and that part being greater or less, as the line of aspect, or axis of vision, is more inclined or oblique to the surface of the earth; which inclination, or obliquity, is greater as the sun is higher: whence, also, the higher the sun, always the less the rainbow.

Fifthly, Why the bow never appears when the sun is above a certain altitude? the surface of the cone, in which it should be seen, being lost in the ground, at a little distance from the eye, when the sun is above 42° high.

Sixthly, Why the bow never appears greater than a semi-circle, on a plane? since be the sun ever so low, and even in the horizon, the centre of the bow is still in the line of aspect; which, in this case, runs along the earth, and is not at all raised above the surface.

Indeed, if the spectator be placed on a very considerable eminence, and the sun in the horizon, the line of aspect, wherein the centre of the bow is, will be notably raised above the horizon (considering the magnitude of the circle whereof the bow uses to be a part). Nay, if the eminence be very high, and the rain near, it is possible the bow may be an entire circle.

Seventhly, How the bow may chance to appear inverted, *i. e.* the concave side be turned upwards? *viz.* a cloud happening to intercept the rays, and prevent their shining on the upper part of the arch: in which case, only the lower part appearing, the bow will seem as if turned upside down; which, probably, has been the case in several prodigies of this kind, related by authors.

Indeed the bow may appear inverted from another cause: for, if when the sun is $41^\circ 46'$ high, his rays fall upon the smooth surface of some spacious lake, in the middle of which a spectator is placed; and if, at the same time, there be rain falling, to which the rays may be reflected from the lake, it will be the same as if the sun should shine below the horizon, and the line of view be extended upwards: thus the surface of the cone, wherein the coloured drops are to be placed, will be wholly above the surface of the earth.

But since the upper part will fall among the unbroken clouds, and only the lower part be found among the drops of rain, the arch will be inverted.

Eighthly, Why the bow sometimes appears inclined? the accurate roundness of the bow depending on its great distance, which prevents us from judging of it exactly; if the rain, which exhibits it, chance to be much nearer, we shall see its irregularities; and if the wind, in that case, drive the rain so that the higher part be farther from the eye than the lower, the bow will appear inclined.

Ninthly, Why the legs of the rainbow sometimes appear unequally distant? if the rain terminate on the side of the spectator, in a plane so inclined to the line of aspect as to make an acute angle on the left hand, and an obtuse angle on the right, the surface of the cone, which determines what drops will appear, will fall upon them in such manner as that those on the left hand will appear farther from the eye than those on the right. For the line of aspect being perpendicular to the plane of the bow, if you suppose two rectangular triangles, a right and left, the cathetus of each to be the line of view, and the base of the semi-diameter of the bow, inclined as above; it is evident, since those angles of the triangles, next the eye, must always be the same (*viz.* 43° in the inner bow), the basis of the right-hand

triangle will, in this case, appear much longer than that of the left.

Dr. Langwith, in the Phil. Transf. N^o 375, describes a remarkable rainbow, in which he observed several series of colours, which increased the bow to a breadth far exceeding what had been determined by calculation. The colours of the primary rainbow, he says, were as usual; under this was an arch of green, and then alternately two arches of reddish-purple, and two of green, and under all a faint appearance of another arch of purple. The order of the colours was, 1. Red, orange, yellow, green, light blue, deep blue, and purple. 2. Light green, dark green, and purple. 3. Green and purple. 4. Green, and faint vanishing purple.

M. Bouguer frequently saw a phenomenon of this kind, when he was upon the mountains of Peru, where the sky is often extremely serene. Similar appearances have been also observed by others. Dr. Pemberton has attempted to explain them by means of the Newtonian doctrine of fits of easy reflection and transmission; but he goes upon the supposition that the differently-coloured rays have their separate fits, on their arrival at the surface of any medium, without any regard to the thickness of it; whereas it is plain, that, in such a case, all kinds of rays are reflected or transmitted promiscuously. It is most probable that these colours are formed in very minute drops of water or vapour, intermixed with the larger drops, that their formation depends upon the same principle with the colours of thin plates, and that they are similar to those of several kinds of halos. Dr. Pemberton himself observes, that it is most likely that these additional rings of colours are formed in the vapour of the cloud, which the air, being put in motion by the fall of the rain, may carry down along with the large drops. This, he says, may be the reason why these colours appear under the upper part of the bow only, this vapour not descending very low. As a farther confirmation of this, these colours, he observes, are seen strongest when the rain falls from very black clouds, which cause the fiercest rains; by the fall of which the air will be most agitated. Phil. Transf. abr. vol. vi. p. 140. Priestley on Light and Colours, p. 593.

It has been a subject of controversy among biblical critics, whether the antediluvian atmosphere presented any such phenomenon as a rainbow. The occasion of this debate is a passage in Genesis, ch. ix. 12—17. Mr. Whitehurst, in his "Inquiry into the original State and Formation of the Earth, &c." attempts to establish the probability that the antediluvian atmosphere was so uniformly temperate, as to be subject to no storms, tempests, or rain. The opinion is by no means probable, nor does the above-cited passage warrant any such conclusion. The rainbow was then made the sign or token of God's covenant with Noah, that no such calamity should again take place. ☾ denotes a sign or token, and in this sense it is used in the case of Cain, Gen. iv. 15. The mark set upon Cain was, as Shuckford conceives, a sign or token (☾) given to him, that he should be preserved from the evil which he deprecated.

RAINBOW, *Lunar*. The moon sometimes also exhibits the phenomenon of an iris, or bow, by the refraction of her rays in the drops of rain in the night-time.

Aristotle says, he was the first that ever observed it; and adds, that it never happens, *i. e.* is never visible, but at the time of the full moon; her light, at other times, being too faint to affect the sight after two refractions, and one reflection.

The lunar iris has all the colours of the solar, very distinct and pleasant; only faint, in comparison of the other; both

both from the different intensity of the rays, and the different disposition of the medium.

In that mentioned, Philosophical Transactions, N^o 331, Mr. Thoreby observes, the largeness of the arch was not so much less than that of the sun, as the different dimensions of their bodies, and their distances from the earth, should seem to require; but as to its entireness, and the beauty of its colour, it was admirable. This continued about ten minutes before the interposition of a cloud hindered its observation.

RAINBOW, Marine. The marine or sea-bow is a phenomenon sometimes observed in a much agitated sea; when the wind, sweeping part of the tops of the waves, carries them aloft; so that the sun's rays, falling upon them, are refracted, &c. as in a common shower, and paint the colours of the bow.

F. Bourzes, in the Philosophical Transactions, observes, that the colours of the marine rainbow are less lively, less distinct, and of less duration, than those of the common bow; that there are scarce above two colours distinguishable, a dark yellow on the side next the sun, and a pale green on the opposite side.

But these bows exceed as to number, twenty or thirty being sometimes seen together: they appear at noon-day, and in a position opposite to that of the common bow, *i. e.* the concave side is turned upwards, as indeed it is necessary it should be, from what we have shewn in accounting for the phenomena of the solar bow. A coloured bow is always to be seen in the scattered water of a jet, a broken cascade, and the like, when the sun and the spectator are in proper situations.

To this class of bows may be referred a kind of white or colourless rainbows, which Mentzelius, and others, affirm to have been seen at noon-day. M. Mariotte, in his fourth *Essai de Physique*, says, these bows are formed in mists, as the others are in showers; and adds, that he has seen several, both after sun-rising, and in the night.

The want of colours he attributes to the smallness of the vapours which compose the mist; but we should rather account for it from the exceeding tenuity of the little vesiculae of the vapour; which being, in effect, only little watery pellicles bloated with air, the rays of light undergo but little refraction in passing out of air into them; too little to separate the differently-coloured rays, &c.

Hence, the rays are reflected from them, compounded as they came, that is, white.

Rohault mentions coloured rainbows on the grass, formed by the refractions of the sun's rays in the morning dew. *Trait. de Phys.*

Rainbows have been also produced by the reflection of the sun from a river; and in the Philosophical Transactions, vol. 1. p. 294. we have an account of a rainbow, which must have been formed by the exhalations from the city of London, when the sun had been set twenty minutes, and consequently the centre of the bow was above the horizon. The colours were the same as in the common rainbow, but fainter.

The best way of forming a resemblance of a rainbow is to fasten a number of small solid glass balls, or a number of small glass bubbles full of water, upon a dark board, and to present the board thus furnished to the sun at a proper inclination, which experience easily finds, whilst you turn your back to the sun, and look at the board.

RAINFELDEN, in *Geography*, a town of Austria; 2 miles W. of Hainfelden.

RAINHAM, a township of Norfolk county, in Upper

Canada; being the first township fronting on lake Erie, west of the grand river Lands.

RAINSBRON, a town of Germany, in the margraviate of Anspach; 3 miles N. of Creglingen.

RAINY LAKE. See *Le PLUE*.

RAJODE, a town of Hindoostan, in Malwa; 30 miles E. of Tandla.

RAJOORA, a town of Hindoostan, in Dowlatabad; 18 miles W.N.W. of Kondur.—Also, a town of Bengal; 65 miles N. of Dacca.

RAJOUR, a town of Hindoostan, in Lahore; 36 miles N.W. of Jummo.

RAJOWLY, a town of Hindoostan, in Bahar; 30 miles S. of Bahar.

RAJPOOTANA, a country of the Rajpoots, generally denoting *Agimere* (which see), and the original country of the founder of the Mahratta state, whose rulers, about half a century ago, aspired at universal empire in Hindoostan; but they have been reduced to their present low state, by the depredations of Mahratta detachments, which, being composed of light horse, and accustomed to separate into small parties, have, by their desultory movements, at once spread desolation, and eluded the attacks of the inhabitants. This is the fact with regard to the open parts of Rajpootana; the mountainous parts remaining free from their incursions.

Rajpootana was divided into three great principalities, under the names of Oudipour, Joodpur, and Ambeer (or Amere), now better known by that of Joinagur, or Jyenagur. (See each respectively.) In Acbar's division of the empire, these principalities were classed as belonging to the soubah of Agimere, sometimes called Marwar. It is not easy to assign the precise limits and dimensions of these principalities, which occupy the space between the western confines of Agra and the north-east part of Guzerat, and between the sandy desert (or Registan) and Malwa; that is, an extent of 330 British miles from N.E. to S.W., and 200 broad in the widest part. Jyenagur or Jyepour lies to the N.E., Oudipour to the S.W., and Joodpur to the N.W., bordering angularly on the other two. Père Wendell's MS., cited by Rennell, states the revenues of Oudipour at 10 lacks of rupees, Marwar at 40, and Jyenagur at 40, *per annum*, in the year 1779. The whole revenue of the soubah of Agimere, in the time of Acbar, appears to have been only about 75 lacks. Aurungzebe is said to have doubled the land-tax on the Rajpoots, and accordingly in Mr. Fraser's account, Agimere is stated at 163 lacks of rupees. The two former, *viz.* Oudipour and Marwar, are very mountainous, with a sandy soil in the vallies; the latter is the most fertile, and was, about the middle of the last century, in a high state of improvement, under the government of the celebrated rajah Jyefing, or Jessing, who founded the new capital of Jyepour, whence the name of the province was changed to that of the capital. Jyepour was a place of great wealth and commerce in 1779, being the entrepot of the principal part of the goods that are brought from every quarter of India. The rajah built an observatory in his capital; but the confusions that have so long prevailed in this province, must have greatly reduced the wealth and importance of the capital. Sindia, as Rennell informs us, received the tribute of all the three Rajpoot provinces, and converted it to his use; and he also made considerable conquests in them, particularly in Jyenagur. In early times the whole Rajpootana probably constituted one entire kingdom, or empire, under the rana or prince of Oudipour, the head of the Rajpoot states; the antiquity of whose house may be inferred from the name

Rhannæ appearing in Ptolemy, nearly in its proper position, as a province. See OUDIPOUR.

The province of Agimere in general (see AGIMERE) has ever been the country of the Rajpoots; that is, the warrior tribe among the Hindoos, and which are noticed in Arrian and Diodorus; and Cheitore, or Oudipour, (considered by Rennell as synonymous,) is, in his opinion, reckoned the first among the Rajpoot states. (See CHEITORE.) From the Ayin Achbaree we derive some new ideas respecting the division of the soubah of Agimere. It consisted at that time of three grand divisions, Marwar, Meywar, and Hadowty (or Nagore); and these contained seven circars or subdivisions, Agimere, Cheitore, Rantampour, Joudypour, Sirowy, Nagore, and Beykeener (or Bicaneer). Marwar, as including the circar and fortrefs of Agimere, has become almost synonymous with Agimere, in common acceptation. The extent of this province, as given by the same book, is 168 coffes, or about 320 British miles, from E. to W.; and 150 coffes, or 285 British miles, from N. to S. Such is the province of the Rajpoots. From the indulgence granted to this tribe throughout India, *viz.* that of feeding on goats' flesh, it may be inferred, says Rennell, that the custom originated in this mountainous country. The grain cultivated there is chiefly of the dry kind. The taxes amounted, in the time of Achar, to no more than a seventh or eighth of the produce of the harvest. Rennell's Memoir.

RAJPOOTS, the inhabitants of *Rajpootana*; which see. They were not confined entirely to the soubah of Agimere; as some inferior tribes of them are settled in Bundelcund, and in Gurry-Mundella. Others, according to Thevenot, are settled in Moultan; and indeed he represents Moultan as the original country of the Kuttries, from whom the Rajpoots sprung.

The Kuttries or Catries, who formed a particular sect of Hindoos at Moultan, were the Catheri of Diodorus, and the Cathei of Arrian, with whom Alexander carried on war, on the borders of the Malli. The Rajpoots are ordinarily divided into two tribes or classes, *viz.* those of Rathore, and Chohan or Seefodya. Marwar, or the N.W. division of Agimere, is the proper country of the former; and Meywar, or Oudipour, of the latter. The Rathore tribe were originally the most numerous of the two; and it has been said by colonel Dow, among others, that the Mahratta chiefs had their origin from the Rathore tribe: and in proof of this it has been alleged, that the etymology of the name Mahratta has been deduced from Rathore, prefixing to it "maha," or great. (See MAHRATTA.) The Rajpoots are represented by Thevenot as having spread from Moultan, their proper country, over all the Indies. Diodorus Siculus distinguishes them by the custom of their women burning themselves alive, on the funeral piles of their husbands; which is indeed a custom among them, as well as some other Hindoos, at this day. Rennell.

RAJPOUR, a town of Bengal, on the bank of the Ganges; 10 miles N.N.E. of Curruckdeagh.

RAISE, in the *Manege*, is used for working. See RAISING.

RAISE is likewise used for placing a horse's head right, and making him carry well, and hindering him to carry low, or to arm himself.

RAISE *Tacks and Sheets*, in *Sea Language*, the order to let them go in the article of tacking, that the sails may be set on the contrary tack they were on before.

To RAISE a *siege*. See SIEGE.

RAISED AIRS. See AIR.

RAISED *Plan*. See PLAN.

VOL. XXIX.

RAISEEN, in *Geography*, a town of Hindoostan, in Malwa; 15 miles S. of Bilfah. N. lat. 23° 16'. E. long. 77° 49'.

RAISER, in *Building*, a board set on edge under the foreside of a step, a stair, &c. See STAIR, &c.

RAISIN, in *Geography*, a river of America, which runs into lake Michigan, N. lat. 43° 12'. W. long. 85° 42'. —Also, a river of America, which runs into lake Erie, N. lat. 43° 20'. W. long. 82° 55'.

RAISIN *Island*, a small island in lake St. Francis. N. lat. 45° 6'. W. long. 74° 27'.

RAISIN, or *Raisin, Market*, a small market-town in the east division of the wapentake of Walscroft, parts of Lindsey, and county of Lincoln, England, is situated on the banks of the river Raifen, whence it derives its name, at the distance of 15 miles N.E. from Lincoln, and 149 miles N.W. from London. According to the population returns of 1811, it contains 164 houses, and 964 inhabitants. Here is a weekly market on Thursday, and there are fairs every alternate Tuesday, after Palm Sunday, and on the 25th of September. The church is an ancient structure, and is remarkable for the peculiar form of the upper windows in its embattled tower. These have a pointed arch, divided into two pointed lights, and a quarterfoil head. Up the centre runs a strong mullion, crossed by a transom, terminating at the impost, as happens in the church of Yarborough, near Louth, which renders it probable that both edifices were erected by the same architect. The living is a vicarage in the gift of the crown; and by the endowment the vicar is entitled to the unusual tythe of ale. Besides the church, there are in Raifin a Roman Catholic chapel, and a Methodist meeting-house; also a free-school, and an hospital for poor old men.

At a short distance from Market-Raifin, are the villages of Middle and West Raifin. Middle Raifin was formerly divided into two parishes, called Drax and Tupholm, but these are now united. At Tupholm stood an abbey of Premonstratensian canons, which was founded in the reign of Henry II., by Alan de Neville, and his brother Gilbert. Previous to the dissolution, it was inhabited by nine monks, whose annual income, according to Speed, amounted to 119*l.* 2*s.* 8*d.* The church is a small, but ancient building, consisting of a nave and chancel, which are separated by elegant screen work, beneath a pointed arch, supported by circular columns. The nave appears to have had side-aisles, as the pillars and pointed arches stand in relief from the present wall.

The principal seats in this vicinity are Willingham-house, a seat of the Boucherett family; and Thurgundy, the property of lord Middleton. The latter anciently belonged to the Willoughbys. The house is situated on an eminence, commanding an extensive view over the vale to Swinhop, and is surrounded by pleasure-grounds, finely varied by wood and lawn. Beauties of England and Wales, vol. ix. by John Britton, 1807.

RAISING, in the *Manege*, one of the three actions of a horse's legs; the other two being the stay, and the tread. The raising or lifting up of his legs in caprioles, curves, &c. is esteemed good, if he perform it hardily, and with ease; not crossing his legs, nor carrying his feet too much out or in; yet bending his knees as much as is needful.

RAISING the *Land*, in *Sea Language*. See *Laying the Land*.

RAISING a *Purchase*, denotes the act of disposing certain instruments or machines in such a manner, as that, by their mutual efforts, they may produce a mechanical force sufficient

cient to overcome the weight, or resistance, of the object to which the machinery is applied.

RAISING-Pieces, or *Reason-pieces*, in *Architecture*, are pieces that lie under the beams, and over the posts or puncheons: those lying on the brick-work are called platbands.

RAISINS, grapes prepared by drying them in the sun, or in the air; to fit them for keeping, and for some medicinal purposes.

Of these there are various kinds: as, raisins of Damascus, thus called from the capital city of Syria, in the neighbourhood of which they are cultivated. They are much used in the composition of ptisans, together with jujubes and dates; they are brought flat, and seeded, of the size of the thumb; whence it is easy judging of the extraordinary bulk of the grape, when fresh. Travellers tell us of bunches weighing twenty-five pounds. Their taste is faintish and disagreeable.

Raisins of the sun are a kind of raisins brought from Spain, of a reddish or blueish colour, seeded, and very agreeable to eat.

There are various other sorts, denominated either from the place where they grow, or the kind of grape, &c. as raisins of Calabria, Muscadine raisins, &c.

The finest and best raisins are those called in some places Damascus and jube raisins. These are the fruit of the *vitis Damascena*, and are distinguishable from the others by their largeness and figure; they are flat, and wrinkled on the surface; soft and juicy within, near an inch long, and semipellucid, when held against a good light; they have a sweet, agreeable, and vinous taste; and when fresh, and growing on the bunch, are of the size and shape of the large olive.

The common raisins are the fruit of several species of grape, which are better or worse, according as they have been more or less carefully cured. The raisins of the sun, or jar-raisins, so called, because they are imported in jars, are all dried by the heat of the sun; and these are the sorts used in medicine.

The common way for drying grapes for raisins is to tie two or three bunches of them firmly together, while yet on the vine, and dip them into a hot lixivium of wood-ashes, with a little olive oil in it. This disposes them to shrink and wrinkle; and after this they are left on the vine three or four days, separated on sticks in an horizontal situation, and then dried in the sun at leisure, after being cut from the tree. Some raisins are dried by the heat of an oven; and the difference between these and such as are dried in the sun, is obvious; the latter are sweet and pleasant, but the former have a latent acidity with the sweetness, that renders them much less agreeable. See **CURRENTS**.

All the kinds of raisins have much the same virtues; they are nutritive and balsamic, but they are very subject to fermentation with juices of any kind; and hence, when eaten immoderately, they often bring on colics. They are allowed to be attenuant, and are given in cases where the humours are too thick and viscid, and they are said to be very good in nephritic complaints; they are, however, too familiar in our foods, to be much regarded at present as a medicine. They are an ingredient, indeed, in our pectoral decoctions, and in some other medicines of that intention; in which cases, as also in others where astringency is not required of them, they should have the stones carefully taken out. They are used in some compositions rather with an intent of taking off the nauseous taste of other ingredients, and for obtunding their acrimony, than of doing any extraordinary service themselves.

RAISIN-Brandy, a name given by our distillers to a very clean and pure spirit, procured from raisins fermented only with water. Thus treated, they yield a spirit, scarce at all distinguishable from some of the wine-spirits; for there are as many kinds of wine-spirits as there are of grapes. The coarser the operation of distilling is performed in this case, the nearer will be the resemblance of the wine-spirit; that is, there will be most of this flavour in the spirit, when as much as can be of the oil is thrown up with a galloping heat.

The distillers are very fond of the wine-spirit, with which they hide and disguise the taste of their nauseous malt, and other spirits; and in defect of that spirit, this of raisins, made in this coarse manner, will go almost as far. It is indeed surprizing how extensive the use of these flavouring spirits is, ten gallons of raisin-spirit, or somewhat less of the wine-spirit, being often sufficient for a whole pipe of malt-spirit, to take off its native flavour, and give it an agreeable vinosity. It is no wonder, therefore, that the distillers, and ordinary rectifiers, are so fond of this, as it is a good cloak for their defects, and the imperfection of their processes.

When raisin-brandy is intended for common use, the fire should be kept slower and more regular in the distillation; and the spirit, though it hath less of the high flavour of the grape, will be more pleasant and more pure.

RAISIN-Wine. See **WINE**.

RAIT, in *Rural Economy*, a term used to signify the process or operation of dissipating the sap of vegetables, by exposure to moisture, or the influence of the atmosphere. It is mostly applied to hemp, flax, or other similar substances, and sometimes to hay, when it has been much exposed to alternations of wet and dry weather.

When the process is performed by means of water, as is mostly the case with hemp, frequently but not always with flax, and occasionally with other articles of the same nature, it is usually denominated water-raiting, and the article is said to be *water-raited*; but where it is effected by exposure to the air, upon the ground, when spread out, it is generally called ground-raiting, and the substance is said to be *ground-raited*. In the performance of these operations or processes with hemp, flax, and such like substances, there is great nicety and attention required to see that they are carried to a sufficient length, without going too far, so as to injure the textures of the substances in their cortical parts. This may probably be accomplished with the greatest certainty by the frequent examination of the materials themselves; keeping them perfectly under the water in the former case, and frequently turned with new surfaces to the atmosphere in the latter, never having the grassy surface on which they are spread out of too great a length. The effects of heavy rains, when long continued, must likewise be carefully attended to in this latter instance. See **FLAX**, **HEMP**, and **WATER-raiting**.

RAITAPOUR, in *Geography*, a town of Hindoostan, in the circar of Rajamundry; 12 miles N. of Rajamundry.

RAITCH, in *Rural Economy*, a term signifying a line or list of white, down the face of a horse. It is a very common mark in the faces of horses.

RAITENBACH, in *Geography*, a town of Germany, in the principality of Culmbach; 8 miles E.N.E. of Wonsiedel.—Also, a town of Bavaria, in the bishopric of Aichstadt; 8 miles N. of Aichstadt.

RAITENBURG, a town of the duchy of Carniola; 3 miles N. of Rudolfswerth.

RAITING, **GROUND**, in *Rural Economy*, that method of raiting or accomplishing the separation of the barks or coverings of the stems of flax, hemp, and other similar plants, by

by means of spreading them out in a thin manner upon close grassy surfaces, instead of putting them into ponds or pools of stagnant water, in order that they may be exposed to the atmosphere. It is occasionally employed for flax and other small stalked plants, but seldom or never for hemp and those which have large ones. It is a practice which stands in need of considerable attention and management. See RAIT.

RAJUAPOUR, in *Geography*, a town of Mocaumpour; 18 miles S. of Bargao.

RAIVATA, in *Hindoo Mythological History*, one of the fables or fages included in the denomination of Menus. Rai-vata is said to have been the son of Agni, the regent of fire, also called *Pavaka*, (which see), and *Menu*.

RAJYA, in *Geography*, a town of Hindoostan, in Bahar; 20 miles E.S.E. of Bahar.

RAKAPORAH, a town of Hindoostan, in the circar of Jushpour; 10 miles N.E. of Odeypour.

RAKAS, a town of Transylvania, on the Alaut; 16 miles N.W. of Cronstadt.

RAKE, in *Agriculture*, a tool of the toothed kind, made use of for many purposes of husbandry, as for collecting together hay, corn, stubble, roots, leaves, and other similar sorts of materials. It is a very useful and convenient kind of tool in all such intentions. There are many descriptions of this sort of implement.

RAKE, *Bean-Stubble*, a tool of the rake kind, constructed for the purpose of clearing bean-stubbles. It is employed on some farms in Essex, as by Mr. Ketcher, at Burnham, where it is found to be well-adapted to this use, and to do its work in a perfect manner. The head, which is seven feet eight inches in length, is formed with a very slight curve, having teeth set in it in rather a close manner, which are one foot and a half in length, bending or curving a little forwards at the points. It is attached by a frame to the axle of the wheels, which is three feet two inches long; and the wheels are two feet six inches in their diameter. The hooks and shafts for the horse are four feet in length. This is a very simple construction of this nature, and one which is capable of easy application. The teeth should be made strong, whether they are of wood or iron. This is an implement which wants to be better known in other districts.

RAKE, *Corn*, a large strong rake, made use of in different districts for bringing together the mown grain crops. It is sometimes constructed with wooden teeth, but a better mode is to have them of iron, being a little bent forward, having the length of seven or eight inches. As it requires much exertion to perform the work with them, they should always be made as light as possible, so as to have sufficient power to perform the work. It has been stated by Mr. Somerville, in his *Agricultural Survey of the District of East Lothian*, that though the common hay-rake is mostly used there, a different kind for grain has been partially tried, and found to answer the purpose much better. In this, the length of the head is from ten to fifteen feet, the handle about seven feet, with a piece of wood across the end of it, by which it is drawn by two men. The teeth are of wood or iron; the last are the best, as well as the most durable, and are a little bent forward at the point, which gives them the power of retaining and carrying the ears along with them, much better than they would otherwise do. To make clean work, especially if the ridges are gathered, the field is raked across: in that way, every thing is taken up. But when it is preferred to draw the rake in the direction of the ridges, it may be considerably improved, by cutting the head into two or three lengths, and joining them with hinges, which will allow it to bend and accommodate itself to the curvature of the ridges. The advantage of this kind

of rake has been found considerable, even in cases where every possible attention has been paid to the cutting of the crop; but it frequently happens, that, owing to the dampness, greenness of the straw, or a foul grassy bottom, it is necessary to leave the crop unbound for a day or two, during which, if it be overtaken by a high wind, much of it will be scattered and lost, unless considerable pains are taken to gather it by hand-raking, or otherwise. Where the long rake is used for that purpose, the expence will in no instance, he thinks, exceed four-pence sterling per acre. An experiment made on a field of 30 acres, will convey some idea of the benefit that may be derived from the use of that instrument. The field was in barley, and the rakings, when threshed, yielded

	£	s.	d.
7½ bolls, sold at 28s. per boll	-	-	10 10 0
150 stones straw, sold at 6d. per stone	-	-	3 15 0
Total produce	14	5	0
Expence of raking 31 acres, at 4d. per acre	0	10	4
Bread and beer to the rakers	0	1	6
Carting from the field, stacking, &c.	0	2	6
Threshing	0	7	6
Total expence	1	1	10

Which deducted from 14l. 5s., leaves a profit of 13l. 3s. 2d. sterling. It is necessary to observe, that about ten acres of the field were left unbound, and a good deal disordered by a high wind; but as considerable pains were taken in the binding, the proportion obtained from these ten acres did not greatly exceed what was got from the rest of the field, the whole of which was cut with a great deal of care.

But though this mode of working the rake affords considerable profit and advantage, they would be a great deal more, by having recourse to horses in the draught of them. One horse in each would do as much labour as several men, in a given time; and by having shafts and low wheels fixed to the tool, it could be readily adapted to this method of being wrought.

RAKE, *Couching*, a large sort of strong horse-rake, with long round tines or teeth, crooked or bent forward in a gentle manner, and placed about two inches distant from each other; and a small beam in the middle, with side pieces, and an apparatus for attaching the horse to it. It is found very useful in bringing together the roots of couch, and other weeds, in order to their being burnt, or carried off the land, and in other ways destroyed. See *COUCH-Rake*, *QUITCH-Rake*, and *RAKE-Twitch*.

RAKE, *Dew*, a sort of large rake, or hand drag, so named from being used before the dew is off the ground, or other sort of harvest work can be begun. It is a powerful convenient sort of implement for harvest work.

RAKE, *Garden*, a well-known sort of tool for raking the ground, as well as for putting in seeds, &c. In order to suit every kind of gardening work with rakes, there should be three or four different sizes, from about six to eighteen inches long in the head, having handles from six to eight feet in length, and the heads toothed with iron teeth two or three inches long, being placed from one to two inches asunder, according to their respective sizes. The first or largest rake should have the head about fifteen to eighteen inches long, the teeth three inches, and placed two inches asunder, which is proper for raking stubborn or rough dug ground, and for putting in large kinds of seeds, raking off large weeds after hoeing, and many other purposes

poses in large gardens. The next size should have the head twelve inches long, the teeth three inches, being placed one inch and half asunder, which is proper for all common raking in ordinary light ground, and for raking in most kinds of small seeds, as well as other purposes. A third sort of small rake should have the head about nine inches long, the teeth two and a half, being placed one inch asunder; proper for fine-raking beds, borders, &c. and raking in some particular fine seeds; as well as between rows, &c. of certain plants occasionally, where larger rakes cannot be introduced. And the smallest sort should have the head six inches long, the teeth two and a half, and placed one inch asunder; being very useful for raking between small plants in beds and borders, and other small parts, where the plants stand close, as well as several other purposes of that kind.

It may be noticed, that all these sorts of rakes are constructed both with wooden heads and iron teeth, and with the heads and teeth wholly of iron in both; of which the teeth are generally flattened, the back edge rounded off, and narrowing gradually to the point; the other straight, and placed on the heads edgeways across, with the back edge outward, and with the points all inclining very moderately inward, in a regular manner: the wooden-headed rakes having each end of the head hooped with a thin flat iron ring, to secure it from splitting. It is very seldom that wooden teeth are employed in this way, or for these uses.

Those of the first sort are generally the lightest and cheapest, being proper for any kind of garden raking; but the latter, or iron-headed rakes, when made neat and as light as possible, with the teeth well set, in a proper position, and firmly fastened, are equally proper, and in some cases preferable, as in some wet and moist soils, as not being liable to clog so much as wooden rakes, and at the same time more durable. They are, however, more proper for middling and small rakes than for large ones; as, in strong raking, the teeth are more liable to get loose than in the wooden-headed rakes. Both the sorts, in their different sizes, are sold at the principal ironmongers' shops, both with and without handles.

And rakes having the heads, teeth, and handles, wholly of wood, may sometimes be used for particular purposes; such as raking in light kinds of kitchen-garden seeds in light ground, and taking off large hoed-up weeds in wide clear spaces, raking up swaths of mowed short grass before the sweepers, also fallen leaves of trees in autumn, and clippings of hedges, &c. as well as several other uses about the pleasure-garden.

RAKE, Hay, a well-known tool, with short teeth and a long handle, made use of in making hay. It is usually made of willow, or some other similar wood, in order that it may be light and handy. The teeth should not be too long, as, when that is the case, they are apt to hang and pull among the stubs of the grass in raking with them, and thereby retard the operation, as well as cause much fatigue to the labourer.

Different improvements have been made on this implement. A late useful alteration is the making the teeth to screw into the head, and fasten with screw nuts, by which the inconvenience of their dropping out in dry seasons is obviated. It has been observed, that with the spring-toothed rake, the operator is capable of performing much more work than by the common one. They are likewise capable of being conveniently made use of both for hay and corn. They were originally made and sold by Mr. Cort, of Leicester.

Another improvement is mentioned in Young's Agricultural Report of Norfolk, which is the addition of wheels. It is stated, that the "hand wheel-rake" of Fleg is an ex-

cellent implement for both hay and corn: it is to answer the purpose of the common hay-rake, and is about four feet long in the rake; and the two wheels, of nine inches diameter, so fixed, that the teeth are kept in any posture, at the will of the holder.

In some parts of Lancashire, they make use of a large horse-rake for collecting the hay together, and raking it up from the ground, which is found to be highly convenient and beneficial; as one horse, in one of these rakes, will perform as much labour as a great number of men, in a certain space of time; and besides the expedition, the work is considerably better done, in consequence of the greater weight of the implement.

The head of the rake has something of a large easy half circular form, into which two strong pieces of wood are fastened, which constitute the shafts for the horse. There are two low wheels behind, and the head has long teeth, curving a little forward, fixed into it at two or three inches from one another. The teeth may be made either of wood or iron, and should have considerable strength. The whole has no very great weight, though it must obviously be considerably heavier than the common rake; which is found of much advantage in its working, as has been hinted at above.

RAKE, Horse, an implement used in Norfolk and Suffolk, on the large and middling-sized farms, and, from its great utility, extending itself into other districts. It is employed for barley and oat crops, being drawn by a horse. And it has been stated by Mr. Young, that one man and a horse, driven by means of a line or rein, are capable of clearing from twenty to thirty acres, in a moderate day's work; the grain being deposited in regular rows or lines across the field, by simply lifting up the tool, and dropping it from the teeth, without the horse being stopped. It cost from four to five pounds.

Figures of it may be seen in the above Agricultural Reports. Horses have now been employed for working other sorts of rakes, and found of great advantage, as has been already seen.

RAKE, Horse Stubble, a large heavy kind of horse-rake, having strong iron teeth, fourteen or fifteen inches in length, placed at five or six inches from each other, and a beam four inches square, and eight or ten feet in length. In drawing it, two horses are mostly made use of, by which it is capable of clearing a considerable quantity of stubble in a short time. Tools of this sort are highly useful on corn farms, for collecting this useful material, and should be much more frequently employed than they are at present.

RAKE, Twitch, a large horse-rake, employed in certain cases for clearing lands from the roots of couch, twitch, or quitch-grass, as well as those of other sorts. It is constructed in different ways, as with one or two rows of teeth; but the latter is probably the best method, as by placing one row opposite the intervals of the other, it must be rendered a very effective tool.

RAKE of a Ship, is so much over her hull as overhangs at both ends of her keel.

That part of it which was before, is called the *rake forward-on*; and that part which is at the setting on of the stern-post, is called her *rake aft*, or *afterward-on*.

When a ship hath but a small rake forward-on, but is built with her stern too straight up, she is called *bluff-headed*.

RAKE of the Rudder, is the hindermost part of it.

RAKE, among Hunters. See RAG.

RAKE, in the *Manege*. A horse rakes, when being shoulder-splaid, or having strained his fore-quarter, he goes so lame, that he drags one of his fore-legs in a semicircle; which

which is more apparent when he trots, than when he paces.

RAKE, or *Vein*, in *Geology*, the most common repository of metallic ores. These veins intersect mountains nearly vertically, or more or less inclined from the perpendicular. They are filled with ores, intermixed with the peculiar minerals accompanying each kind of metal. They vary from a few inches to some feet or yards in width, and extend to a very considerable depth and distance. The upper side of the vein is provincially called the *banger*, and the lower side the *ledger*; and the inclination from the perpendicular is called the *hade* of the vein. For a particular account of the structure and formation of veins, see **VEINS**, *Metallic*.

RAKEL, in *Geography*, a town of Dobruzzi Tartary, on the Danube; 15 miles W. of Isakzi.

RAKESBURG, or **RAKELSPURG**, a town of the duchy of Stiria, situated on an island in the Muhr; the inhabitants of which carry on a considerable trade with Hungary and Croatia; 36 miles S.E. of Gratz. N. lat. 46° 45'. E. long. 15° 36'.

RAKING signifies sloping or winding, as when a wall is not built up right or straight.

RAKING, in *Agriculture*, the operation of performing work with a rake. It is a sort of work that requires little art or trouble in its execution; but whether performed with the common or horse-rakes, it should always be done in an effectual manner. In the business of hay-making, clean raking not only affords a neatness in the appearance, but, over a great extent of surface, a considerable saving of hay. See **HAY-MAKING**.

In raking hay lands, where horses are employed, some degree of care is necessary in directing the work, and driving the animals, in order that no inconvenience of delay may be experienced, and that every part of the land may be gone over in the most regular manner. Small boys may serve to direct the horses by riding upon them, and some saving be made in that way.

In raking cut corn crops with horse-rakes, especially those of oats and barley, it is sometimes the best method to proceed in a cross direction of the ridges, drawing up the produce into long rows at suitable distances; the horses being driven by the men, who know the management of the handles of the rakes, by means of whip reins brought from the horses to the stils of the implements. It seldom happens that so good work can be made in going the lengthways of the lands, particularly where they are much rounded, and of a small size in breadth, as the tools will not fit well to their rounded form, unless where they are constructed in separate parts in their heads, so as to admit of motion by means of joints. In this mode of raking, the corn may sometimes be readily tied up into sheaves.

But in the raking of stubbles, it is more usual to pass in the direction of the ridges, though the contrary method is not unfrequently had recourse to. In those cases, as well as in the others, the strawy grains or stubbles are always brought together into lines or rows, in order to be more readily taken up by the carts either bound or unbound.

In the raking of the roots of weeds together upon lands, it is constantly the best practice to perform the work in both directions; as, by such means, the whole of them may be laid hold of in a more complete and effectual manner than could otherwise be done. See **RAKE**.

RAKING, in *Gardening*, a necessary operation in the garden, to break the surface of the soil small, and render it fine for the reception of particular sorts of small seeds and plants, previous to sowing and planting, as well as to render

it neat and even to the eye. It is also employed in raking in seeds, as being an expeditious mode of covering them in. In all kinds of small seeds, or hardy plants, the ground being dug, &c. and the surface remaining rough after the spade, the seed is sown, and then raked in with an even hand, once or twice in a place, as a back and a fore stroke, or more as may be necessary.

And this operation is useful also among growing plants, that stand distant enough to admit the rake, particularly where the surface is inclinable to bind, or where numerous small seed-weeds appear, as it loosens the soil, and retards the growth of the weeds, and promotes the growth of the young plants. It is also good culture at particular seasons, to annoy slugs, especially in kitchen-gardens, to rake between the rows of small plants in autumn and winter, &c. The raking of the beds, borders, and other compartments of pleasure-grounds, now and then, smooth and even, likewise gives an air of culture and neatness to the whole.

It may be observed, that this sort of work should generally be performed in dry weather, and when the ground is also moderately dry; as when done in rainy weather, or when the ground is very moist and cloggy, the surface is apt to cake and bind hard. This should be well attended to in sowing seeds. Rough dug ground does not rake well, when it is become very dry at top, especially if it was dug wet, and suffered to lie till the clods have become very dry and hard; in which case it will not rake well, until mellowed or pulverized by a shower of rain. But common light garden ground generally rakes best when fresh dug, perhaps the same day, or day after at the farthest, before dried too much by the sun and wind, or rendered wet by rain, &c. The operation should, however, be performed when the ground is in such order as the clods will readily break and fall to pieces under the rake, without clogging much to it, or the mould become even without running into lumps.

RAKING of a Horse, is the drawing his ordure with the hand out of the fundament, when he is costive, and cannot dung. In order to do this, the hand must be anointed with fallad-oil, or butter.

RAKING a Ship, is the act of cannonading a ship on the stern or head, so that the balls shall scour the whole length of her decks, which is one of the most dangerous incidents that can happen in a naval action, so much so, that the men are ordered to lie down at their quarters. This is frequently called raking fore and aft, being the same with what is called enfilading by engineers. See **ENFILADE**.

RAKING-Knees. See **KNEES**.

RAKING-Table, or *Raked Table*, among *Architects*, a member hollowed in the square of a pedestal, or elsewhere. See **CAVETTO**, and **SCOTIA**.

RAKOKIE, in *Geography*. See **RACII-KOKE**.

RAKONITZ, or **RAKOWNITZ**, a town of Bohemia, and capital of a circle of the same name, which is mountainous and covered with forests, but fertile in corn, and affording some excellent horses. It was made a royal town in 1588. It is celebrated for its beer, which is the principal article of its commerce; 22 miles W. of Prague. N. lat. 50° 5'. E. long. 13° 57'.

RAKORA, a town of European Turkey, in Bulgaria; 40 miles S.S.E. of Viddin.

RAKOW, or **RACOW**, a town of Austrian Poland, in the palatinate of Sandomirz, formerly populous; the Soci-nians had a college and printing-house here, but were expelled in 1643; 40 miles W. of Sandomirz. See **RACOW**.

RAKOWEENA, a harbour on the coast of Kamtschatka, in Awatiska bay, three miles long, and one and a half

half broad, with water from thirteen to three fathoms, and a bar at its entrance: it runs at first in a south-east and afterwards in an easterly direction; three miles S. of St. Peter and St. Paul.

RAKSHA, in *Hindoo Mythology*, a species of malignant demon, of whom great use is made in their epic machinery and popular tales. They are of various shapes and colours, and supposed to be animated by the souls of bad men of earlier existence, receiving punishment in these forms as enemies to the gods, and obstructors of their beneficent intentions towards mankind. Another class of these evil genii comprehends those called *Yaksha*. *Rakshasa* and *Yakshasa* are the plurals, and *Rakshini* and *Yakshini* the feminine; for these evil doings are not confined to sex. *Ravana*, the giant king of Lanka, or Ceylon, who opposed Rama, aided by the gods in the invasion of his kingdom, is sometimes called the lord of *Rakshasas*. See **RAVENA**.

RAKULSKOI, in *Geography*, a town of Russia, in the province of Usting, on the Dwina; 20 miles N. of Krasnoborsk.

RALEGH, *Sir WALTER*, in *Biography*, a distinguished character in the reigns of queen Elizabeth and James I., was second son of a gentleman of an ancient family in Devonshire. Few names, says sir Walter's biographer, Mr. Cayley, vary so much in the manner of writing it. By sir Robert Naunton and lord Bacon it is written *Rawleigh*; in some old deeds the orthography is *Rale* or *Ralega*; while king James, Hooker, and other respectable writers, adopt the mode of spelling which is still common in this country, viz. *Raleigh*; but the original letters of sir Walter himself, wherever the signature is preserved, have *Ralegh*, and on that account we choose to adopt it in this work. Sir Walter, of whom we are treating, was born at a farm called Hayes, in that part of Devonshire that borders on the sea, in the year 1552. By his mother he was related to those famous knights, sir John, sir Humphrey, and sir Adrian Gilbert. After he had received the usual school education, he was sent to Oriel college, Oxford, where he distinguished himself by a proficiency in learning far beyond his age; but the active disposition and martial ardour with which he was endowed, soon put an end to his learned career. About the year 1569, he, in company with many young gentlemen of the best families in the country, went into France, as well to instruct themselves in the art of warfare, as to assist the Protestants in that kingdom, who were then grievously oppressed. In this school he was employed five or six years, but by what means he escaped the horrible massacre of Paris, and the provinces, on the famous St. Bartholomew's day, we have no knowledge. He returned to England in 1575, and it should seem he immediately became a resident in the Middle Temple, whence a commendatory poem of his, prefixed to a work of George Gascoigne's, is dated in 1576. That he was not a student in the law, at this time, he has himself declared, and he shortly after passed into the Netherlands, where he served some time against the Spaniards. In this, and other transactions of the same kind, he followed the fashion of the times. France and the Netherlands were in those days the schools of Mars; to which all were obliged to resort who meant to pursue the fortune of arms. Many young men returned to their native country ruined in their fortunes, their constitution, and morals; but Raleigh had made a good use of his time, gained a large stock of useful knowledge, and was so completely polished in his manner of address, that he was now considered as one of the best bred and most accomplished gentlemen in England.

On his return in 1578, he found his half-brother, sir Humphrey Gilbert, engaged in a design of making discov-

eries in North America, for which he had obtained a patent, and for the furtherance of which he had procured the assistance of many friends. Raleigh was delighted with the design, and embarked in it cordially. This project proved very unfortunate to the adventurers, but it gave young Raleigh an introduction to the sea service, in which he afterwards so much distinguished himself. From this unlucky adventure, Mr. Raleigh arrived safe in England in the spring of the year 1579, and very soon after he appears to have offered his services to the queen to go to Ireland, to the inhabitants of which, pope Gregory VIII. and the Spaniards had sent men, money, and other assistance, to enable them to take arms against the established government. He obtained a captain's commission, and served in Munster under the earl of Ormond. In this petty warfare he displayed so much good conduct, vigour, and courage, that he was afterwards made governor of Cork; and as a reward for his services, he received from the crown the grant of a considerable estate in Ireland. A misunderstanding with the lord-deputy Grey put a stop to his farther rise in the army; he returned to England, and was quickly introduced to the queen's notice, and by his own merits attained a large share in her favour. As he was forward to distinguish himself in all public services, so on the return of the duke of Anjou into the Netherlands, he was one of those who accompanied him out of England, by the express command of queen Elizabeth, and on his coming to England in 1582, he brought over the prince of Orange's letters to her majesty. Some months after this he resided at court, and was honoured with the favour and protection even of contending statesmen, who were proud of shewing the true judgment which they had of real merit, by becoming patrons to Raleigh. In 1583 he was concerned in his brother Gilbert's second attempt, and though he did not venture in person, yet he built a new ship, called the bark Raleigh, and furnished it completely for the voyage; "the unsuccessful end of which," says Campbell, "it seemed to predict, by its untimely return in less than a week to Plymouth, through a contagious distemper which seized on the ship's crew."

While at home Raleigh was not negligent of pushing his fortune as a courtier. He had a good person and address, made an elegant appearance, and put on that air of gallantry which was so meritorious in the eyes of Elizabeth. It is said, that he was once attending the queen in a walk, when she came to a spot, that by its mire obstructed her course; he immediately took off his rich cloak, and spread it on the ground for her to walk on. Pleased with this attention, it is observed, that the sacrifice of a *cloak* obtained for him many a *good suit*. The enterprising spirit of Raleigh was shewn in the year 1584, in a scheme which he formed of making discoveries and settlements in those parts of North America which had not been subjected to any European power. His interest at court, and his ability in stating and setting forth his plans to the best advantage, obtained for him an extensive patent for executing his purpose; and, in consequence, with the help of a society of his friends, he fitted out ships under the command of captains Amadas and Barlow, which sailed from Plymouth in that year, and took possession of an island near the mouth of Albemarle river, in what is now called North Carolina. From the terms of the patent, it appears, that the great object of these adventurers, as it was of all others in that reign, was the search after mines of the precious metals. Raleigh was not himself in this expedition: the ships returned in the autumn with some commodities which sold so well, that the company was encouraged to fit out a fleet of seven vessels for the following year, of which the command was given to sir

Richard

Richard Greenville, Raleigh's relation. During this voyage they took possession of that tract of country which has been so famous, by the name bestowed upon it by queen Elizabeth, and not given, as it has been generally supposed, by Raleigh, of Virginia. After expending a large sum in repeated attempts to repair the misfortunes that had happened to the newly established colony, he assigned over his patent to a company, reserving to himself only a portion of the expected gold and silver ore. This enterprise probably made England first acquainted with tobacco, and also conferred upon it the much greater benefit of introducing the culture of the potatoe, first practised on Raleigh's estate in Ireland.

About this time he was chosen knight of the shire for the county of Devon, and very soon after the queen conferred upon him the honour of knighthood, an honour which he did not render cheap by prostituting it. In the year 1585 he fitted out another fleet for Virginia, in which he had good success, his ships, in their return, taking a prize worth 50,000*l.* He was likewise concerned in captain Davis's undertaking for the discovery of the north-west passage, on which account a promontory in Davis's straits was called Mount Raleigh. For these public-spirited and expensive projects, the queen was pleased to make him some profitable grants; particularly two, the first giving him authority to license the retailers of wine throughout the kingdom, and the other of a feigniory in Ireland, consisting of twelve thousand acres, which he planted at his own expence, and many years after sold to Richard Boyle, the first earl of Cork. In 1586 he was appointed seneschal of the duchies of Cornwall and Exeter, and lord-warden of the stannaries; and so high did he seem rising in the queen's favour, that the favourite minister, the earl of Leicester, took the alarm, and brought forward the earl of Essex as his competitor. But her majesty's partiality was fully justified; it was, in this instance, extended to a man, who at all times pursued whatever appeared to him conducive to the public good, how little soever it turned to his private advantage. "With justice, therefore," says Campbell, "was the wise queen Elizabeth liberal to such a man, who, whatever he received from her bounty with one hand, bestowed it immediately in acts glorious to the nation with the other." In the year preceding the attempt of the famous Spanish armada, sir Walter was captain in the queen's guard, and her lieutenant-general for Cornwall. In the latter capacity he was active in disciplining the militia of the county; and he was one of the council of war to whom the consideration of the best means of opposing the dangers of that momentous period was committed. When the armada appeared in the Channel, he was one of the gallant volunteers who nobly joined the English fleet with ships of their own, and had a share in the defeat of the enemy. In 1589 he was among those who accompanied the expelled king of Portugal in his attempt to reinstate himself. The queen shewed her continued approbation of his services, by making him gentleman of her privy-chamber, and augmenting the profits of his other places. This last was no small favour in Raleigh's estimation, for though in many respects of an elevated mind, fond of glory, splendid and liberal, he was likewise intent upon gain, and neglected no source of emolument which his court interest placed within his reach. He did not scruple, we are told by some of his biographers, though the fact is not noticed by Campbell and others, to take direct bribes for the exertion of his influence; and he is said to have received no less than ten thousand pounds for procuring a pardon for Mr. Littleton. See *Biog. Brit. article Littleton.*

On his return from his Portugal voyage he visited his Irish estates, and there either formed or renewed his acquaintance with the poet Spencer, who celebrates him under the title of the "Shepherd of the Ocean," and acknowledges the obligation of having first made him known to the queen. To his Fairy Queen he likewise prefixed a letter to Raleigh, explanatory of its plan and design. The patronage of literature was one of the best traits in the public characters of an age, in which meanness was singularly mixed with heroism. The naval enterprises of the reign of Elizabeth were for the most part predatory expeditions, set on foot by individuals for their private benefit, and encouraged, though but feebly aided, by the crown. In 1592 sir Walter Raleigh engaged in a considerable undertaking of this kind, with a view of attacking Panama, and intercepting the Spanish Plate fleet. He fitted out thirteen ships, by himself and his associates, which were joined by two of the queen's men of war, and he was appointed general of the whole fleet. Scarcely had he set sail when he was recalled by his sovereign; proceeding, however, to Cape Finisterre, he divided his fleet into two squadrons, with cruising orders, and then returned. One of the squadrons fell in with a rich carrack, the capture of which was the only instance of success which attended the expedition. His ardour for war was shewn by his support in parliament of a motion, that certain subsidies granted to the crown should be for the express purpose of carrying on a war offensive and defensive against Spain. To undermine his credit with the queen, Parsons, a Jesuit, published a libel against him, charging him with Atheism; the queen is said to have imbibed some prejudice against him on this account, but he incurred her heavy displeasure by an intrigue with one of her maids of honour, the daughter of sir Nicholas Throgmorton. The consequences of this amour brought a scandal upon the court of the virgin queen; and though he made the best reparation in his power, by marrying the lady, his offence was punished by an imprisonment in the Tower of some months, and a subsequent banishment from the queen's presence.

During his imprisonment he projected an expedition for the discovery of the empire of Guiana, which had already been visited by the Spaniards, and the extent and opulence of which had been the subject of many marvellous tales. Having obtained some preliminary information, from an old navigator whom he dispatched for the purpose, he embarked in person, in the month of February 1595, with a squadron of ships fitted out at a great expence, and sailed to the island of Trinidad, where he made himself master of the town of St. Joseph; he then proceeded up the great river Oroonoko, but was obliged by the heat of the weather, and the difficulties of the navigation, to return, with doing nothing more than merely taking possession of the country in her majesty's name. Unwilling to return without appearing to have done something, he published a work, entitled "Discovery of the large, rich, and beautiful Empire of Guiana:" which was evidently the result of a fertile imagination rather than of real observation, and which Hume stigmatizes as a production "full of the grossest and most palpable lies that were attempted to be imposed on the credulity of mankind."

Sir Walter had so far regained the good opinion of the queen, that he had a naval command in the expedition against Cadiz, in 1596, under the earl of Essex and lord Effingham. In the attack he was one of the leaders of the van, and by his valour and prudence contributed a full share to the success of the glorious action. In the following year he failed as rear-admiral in the expedition of which Essex was commander-in-chief, and the purpose of which was to intercept the Spanish West India fleet. Arriving first with

his squadron at Fayal, after waiting some time for Essex, he thought it expedient to make an attack on the place by himself, which proved successful. The commander-in-chief was mortified with this action, thinking it was designed to rob him of the glory due to him, and would have cashiered Raleigh, if lord Thomas Howard had not interposed his services to effect an apparent reconciliation. On their return lord Essex published some remarks upon what had happened in the course of the voyage, in which he questioned every body's conduct but his own. "The queen, however," says Campbell, "taking time to inform herself, made a right judgment of the whole affair; in consequence of which she paid a due respect to every man's merit, and greater to none than to that of sir Walter Raleigh."

During the remainder of this reign Raleigh chiefly appears as a member of parliament, and as an assertor of the privileges and interests of the people in the west, over whom his authority extended. That he was completely restored to the favour of his royal mistress is evident from the circumstance, that in 1661 he attended her in a progress through part of the kingdom. He was likewise appointed by her to receive the duke of Biron on his arrival as ambassador from France, and conferred with him on the subject of his mission. In the queen's last parliament sir Walter was a very active member, and distinguished himself upon all occasions, by opposing such bills as, under colour of deep policy, were contrived for the oppression of the middle and lower ranks of society. He witnessed the ruin of his great antagonist the earl of Essex, whose execution he indecently urged upon the minister Cecil; and he was even an eye-witness of the deed. Campbell, endeavouring to justify him in every thing, is evidently, in some instances, a panegyrist rather than a faithful historian. The decease of the queen, which soon followed the execution of her former favourite lord Essex, and which was probably hastened by it, gave a final, and to Raleigh a very unexpected, blow to his own prosperity.

When James came to the crown it was a sort of contest between sir Walter Raleigh and sir Robert Cecil, who should obtain the confidence of his majesty; the latter, however, was admitted to the royal councils, to the exclusion of sir Walter Raleigh. In truth, James had a prepossession against Raleigh, as having been the enemy of Essex, and still more, as having, with some others, entertained a design of forcing the king to agree to certain limitations with respect to the number of his countrymen whom he was to bring with him. Sir Walter's martial and enterprising spirit was also obnoxious to a prince of a pacific disposition. He was, therefore, received, barely with civility, a circumstance which preyed upon his high spirit, and was probably the means of throwing him into the party of the discontented. A conspiracy, for the purpose of placing upon the throne lady Arabella Stuart, was at this time formed, in which Raleigh in some measure participated. He was apprehended, and brought to trial on a charge of high treason; but, says the historian, his condemnation, upon the evidence produced, was one of the most disgraceful instances on record, of the base subservience of an English jury to the vindictive wishes of a court. His only accuser was lord Cobham, a man of bad character, and one who was deeply implicated in the plot, to whose proposals he had given ear, but probably without entering into, or even approving them. In his defence he displayed so much eloquence, temper, and force of argument, that some, who had been highly prejudiced against him, were brought to regard him as an innocent victim, and, it should seem, from the testimony of contemporary historians, that all parties were ashamed of the injustice of his condemnation.

It is said that even Coke, the attorney-general, who treated Raleigh on his trial with all the abuse that belonged to his character, and was thought authorized by his office, expressed surprize at the sentence, and declared that he had charged him with no more than misprision of treason. Three were executed for this plot, two were pardoned, and Raleigh was only reprieved and committed to the Tower. His wife, at her own earnest solicitation, was permitted to become his fellow-prisoner, and his youngest son was born in the Tower.

In Mr. Cayley's life of sir Walter Raleigh, published in London in 1806, we have a curious letter of lord Cecil, then secretary of state, to sir Thomas Parry, the English ambassador in France, in which he gives an account of the conspiracy just referred to, and of the motives which led the different persons to take a part in it. Sir Walter was indicted for conspiring to deprive the king of his government, to raise up sedition within the realm, to alter the religion and bring in the Roman superstition, and to procure foreign enemies to invade the kingdom. The principal overt act laid in the indictment was, that sir Walter had a conference with lord Cobham, as to the best means of advancing Arabella Stuart to the crown and throne of this kingdom, and that they should apply to the king of Spain to procure his assistance in this cause. Sir Walter made an able stand in his trial against the legality of conviction upon the evidence of a single witness, but the judge, rendered infamous by his conduct on the trial, over-ruled the objections.

The active mind of sir Walter Raleigh was now left to exert itself within the walls of a prison, and its employment conducted more to his honour than his liberty perhaps would have done. Here he composed the greater part of his works, especially his "History of the World." Prince Henry, a youth of most amiable qualities, and as unlike his father as possible, contracted a generous admiration for the splendid talents of Raleigh, and cheered him in his solitary confinement by his friendship and correspondence. "No king," said the royal youth, "but my father would keep such a bird in a cage." Henry, however, died, and with him the hopes of deliverance vanished from the mind of the state prisoner. At length, however, after twelve years' confinement, sir Walter obtained his liberation, but probably not without the use of bribes, applied to the new favourite Villiers. For the purpose of repairing his fortunes, he planned a new expedition to Guiana, and his report of a rich gold mine existing in that country was a sufficient inducement for a number of adventurers to engage in the scheme. He obtained a patent under the great seal from the king, for making a settlement in Guiana. James, however, in order to retain his hold upon him, did not grant him a pardon of the treasons of which he had been convicted. There is no doubt but sir Walter might have purchased a pardon, and, at one time, had thoughts of doing so. He even consulted sir Francis Bacon, whether it would not be advisable for him to give a round sum of money for a pardon in common form; to which the learned lawyer answered; "Sir, the knee timber of your voyage is money; spare your purse in this particular, for, upon my life, you have sufficient pardon for all that is past already, the king having under his broad seal made you admiral of your fleet, and given you power of the martial law over your officers and soldiers." Raleigh having employed all his resources in fitting out the expedition, sailed for Guiana with twelve armed vessels in July 1617. He had not set sail long before he was obliged to put into the harbour of Cork, by stress of weather, where he remained till the 19th of August. In November he arrived at Guiana,

Guiana, where he was received with the utmost joy by the Indians, who not only rendered him all the service in their power, but endeavoured to persuade him to end all his labours there, and take upon himself the sovereignty of the country, which, however, he steadily refused. A violent and long continued sickness prevented him from undertaking the discovery of the mine in person. This important affair he entrusted to one of his captains, Keymis: the scheme, however, proved abortive, the Spaniards having been before hand with him in the search of gold. Hume, for the purpose of exculpating James, endeavours to shew that the real intention of sir Walter Raleigh was to plunder the Spanish settlements, and neither to colonize, nor to work the mines. He assumes that Raleigh was a wilful deceiver in the expectations he had raised of vast subterranean riches; but considering his character, it is surely more reasonable to believe that he was carried away by some vague ideas of this kind, and Hume admits that the Spaniards were at the very time working some mines. It will be readily admitted, that James did not imagine he was giving Raleigh a commission of hostilities against Spain, yet he must have known that the exclusive claims of that crown in South America rendered every interference with its dominion hostile in its eyes. The fact seems to be, that the expedition was undertaken with an intention to make the most of it, by any means within the power of the armament, and that the commander trusted to its success for justification before a court where bribery to favourites was omnipotent.

In this expedition Raleigh's eldest son lost his life, of which, and of the unfortunate issue of Keymis's undertaking, he reproached his captain very severely, who, without hesitation, put an end to his own life. Raleigh, with a heavy heart, steered homewards. In July 1618 he arrived at Plymouth, and in his journey to London he was arrested, and carried back to Plymouth. Twice he attempted to escape, but was secured and committed a prisoner to the Tower. James was exasperated at the injury which had been inflicted on Spain, a power then in amity with England, and which had been complained of by the Spanish court in very strong terms. He was, moreover, about to enter into a more intimate connection with that court, and therefore, without hesitation, determined to sacrifice Raleigh to its resentment. Though his death had been determined on, it was difficult to take away his life. His conduct in the late expedition, though the want of success had rendered it criminal in the eyes of the court, was far from being so in the sight of the nation; and though judges might have been found who would pronounce it treason, yet even in those days it was not easy to find a jury who would, without evidence, have found him guilty. The commissioners therefore, who had been appointed to enquire into the matter, and who had frequently examined him, finally reported, that no ground of legal judgment could be drawn from what had passed in the expedition. Upon this, it was resolved to call him down to judgment upon his former sentence, which, says Campbell, was done, with all the circumstances of iniquity and brutality that can well be conceived. Being brought before the court of king's bench, his plea of an implied pardon, by his having acted under the king's commission since sentence had been pronounced, was over-ruled, and he was not permitted to enter into a vindication of his conduct in the late voyage. Execution was accordingly awarded, and the king's warrant for it produced, which had been signed and sealed before-hand.

"That this judgment was illegal," observes Dr. Campbell, "and that sir Walter was really murdered, has often been said, and, I believe, seldom doubted; but I think it has not been made so plain as it might be, and, therefore, in

respect to his memory, I will attempt it, by shewing that the judgment was absolutely illegal, as well as manifestly iniquitous.

"It is a maxim in our law that the king can do no wrong; and most certain it is, that no king can do legal wrong, that is to say, can employ the law to unjust purposes. Sir Walter Raleigh, after his conviction, was dead in law, and, therefore, if king James's commission to him had not the virtue of a pardon, what was it? Did it empower a dead man to act, and not only to act, but to have a power over the lives and estates of the living? It either conveyed authority, or it did not. If it did convey authority, then sir Walter was capable of receiving it; that is, he was no longer dead in law: or, in other words, he was pardoned. If it conveyed no authority, then this was an act of legal wrong. I cannot help the blunder; the absurdity is in the thing, and not in my expression. A commission under the privy seal, if not under the great seal, granted by the king, with the advice of his council, to a dead man; or, to put it otherwise, a lawful commission given to a man dead in law, is nonsense not to be endured; and, therefore, to avoid this, we must conceive, as sir Francis Bacon, and every other lawyer did, that the commission included, or rather conveyed, a pardon. Indeed, the same thing may be made out in much fewer words. Grace is not so strong a mark of royal favour as trust; and, therefore, where the latter appears, the law ought, and, indeed, does, presume the former. This judgment, therefore, did not only murder sir Walter Raleigh, but, in this instance, subverted the constitution, and ought to be looked upon, not only as an act of the basest prostitution, but as the most flagrant violation of justice that ever was committed."

The sentence of death was pronounced on him one day, and put in execution on the following, Oct. 29, 1618, in Old Palace Yard. His behaviour on the scaffold was calm and manly. He addressed the people at some length: he said he never feared death, and much less at that time; that as to the manner of it, though to others it might seem grievous, yet for himself, he had rather die in this way than in a burning fever. He desired to see the axe, and feeling the edge of it, said to the sheriff, "this is a sharp medicine, but a sure remedy for all evils." Being asked which way he chose to place himself on the block, he replied, "so the heart be right, it is no matter which way the head lies," and giving the signal, he received the stroke with the most perfect composure. Such was the end of the illustrious sir Walter Raleigh, in the 66th year of his age, by a sentence which was regarded as one of the most dishonourable measures of an odious administration. The panegyric upon his character by Dr. Campbell is much too highly coloured: sir Walter Raleigh was not faultless, though in extent of capacity and vigour of mind he had few equals in an age that abounded with great men. His imprisonment was the occasion of his obtaining a high reputation as an author. His writings were on various topics, and are classed as poetical, geographical, political, philosophical, and historical. They are now but little known. His "History of the World," though not much read, is regarded with respect, as one of the best specimens of the English language of that time: the style is pure, nervous, and without pedantry. It is the style of a man of business as well as of a scholar. It has been many times reprinted, but the best edition is that of Oldys, in 1736. He brought down his history no farther than the overthrow of the Macedonian empire. Of his miscellaneous works, a collection in two volumes 8vo. was printed in 1748. Biog. Brit. Hume. Campbell. Cayley.

RALEIGH, or RAYLEIGH, in *Geography*, a market-town

and parish in the hundred of Rochford, and county of Essex, England, is situated at the distance of 14 miles S.E. by S. from Chelmsford, and 34 miles E. by N. from London. This place appears to have been anciently of considerable note. It was the head of the barony of Swene, and had a castle adjoining to it, of which some fragments and earth-works still remain. These consist of a mount, with an oval-shaped base, surrounded by a double ditch and rampart, and several outworks, particularly on the east side. The summit of the mount is divided; the western division being of a circular form, and 100 feet high; and the eastern one of an oval form, and lower: the principal ditch varies in width from 36 to 50 feet, and the interior vallum is 50 feet high. The church here is an ancient edifice, and contains an old tomb, greatly mutilated, but displaying the remains of very beautiful workmanship in the pointed style. The person whose memory it was intended to preserve is now unknown; the upper part, to which the inscription was probably affixed, being totally destroyed. The market at Raleigh is held on Saturday, weekly; and there is an annual fair on Trinity Monday. Hearne, in his edition of Leland's Itinerary (vol. iii. p. 8.), informs us that a custom-court is kept here, yearly, the Wednesday next after Michael's day. "The court," says that author, "is kept in the night, and without light, but as the skey gives, at a little hill without the town, called the King's hill, where the steward writes only with coales, and not with incke; and many men and manners of great worth hold of the same; and do suite unto this strange court, where the steward calls them with as low a voice as possible he may; giving no notice when he goes to the hill to keepe the same court; and he that attends not is deeply amerced, if the steward will. 'Tis commonly called *Lawless-Court*." Weever, in his "Funeral Monuments," adds, respecting this custom, that he was informed, "that this vile attendance was imposed at the first upon certaine tenants of divers manners hereabouts, for conspiring in this place, at such an unseasonable time, to raise a commotion." According to the parliamentary returns of 1811, Raleigh parish contains 162 houses, and 1131 inhabitants. Beauties of England and Wales, vol. v. By E. W. Brayley and John Britton, F.S.A. 1810.

RALEIGH, a township of Essex county, in Upper Canada, W. of Harwich, bounded on the N. by the Thames, and S. by lake Erie.

RALEIGH, a town of America, in Wake county, North Carolina, the present seat of government, about ten miles from Wake court-house. The general assembly of the state in December 1791, appropriated 10,000*l.* towards erecting public buildings, and named it after the celebrated sir Walter Raleigh, under whose direction the first settlement in North America was made at Roanoke isle and in Albemarle sound. The state-house is a large handsome building, and cost 6000*l.* The plan of the town is regular; the streets intersecting each other at right angles. It is, however, subject to the disadvantage of being remote from navigation; 61 miles N.E. of Fayetteville, 147 from Petersburg in Virginia, and 448 S.W. of Philadelphia.

RALEMO, a river of Chili, which runs into the Pacific ocean, S. lat. 37° 55'.

RALENDORF, a town of the duchy of Carinthia; 12 miles S. of Saxenburg.

RALESTEDE, a town of the duchy of Holstein; 8 miles E. of Hamburg.

RALICOTTA, a town of Hindoostan, in Vissiapour; 31 miles N. of Anamagar.

RALLENTANDO, Ital., a musical term of late invention, for relaxing the measure at particular parts of a

composition, which, when done by a great master, manifests feeling and intelligence; but when attempted by mean performers, it has no other effect upon an audience than that of breaking time: and we think that this refinement is often abused. It has been chiefly practised in France, and favours of affectation, and that *overcharged tenderness* which renders the national *airs tendres* so disagreeable, or so ridiculous, to the natives of all other countries.

RALLUS, the *Rail*, in *Ornithology*, a genus of birds of the order *Grallæ*: the generic character is, that the bill is thickish at the base, attenuated on the back towards the tip, compressed, a little incurved, pointed; the tongue is rough at the tip; the body is compressed; the tail is short; the feet have four cleft toes. There are seventeen

Species.

* **CREX**; land rail, crane, corn crane, daker hen, &c. Of this species the wings are of a rusty red; the bill and legs of a brownish-ash; the irides are of a hazel colour; the feathers of the body are of a reddish-brown; the upper ones are black in the middle; the chin is very pale, and the belly is of a whitish-yellow. It is about nine or ten inches long, and inhabits the sedge parts of Europe and Asia. From the circumstance of its appearing at the same time with the quail, and frequenting the same places, it has been denominated the king of the quails. Its well-known cry is first heard as soon as the grass becomes long enough to shelter it, and continues till the grass is cut. The bird, however, is seldom seen, as it skulks in the thickest parts of the herbage, and runs so nimbly through it, winding and doubling in every direction, that it is difficult to come near it. When it is hard pushed by the dogs, it sometimes stops short and squats down, by which means its too eager pursuer overshoots the spot and loses the trace. It seldom springs but when driven to extremities, and generally flies with its legs hanging down, but never to a great distance. As soon as it alights, it runs off, and before the fowler has reached the spot, the bird is at a considerable distance. It emigrates, appearing with us about the latter end of April, and departing in October. On its first appearance, and till the female begins to sit, the male is frequently heard to make a singular kind of noise, much resembling that of a comb when the finger is drawn along the teeth of it, and which has been used as a decoy. When they first arrive, they are very lean, but before their departure, they become excessively fat, and are much sought after for the delicacy of their flesh. They lay from twelve to sixteen eggs in the grass, of a dirty whitish colour, with a few yellow spots: the flesh is excellent. There are two varieties, thus described: 1. Rufous brown, beneath paler; wings and tail deeper; the chin and vent are white; the legs are dusky red. This is found in the island of Jamaica. The bill is larger and black. 2. Reddish-grey beneath, and wing-coverts rusty brown. This species inhabits China; the legs are of a dusky colour.

AQUATICUS; Water Rail. Wings grey spotted with brown; flanks spotted with white; bill orange beneath, but black and reddish at the base; the irides are red; the feathers of the upper part of the body are of an olive-brown, and black in the middle; the lower ones are cinereous; those of the lower part of the belly and vent are edged with rufous; quill-feathers dusk; the lower tail-coverts are white; the tail-feathers are short and black; the two middle ones at the tip, and the others, are edged with ferruginous; the legs are of a dusky red. It is about twelve inches long, but does not weigh more than four ounces. It is found in the watery places in Europe and Asia. It is sometimes, but not in any

any great numbers, met with in various parts of Great Britain, in low situations, about water courses and rivulets, where it seeks shelter among sedge, rushes, and reeds, and is seldom put to flight, depending on its legs for safety. When roused it flies only to small distances, and in a heavy and very awkward manner, with its legs hanging down. It runs nimbly, and frequently flits up its tail. The nest is made of sedge and coarse grass, among the thickest aquatic plants, or in willow beds. The female lays six or more eggs, rather larger than those of a blackbird, of a pure white colour. This bird continues with us all the year, and by many it is erroneously believed to be the land rail metamorphosed in the autumn; but the different bills which the two birds have constitute an essential distinction.

***PORZANA**; Spotted gallinule, or spotted water hen. This species has the two middle tail-feathers edged with white; the bill and legs are of a pale olive. It inhabits Europe and North America, and is generally found on the sides of small streams, hiding itself among the bushes; it is nine inches long. This bird is described as having a greenish-yellow bill; its irides are hazel, and head brown, spotted with black. The line over the eyes is of a pale grey; the neck above and flanks are of a brown-ash, with small white spots; the back and wing-coverts are olive, with black stripes, and near the edges of the feathers with white spots, the greater with white stripes and lines; the cheeks, chin, and throat, are of a pale grey, with brown spots; the breast is brown, with white spots; the belly is varied with cinereous and white; the vent is of an ochre-yellow. This bird is extremely timid and sequestered, and is but seldom seen in Great Britain, eluding observation by its perpetual vigilance and lurking habits. Its nest is formed, with singular care, of matted rushes, and materials which will float on the water, on which it remains tied, by some filaments, to the stalks of reeds, by which it is prevented from being carried away by the tide or current. The bird is in great esteem for the table.

CREPITANS; Clapper Rallus. Bill and legs brown; body above olive, the feathers ashy at the edges; chin white, throat and breast yellowish-brown. This species inhabits New York, and is from fourteen to sixteen inches long.

FUSCUS; Brown Rallus. This is brown, as its specific name imports; its vent is waved with white; the legs are yellow. It inhabits the Philippine isles, and is seven inches long. The body beneath is light chestnut, on the belly it is inclining to grey; the tail is barred with white and black.

STRIATUS; Streaked Rallus. Blackish, waved with white; chin reddish. The bill of this species is of a horn colour; the crown is varied with dusky and bay; the nape is bay; neck, back, shoulders, and rump, brown, with whitish spots; the wing-coverts are marked with a few transverse whitish streaks; the chin is of a reddish-white; the cheeks, throat, breast, and upper part of the belly, cinereous, with a tinge of olive; the lower part is barred with dusky and white; quill-feathers brown, the outer bands reddish-white, the inner are white; the tail is brown with white lines; the legs are of a greyish-brown. It inhabits the Philippine islands, is eight inches long, and is probably a variety of the philippensis.

TORQUATUS; Banded Rallus. Brown, beneath waved with white; it has a white line below the eyes. This also is found in the Philippine isles, and is twelve inches long. The bill and legs are grey-brown; cheeks and chin black. The body beneath is transversely streaked with black and white; the collar is of a bay colour; the quill-feathers on the outer

edge paler; bands within on the first three white, the six next reddish-bay.

PHILIPPENSIS; Philippine Rallus. The specific character of this bird is brown, but beneath it is barred with grey; the eye-brows are white, and the neck beneath has a reddish cast. There are three other varieties, thus described: 1. Red-brown, spotted and streaked with black and white; head chestnut; body beneath and eye-brows cinereous; this, notwithstanding its name, is found at Otaheite. 2. Brown, spotted and streaked with white, beneath white; eye-brows grey; the tail is barred with brown and white; this inhabits Tongataboo. 3. Above brown, beneath ashy; back and wings lined with white spots; the belly beneath is white, with blackish bars. This is about eleven inches long, and is found in the Philippine islands.

ECAUDATUS; Tailless Rallus. Olive; beneath blueish; body transversely waved with black; eye-brows white. It inhabits Otaheite. The bill is blackish, and the upper part of the head is of a pale brown; the orbits are black; over the eyes, on each side the head, it has a broad white line; the body above is of a deep glossy olive, with a tinge of olive on the shoulders; the vent is of a pale yellow; the tail is so short as to be scarcely perceptible; the coverts are of a pale blue.

CAROLINUS; Soree. This bird is brown; the frontlet is black; the breast is of a lead colour; the bill is yellow; the legs are greenish. It inhabits Virginia, and is from seven to eight inches long; this is a capital bird for the table. The irides of this bird are red; the crown and body above are brown, marked with black spots; the face and chin are black; but the rest of the neck, temples, and breast, are of a blueish-ash; the belly and outer edge of the wings are white; the wings and tail are brown.

PHENICULUS; Red-tailed Rallus. This species is black but beneath it is white; the bill and legs are greenish; the front is naked and of a flesh colour; the vent and tail of a rusty red. It is found in the island of Ceylon, and is about nine inches long. The bill and legs are tinged with red; the crown and cheeks are pure white; the quill-feathers are spotted with blue. There are two varieties. 1. Above cinereous, beneath white; the belly and vent are red. This is an inhabitant of China, and is fifteen inches long. 2. The front of this is white; the vent is red, and the legs are yellow. It is found in Madagascar, and is longer than the last.

VIRGINIANUS; Virginian Rallus. Brown, without spots; the bill and legs are brown. It inhabits Virginia, and is probably a variety of the *R. aquaticus*.

FERRUGINEUS; Red-breasted Rallus. This bird is dusky above, and cinereous beneath; the neck and breast are ferruginous; the bill is pale, and the legs yellow. It is nine inches long; the eye-brows are pale, and the flanks are marked with transverse, narrow, white lines.

CAPENSIS; Cape Rallus. This species is of a ferruginous colour; but the lower part of the breast, belly, vent, wings, and tail, are waved with black and white; the bill is black, and the legs are of a blood-red. It inhabits the Cape of Good Hope and Ceylon, and is of the size of the *R. crex*. The two middle tail-feathers are ferruginous.

CÆRULEUS; Blue-necked Rallus. This is of a bay colour above, but blueish beneath; the bill and legs are red; the vent is white, and the belly is marked with transverse black streaks. It inhabits the Cape of Good Hope; it is seven and a half inches long.

ZEYLANICUS; Ceylon Rallus. The head of this bird is dusky; the body above is ferruginous, beneath it is reddish, waved with brown; the first quill-feathers are black; the

bill and legs are red. It is found, as its name imports, at Ceylon; it is larger than the *R. aquaticus*, and has a long tail.

AUSTRALIS; Troglodyte Rallus. Rusty ash; wings and tail deep brown; the feathers are barred with black. It inhabits New Zealand, and is seventeen inches long. The bill and legs are yellowish; the body above is of a rusty brown, beneath rusty ash; quill and tail-feathers are waved with black.

PACIFICUS; Pacific Rallus. Black, speckled with white; wings barred; body beneath whitish; the head is brown, the breast is of a blueish-ash. It is found in Otaheite, and the neighbouring isles. Bill red, the legs are of a flesh colour; the chin and eye-brows are white; the nape of the neck is rusty.

TABUENSIS; Tabuan Rallus. Brownish-black; beneath it is of a dusky colour; the bill is black, and the legs are bay. A variety has its vent streaked with black and white; the legs are red. It inhabits the South-sea islands, and is six inches and a half long. The eye-lids and irides are red.

NIGER; Black Rallus. Black; bill red at the base, brown at the tip; the legs are brown or red. This is an African bird, and is nine inches long.

SANDWICENSIS; Sandwich Rallus. This is of a pale ferruginous colour; but the bill is of a dusky ash; the legs are of a dull flesh colour. A variety has a yellowish bill and legs. It inhabits the Sandwich islands; and another variety is very small, and found in the Tanna isles.

TAITIENSIS; Otaheite Rallus. Cinereous; body above red-brown; the bill, rounded tail, and claws, are black. This inhabits Otaheite and the Friendly isles, and is about six inches long. The quill-feathers are dusky and edged with white; the legs are yellow.

OBSCURUS; Dusky Rallus. This is brown streaked with black, beneath it is of a rusty brown; the bill is black, and the legs are of a red-brown. It inhabits the Sandwich islands, and is six inches long; the edge of the mandibles is yellowish.

LONGIROSTRIS; Long-billed Rallus. The upper part of this species is cinereous, spotted with brown, beneath it is rusty white; the flanks are transversely waved with white, the bill is long and of a ferruginous colour. It inhabits Cayenne, and is from nine to twelve inches long. The bill is tipped with brown; the legs are yellowish, and the chin whitish.

VARIEGATUS; Variegated Rallus. This bird is streaked and spotted with white and black; the hind-head is dusky; the bill is yellowish; the chin is white; and the legs are yellow. It inhabits Cayenne, and is eleven inches long. The wings are brown, the coverts are spotted with white; some of the middle tail-feathers are edged with white.

CAYENNENSIS; Cayenne Rallus. The crown of this bird is rufous; the body above is of an olive-brown; beneath it is rufous; the ocular band is blackish; the quill-feathers are black; the bill is brown, and the legs bay. There is a variety having its crown bay; chin and vent reddish-white. It inhabits Cayenne and Guiana; it is eight inches long: in the evening it is noisy and gregarious, by day it is solitary; it builds in the forked branch of a shrub, near the ground. The vent is pale.

JAMAICENSIS; Jamaica Rallus. Above reddish-brown with black streaks; the bill and chin are black; the throat and breast are of a blueish-ash; the belly is marked with white and brown lines. It, as its name imports, inhabits Jamaica, and is six inches long. The bill is reddish at the base; wing-coverts brown, spotted with white; the quill-feathers

are of a reddish-brown, with black lines, the secondaries

and tail-feathers are spotted with white, and the legs brown.

MIXTUS; the Little Rallus. This is brown, but beneath it is yellowish; eye-brows, streaks on the back, and spots on the wing-coverts, white; tail barred black and white. A variety has the middle of the neck above rufous; the belly and vent are waved with black and white. It inhabits Cayenne and Jamaica, and is five inches long. The bill is brown; the wing-coverts are black; the chin is whitish, and the legs are yellow.

PUSILLUS; Dwarf Rallus. Striped with ferruginous and black; the body beneath is blackish, with narrow white bands; the throat and breast are blueish. This is found near salt lakes of Dauria, and is of the size of a lark. The face, neck beneath, and middle of the breast longitudinally, are blueish; the middle of the chin is whitish; the longitudinal band through the eyes of a pale rusty colour; the back is scattered with white longitudinal lines; the legs are greenish.

BARBARICUS; Barbary Rallus. This is of a ferruginous colour; the bill is black; the wings are spotted with white; the rump is streaked above with white and black, and beneath with white; the legs are of a dusky brown. This, as its name imports, is an inhabitant of Barbary, and is the size of a plover.

DUBIUS; Doubtful Rallus. Striped with brown and ferruginous; the belly is white; the flanks are barred with brown and rusty ash; the first quill-feathers without are longitudinally white. It is the size of the common gallinule. The face is of a pale rusty colour; the chin is of a dirty white, surrounded with a broad brown collar; the sides are brown; the bill and legs greenish-black.

RALLYING, in *War*, the reassembling, or calling together of troops, broken, routed, and put to flight.

RALPH, JAMES, in *Biography*, a miscellaneous writer, descended probably from mean parentage, was the intimate friend of Dr. Franklin, who speaks of him as ingenious and shrewd, genteel in his address, and extremely eloquent. Franklin knew him in America, and though he does not mention what Ralph's situation then was, yet as he wrote a fine hand, and was well versed in accounts, it is imagined he was a schoolmaster. In 1725 Ralph accompanied Franklin to England, with a resolution of not returning to America, where he left his wife, with whom, and with whose family, he had lived on ill terms. In London he was, for a considerable time, supported by his friend Franklin, till their intimacy was dissolved, when Ralph considered the quarrel as a complete discharge of the debt which he owed his benefactor. Ralph changed his name to that of Franklin, which he thought necessary, having formed a new female connection, and settled as a schoolmaster in a village in Berkshire. From this time there is no regular narrative of his life, which was probably passed as a hired party writer. He is spoken of with much contempt in the *Dunciad*, as the author of a poem called *Night* :—

“ Silence, ye wolves! while Ralph to Cynthia howls,
And makes night hideous—Answer him, ye owls.”

In a note, it is said he wrote a swearing piece, entitled “*Sawney*,” very abusive of Swift, Gay, and Pope; that he panegyriced his own works in the journals, was wholly illiterate, wrote plays, and was employed in a political newspaper. The satire of Pope must be taken with much limitation, it being inspired by party motives: Ralph having recommended himself to persons in power at the beginning of George II.'s reign, would for that reason be obnoxious to Pope and his friends. He became an able

writer in prose, and was author of many political pamphlets, which were much applauded in their time; but his chief work was "The History of England during the Reigns of William, Anne, and George I., with an introductory Review of the Reigns of the Brothers Charles II. and James II., in which are to be found the Seeds of the Revolution. By a Lover of Truth and Liberty," 2 vols. fol. 1774—6. This work obtained the plaudits of Mr. Fox, who, in his posthumous historical fragment, speaks of the author as an historian of great acuteness as well as diligence. The last publication of this author was entitled "The Case of Authors by Profession or Trade, stated with regard to Bookfellers, the Stage, and the Public," which is said to contain much good sense and lively satire. Mr. Ralph died at Chiswick, in the year 1762. Gen. Biog.

RAM, in *Geography*, a town of European Turkey, in Servia, on the S. side of the Danube; 10 miles E. of Pafarowitz.

RAM, in *Agriculture*, the male of the sheep kind. It may be observed, that the rams of different breeds of sheep vary greatly in their forms, wools, and fleeces, and other properties; but the following description by that excellent stock-farmer, Mr. Culley, deserves the attention of the breeder and grazier. According to him, his head should be fine and small, his nostrils wide and expanded, his eyes prominent, and rather bold or daring, ears thin, his collar full from his breast and shoulders, but tapering gradually all the way to where the neck and head join, which should be very fine and graceful, being perfectly free from any coarse leather hanging down; the shoulders broad and full, which must at the same time join so easy to the collar forward, and chine backward, as to leave not the least hollow in either place; the mutton upon his arm or fore-thigh must come quite to the knee; his legs upright, with a clean fine bone, being equally clear from superfluous skin and coarse hairy wool from the knee and hough downwards; the breast broad and well forward, which will keep his fore-legs at a proper wideness; his girth or chest full and deep, and instead of a hollow behind the shoulders, that part by some called the fore-flank should be quite full; the back and loins broad, flat, and straight, from which the ribs must rise with a fine circular arch; his belly straight; the quarters long and full, with the mutton quite down to the hough, which should neither stand in nor out; his twist, or junction of the inside of the thighs, deep, wide, and full, which, with the broad breast, will keep his fore-legs open and upright; the whole body covered with a thin pelt, and that with fine, bright, soft wool. It is observed, that the nearer any breed of sheep comes up to the above description, the nearer they approach towards excellence of form.

But though this is a very correct, appropriate, and admirable description of a finely-formed ram, objections have been made by some to a few of the properties which are laid down. Width and expansion of the nostrils in sheep, it is supposed, are liable to cause the lower parts of the noses to be too thick and large; while in naturally good and improved forms, the lower parts of the noses and mouths are for the most part small. Nor is the prominent and bold daring eye held in more estimation, as it is thought not to shew a good disposition; but, on the contrary, to display too much quickness and activity, or wildness of nature in the animal. Opinions, however, differ much on this point among sheep-farmers; and a lively quick eye is almost always considered as favourable to a good disposition.

Rams naturally possess more boldness and courage than either wethers or ewes; and they are very apt, unless

great care is taken, to acquire mischievous habits of attacking persons or animals that may by accident approach them.

In some sheep-districts the breeders are greatly in favour of large rams, but in others those of a smaller size are preferred; the choice of the size of the rams should, however, in every instance, be regulated by the nature and abundance of the keep, or the quality of the lands, as it is utterly impossible that the inferior sorts of pastures can keep sheep-flock of the large size, as in those of the better kinds; and it would be highly disadvantageous in the best rich sorts to have a small-sized stock when they could support a large one in an equally perfect manner. Middle-sized rams are, upon the whole, the most suitable and proper for lands in general, and for all the purposes of the breeder.

The growth and constitutions of young rams should never be suffered to be endangered by their having too great a number of ewes, as is too frequently the practice with sheep-breeders.

It is a very improper custom, but one which prevails with the graziers in some sheep-districts, to keep all their rams, perhaps to the amount of from twenty to fifty or more of all kinds, in one field or pasture; as their contentions are often so violent, especially about the riding time, as to cause the loss of one or two rams to each in all such cases. This practice is the most common in the sheep-districts towards the southern part of the island, being seldom met with in those of the midland or more northern parts. It ought to be every where done away with.

The old rams are now almost always got quit of by being fattened as rams, and sold at the neighbouring markets, or to butchers, at a very inferior price, there being often much competition for this sort of low-priced meat in some situations. It was formerly, however, the custom in some places to knit them before they were fattened and sold to the butchers or otherways, but much injury and loss being found to be sustained by that method, it has been left off; it being now concluded, on the whole, that the loss by knitting the rams is greater than that which is suffered in the reduction of the price of ram mutton.

The practice of letting out rams in the midland districts for the purpose of improving the breeds of sheep, having produced such beneficial effects, the rise, nature, and progress of it may deserve the attention of the flock-farmer. It has been ably and accurately delineated, in the following manner, by Mr. Marshall, in his *Rural Economy* of that part of the kingdom.

It is stated, that in this district, in general, the management respecting rams is similar to that of other parts of the island; the breeders rearing or purchasing them. But that it is observable, however, that the advocates of the old breeds, though they will not adopt the modern flock, have fallen, in some degree, into the modern practice of letting by the season. But that the rams of the modern breed are never sold; but are passed from breeder to breeder, by the season only. And that for the purpose of promoting this intercourse, each principal breeder has his show of rams; commencing, by common consent, the 8th of June, and lasting until Michaelmas, or until the season of letting be past. That during a few weeks after the shows commence, every ram-breeder may be said to keep open house. Breeders and others, from all quarters of the kingdom, as well as the promoters of the breed who reside in the neighbourhood, attend these shows; going, in parties, from one to another: some to take, others to see and pass their judgment. And that these private exhibitions close with a public show, at Leicester, the 10th of October; when rams of every description, but mostly an inferior sort of the improved

proved breed, are collected; being brought in waggons; many of them from a considerable distance; some to be *sold*, but chiefly to be *let* for the season. That this show has been held, he believes, time immemorial; not, however, for the purpose of *letting*, but for that of *sale*. But the letting of rams by the season, has long, he understands, been a practice in Lincolnshire. However, the origin, in the midland districts, may be traced—to a ram let by Mr. Bakewell, at Leicester fair, about forty years ago, at the low price of sixteen shillings. But humble, however, as was this beginning, it proved, Mr. Marshall says, to be the first stone of the foundation of a department of rural business, that has already risen to an astonishing height, and may, for some length of time, continue to bring in a copious source of wealth to the country. In the management of this business, the principal ram-breeders save annually, twenty, thirty, or perhaps forty ram-lambs; castration being seldom applied, in the first instance, to the produce of a valuable ram. For, in the choice of these lambs, they are led more by blood, or parentage, than by form; on which, at an early age, little dependance can be placed. He adds, that their treatment, from the time they are weaned, in July or August, until the time of shearing, the first week in June, consists in giving them every indulgence of keep; in order to push them forward for the show: it being the common practice to let such as are fit to be let the first season; while they are yet yearlings—provincially *sharhogs*. Their first pasture, after weaning, is pretty generally, he believes, clover that has been mown early, and has got a second time into head: the heads of clover being considered as a most forcing food for sheep. After this goes off, turnips, cabbages, colewort, with hay, and report says, with corn. But the use of this the breeders severally deny, though, collectively, they may be liable to the charge. However this may be, something considerable depends on the *art* of making *up*,—not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults; and, beside, is the best evidence their owners can produce, of their *fatting quality*,—their natural propensity to a state of fatness; while in the fatness of the sharhogs is seen their degree of inclination to fat at an *early age*. And that the fatting quality being the one thing needful in grazing flock: and being found, in some considerable degree at least, to be hereditary,—the *fattest* rams are of course the *best*; though other attachments, well or ill placed, as to form, or fashionable points, will perhaps have equal or greater weight in the minds of some men, even in this enlightened age and district. And the shearlings, which will not make up sufficiently, as to form and fatness, are either kept on to another year, to give them a fair chance, or are castrated, or butchered, while sharhogs.

With regard to the showing, it is remarked, that the shows of the principal breeders consist, by common consent, of forty rams each, mostly from one to five years old, they being seldom found efficient after that age; some, however, will continue in vigour to the sixth or seventh year. And that, during the show, they are mostly kept in small inclosures, of two, three, or four acres; with three, four, or more rams in each, according to their ages, and the advancement of the season. And in a corner, or other convenient part of each paddock, a small pen, made with hurdles, is placed; for the purpose of handling them. Into these pens they go, through custom, as tractably as worked oxen to their stalls. Indeed, the old rams, from the un-wieldiness of their frame, and the load of fat they have to carry at this season, as well as from habit, will suffer themselves to be handled abroad; and even appear to take pleasure in the respect which they have shewn them. But it is

observed, that of late a new method of showing has been struck out by the leading breeder, and adopted by *one* at least of his followers. Instead of showing them abroad, and driving three or four of them up together in a pen, they are shut up in hovels, and brought out separately, being *never seen* together. He thinks, that among accurate judges, this mode of showing may be well enough; but to those who have had less experience it gives offence, as it deprives them of their best guide, comparison; and he can see no fair advantage accruing from it to the latter.

It is remarked, that though the desirable *points* of a ram are such as have been noticed, the choice of the hirer is determined, in some measure, by the intention for which he is about to hire: as whether it be that of getting wedders, or mere grazing flock: or rams for the purpose of letting. Hence the grazier and the ram-breeder choose different sheep, so as to suit their different purposes. He adds, that the characteristic difference between what is termed a *ram-getter* and a *wedder-getter*, or a good grazier's sheep, is that of the former being every where cleaner and finer, the head small, the bone and ossal light, the flesh good, and the form beautiful. The mere grazier likes a ram no worse for having a strength of frame, and is less scrupulous about his form than the ram-breeder, whose great object is fineness: his ewes, and the natural tendency of the breed, serve to give his offspring size and substance when it is wanted.

In respect to the practice of letting, it is observed, that a novel circumstance has likewise taken place lately in the business of letting. The long established custom of setting a price was exploded, at least by the late Mr. Bakewell, and one of his disciples; whose customers were left to make their own valuations, and bid what they pleased. But this, as well as shewing them separately, it is observed, gives great offence, especially to strangers, who cannot brook the idea of being both buyers and sellers. The latter, however, has more than one advantage in reserving the price, provided he do not thereby drive away his customers: he is, in effect, letting to the best bidder. Beside, he is, through this mean, enabled to *regulate his prices* to his customers, without giving any of them pointed offence: for as the principal breeders are, in the nature of their business, competitors, it is no more than common good policy, in the leader at least, to advance himself, and keep back those who press upon him closest. It is, therefore, good management, Mr. Marshall thinks, in him to let a superior ram to an inferior breeder, whose ewes are yet of base blood, at a lower price than to one who is farther advanced, and whose ewes perhaps are nearly equal to his own: for if the hirer may not thereby be able to get the lead from him, he may run away with part of the best prices; and the only line the leader has to tread is, either to refuse him, or to make him pay in the first instance. And again: sometimes two or three capital breeders will join in the hiring of one superior ram; and, in this case, the blood being more widely dispersed, the price ought to be, and always is advanced, in proportion to the number of partners there may be in the business. Hence, in the leader, a reservation of price may be allowable, especially in the letting of first-rate rams.

He observes, in regard to the conditions of letting, that notwithstanding the number of years the letting of rams has now been in use, and the extraordinary height to which the prices have risen, the transaction does not appear to have yet received any settled form; nor to have been rendered *legally* binding, by any written articles, or conditions of letting; much being still left to the *honour* of the parties. It is, however, generally understood, that the price agreed upon

upon shall not be paid, unless the ram in contract, or another as good, impregnate the stipulated number of ewes. If, through accident or inability, part only be impregnated, a proportional part of the price is abated. If he die while at ride, the loss falls on the letter, whether his death happens through accident or neglect; no case, he understands, having yet been otherwise determined. It is likewise understood, that the hirer shall not suffer him to serve any other than his own ewes; and of these, no more than a stipulated number, which is proportioned to the age or ability of the ram, and the mode of using him. And further, that if a grazier hire a valuable ram, at a wedder-getter's price, (which is not unusual at the wane of a season, when valuable rams happen to be unlet,) it is understood, or rather agreed, that he shall not fear rams from him; a condition which may frequently be advantageous to both parties. The letter pockets five or ten guineas, which otherwise he might not have had; and the hirer, by suffering himself to be "tied down," as it is termed, gets a greater improvement in his flock than otherwise he could have got for the same money. He adds, that the time of paying the money is, he understands, unfixed; seldom, he believes, until after the ewes have brought proofs of the ram's efficiency, or after the lambing season.

It is observed, that with regard to the prices for letting rams by the season, that from the first letting to the year 1780, the prices kept gradually rising from sixteen shillings to a guinea; and from one guinea to ten. In 1780, Mr. Bakewell let several at ten guineas each; and what is rather inexplicable, Mr. Parkinson of Quarendon let one, the same year, for twenty-five guineas, a price which then astonished the whole country. That from that time to 1786, Mr. Bakewell's stock rose rapidly, from ten to a hundred guineas; and that year he let two-thirds of one ram (reserving one-third of the usual number of ewes to himself) to two principal breeders, for an hundred guineas each; the entire services of the ram being rated at three hundred guineas. This excellent breeder making that year, by letting twenty rams only, more than a thousand pounds! and that, since that time, the prices have been still rising. Four hundred guineas have been repeatedly given. The above breeder, this year (1789), makes, he understands, twelve hundred guineas by three rams, (brothers he believes,) two thousand of seven, and of his whole letting full three thousand guineas! And that he now lets nothing under twenty guineas; a well-judged regulation, which Mr. Marshall thinks will probably be beneficial both to himself and his customers.

It is added, that, beside this extraordinary sum made by Mr. Bakewell, there are six or seven other breeders who make from five hundred to a thousand guineas each. The whole amount of monies produced this year, in the midland counties, by letting rams of the modern breed for one season only, is estimated, by those who are adequate to the subject, Mr. Marshall says, at the almost incredible sum of ten thousand pounds. He knows that it is a popular idea, especially of those who, living at a distance, have only heard of these extraordinary things, without having an opportunity of coming at facts, that the extravagant prices which are talked of are merely nominal; the principal part of the money being returned, the actual prices given being small, in proportion to those held out. This, however, is, he believes, and on the best authority, an erroneous idea. At the first setting out of the high prices, there might be some transactions of that nature; but if ever they existed, they have ceased long ago. Mr. Bakewell at present has the name, at least, of being parsimonious, even to the shepherds

of the flocks on which his rams are employed. His highest present, he understands, is five shillings; if the price be under fifty guineas, only half-a-crown. But the enormoufness of these prices may be explained, he thinks, on other grounds. The high prices are not given, he says, by graziers, for the purpose of getting wedders, as grazing stock; but by ram-breeders, for the purpose of getting rams, to be let to graziers: the highest being given by the principal breeders only, not for the purpose of getting rams to let to graziers as wedder-getters, but for that of getting rams, to be let out again to inferior tup-men, as ram-getters.

It is further stated, that the graziers' prices run, even now, from one to ten guineas. He has not heard of more than ten guineas being given, by a mere grazier, for a ram, for the sole purpose of getting grazing stock: five or six guineas is the common price. And supposing he gives the highest price, ten guineas, and that the ram serves a hundred ewes, (some single, some double,) the expence of getting amounts to no more than two shillings a head; which is inconsiderable, compared with the difference between a well and an ill grazing sheep, between a sheep that will get as fat at two years old as another will at three; or, in other words, which will, at two years and a half old, fetch ten or fifteen shillings more than his comrades of another breed, but of the same natural size, and going in the same pasture, or feeding on the same sort of food. In respect to the middle prices, as those from twenty to fifty guineas, they are, under the present circumstances, equally reconcilable, he thinks, to common sense. If a breeder, who gives fifty guineas, rear ten tolerable rams fit for the grazier's use, and let them at five guineas each, he brings himself home, even the first season of letting, beside having the rams for another and another season, and beside a general improvement in his stock for the future. And those who give the higher prices, as one to two hundred guineas, have, or ought to have, proper bases to build upon, sufficient stocks of well-bred ewes; in which case, they have a fair chance of producing ram-getters, worth, while the present spirit of improvement lasts, twenty to fifty guineas a season. And that with respect to the very high prices, they are given by a few first-rate breeders, who are playing a high game, running a hard race, for the pride and profit of being a leader, when Mr. Bakewell is not; a contention which may last as long as Mr. Bakewell, and be at once an honour to his genius, and a reward of his services.

In respect to the treatment of rams after letting, it is remarked that the breeders of rams, as well as of bulls, find it expedient to reduce them from the cumbrous state in which they are shewn, previously to the season of employment; the old rams, in particular, being frequently returned upon their hand, non-efficient. Hence, as they are let, they are transferred to private pastures, and moderate keep; it being a pretty general rule not to shew a ram after he is let, or contracted for to a person.

In the sending out let rams, the usual time of beginning is the middle of September: the means of conveyance, carriages of two wheels with springs, or hung in slings; some of them being large enough to hold four rams. In these they travel from twenty to thirty miles a day; being sometimes sent, in this way, two or three hundred miles, and sometimes more.

It has been observed by the same writer, that the manner of using these rams has lately received a very great improvement. Instead of turning them loose among the ewes at large, as heretofore, and agreeably to the universal practice of the island, they are kept apart, in a separate paddock or
small

small inclosure, with a couple of ewes only each, to make them rest quietly; having the ewes of the flock brought to them singly, and leaping each only once. He thinks, by this judicious and accurate regulation, a ram is enabled to impregnate near twice the number of ewes he would do, if turned loose among them, especially a young ram. And he adds, that, in the old practice, sixty or eighty ewes were esteemed the full number for a ram: in the new, from a hundred to a hundred and twenty are allowed. Seven score have been served by one ram in a season: this is, however, much too great a number.

And while at ride, the treatment of the ram is merely that of keeping him well, and free from disorders; suffering him to serve no other than the hirer's own ewes, and of these the limited number only, and to return him safe when he has done; generally the beginning of December: or, if the hirer has met him on the road, (which is customary,) the latter, in return, meets him on his journey home. And the after-treatment consists in striving, by every deviseable means, to reload his carcase, and make him fat and handsome for the ensuing show, in order that he may be let again with advantage.

This is the whole of the plan that was pursued in that district, which has led the way to so much improvement in the breeding of sheep stock; and from which the country has derived such vast benefits, and such a number of advantages. But though the above practices have not been lately carried on to their former extent, they are still very considerable. See SHEEP.

It is remarked, that the practice of hiring rams in Romney Marsh is not carried on with the same degree of spirit as it is in Leicestershire, and that rams were of more value for the hiring season some time ago than they are at present, especially when the crops of the above county took place, as then from twenty to one hundred guineas were frequently given. One grazier some time since let rams to the amount of twelve hundred guineas; but the rage is now over, the people not being so foolish as to be duped out of their money, without the prospect of being repaid. It is here the practice with some to ride their ram lambs; but they are said always to be injured in their growth, if not in their constitutions and dispositions, by it. When a ram dies while at ride, the loss falls on the owner, and, beside, he is not paid for the riding. The time of paying is when the rams are removed from the ewes. This is done by carrying them away in carts, or leading them by ropes. The ram lambs are here now mostly selected and saved, in such numbers as are proper for the hirers.

Some time before the riding season, the graziers call and agree for the hiring or purchasing of rams, the general price usually from three to five guineas; but a superior one will bring ten in particular cases, though many good useful ones let at three guineas. Some purchase them to ride, and immediately afterwards sell them in the markets. The rams, which are to be hired, are here shewn all together in pasture fields, which is a disadvantageous method.

In Suffex, until lately, ten guineas were the highest price that was heard of for the sale of any ram. Now some let many of their three-years old rams for fifty; and inferior ones at thirty, twenty, and ten guineas. Some have even been let so high as one hundred guineas.

RAM is also a term used to signify any thing which has a strong smell or taste.

RAM, in *Astronomy*. See ARIES.

RAM of *M. Montgolfier*, *Hydraulic*, in *Mechanics*, a machine for raising water to any given height, which has lately attracted much attention in France. The first person who

employed this method was Mr. Whitehurst, and it was afterwards improved by Mr. Boulton. Its construction and use may be sufficiently understood by the following statement. It serves to raise water by means of the momentum of a stream of water flowing through a long pipe. The passage of the pipe being stopped by a valve, which is raised by the stream, as soon as its motion becomes sufficiently rapid, the whole column of fluid must necessarily concentrate its action almost instantaneously on the valve, and in this manner it loses the characteristic property of hydraulic pressure, and acts as if it were a single solid; so that, supposing the pipe to be perfectly elastic and inextensible, the impulse must overcome any pressure, however great, that might be opposed to it; and if the valve open into a pipe leading to an air-vessel, a certain quantity of the water will be forced in, so as to condense the air, more or less rapidly, to the degree that may be required, for raising a portion of the water contained in it to any given height. Young's *Course of Lectures on Nat. Philos.* vol. i.

RAM, in *Mythology*, the name of the highest god among the Gentoos. When a widow offered herself to be burnt on the funeral pile of her husband, she was encouraged by the presence of a number of attendants, who formed a circle around her, and offered her fresh betel, intreating that, as she would in a short time appear with her husband in the presence of Ram, or their highest god, she would supplicate for various favours for them; and above all, that she would salute their deceased friends, whom she might meet in the celestial abodes, in their names.

RAM, *Battering*. See ARIES.

RAM's-Horns, in *Fortification*, a name given by M. Belidor to the tenailles.

RAM-Head, on board a *Ship*, the name of a great block belonging to the fore and main halliards. It hath in it three shivers, into which the halliards are put, and at its head the ties are reeved into a hole made there for that purpose.

RAM-Head, in *Geography*, a cape on the S. coast of Ireland, and county of Waterford; four miles E. of Youghal bay. N. lat. $51^{\circ} 56'$. W. long. $7^{\circ} 44'$.—Also, a cape on the S.E. coast of New Holland. S. lat. $36^{\circ} 56'$. E. long. $149^{\circ} 35'$.—Also, a cape of England, on the S. coast of Cornwall, in the English Channel, between Whitefish bay and Plymouth sound. N. lat. $50^{\circ} 19'$. W. long. $4^{\circ} 12'$.

RAM-Hormuz, a town of Persia, in Chufistan; 65 miles S.E. of Sufter or Shuster.—Also, one of the most romantic vallies in Persia, which has been lately placed under the beglerbeg of Bebahan. It is fifteen furlongs in length (the furlong being estimated at $3\frac{3}{4}$ English miles), and from six to eight miles in breadth. The river Jeraki, entering at the eastern extremity, flows through the centre of it, when meeting the Kkøorkhankende, which descends from the mountains six miles E. of the town of Ram-Hormuz, they together force a passage through a low ridge of hills, which skirt the valley to the south. This fertile spot is, at present, in the hands of five hostile chiefs; the first of whom is an Arab, who resides in a mean village, situated at the W. end of the valley, and built amidst the ruins of the ancient city of Ram-Hormuz. The remaining four are Persians, and brothers, who have each a castle, or fortified village; from which they make frequent sallies, and carry off the corn and cattle of their rivals. A great battle was fought in this valley, between Artaxerxes Babegan, and Artabanes, in which the former was victorious, and first assumed the title of "Shah en Shah," or king of kings. Kinncir's *Perf. Emp.* 1813.

RAM's *Island*, an island in lough Neagh, Ireland, about two miles from the shore, and containing about six acres.

acres. It is in the western part of the lough, in what is called Sandy bay, and is the only island. One of the round towers, so frequent in Ireland, is found here, and renders it an interesting object from the neighbouring grounds. Dubourdieu's Antrim.

RAMA, or RAMLA, a town of Palestine, which was formerly large, and defended with strong walls; celebrated as the place where St. Paul cured Æneas. The Mussulmen reverence here the tomb of Locman the wise, and the sepulchres of seventy prophets, said to have been buried here. The church of St. George is the only object now worthy of notice. The place has a kind of market for gall-nuts, fena, and gum arabic, which the Arabs bring hither for sale; 20 miles N.W. of Jerusalem.

RAMA, a town of Dalmatia; 20 miles S.W. of Mostar.

RAMA, or *Ramah*, signifying an eminence, in *Scripture Geography*, a town of Judea, in the tribe of Benjamin, according to the book of Joshua, ch. xviii. v. 20. It was situated towards the mountain of Ephraim, between Gaba and Babel, about seven miles from Jerusalem, according to St. Jerom. This city lay on the road from Samaria to Jerusalem; for which reason Baasha, king of Israel, caused it to be fortified, to obstruct the passage from the land of Judah into that of Israel. This is the Ramatha, or *Ramathaim-Zophim*, the country of the prophet Samuel. 1 Sam. i. 1—19. and ii. 11. &c. It was on the frontiers of Ephraim and Benjamin; and frontier cities were inhabited by both tribes. Jeremiah probably speaks of this Ramah. Jer. xl. 1, 2, 3. See also ch. xxxi. 15, 16, 17.

RAMA, a city of Naphtali (Josh. xix. 36.), on the frontier of Asher (Josh. xix. 29.)

RAMA, in *Hindoo Mythology*, is the name of a distinguished mortal, in whom their deity Vishnu was incarnated for the purpose of relieving mankind from the tyranny and oppression of Ravana, the malignant king of Lanka, or Ceylon. This incarnation is one of the ten avatars, or descents of Vishnu, and is, in its supposed importance, second only to that of Krishna. It is similarly a popular history, and allusions to it perpetually occur in the writings and conversation of the Hindoos. The invasion and conquest of Lanka is the subject of one of their finest poems, entitled the Ramayana; it furnished subjects for the drama, for itinerant bards, and for every purpose of poetry, being replete with magnificent imagery, and abounding in striking incidents. (See RAMAYANA.) The mortal parents of this divine hero were Raja Dasa-ratha, king of Ayodetra (Oude), and his first wife Kahunsiya. Hence this Rama is sometimes stiled Das-rat Rama, to distinguish him from other heroic Ramas; and sometimes Rama Chandra, meaning of lunar descent.

There are three persons of the name of Rama, recorded as incarnations of Vishnu. One is Bala Rama, the elder brother, by the same parents, of Krishna; the second, Parasu Rama; and the third, Rama Chandra, the subject more immediately of this article. But it has been made a question, whether they be not three representations of one person, or three different ways of relating the same history; and whether any or all of them mean Rama the son of Cushi, sir W. Jones (*As. Ref.* vol. i.) says he leaves others to determine. He deems Rama to be the same as the Grecian Dionysos, who is said to have conquered India with an army of satyrs, commanded by Pan; and Rama was also a mighty conqueror, and had an army of large monkeys or satyrs, commanded by Maruty, son of Pavan. (See MARUTY.) Rama is also found, in other points, to resemble the Indian Bacchus: he is, notwithstanding his lunar appellation above noticed, fabled to be a descendant of the sun,

VOL. XXIX.

his wife's name is Sita; and it is very remarkable that the Peruvians, whose Incas boasted of the same descent, stiled their great festival Ramasitoa.

In a charge delivered by Dr. Watson, afterwards bishop of Landaff, to the clergy of the archdeaconry of Ely in May 1780, are many curious and shrewd observations on oriental usages. He notices a "string of customs wholly the same amongst people so far removed from each other as the Egyptians and Peruvians. The Egyptian women, he says, made sacred cakes of flour, which they offered to the queen of heaven, at their principal solar festivals called Raymi and Citua: the Peruvian women did the same." Almost all the customs described as common to these distant people, the Egyptians and Peruvians, as well as that quoted, are Hindoo customs, ancient and existing.

All the Ramas are famed as great warriors and as youths of perfect beauty. In the Gita, an epifode of the Mahabarat, Krishna, describing himself to Arjun as pre-eminent among all things and persons, says, "Among those who carry arms, I am Rama." It is Rama Chandra, however, and his lovely Sita, who are the favourite subjects of heroic and amatory poetries: he is described in the Ramayana "of ample shoulders; brawny arms, extending to the knee; neck shell-formed; chest circular and full, with auspicious marks; body hyacinthine; with eyes and lips of sanguine hue; the lord of the world; a moiety of Vishnu himself; the source of joy to Ikshwaku's race." He is suitably mated in his faithful Sita, one of the most interesting females in Hindoo poetry. (See under her name for some account of her, and a description of her person.) Rama is also called *Raghuva*, or son of *Raghu*, (see these articles,) like Ikshwaku, one of his mortal ancestry. Kaka-paksha-dara, or crow-winged, is an epithet given to the Ramas, and to other warriors, from a certain mode of shaving the head, leaving the hair over the ears only, resembling crow's wings, as is fancied. Shyamula, or blue-bodied, is an appellation of Rama, as well as of Krishna, and of their common prototype, Vishnu; all being represented of hyacinthine hue. It may be here remarked, that several incidents in the Sri-Bhagavat, (a history of Krishna,) and in the Ramayana, told similarly of their several heroes, seem to mix or approximate, though perhaps scarcely to identify, the characters of Krishna and Rama. Each won a wife by bending an unyielding bow, not very unlike the story of Ulysses. Each is described as overcoming the demon Kumbakarna, and others. Krishna descended into hell; so did Sita, the fukti, or energy of Rama. Both have adventures with the bear Jamba. See JAMBA, &c.

All sects and tribes, who, under the denomination of *Vaishnavas* (which see), worship Vishnu, (bating such deistical philosophers as sceptically deny the personal existence of inferior deities, attributes, or avatars, of whom see under JAIMINI,) agree in stating, that, with the exception of Krishna, the potentiality of the preserving power was never exhibited in such plenitude as in the avatars of Rama. In popularity, and in dramatic, historic, and poetic shapes, it rivals that of Krishna. And as one or more sects adore Krishna as the deity himself, and draw rules for their religious and moral conduct from the Sri-Bhagavat; so the sect called Ramanuj similarly clothe Rama in almighty attributes, and deem the Ramayana a complete body of ethics and morality. See RAMANUJ.

In the series of incarnations of Vishnu, called *das-avatara*, or the ten descents, to distinguish them from others of less importance, the avatars of Parasu Rama and Rama Chandra are usually placed sixth and seventh, as given under VISHNU. Sometimes Krishna is altogether omitted; in which case,

Bala Rama ranks as the eighth. *Mufali* is a name of the third Rama, under which word some notice is taken of him. And of *Parufa* or *Parufba Rama*, see under that article. The name of Rama, or perhaps more correctly of Rami, is one of the many names of Parvati, consort of Siva. The name is also used, beyond the pale of his own sectaries, in supplication and praise. *Ram-Ram* is a usual salutation, like our good morrow, between friends at meeting or parting, and is used by both Vaishnavas and Saivas; and it is reverently reiterated in times, and in aid, of abstraction (see *JAP*); and under the operation of feelings of enthusiasm or distress.

The history of the Ramas mixes itself with that of so many others of Hindoo mythological persons, that in many of our accounts of such persons, &c. particulars occur respecting them. Those desirous of farther notice of the Ramas are, therefore, referred, in addition, to the following articles: *CEYLON*, *JAYA*, *KAHUNSILYA*, *LAKSHIMAN*, *LANKA*, *MARUTY*, *RAVENA*, *RAMAYANA*, *RUNEKA*, *SITA*, &c. from which other references point to articles on subjects connected herewith.

RAMADA, or *Nem Salamanca*, in *Geography*, a town of South America, in the province of St. Martha; 90 miles E. of St. Martha. N. lat. 11° 10'. W. long. 72° 20'.

RAMADAN, a sort of lent observed by the Mahometans, in obedience to the express command of the Koran, during which they fast the whole day, from the time the new moon first appears, till the appearance of the next new moon, with such extreme superstition, that they not only abstain from eating, drinking, and women, but dare not wash their mouth, nor even swallow their spittle, from day-break till night, or sun-set.

The men, indeed, are allowed to bathe themselves; but it is on condition they do not plunge the head under water, lest some drops enter by the mouth or ears, &c. But as for the women they are strictly forbidden bathing. Some are so cautious, that they will not open their mouth, to speak, lest they should breathe the air too freely. The fast is also deemed void if they kiss or touch a woman. To make amends, they fast all night till day-break; though the more rigid begin the fast again at midnight; and usually spend more in this month than in six others.

The Ramadan happens at different seasons of the year; and when it is in the summer it is very hard on the labourers. This month once in thirty-three years is in every season of the year, the Turkish month being lunar, and they beginning at the day they can see the moon; whereas the Jews begin their account from the day the moon makes, which is a day before the Turks.

The reason given why the month of Ramadan was fixed upon for this purpose is, that on this month the Koran was sent down from heaven. From this fast of Ramadan none are excused, except travellers and sick persons, under which latter denomination are included all those whose health would be manifestly injured by keeping the fast; but then they are obliged, so soon as the impediment is removed, to fast an equal number of other days; and breaking of the fast is ordered to be expiated by giving alms to the poor.

RAMAG, a word used by some of the chemical writers to express ashes.

RAMAGE, a term used for the boughs or branches of trees. Hence,

RAMAGE-Hawk, or *Falcon*, one that is wild and coy, as having been long among the boughs, preying for itself. All falcons retain this name till they have left the acry; being so called in May, June, July, and August. These are very rarely reclaimed. See *BRANCHER*, *FALCON*, and *HAWKING*.

RAMAGE Velvet. See *VELVET*.

RAMAGURRY, in *Geography*, a town of Hindooftan, in the Carnatic; 30 miles W. of Trichinopoly.

RAMAH, a town of Arabia, in the province of Nedsjed; 120 miles N.W. of Jamama.

RAMAH, or *Ramalla*, *Ramola*, *Ramula*, *Ramba*, *Ruma*, or *Rempbitis*, a city W. of Jerusalem, between Lydda and Joppa, according to St. Jerom; or between Joppa and Jerusalem, as modern travellers describe it. This is the place which Eusebius and St. Jerom took for Arimathea, the country of Joseph. Matt. xxvii. 57.

RAMAI, in *Natural History*, a name given by many old writers to bole armenic.

RAMAK, in *Ichthyology*, a species of *Sciæna*; which see.

RAMALINGA, in *Geography*, a town of Hindooftan, in Coimbatore; 16 miles S.S.W. of Errood.

RAMALIS VENA, a name given by some anatomical authors to the vena portæ.

RAMANUJ, the name of a religious sect of Hindoos, of the great subdivision of Vaishnava, who worship Vishnu, the personification of the preserving power of the deity, in his incarnation of Rama. Of this sect some worship Rama only, some his spouse Sita, and some both Rama and Sita conjointly. (See *RAMA*.) Among the Ramanuj none are addicted to the indecent, or left-handed, mode of worship noticed under the article *RADHA* as disgracing her votaries. (See farther under *SAKTA*, and *SECTS of Hindoos*.) The different sects of Hindoos are distinguishable by a variety of marks on their foreheads; of which a great many are represented in the second plate, with copious explanations in page 404, of the Hindu Pantheon. The sect of Ramanuj are known by a double upright white line on the forehead, with a red line between, or sometimes a circlet or dot. Sometimes the lines are red and the circlet black.

RAMAS, CAPE, in *Geography*, a cape on the W. coast of Hindooftan; 21 miles S. of Goa.

RAMASSERAM, a town of Hindooftan, in the circuit of Rajamundry; 35 miles S.S.E. of Rajamundry.

RAMAYANA, the title of a poem in the Sanscrit language, of great celebrity in India, and regarded as sacred by some sects of Hindoos, and greatly venerated by all. Its subject is the exploits of three persons named Rama; but more especially the wars conducted by one of them, named Rama Chandra, for the conquest of Lanka or Ceylon, from its powerful sovereign Ravena, or rather, indeed, for the rescue of his wife from the hands of that tyrant. It is comprised in seven kandas, or books, containing 24,000 shlokas, or metrical stanzas; named thus: 1. *Adi-kanda*, containing 64 sections, and 2850 stanzas; 2. *Ayodhya-kanda*, 80 sections, and 4170 stanzas; 3. *Aranyaka-kanda*, 114 sections, and 4150 stanzas; 4. *Keshkinda-kanda*, 64 sections, 2925 stanzas; 5. *Sundara-kanda*, 43 sections, 2045 stanzas; 6. *Yudha-kanda*, 105 sections, 4500 stanzas; 7. *Uttara-kanda*, 90 sections, 3360 stanzas. The *Ramayana* may be called an epic poem, as it is on one continued, interesting, and heroic action. It is second in celebrity only to the *Mahabarat*, and perhaps superior to it in reputation for holiness. (See *MAHABARAT*.) We have the authority of sir William Jones for saying, that this great epic poem, in unity of action, magnificence of imagery, and elegance of diction, far surpasses the elaborate work of Nonnus, in forty-eight books, entitled *Dionysiaca*; and for believing that the heroes of the poems Rama (patronimically distinguished by the name of *Dasrat Rama*) and *Dionysos* are the same.

A curious parallel might be drawn between the manners and customs described in these two works, the Dionysiaca and Ramayana. The processions and rites detailed in the former seem descriptive, with a little licence for poetical embellishment, of those in usage to this day in India. Some of these Bacchic orgia are noticed under our articles DIONYSIA and NONNUS; which see. A keen etymologist would find innumerable lingual coincidences; and, in truth, many of the names of persons, Bacchus and Dionysos, and of places, as well as original persons, seem soberly traceable to the sacred language and rites of the Brahmans.

So highly is the Ramayana venerated, that the fourth class of Hindoos, the Sudra, is not permitted to read it. At the end of the first book, a promise is made of great benefit to any individual of the three first classes or tribes who shall duly read it. "A Brahman, reading it, acquires learning and eloquence; a Kshetriya will become a monarch; a Vaishya will obtain vast commercial profits; and a Sudra, hearing it, will become great." Of these distinctions of tribes or classes, the reader will find due notice under SECTS of Hindoos. Under RAMA we have stated that his name reiterated is used by several sects as a sort of salutation, or benediction. The author of the Ramayana, in the vanity of playful egotism, which, from its frequency with oriental poets, has ceased to seem assuring, calls on his readers to "salute Valmiki, the kukila (cuckoo), who, mounted on the branch of poetry, sounds the delightful note of Rān-Rām."

It has been surmised that the Ramayana, like the Mahabarat, is allegorical, so far as relates to personal adventures; which, in both cases, are mere machinery for the introduction of a concealed system of philosophy and ethics: in the first instance the allegory is *physical*, in the latter *moral*. Under the article MAHABARAT the allegorical nature of that extraordinary poem is sufficiently shewn. The Kurus and Pandus, the heroes of that poem (see KURU and PANDU), are personifications of virtues and vices. The Ramayana and the Dionysiaca relate how their respective Indian conquerors led armies of satyrs. (See hereon under MARUTY and RAMA.) These satyrs, or monkeys, we apprehend to be personifications of winds, or gaseous metaphors. In the Ramayana we find the machinery to consist of the sun and planets, fire, the firmament, wind, water, &c. personified in the gods or regents of those bodies, elements, &c. It has been farther surmised, that whenever these two extraordinary poems, the Mahabarat and Ramayana, shall appear in English, and their allegories be more fully examined, it may possibly be found, that not only the three Ramas will melt into one, but that all will amalgamate with Krishna. Some objections to the identity of the Ramas have been offered of a chronological nature. Parasu Rama, it is contended, reigned or flourished eight generations before Rama Chandra. Their poetical identity, however, is sufficiently established; and one can scarcely bring such a tissue of allegory, incarnations, and whimsical adventures, to the test of sober historical and chronological accuracy. Persons of these names may have reigned or flourished at any given period, for they have always been very common, and are so still.

The Ramayana is so replete with incident, that it is scarcely possible to give any analysis of its subject with sufficient brevity for this work. Unity of action is, however, its characteristic, namely, the recovery of Sita from the hands of her ravisher Ravena, the gigantic tyrant of Ceylon. It may be noticed in passing, that the Ramayana, like the Iliad, is founded on a rape, and that Sita is the Helen of the Hindoo epic. (See SITA.) So inseparably intermixed are the varied subjects of the Hindoo mythological

history, that the discussion of one necessarily brings another under notice. This is the cause of such frequent references to and from the articles under which we have endeavoured to give a succinct account of such a number of subjects of that description, distinct apparently, but in reality connected, and often confounded with each other. On the subject of this article, the Ramayana, or for quotations from it, we may therefore refer to the following, among others: CEYLON, LAKSHMI, LANKA, MANTRA, PARASU RAMA, MENAKA, RAVENA, RHEMBA, in addition to those pointed to in earlier passages of this article, and in those articles just named.

What precedes, referring to the poem bearing the title of this article, is offered respecting the Ramayana of Valmiki. There are many other poems of the same name in Sanscrit, Prakrit, Hindvi, and many other Hindoo dialects; as well as in Arabic, Persian, Malayan, and others derived from the like source. These are of course of unequal celebrity and merit; and acknowledged to be greatly distant from Valmiki's divine poem. Even of this it may be said, that the style is frequently flat and diffuse, deficient in ornament, and abundant in repetitions. As well as Valmiki's work, several others, under the same title, are usually considered with more respect than mere profane poems. One is ascribed to Vyasa, the reputed author or compiler of the Vedas and Puranas. (See those articles.) A considerable portion of several of the latter mythological romances is occupied by the same subject, to wit, the adventures of Rama; but in the Vedas no mention is made of this person, except, indeed, in some detached parts, reasonably suspected to have been interpolated by zealous sectaries. The titles even of the philosophical and profane poems, commentaries, &c. that in divers languages owe their origin to the Ramayana, would require a catalogue of no inconsiderable extent to contain them. Among these are included many dramatic works. The quotations from, and allusions to its mythological personages and fables, in the works of the minor poets, are incessant; and upon the whole, there is no subject, perhaps, in the whole range of Hindoo mythology, or history, so often in the minds and mouths of that race of all ranks and sects, as the story of the Ramayana in some of its bearings. That of Krishna rivals it in popularity. Both are chanted by itinerant bards, who illustrate their subjects by exhibiting a series of pictures from the Ramayana and Mahabarat. Women fingers frequently accompany these eastern troubadours, who are commonly met with in every city, camp, and town of India.

RAMAZZINI, BERNARDIN, in *Biography*, an Italian physician of distinction, was born at Carpi, near Modena, in 1633, where his father was a respectable citizen. Having received a classical education from the Jesuits at his native town, he went to Parma for the study of philosophy at the age of 19, undecided what profession to adopt: at the end of three years he selected that of physic, and received the degree of doctor at Parma in the beginning of 1659. He then repaired to Rome for the completion of his studies, and settled in practice in the duchy of Castro. He was soon obliged by ill health, however, to return to his native air; and, on his recovery, he married, and pursued his profession at Carpi. Finding his reputation increasing, he removed to Modena, at the solicitation of some friends, in 1671, where he met with merited success, and excited the jealousies of his brethren. In 1682 he was appointed professor of the theory of medicine in the university, which had been recently established at Modena, by duke Francis II.; and he continued to fill this office for eighteen years, attending at the same time to practice, and not neglecting the cultivation of polite literature, to which he was particularly partial. The

elegance of his Latin style in his writings, evinces the success with which he pursued the study of the classics. In 1700 he was invited to a professorship at the more distinguished university of Padua, and removed thither. Though somewhat advanced in age, he fulfilled the duties of his chair with an ardour, not to be surpassed by his junior colleagues, for the space of three years, when he was attacked with a disease of the eyes, which threatened to destroy his vision, and which, in fact, did ultimately deprive him of that faculty. Having lost the pleasure of reading, which was the only source of his regret, he supplied that amusement by the assistance of his grand-children, who read to him, and acted as his amanuenses. In 1708, however, the senate of Venice appointed him president of the college of physicians of that capital, and in the following year raised him to the first professorship of the practice of medicine. He continued to perform the duties of these honourable posts, at the earnest solicitations of his constituents and pupils, with great diligence, to the end of his life, and died on his birth-day, November 5th, 1714, in consequence of an attack of apoplexy, which seized him while he was preparing for his lectures, at the age of 81.

Ramazzini was a member of several of the academies of science established in Germany, Berlin, &c., and left several works; the principal of which, and one which will ever be held in estimation, is his treatise on the diseases of artists and manufacturers, entitled "De Morbis Artificum Diatriba," first published in 1700, and frequently reprinted. He also published some tracts relative to certain epidemics, both among men and cattle; some "Ephemerides Bârometricæ;" a work on the abuse of Peruvian bark; and several orations delivered in his professorial capacity. All his works have been collected and published together at Padua, Geneva, London, and Naples; the edition of London is the most correct. Eloy Dict. Hist. de la Med. Hutchinson's Biog. Med.

RAMBANG, in *Geography*. See REMBANG.

RAMBERVILLE, or REMBERVILLE, a town of France, in the department of the Vosges, and chief place of a canton, in the district of Epinal; 19 miles E. of Mercourt. The place contains 4926, and the canton 14,014 inhabitants, on a territory of $317\frac{1}{2}$ kilometres, in 28 communes. N. lat. $43^{\circ} 21'$. E. long. $6^{\circ} 43'$.

RAMBIN, a town of Anterior Pomerania; 10 miles W.S.W. of Bergen.

RAMBLE, a town of Spain, in the province of Cordova; seven miles N.W. of Montella.—Also, a town on the W. coast of the island of Teneriffe; three miles W. of Laguna.

RAMBOUILLET, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Versailles, the seat of a tribunal, and of a national farm, where the sheep are much celebrated for the fineness of their wool; 27 miles S.W. of Paris. The place contains 2586, and the canton 9652 inhabitants, on a territory of 305 kilometres, in 17 communes. N. lat. $48^{\circ} 39'$. E. long. $1^{\circ} 54'$.

RAMBURE, a town of France, in the department of the Somme; 3 miles W. of Oisemont.

RAMBURELLES, a town of France, in the department of the Somme; 9 miles S. of Abbeville.

RAMCHUND-POUR, a town of Bengal; 30 miles N.E. of Calcutta.

RAMCHUNDRA, a town of Hindoostan, in the circuit of Mohurbunge; 23 miles S.S.E. of Harriopour.

RAMCHUNPOUR, a town of Bengal; 60 miles N. of Dacca.

RAMCOTTA, a town of Thibet; 18 miles S.W. of Sirinagur.

RAMCOUTY, a town of Hindoostan, in Bahar; 28 miles N.E. of Goorackpour. N. lat. $26^{\circ} 51'$. E. long. $84^{\circ} 8'$.

RAMDILLY, a town of Hindoostan, in the Nays; 25 miles N.N.W. of Tellicherry.

RAMEAU, JOHN PHILIP, in *Biography*, chevalier de St. Michel, composer to the king of France, and to l'Academie Royale de la Musique, or serious opera at Paris, was born at Dijon in 1683. He went early in his life to Italy, and at his return was appointed organist at Clermont en Auvergne, where his "Traité de la Musique" was written, in 1722. He was afterwards elected organist of St. Croix de la Bretonnerie at Paris. Here his time was chiefly employed in teaching; however, he published harpsichord lessons, and several other theoretical works, without distinguishing himself much as a vocal composer, till the year 1733, when, at fifty years of age, he produced his first opera of "Hippolite et Aricie." The music of this drama excited professional envy and national discord. Party rage was now as violent between the admirers of Lulli and Rameau, as in England between the friends of Bononcini and Handel, or, in modern times, at Paris, between the Gluckists and the Piccinists.

When the French, during the last century, were so contented with the music of Lulli, it was nearly as good as that of other countries, and better patronized and supported by the most splendid prince in Europe. But this nation, so frequently accused of more volatility and caprice than their neighbours, have manifested a steady persevering constancy in their music, which the strongest ridicule and contempt of other nations could never vanquish.

Rameau only answered his antagonists by new productions, which were still more successful; and, at length, he was acknowledged by his countrymen to be not only superior to all competition at Paris, but sole monarch of the musical world. From 1733 to 1760 he composed twenty-one operas, of which the names and dates are annually published in the "Spectacles de Paris," and in many other periodical works.

Rameau's style of composition, which continued in favour almost unmoested for upwards of forty years, though formed upon that of Lulli, is more rich in harmony, and varied in melody. The *genre*, however displeasing to all ears but those of France, which had been nursed in it, was carried by the learning and genius of Rameau to its acme of perfection; and when that is achieved in any style, it becomes the business of subsequent composers to invent or adopt another, in which something is still left to be done, besides servile imitation.

The opera of "Castor and Pollux" having been long regarded in France as the master-piece of this composer, we shall here insert a few remarks upon it, that have been made on a recent examination.

The overture is the best of this author, upon Lulli's plan. The opening symphony is beautiful; but why the same melody was not applied, in the same measure, to the poetry, we know not, unless the versification required a change of time; but, in that case, why write the symphony on a subject that would not suit the words? But those eternal changes in the measure, which tease and disappoint the ear of all that are used to other music, is general in serious French operas, and seems as much the fault of the poet as musician. It is, however, wonderful, that this defect was not sooner discovered. The over-charged tenderness of Rameau's music appears in all his slow movements, which are in one style, and generally in triple time. This master perpetually

tually discovers himself to be a great harmonist; but inured to a bad taste and style of composition, as well as to bad fingering, he has only augmented the defects of his predecessors, and rendered what was rude and clumsy in Lulli still more offensive, by endeavours at sweetness or high seasoning. The appoggiaturas, or leaning notes, being so frequently incorporated in the harmony, renders it crude, and the hanging on every note, as if unwilling to relinquish it, checks and impedes the motion of the air, and gives it a slow and languid effect, however lively the theme on which it is composed. Every passage in such melody resembles a French heroic verse:

“ Each is an *Alexandrine*, through the song,
That, like a wounded snake, drags its slow length along.”

The opening of the second act, “*Que tout gemisse*,” is very fine, and the pathos well applied; but the subsequent air, which is cast in an admirable mould, is spoiled by frequent and unnecessary changes of measure; and yet in spite of these defects, and the vocal outrages of mademoiselle Arnould, we were more pleased and affected by this scene, than any other we ever heard at the French serious opera. The march, which has few appoggiaturas in it, is like other Christian music.

The *prelude tendre*, at the opening of the third act, abounds with too many of these drags, which being equally harsh to the ear and injurious to pulsation, seem to prevent the performer from ever falling on his feet; and bar eleventh, the chord of the superfluous fifth, which makes all nature shudder, except our Gallic neighbours, is here continued so long, that it distorts the countenance of every other hearer, like *hiera picra*. The major minuet, page 121, after so long and tiresome a minority, is rich in harmony and graceful in melody. The voice is worse used by the composer than the most insignificant instrument. For after several symphonies that are extremely promising, and the ear has been made to expect a continuation of the prefatory strain, nothing is given to the vocal part but broken accents and dislocated measures. In the *chaconne*, which is admirable, the measure is well marked and well accented. This must long have preceded Jomelli's favourite *chaconne*, and have served as a model to him, Theller, and others, in composing this species of dance. More genius and invention appear in the dances of Rameau than elsewhere, because in them, there is a necessity for motion, measure, and symmetry of phrase. And it may with truth be said, that nothing in Lulli's operas was imitated or adopted by the rest of Europe, but the style of his overtures, or in Rameau's, but the dances.

But though the several merits of this musician have been too much magnified by partizans and patriots in France, and too much depreciated by the abettors of other systems and other styles, as well as patriots of other countries, yet Rameau was a great man; nor can the professor of any art or science mount to the summit of fame, and be elected by his countrymen supreme dictator in his particular faculty, without a large portion of genius and abilities.

The successful revival of his opera of “*Castor and Polux*” in 1754, after the victory obtained by his friends over the Italian burletta singers who had raised such disturbance by their performance of Pergolesi's intermezzo, the “*Serva Padrona*,” was regarded as the most glorious event of his life. The partizans for the national honour could never hear it often enough. “*This beautiful opera*,” says M. de la Borde, “*without any diminution in the applause or pleasure of the audience, supported a hundred representations,*

charming at once the soul, heart, mind, eyes, ears, and imagination of all Paris.”

From this era to the time of his death, in 1767, at eighty-four years of age, Rameau's glory was complete. The Royal Academy of Music, who all regarded themselves as his children, performed a solemn service in the church of the Oratory, at his funeral. And M. Philidor had a mass performed at the church of the Carmelites, in honour of a man whose talents he so much revered. See *BASE*, *BASSE Fondamentale*, and *COUNTERPOINT*.

RAMED, a name given by some chemical writers to rhubarb.

RAMEDEGA, in *Geography*, a town of Hindoostan, in the circar of Gangpour; 15 miles S.W. of Pada.

RAMEE, a town of Bengal; 50 miles S. of Islamabad.

RAMEEAPATAM, a town of Hindoostan, in the Carnatic; 30 miles S. of Ongole.

RAMEEPOUR, a town of Hindoostan, in Allahabad; 35 miles E.N.E. of Gazypour.

RAMELLI, **AGOSTINO**, in *Biography*, a celebrated Italian mechanist and engineer, was born, in 1530, at Manfreda, in the diocese of Milan. Having entered the army, he served a considerable time under the marquis de Marignano, a general of Charles V. After this, he served under the duke of Anjou as captain, or engineer, at the siege of Rochelle, in 1573, where he was dangerously wounded, and taken prisoner. When that prince, afterwards Henry III., was called to the crown of Poland, he was the friend of Ramelli, and he nominated him his engineer when on the throne of France. In 1588 he published a work in Italian and French, entitled “*Le Diverse et Artificiose Machine del Capitano Agostino Ramelli*,” &c. with nearly 200 figures, describing a great number of machines for various purposes, most of his own invention, and which exhibit much ingenious contrivance. The work is very scarce, and is much prized by the curious.

RAMELSPACH, in *Geography*, a town of Austria; 5 miles S.E. of Meiffai.

RAMELTON, or **RATHMELTON**, a small post-town of the county of Donegal, Ireland, situated on a bay at the bottom of lough Swilly. It is 117 miles N.W. by N. from Dublin.

RAMENAPILLY, a town of Hindoostan, in the circar of Rajamundry; 42 miles E. of Rajamundry.

RAMENTUM, in *Botany*, a form of pubescence in plants, which, as the name signifies, has the appearance of a shaving, being flat, membranous, mostly irregular in size and shape, quite unlike the uniform hairs or bristles of which the clothing of most plants consists. (See *PUBESCENCE*.) The above term was first used, if we recollect rightly, by PHeritier, and occurs in some species of *Begonia*. The scabiness of Ferns is of a similar nature.

RAMERUP, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton, in the district of Arcis-sur-Aube; 6 miles E. of Arcis-sur-Aube. The place contains 493, and the canton 8870 inhabitants, on a territory of 440 kilometres, in 29 communes.

RAMESAN, an oriental term for a month of fasting, very religiously observed among the Turks, and otherwise called *Ramadan*; which see.

RAMESERAM, in *Geography*, a town of Hindoostan, in the circar of Cuddapa; 6 miles E. of Gandicotta.

RAMETTA, a town of Sicily, in the valley of Demona; 6 miles W. of Messina.

RAMEX,

RAMEX, (*ramus*, a branch,) in *Surgery*, a rupture, or hernia. See HERNIA.

RAMEX *Vaccinium*. See CIRSOCLE.

RAMGAD, in *Geography*, a town of Hindoostan, in Bahar: 10 miles W. of Bahar.

RAMGARY, a town of Hindoostan, in the country of the Navys: 19 miles W.N.W. of Palicaudchery.

RAMGAUT, a town of Hindoostan, in the subah of Delhi: 37 miles S.E. of Secundara.

RAM-GETTER, in *Rural Economy*, a term applied by the medland breeders to such rams as are proper for getting ram-sock, in contradistinction to such as are fit only for getting wedder-sock. See RAM.

RAMGONGA, in *Geography*, a river of Asia, which rises in Thibet, and runs into the Ganges, 10 miles N. of Canoge.

RAMGOT, a town of Hindoostan, in Concan: 25 miles N. of Goa.

RAMGUR, a circar of Bengal, bounded on the N. by Bahar, on the N.E. by Curruckdeagh, on the S.E. by Pacheta, on the S. by Nagpour, and on the W. by Kooda and Toree; about 90 miles long, and 60 broad.—Also, the capital of this circar; 175 miles W.N.W. of Calcutta. N. lat. 25° 40'. E. long. 83° 42'.—Also, a town of Hindoostan, in Dowlatabad: 35 miles S. of Neermul. N. lat. 18° 30'. E. long. 79° 11'.—Also, a town of Hindoostan, in Malwa; 8 miles S. of Ragoopour.—Also, a town of Hindoostan, in the subah of Delhi; 5 miles N. of Coel.—Also, a town of Hindoostan, in Guzerat; 50 miles E.S.E. of Surat.—Also, a town of Bengal; 13 miles N.W. of Midnapour.

RAMGUR. See SESVAH.

RAMGURRA, a town of Hindoostan, in the Mysore, captured by the English in 1791: 42 miles N.E. of Seringapatam.

RAMHYTTE, a town of Sweden, in Westmanland; 35 miles from Stromholm.

RAMI, in *Hindoo Mythology*, one of the many names of the goddess *Parvati*; which see. Under this name she is said to be worshipped at the splendid temple on the island called Ramiseram, between Ceylon and the cape named by us Comorin, but which should be called cape Kaumari, or Kumari, another of the names of this goddess, and meaning the virgin. (On this point see LANKA and PARVATI.) Sami is the name of a tree or wood sacred to Parvati, and she is sometimes called Sami Rami, and it has been upheld that this is the origin of the Semiramis of the Greeks. (See hereon *As. Res.* vol. iv. p. 382. vol. viii. p. 256. 8vo. ed.) A description of the celebrated temple of Ramiseram will be found under that article. See also SAMI.

RAMIAVENPOUR, in *Geography*, a fort of Bengal; 27 miles S.S.W. of Burdwan.

RAMIFICATION, the production of boughs or branches, or of figures resembling branches.

RAMIFICATIONS, in *Anatomy*, are the divisions of the arteries, veins, and nerves, arising from some common trunk.

RAMIGRI, a word used by some writers as a name for colophony.

RAMILLIES, in *Geography*, a village of France, in the department of the Sambre and Meuse, at the source of the river Gees; worthy of being recorded on account of a battle fought here in the year 1706, between the allies commanded by the duke of Marlborough, and the French under marshal Valleroy. The confederates took the whole of the enemy's baggage and artillery, and about 120 standards, 600 officers, and 6000 private soldiers: about 8000 were killed

or wounded. The loss of the allies did not exceed 3000 men: 13 miles N. of Namur.

RAMING, a town of Austria; 11 miles S. of Steyr.—Also, a town of Persia, in the province of Irak; 40 miles E. of Conar.

RAMINGAM, a town of Hindoostan, in Dowlatabad; 10 miles N. of Oudigher.

RAMINGSDORF, a town of Austria; two miles E. of Steyr.

RAMINGUE, in the *Manege*. A horse gets this name that is restive, and resists or cleaves to the spurs; that is, defends himself with malice against the spurs; sometimes doubles the reins, and frequently jerks to favour his disobedience. See TICKLISH and DOUBIE.

RAMIS, BARTOLOMEO, in *Biography*, a Spaniard, the first modern who sustained the necessity of a temperament in musical instruments, of which the tones are fixed. He was contemporary with Franchinus, and in 1482 published a work, entitled "De Musica, Tractatus, five Musica practica."

He seems to have converted Pietro Aaron to his opinion: as that theorist manifestly exalts the character of Ramis on all occasions at the expense of Franchinus.

The Spaniard was attacked in a rough manner by Nicholas Burtius, for differing from Guido in his division of the monochord, in a tract entitled "Musices Opusculum cum Defens. Guidonis Arctini adversus quendam Hispanum veritatis pravaricator." Bonon. 1487. This tract, printed in black letter, is in the *Ashmolei Collect.* among the books of Art. Wood.

Burtius imagined the honour of Guido to be injured by the Spaniard, as Guido used the Pythagorean proportions, and had never thought of a temperament. Burtius, in his turn, was handled very roughly by Spataro, the disciple of Ramis (Joannes Spadarius Bononiensis, *Musices ac Bartolomei Rami Pauli ejus Præceptoris honesta Defensio* in Nicol. Burtij Parmens. *Opusc.* Bologna, 1491.); and the venerable Franchinus, finding himself very rudely handled in the dispute by the favourers of temperament, in 1522, when he was upwards of seventy years of age, took up the defence of Pythagoras, as Fontenelle, at near a hundred, did of Des Cartes. After this, the war became general, and continued to rage with great violence for more than a century, between the friends of tempered scales, and the adherents to ancient proportions and equal harmony.

RAMISERAM, in *Geography*, an island in the Indian sea, between the island of Ceylon and the coast of Coromandel; 10 which there is a passage of about 12 or 14 leagues from the island of Manaar, on the coast of Ceylon. But the advantages that might be derived from this speedy communication are in a great measure prevented by the numberless shallows and sand-banks, which every where interrupt the passage, and which are so high, that many of them are dry except during the monsoons. There is in particular a line of sand-banks, which runs quite across from Manaar to Ramiseram, denominated Adam's bridge, and also Rama's bridge, because God is said to have come by this way into Ceylon. (See ADAM'S BRIDGE and MANAAR.) From Rama, Ramiseram takes its name, and it has a large temple dedicated to him. The shortness of the passage from Ramiseram to Manaar is particularly useful on account of the speedy conveyance it affords to people on business, and the communication of intelligence. The messengers who usually go from Columbo to Manaar, a distance of 160 miles, in three days, take boat here, and cross over by Adam's bridge to Ramiseram, and then proceed along the Coromandel coast to Madras. An express

express in favourable weather will run from Columbo to Madras in eight days, and the journey has been accomplished once in seven days. (See MANAAR.) The isle of Ramiseram, which is the limit of the Hindoo religion in more modern times, and of the conquests of the Mullulman princes, is, as we have said, separated from Ceylon by Adam's bridge. The island is low, sandy, and uncultivated, except with a few scattered Palmira and cocoa-trees. The pagodas, for which it is so famous, lie on the Ceylon side, near the sea, and are the resort of innumerable multitudes of different sects of religion in India, during the season of certain festivals. The numerous pagodas are constructed in the same stile with those on the Coromandel coast; and they are surrounded with the houses of the brahmins, priests, and other religious persons, whose zeal leads them to attend on their temples; among whom, in particular, may be seen the descendants of the Tamuls, Telingas, Canarians, Mahrattas, and Orias, who compose a great body of the original inhabitants of the southern peninsula. Their houses are built of the cocoa-tree, in small squares and streets, where their families are seen reclining on the little mud terraces, and under the payals or virandahs. They do not allow Europeans to enter these temples; but they are known to resemble those of the coast in their crowded ornaments, spires of brickwork, long porches in front, and vistas, at the extreme end of which are placed the deities, in an obscure situation, surrounded by lamps burning day and night. The same reserve to strangers subsists among all the southern brahmins. The brahmins allow no labour or cultivation to be carried on in the island of Ramiseram, considering it altogether as sacred. The contributions of those who visit it are sufficient for the support of the temples. Several of the neighbouring Poligar chiefs contribute largely, and some of these rajahs have statues erected to them for their gifts. The chief pagoda has several of these statues in its different squares. Low as the sand lies in this island, good water is easily procured; for on scooping it up, the water collects immediately in the holes; but this is not the case in Manaar and the west coast of Ceylon.

The guardianship of this sacred isle belongs to a family of devotees, called "Byragees," the chief of whom is always doomed to celibacy: the succession being carried on by the sisters or the collateral branch, who only are permitted to marry. This institution is similar to that of the sovereignty of the Travancorians and Nairs of the Malabar coast. The clothes and turbans of the devotees are of a tawny red colour, decorated with large black beads, of a particular kind of wood. From the pagodas just mentioned there runs out a long narrow piece of sand, terminating in a point, within a mile of which is a choultry at Tona Goody. This is a square of houses with a court inclosed for the accommodation of pilgrims, who come to the farthest point of the island to perform their ablutions in the sea, the most sacred and the purest of their ceremonies. A brahmin takes care of this choultry, and a pole with a light is fixed at the end of the point to direct the pilgrim. N. lat. 9° 18'. E. long. 79° 22'. Percival's Ceylon.

Of the temple in this island we shall give some account, extracted from a publication of Mr. Cordiner, who visited it. The external appearance is not remarkably grand, and at a distance, no idea is excited of the minute ornaments and laboured workmanship which strike the eye on a nearer inspection. All the architecture seen without doors is insignificant, compared with the magnificence of the interior. After an examination of the whole structure, which is entirely of hewn stone, Mr. C. deemed the extent of masonic labour in its erection, must have been equal to that of any

of the most splendid cathedrals of Europe. "On entering it we were," he says, "completely astonished at the grandeur of the workmanship, and extent of the dimensions, which far surpassed any idea that we had formed of Indian magnificence." From the west gate a low gallery, 144 feet in length, with three rows of pillars on each side, leads down to the centre of the building; where it branches off, in galleries similarly constructed, to the right and left, each extending 150 feet, then running from west to east 500 feet, and enclosing an oblong rectangular space. The gallery runs also along the centre of the temple 788 feet, and a similar gallery runs across from north to south, where are like entrances, intersecting the former in the centre of the rectangular space. All the galleries have on each side triple rows of massy stone pillars, of highly laboured workmanship. Those in the front line are the largest and most superb, having a huge lion, with the mouth wide open, sculptured in bas relief, above three distinct capitals, over which are a scroll, and a richly ornamented cornice. Statues of the size of life are attached to many of the pillars, representing gods and deified persons. The pillars stand on a continued basement, forming the floor of the galleries, raised three feet, with steps to ascend by, all of stone. The roofs of all the galleries are flat, formed of stones reaching across, from the projection of one cornice to that of the other. The galleries are eighteen feet wide, and in the centre thirty feet high from the floor. The number of pillars within the temple amounts to 2628. The edifice is inclosed by a heavy stone wall, 20 feet high, 830 feet from east to west, and 625 from north to south. Large as these dimensions may appear, they are stated to be but small compared with those of temples on the continent of India, one of which covers a square mile of ground. The covered gallery, fronting the south gate, which seems unfinished, strikingly resembles the entrance of the Elephanta cavern, near Bombay. Solid pyramidal erections surmount the western and eastern entrances, composed externally of a great number of small pillars, two and two, in the form of window frames or gateways, rising one above another, in seven different stories. That over the western, which is the principal entrance, appears to be 150 feet high; the eastern seems lower, and unfinished. The north and south gates are less majestic than the others; but their completion is said to be intended, when they will be similarly surmounted and ornamented as the western portal. Privileged persons, among whom were women carrying water-pitchers, appeared constantly passing and re-passing about the interior of the temple.

Two hundred Brahmins are attached to this temple, and supported in ease and luxury by its endowments. It is dedicated to Siva, the destroying power, called by the vulgar Rama Lingam. It contains likewise, Mr. Cordiner says, images of Visnu the preserver, and of all the subordinate divinities. Of Brabma, the creator, he states, the Hindoos never dare to form any likeness. This is a common error, that is explained and corrected in the article IDOLATRY of this work.

A broad street runs parallel to each side of the temple composed of comfortable houses, and large choultries for the accommodation of pilgrims and travellers, of stone, with flat roofs supported in front by pillars; the fronts being open. In one of these Mr. Cordiner observed two ivory palankeens inlaid with gold, the property of officers belonging to the sanctuary. In others he noticed five carriages, called by the English Swamy coaches, used for the purposes of carrying the idols in procession: the use to which the ivory palankeens are, we apprehend, also applied.

These

These carriages are described as solid masses of wood, of a pyramidal shape, intended to symbolize the Linga. (See LINGA.) The exterior of these coaches are covered with grossly obscene carving.

At the external corners of the temple, and in the streets of the town, there are smaller temples in honour of different deities, and containing images. In some of the streets spreading trees, among them the ficus religiosa and tamarind, are surrounded with square stone terraces, on which are placed little images of Pollear or Ganefa, (see POLLEAR,) the Linga, two serpents entwined, and other emblems of Hindoo mythology. These terraces are used for contemplation, or more active religious duties, as noticed under the article PRADAKSHNA. Rows of fruit-trees, among them the cocoa-nut, plantain, and pomegranate, stand in gardens beyond the north and south walls of the temple.

On the opposite side of the island, near the sea, distant about eight miles from the temple, is the ancient fort and choultry of Pombom. The road between is very elegantly paved with smooth stones, each six feet by four; and the greater part of the road is nobly shaded by the most beautiful and majestic trees. The larger trees of this superb avenue are surrounded by smooth raised terraces of masonry, on which travellers rest in comfort, completely shaded. About half way between the grand temple and Pombom is a very elegant small temple, built on the same general plan with the larger, having two massy towers raised in the centre of the oblong area, and a covered walk, with three rows of pillars on each side, all round. The outside of the towers is completely covered with statues in miniature, representing all the variety of their mythological divinities. The choultry, for the accommodation of pilgrims and travellers at Pombom, has two fronts, and three inclosed squares; and is surrounded by piazzas raised several feet, with square pillars and terraced roofs. Contiguous is a small temple, the door of which was open, displaying an image of Ganefa or Pollear, in the usual form, elephant-headed and pot-bellied, ornamented with necklaces of flowers.

There are several other elegant temples on this interesting island, which is entirely dedicated to the purposes of religion. No plough is allowed to break the soil, and no animal, wild or tame, is ever killed on it.

Dancing girls, mountebanks, and beggars, abound here, as in other resorts of the idle and wealthy.

The small remains of antiquity still extant on Ceylon, sufficiently prove that similar religious institutions did once exist there, and that choultries and temples were erected at the different stages, all the way from Manaar through the island, 200 miles, to Dondra, its southern extremity, and the ultimate extent of Hindoo pilgrimage. At the latter place, the ruins of a temple dedicated to Siva are still to be recognized; but only some rows of scattered pillars, and a few remnants of broken images, have survived the fanatic fury of the early European invaders. Rama's peaceful island falling under the protection of a more liberal and enlightened government, fortunately escaped those religious tempests, which spread destruction round the coasts of Ceylon.

Lord Valentia has more recently visited this interesting scene, and Mr. Salt, who accompanied his lordship, has published a very elegant view of the temple. The entrance is described to be through a gateway, about 100 feet high, covered with carved work to the summit. The door is 40 feet high, composed of single stones placed perpendicularly, with others crossing. This massive workmanship reminded lord Valentia of the ruins of Egyptian architecture. He

describes the quadrangle to be about 600 feet each side, and says that, on the whole, this temple is the finest piece of architecture that he had seen in the east. Words, he says, cannot describe its magnificence. The concourse of pilgrims is very great, and brings in a large sum; each paying according to his rank. The raja of Tanjore had been expected the year before, but could not afford it; as in presents and various expences, it was estimated that his highness could not have performed this act of devotion under 60,000 pagodas, about 25,000*l.* sterling. His whole family would of course have expected to participate in the happiness and benefits of the pilgrimage. The idol uses no water but what is brought from the Ganges by fakirs: with this it is bathed every morning; and this holy water, thus acquiring additional sanctity, is sought and purchased by the devout for sin-exPELLING purposes.

RAMISTS, in the *History of Learning*, the disciples of Peter Ramus, who was born in a small village in Picardy, in 1515, and from being a servant in the college of Navarre at Paris, became, by his talents, industry, and perseverance, one of the most famous professors of the sixteenth century. By attacking the authority of Aristotle, and attempting to substitute in the place of his logic a method of reasoning better adapted to the use of rhetoric and improvement of eloquence, he excited a terrible uproar in the Gallic schools; so that the two first books he published, viz. his "Institutiones Dialecticæ," and "Aristotelicæ Animadversiones," were prohibited through the kingdom of France, and the author prohibited from any more teaching philosophy. His enemies persecuted him with lampoons and satires, and even held him up to public ridicule on the stage. However, Ramus afterwards recovered his credit, so that he obtained the royal professorship of philosophy and eloquence, and afterwards of mathematics, at Paris, in 1547. But his enemies were inveterate in their persecution of him, and as soon as it was known that he favoured the party of the Hugonots, he was obliged once again to withdraw himself from the effects of their resentment. In the intervals of peace, he returned to his station; but in 1568, when the civil war was a third time renewed, he resolved to leave France, and make a tour through Germany. After spending three years in visiting the principal German universities, and receiving many tokens of respect, he resolved, fatally for himself, in 1571, to return to his own country. Accordingly he settled at Paris, where he perished in the massacre on St. Bartholomew's day. On the tumult of this execrable day, Charpentaire, professor of mathematics, who had been eclipsed by the superior talents of Ramus, seized the opportunity of being revenged upon his rival, and, under the pretence of religion, employed assassins to murder him. His body was afterwards thrown into the street to the enraged pupils of Charpentaire, who dragged it ignominiously along the streets, and then cast it into the Seine.

The disciples of Ramus, such was the astonishing influence of their master's learning and character, prevailed so far as to banish the Peripatetic philosophy from several seminaries of learning, and to substitute in its place the system of their master, which was of a more practical kind, and better adapted to the purposes of life.

Although he had considerable merit in exposing the defects and inconsistencies of the Aristotelian philosophy, he does not seem to have been equally successful in his attempt to establish a new logical institute. The general outline of his plan is as follows. Considering dialectics as the art of deducing conclusions from premises, he endeavours to improve this art, by uniting it with that of rhetoric. Of the several branches of rhetoric he considers invention and dis-
position

position as belonging equally to logic. Following chiefly the example of Cicero, he divides his treatise on Dialectics into two parts; the first of which treats of the invention of arguments, the second of judgments. Arguments he derives not only from what the Aristotelians call middle terms, but from any kind of propositions, which, connected with another, may serve to prove any assertion. Of these he enumerates various kinds. Judgments he divides into axioms, or self-evident propositions, and "dianoëa," or deductions by means of a series of arguments. Both these he divides into various classes; and illustrates the whole by examples from the ancient orators and poets.

In the logic of Ramus, many things are borrowed from Aristotle, and only appear under new names; and many others are derived from other Grecian sources, and particularly from the dialogues of Plato, and the logic of the Stoics. Whilst the author has the merit of turning the art of reasoning from the futile speculations of the schools to forensic and common use, his plan is defective in confining the whole dialectic art to the single object of disputation, and in omitting many things which respect the general culture of the understanding, and the investigation of truth. Defective as the system of Ramus is, lord Bacon (Augm. Sc. l. vi. c. 2.) has passed too severe a censure upon him, and others have concurred in it: for he is unquestionably entitled to great commendation for having, at the period in which he lived and wrote, with so much firmness and perseverance, asserted the natural freedom of the human understanding. The logic of Ramus obtained great authority in the schools of Germany, Great Britain, Holland, and France; and science derived ultimate advantages from the contents which were maintained between the followers of Ramus and those of the Stagyrite. But the fame of Ramus vanished before that of Des Cartes. Brucker's Phil. by Enfield, vol. ii.

RAMLA, in *Geography*, the original *Arimathea*, a town of Palestine, distant one-third of a league from the village of Loudd, or the ancient Lydda and Diospolis. This town is almost in as ruinous a state as Loudd itself. Within its boundaries nothing is found but rubbish; nevertheless, the aga of Gaza resides here in a serai, the floors and walls of which are tumbling down. He maintains about 100 horsemen, and as many Barbary soldiers, who are lodged in an old Christian church, the nave of which is used as a stable, and in an ancient kan, which is disputed with them by the scorpions. The adjacent country is planted with lofty olive trees, disposed in quineunces. Amidst these plantations, which are decaying, are found dry wells, cisterns fallen in, and vast vaulted reservoirs, which prove that, in ancient times, this town must have been upwards of $1\frac{1}{2}$ league in circumference. At present it scarcely contains 200 families. The little land, which is cultivated by a few of them, belongs to the musfi, and two or three of his relations. The rest content themselves with spinning cotton, which is chiefly purchased by two French houses established there. At Ramla there is also a soap manufactory, the produce of which is almost wholly sent to Egypt. In 1784 the aga built here a wind-mill, which, says Volney, is the only one I have seen in Syria or Egypt, though they are said to have been invented in these countries. The only remarkable antiquity at Ramla is the minaret of a ruined mosque on the road to Yafa. By an Arabic inscription, it appears to have been built by Sai-el-din, sultan of Egypt. From the summit, for it is very lofty, the eye discerns the whole chain of mountains, which begins at Nablous, and skirting the plain, loses itself toward the south. Volney's Travels in Egypt and Syria, vol. ii.

Vol. XXIX.

RAMLEAH, a mountain of Arabia, in the province of Nedsjed, extending from S.W. to N.E. about 250 miles; the S.W. extremity being 80 miles E. of Kalaat el Moilah.

RAMLER, CHARLES-WILLIAM, in *Biography*, a celebrated German poet and professor of belles lettres at Berlin, was born at Colberg in the year 1725. He was distinguished at a very early period by his poetical genius; and in 1754 published a poem, entitled "The Game of Chess," which displayed a considerable share of genius. In 1758 he translated the abbé Batteaux's Treatise on the Belles Lettres, which he adapted to the genius of his native language, and added some dissertations on the German style and versification. In the following year he published, in conjunction with Lessing, the epigrams of Logan, an author who, notwithstanding his great merit, had been suffered to remain in obscurity. In 1760 he published "Sacred Cantatas," which were followed, during the next 20 years, by a great number of other publications, chiefly poetical, of which a list is given in the General Biography. In the year 1780 Ramler turned his attention to several of the old German poets, and published at Leipzig the Epigrams of Wernike, Opitz, Tscherning, Andrew Gryphus, and Adam Olearius. He was so successful in polishing the works of others, and gave such proofs of his taste and critical talents, that Göze, one of the most distinguished German amatory poets, allowed him full liberty in his last will to retain or reject such parts of his poems as he might think proper. In 1782-3 he published at Berlin a translation of the poetical pieces in the different volumes of the Spectator, which he followed, in the subsequent ten years, by a variety of other works on different subjects; among which may be mentioned "A short Introduction to Mythology, in two Parts." Ramler has been styled the German Horace; and his biographer says, that though his verses display perhaps less boldness and simplicity than those of the Roman, they equal them in sublimity, and surpass them in harmony. It has been remarked to the honour of Ramler, that he attached to him Frederic the Great, and his successor, by his poetical talents: from the latter he had a considerable pension paid him during the closing years of his life. Ramler was one of the directors of the national theatre at Berlin, and professor of the belles lettres in the school of the corps of cadets; but the latter office he resigned in 1790. Gen. Biog.

RAMME, in *Geography*, a river of the duchy of Bremen, which joins the Olte, near its source.

RAMMÉD *Earth Buildings*, in *Rural Economy*, are such as are raised with some sort of earthy material. This mode of building with earthy materials is supposed by some to have been known at a very early period, and has been long practised with success in the southern parts of France, especially about Lyons, though but little understood in any other part of Europe until lately. This method has, however, appeared to have so many advantages, that it was made trial of in different places in this country; and the result has been so favourable, that the practice seems to deserve the attention of the proprietors of land, in all situations where buildings are to be erected on a cheap and economical plan. In order to facilitate the knowledge of the art, Mr. Holland has presented the public with the method of performing the business, in a paper, translated from a French work on the subject, inserted in the first volume of Communications to the Board of Agriculture, in which he says that the French writer, M. Francois Cointeraux, remarks, that the possibility of raising the walls of houses two or even three stories high, with earth only,

which will sustain floors loaded with the heaviest weights, and of building the largest manufactories in this manner, may astonish every one who has not become an eye-witness of such things. It is a method, which in the above district of France is known by the term *pisé*; but as it is accomplished by the ramming or compressing earth, or earthy substances, in moulds or cases, the above term has also been applied to it. See *Pisé*, *Building in*.

RAMMEKENS, in *Geography*, a sea-port town of Holland, in the isle of Walcheren, formerly one of the best harbours in Zealand. This town, which was constructed as a fortress in the year 1547, and called "Zeebourg," was one of the towns pledged to queen Elizabeth by the states general for the succours she lent them against Spain in the year 1585; three miles E. of Flushing.

RAMMEL, in *Agriculture*, a term applied to a substance which forms a part of the subsoil or substrata of particular districts. It is usually covered with a thin weak earth or mould in some places. It is penetrable by the roots of some plants, but notwithstanding that, is very unfriendly to the vegetation of plants in general. It is frequently met with in Cheshire and some other counties. See *SOIL*.

The term signifies a composition of various kinds of clay, white sand, and gravel, which is intimately intermixed with a small portion of oxyd of iron. It is for the most part found under a weak brown or grey earth which is rarely more than four or five inches in depth in the above district, lying in strata of from eighteen to thirty inches in thickness, upon a white or red sand or clayey marle, the latter often partaking of its nature for the depth of some feet. Rammel or rammelly soils are therefore constantly of a barren and unproductive nature.

RAMMELBERG, in *Geography*, a large and lofty mountain in Westphalia, celebrated for its mines. These mine-works yield lead, copper, silver, some gold, borax, lapis calaminaris, zinc, sulphur, jet, vitriol, and yellow ochre. It lies near Goslar.—Also, a town of Westphalia, in the county of Mansfeld; three miles S.E. of Wippra.

RAMMELLY, in *Agriculture*, a word used to signify such crops as are tall or rank, as beans, &c.

RAMMER, a well-known implement formed of wood in different ways, according to the purpose for which it is to be used. These implements are very necessary in putting posts into the ground, in inclosing land, in order to close the earth firmly about them, as well as for laying down turf or sward, in order to render it smooth and even. See *BEEBLE*.

RAMMER of a Gun, the *gun-slick*; a rod or staff used in charging a gun, to drive home the powder to the breech, as also the shot, and the wad, which keeps the shot from rolling out.

The rammer of a great gun is a cylinder of wood, whose diameter and length are each equal to the diameter of the shot, with a handle fixed to it. See *SPUNGE*.

RAMNA, in *Geography*, a mountain of Bosnia; 16 miles N. of Orach.

RAMNAGUR, a town of Hindoostan, in Bahar; 42 miles N.E. of Durbungah.—Also, a town of Bengal; 10 miles N.E. of Kisheragur.—Also, a town of Hindoostan, in Oude; 27 miles N.E. of Lucknow.

RAMONCHAMP, a town of France, in the department of the Vosges, and chief place of a canton, in the district of Remiremont. The place contains 2385, and the canton 11,325 inhabitants, on a territory of 245 kilometres, in 6 communes.

RAMONDON, LEWIS, in *Biography*, an English singer, who first appeared on the stage of Drury-lane in 1706. But

he sung in Arfinoe, and Pyrrhus and Demetrius, when these operas were performed at the Queen's theatre in the Haymarket. He appears no more as a public singer after this period, but his name occurs as a composer in a collection of songs called the "Merry Musician," 1716; and as the editor of "the song tunes in the opera of Camilla, contrived and fitted to the harpsichord or spinet;" in the title of which it is said, "that the lessons being placed on five lines render them proper for a violin and a base." Almost all organ and harpsichord music was till this time written and printed on six lines.

RAMOO, in *Geography*, a town of Aracan; 60 miles N.N.W. of Aracan.

RAMOR, LOUGH, a lake of Ireland, in the southern part of the county of Cavan, which contains several islands, on which are beheld the ruins of some ancient castles. These were formerly adorned with wood, but are now bleak and desolate. The river Blackwater, which issues from it, joins the Boyne at Ravan. Lough Ramor is about 13 miles S. from Cavan.

RAMOS, or LAMOS, a river of Africa, which runs into the Atlantic, 60 miles N.N.W. of cape Formosa. N. lat. 5° 45'.

RAMOS, DOS, an island in the river of the Amazons, about 70 miles long, and from 10 to 20 broad; 60 miles above PAUXIS.

RAMOSE LEAF, in *Botany*. See *LEAF*.

RAMOTH, in *Scripture Geography*, a famous city of Palestine, in the mountains of Gilead, and hence called Ramoth-Gilead. This city belonged to the tribe of Gad. It was assigned to the Levites, and was one of the cities of refuge beyond Jordan. According to Eusebius, it was 15 miles E. from Philadelphia; but St. Jerom places it in the vicinity of Jabok, and consequently N. of Philadelphia.

RAMOUCHI, in *Geography*, a river of Thibet, which runs into the Dewa, N. lat. 30° 20'.

RAMOURY, a town of Hindoostan, in the circar of Hindia; 20 miles E. of Hurdah.

RAMPAH, a town of Hindoostan, in the circar of Rajamundry; 40 miles N. of Rajamundry.

RAMPANT, in *Heraldry*, is applied to a lion, bear, leopard, or other beast, in posture of climbing, or standing upright upon his hind-legs, and rearing up his fore-feet; shewing only half of his face, as one eye, and one ear.

The term is French; and signifies, literally, *creeping*. It is different from *saliant*, which denotes a posture less erect, or somewhat stooping forwards, as if making a fall.

This posture is to be specified, in blazoning, in all animals, except in the lion and gryphon; it being their natural situation.

RAMPARA, in *Geography*, a town of Hindoostan, in Concan; 20 miles N. of Gheriah.

RAMPART, or RAMPIER, in *Fortification*, a massy bank, or elevation of earth about the body of a place, to cover it from the direct fire of the enemy, and of sufficient thickness to resist the efforts of the cannon for many days; and formed into bastions, curtains, &c.

The word is formed from the Spanish *amparo*, *defence*, or *covering*.

Upon the rampart the soldiers continually keep guard, and pieces of artillery are planted there for the defence of the place. Hence, to shelter the guard from the enemy's shot, the outside of the rampart is built higher than the inside, *i. e.* a parapet is raised upon it with a platform. Hence, also, earth not being capable to be raised perpendicularly, like stone, the rampart is built with a talus or slope, both on the inner and outer side.

The rampart is sometimes lined, *i. e.* fortified with a stone wall withinside, otherwise it hath a berme.

It is encompassed also with a moat or ditch, out of which the earth that forms the rampart is dug.

The height of the rampart should not exceed three fathoms, this being sufficient to cover the houses from the battery of the cannon: neither ought its thickness to be above ten or twelve, unless more earth be taken out of the ditch than can be otherwise bestowed. See CONSTRUCTION, according to *M. Vauban's first Method*.

The ramparts of half-moons are the better for being low, that the small fire of the defendants may the better reach the bottom of the ditch; but yet they must be so high as not to be commanded by the covert-way.

RAMPART is also used, in *Civil Architecture*, for the space left void between the wall of a city and the next houses. This is what the Romans call *pomerium*, in which it was forbid to build, and where they planted rows of trees, for the people to walk and amuse themselves under.

RAMPARTS, in *Geography*, a town of Bengal; 8 miles S.E. of Rungpour.

RAMPERING, or SODDING, denotes the process of building sod or turf walls, or banks.

RAMPFERSGRUBE, in *Geography*, a town of Germany, in the county of Henneberg; six miles W. of Meinungen.

RAMPHASTOS, the Toucan, in *Ornithology*, a genus of birds of the order Picæ, of which the generic character is as follows: Bill very large, light, hollow, convex, serrate at the edges; each mandible incurvate at the tip; nostrils behind the base of the bill, long, narrow; the tongue is feathered at the edges, the feet mostly climbers.

The birds of this genus first became known to naturalists on the discovery of South America, and to the warmer regions they appear, in general, to be confined. Like the hornbills, they are distinguished by the size of their beaks, which, in some species, is nearly equal to that of the whole body. It is, however, of a very light substance, and, in the living bird, it is compressible between the fingers. Both mandibles are serrated in an outward direction; the tongue is of a highly singular form, representing the appearance of a very narrow lanceolate feather, being of a somewhat horny or cartilaginous nature, and divided on each side into innumerable short and close-set fibres; in consequence of which structure it was described by some early writers on natural history as a real feather, supplying the place of a tongue. The orbits of the eyes are generally bare. The toucans are supposed to feed on fruits, but in a state of captivity they will eat animal food. They deposit their eggs, which are usually two in number, in the hollows of trees, on the surface of the decayed wood. These birds have been as yet met with only in South America, and there merely between the tropics, being totally incapable of sustaining the cold. They are easily tamed and familiarized, and several species have been brought to England, where fruits, fish, and flesh have been promiscuously devoured by them with considerable voracity. Whatever was received by the bill was thrown into the air, and on its return caught, and, without the slightest mastication, instantly devoured. There are seventeen species enumerated by Gmelin, though Mr. Latham mentions only fifteen.

Species.

VIRIDIS; Green Toucan. Green, with a yellow belly, and red rump. This species is found in Cayenne, and is about fourteen inches long. The upper mandible is yellow, with red sides, and a black line in the middle; the lower

one is black, the base and round the nostrils are red; the teeth in both are white; the irides and naked orbits are yellow; the legs are of a lead colour; the claws are black; the tail is wedged, beneath inclining to ash; head, chin, and throat, in the male black, in the female bay, terminated by a black narrow transverse band.

EDENTULUS; Toothless Toucan. In this the bill is not serrate at the edges. It inhabits Cayenne, and is twelve inches long. The upper part of the body is green, but beneath it is more of a yellowish colour; the head and neck are chestnut; the rump is red; the upper mandible is brown, the lower black; the thighs green, and it is thought to be a variety of the *viridis*.

PAVONICUS; Pavorine Toucan. The general colour of this is green; but the feathers are sprinkled with red spots. It is also known by a mixture of red and changeable or peacock-coloured feathers interspersed. The bill is variegated yellow and black; the legs and claws are black.

PIPERIVORUS; Piperine Toucan. Green; the fore parts are black; the vent and thighs red. This species has been described by Edwards under the name of the green toucan. Its length is about seventeen inches, and its general colour is of a dull green; the head, neck, and breast, are of a deep black; behind each ear is a somewhat lengthened orange-coloured spot, and immediately behind the lower part of the neck is an orange-coloured bar or collar; the belly is pale and yellowish-green; the thighs are purple; the vent is red, and the tail, which is cuneated, slightly tipped with dull red; the bill is about three inches long, and of a black colour, but towards the base it is varied with red, whitish, and orange-yellow. In the female the head, neck, and breast, are brown instead of black, and the lower part of the belly is grey. It is a native of Cayenne, and said to feed on the pepper of the country. The female of this species has been known to vary in having the bill of a horn colour, with a black bar near the end, and two others near the edge; the ridge also being black, and the yellow crescent at the neck is wanting.

ARACARI. This species is green, but the abdominal band, vent, and rump, are red; the belly and breast are yellow. It is a native of Brazil, Surinam, and Cayenne, and is full sixteen inches long. The upper mandible is black on the back and tip, but the sides are whitish. The base is three-lobed at the nostrils, with a white arch at the root, lower black; the head, the wings, and tail, are black; the breast and body are yellow and scarlet, with a black roundish spot in the middle of the breast, and a similar transverse one on the beginning of the belly; the thighs are tawny.

TORQUATUS; Collared Toucan. This bird is black above, and beneath it is whitish; the belly is green, the hind part is red, and the collar red. It inhabits the coasts of New Spain, is about eighteen inches long, and feeds on fish. The upper mandible is blackish, and the lower black; the irides are of a reddish-yellow; the head and neck are black; the lower tail-coverts are red; the thighs purple; the legs are of a greenish-ash colour; the claws are black.

PISCIVORUS; Brazil Toucan. This is blackish, but the abdominal band and vent are red; the rump is white. It inhabits South America, and is twenty-one inches long. The bill is yellow, with a scarlet spot on the tip; the lower mandible is blue; the cap, back, wings, tail, belly, and thighs, are black; the temples, chin, breast, and rump, are white.

ERYTHRORYNCHOS; Red-beaked Toucan. Blackish; cheeks, chin, and throat, white; upper tail-coverts sulphur, but the lower and crescent on the breast are red. This is

found in various parts of South America. The base and back of the bill are yellow; tip of the upper mandible, and hollow of the lower, red; the nostrils are edged with black; the orbits are blueish; the legs are plumbeous, and the claws are black.

TUCANUS; Yellow-breasted Toucan. This is also blackish; the abdominal band, vent, and rump, yellow. It measures about nineteen inches in length, and has been described by Mr. Edwards from a living specimen brought into England. According to this gentleman, the bill of this species is large in proportion to the size of the bird; it is compressed sideways, having a sharp ridge along its upper part, and toothed on its edges; the upper mandible is green, with a long triangular spot of orange colour on each side, and the ridge on the upper part yellow; the lower mandible is blue, with a shade of green in the middle; the point is red; it has about five transverse faint dusky bars, which cross the joinings of the two mandibles; the nostrils are invisible in the black line that furrows the bill; the iris of the eye is of a fair green colour; round the eye is a broad space of naked skin, of a violet colour; the skin beneath the feathers is of a violet colour, below which is a bar of scarlet feathers, which parts the yellow on the breast from the black on the belly; the covert-feathers of the tail are white above, and those beneath are of a fine red; the crown of the head, upper part of the neck, the back, wings, belly, and tail, wholly black, though on the upper side of the wings and tail it has a changeable gloss of blueish-purple; the legs and feet are all of a blue or violet colour. The specimen from which this description was made, was brought from Jamaica, but the bird is a native of the hotter parts of South America.

PICATUS; Preacher Toucan. Blackish; breast yellow, vent and tips of the tail-feathers red, rump black. It inhabits Guinea and Brazil, and is more than twenty inches long. The bill is yellowish-green, tipped with reddish; the belly is red; the tail is dotted with red at the tip. This bird is said to have a frequent habit of moving its head from side to side, while uttering its notes; hence it has obtained the name of preacher.

DICOLORUS; Yellow-throated Toucan. Blackish; breast, belly, vent, and rump, red; the chin is yellow. It inhabits Cayenne, and is seventeen inches long. The bill is olive, with a black base; the mandibles are edged with red; the cheeks are of a sulphur colour; the throat is orange, but edged with sulphur.

TOCO; White-throated Toucan. Blackish; chin, throat, and rump, white; orbits, circle on the breast, and vent, red. It inhabits Cayenne, and is about nine or ten inches long. The bill is of a reddish-yellow, the base is black; the upper mandible is black at the tip.

INDICUS; Indian Toucan. The throat, quill-feathers, and tail, black; the cheeks and breast are white; belly and thighs are yellow; the crown is of a reddish-orange; rump crimson. It is found in divers parts of India. The bill is hardly ferrate, and not so large as in the others.

LUTEUS; Yellow Toucan. This is of a yellowish-white; the neck is marked with two black lateral stripes; the tail and wings are variegated with black and white; the lesser wing-coverts are yellow. It inhabits New Spain, and is about the size of a pigeon. The bill is black; the irides are yellow; the legs are brown; the claws are yellowish.

CARULEUS; Blue Toucan. Blue mixed with cinereous. It inhabits the coasts of New Spain. The bill is longer than the body; the eyes are black and the irides are tawny.

DUBIUS. This is the blue-throated toucan of Mr. Latham, described from a catalogue of the museum of baron

Fangeres of Montpellier, where it is announced as an undescribed species.

ALBUS; White Toucan. This is entirely white.

RAMPICHERLA, in *Geography*, a town of Hindoostan, in the circar of Guntoor; 12 miles N.E. of Innaconda.

RAMPIN, in the *Manege*. See **TOE**.

RAMPION, in *Botany*. See **RAPUNCULUS**, of which Dr. Johnson supposes it a corruption. See also **PHYTEUMA**.

RAMPIONS, *Crested*, a species of the *lobelia*.

RAMPIONS, *Common esculent*, a species of the *campanula*; which see.

RAMPIONS *with scabious heads*. See **JASIONE**.

RAMPOUR, in *Geography*, a town of Bengal; 13 miles N. of Curruckpour.—Also, a town of Hindoostan, in Bahar; 31 miles N.W. of Bettiah.—Also, a town of Almora; 30 miles N.N.W. of Bereilly. N. lat. 28° 45'. E. long. 79° 22'.—Also, a town of Hindoostan, in Oude, on the Ganges; 34 miles N.W. of Manickpour.—Also, a town of Hindoostan, in Oude, on an island formed by the divided stream of the Dewah; 35 miles N.E. of Lucknow.—Also, a town of Hindoostan, in Oude; 25 miles E.S.E. of Goorackpour.—Also, a town of Hindoostan, in Oude; 30 miles N.E. of Goorackpour.—Also, a town of Hindoostan, in the Carnatic; 30 miles S.W. of Nellore.—Also, a town of Hindoostan, in the circar of Boggilund; 20 miles W. of Rewah.—Also, a town of Hindoostan, in Benares; 20 miles N.W. of Bidzigur.—Also, a town of Hindoostan, in the circar of Schaurunpour; 23 miles S.S.W. of Schaurunpour.—Also, a town of Hindoostan, in the circar of Oudipour; 40 miles E.N.E. of Oudipour.

RAMPS, in *Fortification*, are gentle slopes made for the cannon to be drawn up and down by, and also for the easy communication of the troops posted in a battery that is raised above the level of the ground on which it is built. The rise of these slopes is about two inches, on twelve of base, or the length of the ramp's base is six times the height, and this is general for the draught of carriages; but footways need not be of so gentle a slope, as a rise in one foot in three may answer the purpose; or, instead of ramps, stairs may be, and commonly are, used for the passage of the foot. The breadth of a carriage ramp is usually about nine or ten feet, that breadth being sufficient both for the carriage and footway; but those for foot-passage only need not be above three or four feet wide. Ramps may either rise on the side of an elevated work, or against a salient angle of that work, or on each side of an entering angle.

RAMQUILLA, in *Geography*, a town of Sweden, in the province of Smaland; 5 miles N.W. of Calmar.

RAMSAY, ALLAN, in *Biography*, a poet of considerable celebrity, who wrote in the Scottish dialect, was born in the year 1686, in the parish of Crawford, Lanarkshire. He received no other education than that of the parish school, and was apprenticed to a barber in Edinburgh. It has not been ascertained when he first began to make verses; but about the year 1715, several of his poems had been published. Soon after this he laid aside the trade to which he had been brought up, and adopted the more congenial one of a bookseller. In 1721 his detached poems were published, by subscription, in a quarto volume. In 1724 he began to publish his collection of songs, entitled "The Tea-table Miscellany," which at length extended to four volumes. This work was followed by one, entitled "The Evergreen," being a collection of songs written by the ingenious before the year 1600. These publications were well received; but his fame was greatly extended by his

"Gentle Shepherd," which was afterwards enlarged from two pastoral poems, in the form of a regular drama. He now held a correspondence with several poets and other ingenious persons of the time, and his shop in Edinburgh was the resort of the men of letters who then flourished in the capital of Scotland. He is supposed to have opened the first circulating library in that city, and in 1736 he built a play-house, which was the first ever known at Edinburgh; but the act prohibiting the exhibition of plays in unlicensed buildings, caused it to be shut up. Ramsay, towards the middle of his life, withdrew from the field of authorship, and attended to the much more profitable business of selling, rather than writing of books. He died in 1758, at the age of 71. The poems of Allan Ramsay, says an eminent critic, "display none of the fire of the genius so conspicuous in those of Burns, but have occasionally an agreeable pastoral simplicity, and are often marked with a vein of humour, natural, though coarse. The Gentle Shepherd is, perhaps, one of the best pastorals with respect to the pictures of real life, which are drawn with great propriety, and generally present pleasing images."

RAMSAY, ALLAN, son of the preceding, was born at Edinburgh about 1709, and having devoted himself to painting, went at an early period of his life to study in Italy, and there received instructions from Solimene and Imperiale.

After his return, he practised in Edinburgh for some time, but afterwards removed to London, and by the influence of his countryman, the earl of Bute, was introduced into the vortex of the court, painted the prince of Wales, and on the death of Shakleton in 1767, was appointed principal painter to the crown; although Reynolds was then in possession of the highest reputation.

Ramsay never ventured to attempt the higher walks of the art, but confined himself solely to portraits, which he painted agreeably. Not possessed of brilliancy of genius sufficient to attempt strong character, with striking effects in his pictures, he contented himself with that portion of art which meets the expectations of common observers; never offending with affectation or neglect, he finished his pictures with care and neatness, and retained his friends and reputation till he ceased to practise. He was so far attached to his art, that he visited Italy four times: to what purpose does not appear, unless it were to derive benefit from the portraits of Pompeo Battoni; for no traces of higher character are observable in his productions. Yet he was a man of sound sense and strong understanding; possessed of literary acquirements, and devoted to study. Though he understood the Latin, French, and Italian languages, he was not satisfied till he added a knowledge of the Greek, acquired when he was advanced in life. Thus endowed, he was emulous of literary fame, and published, under the title of "The Investigator," Essays on Ridicule, as the test of truth, on the Naturalization of Foreigners, on Taste, &c.; and, as occasion prompted, the town was favoured by him with some fugitive pieces on the politics of the day. He was always held to be highly estimable as a man, and enjoyed his fame and good fortune to about the advanced age of 75.

RAMSAY, ANDREW MICHAEL, called the chevalier Ramsay, was born at Ayr, in Scotland. He received a good education at Edinburgh, where he distinguished himself so much, that he was chosen to attend the son of the earl of Weemys at St. Andrew's. After this he went to Leyden, with the view to farther improvement, where he became acquainted with Poiret, one of the leaders of the Quietists, some of whose doctrines he imbibed. He

next went on a visit to the celebrated Fenelon, archbishop of Cambray, who converted him to the Roman Catholic religion, and Ramsay ever after this considered himself as the disciple of that excellent prelate. Upon his works he formed his literary taste, and he even adopted France for his country, and made use of its language in his writings. Here he obtained some posts of honour and emolument, and was made knight of the order of St. Lazarus, whence he had the title of chevalier. His reputation caused him to be invited to Rome by the Pretender, in order that he might undertake the care and education of his children. This he accepted; but having found that little court so divided by faction, he quickly resigned his office, and returned to Paris. In the next year, 1725, he re-visited his native country, and resided some years with the duke of Argyle, employing himself in the composition of several works. After his return to France, he entered into the service of the prince of Turenne, duke of Bouillon. He died in 1743, at St. Germain-en-Laye, the retreat of the exiled Stuart family, at the age of 57. His principal writings were, "L'Histoire de la Vie et les Ouvrages de M. de Fenelon;" "Essai sur le Gouvernement Civil;" "Discours sur le Poeme Epique;" "Le Pŷchometre," being remarks on lord Shaftesbury's Characteristics; "L'Histoire du Marechal de Turenne;" and "Les Voyages de Cyrus." The last is that which is by much the best known, and it has been frequently printed in the French and English languages. Voltaire has styled it a feeble imitation of Telemachus; it is, however, written with elegance, but is tedious. Another of the chevalier's works was "A Dissertation on Free-Masonry," of which he was grand chancellor in France. In this he traces the origin of the institution to Palestine, in the time of the Crusades; and having found a great declension of the mystical ceremonies formerly practised, he strongly urged their renewal, and proposed a general assembly of the brotherhood of all nations to be held at Paris. Biog. Brit.

RAMSAY, in *Geography*. See RAMSEY.

RAMSAY Point, a cape on the S.E. coast of the island of Lewis. N. lat. 57° 44'. W. long. 6° 36'.

RAMSBURY, a village and parish in the hundred of Ramsbury, and county of Wilts, England, is situated about six miles to the eastward of the town of Marlborough, and 70 miles west by south from London. In the time of the Saxons it was a place of so much importance, as to be constituted the seat of the see, when Wiltshire was made a distinct bishopric by Plegmund, archbishop of Canterbury, in the year 909. Ramsbury church was then the cathedral church of the diocese, and continued to be so till bishop Herman prevailed upon king William the Conqueror to unite the bishoprics of Wiltshire and Sherborne, and fixed his episcopal seat at Old Sarum. The church, an ancient building, is divided into a nave, two aisles, and a chancel, with a massive square tower at its western extremity. In the chancel is a long stone, which tradition affirms to be the grave-stone of a giant; also an old altar tomb of Purbeck marble, without any inscription, and several monuments commemorative of the Joneses of Ramsbury manor, or park. This seat is now the property of sir Francis Burdett, bart. in right of his mother, second daughter of the late William Jones, esq. The house was designed in the Grecian style, by John Webb, nephew to Inigo Jones. The inclosures are extensive and well wooded, and are intersected by a branch of the river Kennet, which spreads itself out in the form of a lake, from the sides of which the grounds rise in easy, sloping lawns.

Littlecot park, the seat of major-general Edward Leybourne

bourne Popham, is situated partly in the parish of Ramfury, and partly in that of Chilton-Foliot. The house is a large ancient structure, built by one of the Darells, the former possessors of this domain, about the time when feudal warfare ceased, and defence was no longer an object in a country mansion. Notwithstanding many late alterations, the interior still preserves many of its original features. The great hall is very spacious, floored with stones, and lighted by large and very lofty windows. - In it stands a large oaken table, at which the vassals of the domain were wont to feast at the expence of their lord. The remainder of the furniture is in a suitable style, particularly an arm-chair, which is said to have been used by sir John Popham, chief justice of the court of king's bench in the reigns of queen Elizabeth and king James I., who purchased the house and manor from the last of the Darells. There is also a curious instrument for the punishment and confinement of servants; by fastening their thumbs between two boards. The walls of the hall are decorated by numerous guns, carbines, pistols, doublets, &c. : and here are also two very fine candelabras, designed and executed by Mr. George Bullock of London, in an admirable style, as adapted to the age and character of the mansion. One of the bed-rooms is said to have been the scene of a singular and mysterious murder, the incidents attending which are recorded in a note to Scott's poem of Rokeby. In the gallery, which is about 110 feet in length, are portraits of judge Popham and Nell Gwyn; also a curious piece of needle-work, representing a large Roman tessellated pavement, which was discovered in the adjoining park in 1728, by Mr. George (steward to Edward Popham, esq.), who made a coloured drawing of it, and communicated the same to the Society of Antiquaries. This pavement consisted of two divisions, which appear to have formed the floor of a temple. The interior division was ornamented with the figure of Apollo playing on a harp; and in four surrounding compartments were four female figures riding on different animals, and designed to represent the Hours, or Seasons. Exterior to the circle inclosing them were three other compartments, each displaying a face of the sun. From these circumstances the temple is supposed to have been dedicated to Apollo; but some emblems on its exterior division referring to Ceres and Neptune, it may, perhaps, be more properly esteemed a sort of pantheon. Another smaller Roman pavement, and a curious cup or patera of brass, were likewise discovered by Mr. George on Rudge-farm, adjoining the northern boundary of Littlecot park. The cup was adorned with foliage, and was inscribed with the names of five Roman stations. It was conjectured by Gale to have been a libation cup used at an annual feast instituted by the inhabitants of these towns.

Pickedfield, in this vicinity, is a government dépôt for the interior, established in 1803. It includes about forty acres of ground, on which are erected three magazines for powder, barracks for a detachment of the military, and various necessary houses and offices. Beauties of England and Wales, vol. xv. by John Britton, F.S.A.

RAMSDAL. See REMSDAL.

RAMSDEN, JESSE, in *Biography*, an eminent English mathematical and astronomical instrument-maker, the son of an inn-keeper at Salterhebble, near Halifax, in Yorkshire, where he was born in the year 1735. At nine years of age he was admitted into the Halifax free-school, where he acquired, during three years, the elements of classical learning; after which he was removed to the care of an uncle at Craven, by whom he was sent to a clergyman of the name of Hall, who had acquired much reputation by teaching at his school the mathematical sciences. Under this gentleman's instruc-

tions, young Ramsden became a proficient in geometry and algebra, and was advancing rapidly in these and other collateral branches of study when his father sent for him home, to apprentice him out with a clothier at Halifax. At the age of twenty he went to London, where he became clerk in a wholesale cloth warehouse. This situation he retained about two years and a half, when his inclination for the sciences revived so strongly, that he resolved to qualify himself for some business which should prove suitable to the bent of his mind. With this view he bound himself apprentice for four years to Mr. Burton in the Strand, who was esteemed one of the best workmen of his time in making thermometers and barometers, and in engraving and dividing mathematical instruments. After the expiration of his apprenticeship, he worked as journeyman with a person of the name of Cole, with whom he afterwards associated himself as partner. This connection did not last long, when Mr. Ramsden opened a workshop on his own account, in which he soon recommended himself to the employment of the principal mathematical instrument-makers in London. In the course of his business his repeated examination of the instruments which were sent him to be engraved or divided, led him to discover their defects, and his genius suggested to him the means of removing them, or of constructing better instruments. In order to put his plan into execution, he made himself master of the practical operations of the trade, and formed the design of examining every astronomical instrument in use, with the view of correcting those which, being founded on good principles, were faulty only in the construction, and of proscribing those which were defective in both these respects. About this time, by his marriage with Miss Dollond, he became possessed of a part of Mr. Dollond's patent for achromatic telescopes. In the year 1766, Mr. Ramsden opened a shop in the Haymarket, where he continued till 1774, when he removed to Piccadilly, where he remained till the time of his death. Before his settlement in the Haymarket, he had improved the sextant, and he had invented his celebrated dividing machine. (See the art. ENGINE.) Having spent ten years in bringing this machine to perfection, he obtained from the Board of Longitude a premium of 1000*l*. Mr. Ramsden constructed an instrument for dividing straight lines, which has been described in a former volume of the *New Cyclopædia*, and while he was employed on his dividing-machine he made great improvements in several other instruments. The THEODOLITE (see the article), before his time, consisted merely of a telescope, turning on a circle, divided at every three minutes, by means of a VERNIER, which see; but in the hands of Mr. Ramsden it became a new and perfect instrument, serving for measuring heights and distances, as well as taking angles. The largest and most perfect theodolite ever constructed was made by him for general Roy, for the purpose of measuring the series of triangles in England. Though this instrument is only of eighteen inches radius, its accuracy is so great as not to admit of an error of a single second. With this instrument general Roy measured the angle between the polar star and the sides of his triangles, in order to have the exact difference between the observations of Paris and Greenwich, which he found to be 9' 20". Mr. Ramsden was a great improver of the barometer for measuring the height of mountains, which he could obtain to a degree of accuracy that was very surprising, and he caused to be engraved a table to accompany his barometers, which, without the trouble of calculation, gives the heights of places, according to the heights of the mercury, and even at different temperatures. He also pointed

pointed out a new method and apparatus adapted to the conveyance and support of the portable barometer. Mr. Ramsden made improvements on the electrical machine; and on manometers for measuring the density of the air: he invented an instrument for measuring inaccessible distances: affaying balances which turn with less than a ten-thousandth part of the weight used: levels and a variety of other instruments. The pyrometer also exercised his talents, and on this occasion, as on all others, Mr. Ramsden shewed a sort of natural and almost intuitive sagacity in discovering the essential faults of an instrument, and in inventing the most simple and exact methods of correcting them. With respect to optics, he discovered a method of correcting, in a new and perfect manner, the aberration of sphericity and refrangibility in compound eye-glasses applied to all astronomical instruments. Opticians had imagined that the purpose might be accomplished by making the image of the object-glass fall between the two eye-glasses, which was attended with this great inconvenience, that the eye-glass could not be touched without deranging the line of collimation, and the value of the parts of the micrometer. To remedy this inconvenience, he set out from a simple experiment, *viz.* that the edges of an image observed through a prism are less coloured, according as the image is nearer the prism. This led him to attempt placing the two eye-glasses between the image of the object-glass and the eye, without failing to correct the two aberrations; which he did by changing the radii of the curves, and placing the glasses in a manner very different from that commonly employed. In the Philosophical Transactions for the year 1779, Mr. Ramsden has described a new reflecting object-glass micrometer; to the paper on this subject we refer our readers, and also to the article MICROMETER in this Dictionary. With this micrometer the diameters of the planets may be measured; it may be adapted to all kinds of achromatic telescopes; it may be brought near to, or removed from, the object-glass at pleasure, to render vision distinct; and it may be removed from the telescope, if the observer wish to use the latter without a micrometer. The high degree of merit to which Mr. Ramsden's many and important inventions were intitled, led his friends to propose him as a member of the Royal Society, and he was elected in the year 1786.

The *Equatorial* or *Transit* instrument (see the articles) received great improvements in the hands of Mr. Ramsden, who rejected the endless screw, which by pressing on the centre destroyed its precision; he placed the centre of gravity on the centre of the base, and caused all the movements to take place in every direction; he pointed out the means of rectifying the instrument in all its parts, and he applied to it a very ingenious small machine, for measuring or correcting the effect of refraction. The greatest equatorial instrument ever attempted, is that which he constructed for sir George Shuckburg, on which he employed several years, and of which we have given a description and figure. Mr. Ramsden's meridian telescopes which he made for Blenheim, Mannheim, Dublin, Paris, and Gotha, are also remarkable for the excellence of their object-glasses. With that of Dublin, Mr. Usher observed stars of the fourth magnitude in the open day, and those of the third very near their conjunction with the sun. These telescopes are eight feet in length. There is a five-foot one at the observatory at Palermo. Mr. Ramsden made great improvements in the mural quadrant, of which a full account will be found in the article CIRCLE, to which we refer our readers for much valuable information on the subject of astronomical instruments. Having in various parts of our work entered into the nature

of Mr. Ramsden's improvements and inventions, it is unnecessary to repeat here what has already been fully explained.

The field in which the inventive genius and superior talents of Mr. Ramsden were exercised, was, as we have seen, very extensive. In order that every part of his instruments might be fabricated under his own inspection, he collected in his workshops men of every branch of trade necessary for their construction. So important did he consider the principle of division of labour, that he always confined the same workmen to the same branch, and by that means arrived at the greatest correctness and nicety in executing it. Notwithstanding the great perfection of his instruments, which ought to have secured to Mr. Ramsden a large fortune, he sold them cheaper than any other artist in London, sometimes even one-third below the usual price. Such was the demand for them, from almost all parts of the world, that though he employed sixty men, he was unable to execute all the orders which he received. His great attention to business injured his health, and hastened his death. He died at Brighton, where he had been for the benefit of the sea-air, November 5, 1800, in the sixty-sixth year of his age. He had been elected a member of the Imperial Academy of Sciences at Peterburg in 1794, and in the following year he was presented with the gold medal, adjudged by the Royal Society to persons distinguished for their scientific talents.

Mr. Ramsden was by nature endowed with uncommonly strong reasoning powers, and a most accurate and retentive memory, but, at the same time, with such a quickness of penetration, that he could, as it were, with a single glance, view in every light the subject on which he thought, and adopt the most advantageous mode of considering it. He possessed, in an exquisite degree, that quality of mind which is emphatically styled elegance, which in the abstract sciences leads to clearness, simplicity, and precision, as in the fine arts and literature, it gives the last polish to genius, and is more generally known by the appellation of taste. In his habits he was temperate to abstemiousness, satisfied with small quantities of food, and a small portion of sleep. Unacquainted with dissipation or amusement, and giving but little time even to the society of his friends, the whole of those hours which he could spare from the duties of his profession, he devoted either to further improvements in his instruments, or to the perusal of books of science, particularly those mathematical works of the sublime writers which had any connection with the subject of his own pursuits. Mr. Ramsden's only relaxation from almost constant and severe studies, was the occasional perusal of the best authors, both in prose and verse; and when it is recollected that at an advanced age he made himself so completely master of the French language, as to read with peculiar pleasure the works of Boileau and Moliere, no one can believe that he mis-spent even his hours of amusement. Short and temperate as were his repasts, a book or a pen was the constant companion of his meals; and when illness broke his sleep, a lamp and a book were ever in readiness to beguile the sense of pain, and make bodily sickness minister to the progress of his mind. He was well skilled in the abstruse parts of mathematics, and conversant with the best writers on the sciences; and such was his manual dexterity, that there was not one tool in any of the numerous branches of his profession which he could not use with a degree of perfection equal to that of the very best workman in that particular branch, and he could have begun and finished every single part of his most complicated instruments. For this article we are chiefly indebted to a very elaborate and excellent original memoir in the 8th vol. of the Gen. Biog.

decoration, appear ranges of small femicircular arches springing from plain octagon pillars; the capitals of the piers which support it also displaying some curious sculpture. Among the sepulchral memorials here, are several in memory of the Sparkings of Ellington, and the Manstons of Manston-court, an ancient mansion, situated about two miles to the north-west of St. Lawrence, now converted into a farmhouse. Minster, another village in this vicinity, derives its name from a church or nunnery founded here in 670, by Domneva, wife to Merwald, son of Penda, king of Mercia. In the early part of life she had been left, with her sister Ermengitha, and her brothers Ethelred and Ethelbright, under the guardianship of her uncle Egbert, king of Kent, who murdered the princes, and in expiation of the crime offered to give to Domneva whatever she should ask. The lady demanded as much land as a tame deer would run over at one course, to endow a monastery, which was accordingly granted to her. When her buildings were raised, she placed therein 70 nuns, and, taking the veil herself, became their first abbess. She was succeeded by her daughter St. Mildred, from whom the abbey afterwards was denominated St. Mildred's abbey. This establishment was frequently plundered by the Danes during the eighth and ninth centuries, and at length was set fire to, and totally destroyed, together with the nuns, the clergy, and many of the people who had fled hither for sanctuary. The possessions of this abbey were subsequently granted to the monks of the monastery of St. Augustine, in Canterbury, by king Canute, and by them the body of St. Mildred was removed to their own abbey. The parish church of Minster, which occupies the site of the ancient nunnery, appears to have been originally founded about the time of the conquest, but it has undergone many alterations, and consequently exhibits various styles of architecture. The nave, which is the oldest portion of it, is divided from the aisles by semi-circular arches springing from short massive columns. The chancel is vaulted with stone, as is likewise part of the transept. Beauties of England and Wales, vol. viii. by E. W. Brayley. History of Kent, by Edward Hasted, esq., 8vo. edit. vol. x. Lewis's History of the Isle of Thanet, 4to.

RAMSHAGUR, a town of Bengal; 5 miles S. of Dinagepour.

RAMSHYDA, a town of Sweden, in the province of Nericia; 28 miles N. of Orebro.

RAMSIN, a town of Saxony; 3 miles W. of Bitterfeld.

RAMSONS, in *Botany*, a name given to the broad-leaved wild allium. See ALLIUM.

RAMSTADT, in *Geography*, a town of Hesse-Darmstadt; 3 miles S.E. of Darmstadt.

RAMTCHIEU, a lake of Thibet, formed by three separate rivulets, and surrounded with an incrustation, of a white colour and saltish taste. This substance is collected and employed for cleansing and washing woollen and cotton cloths, as a substitute for soap, to which the inhabitants of the adjacent country are utter strangers. Near this lake is a large monastery, called Lubchea Goomba, seated amidst rocks, which protrude their bases into the lake, and are bordered with a white foam, produced by its agitated waves. The banks of this lake are perforated with innumerable burrows of a small animal, to which they give the name of rat, larger than a musk rat, of a cinereous grey, without a tail, conceived by Mr. Turner to have been the daman of Israel and Egypt, or the Schaphan of the Hebrews. The lake is also frequented by great abundance of water-fowl, wild geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious

numbers of saurasses, the largest species of the crane kind, are here seen at certain seasons of the year, so that any quantity of eggs may be collected. The lake gradually narrows, and from its northern edge sends off a small brook; and at the other extremity it discharges itself into a much larger lake. This lake, it is said, is held in high respect by the inhabitants of Bootan, whose superstition leads them to consider the increase or decrease of its waters as portentous of good or evil to their nation. They fancy it to be a favourite haunt of their chief deities. Turner's Thibet, p. 212. &c.

RAMTEAK, or RAMTEGH, a town of Hindoostan, in the circar of Goondwana, held sacred by the Hindoos, who pretend that Ram collected his army here, prior to his expedition against Rawun at Lanka, or Ceylon. The Hindoos believe all the Europeans to have descended from Rawun, and Ceylon to be an immense mountain of gold invisible to them. Near the town is a temple, in which they offer up their sacrifices and devotions; 15 miles N.E. of Nagpou. N. lat. 21° 23'. E. long. 79° 57'.

RAMTRUT, in *Mythology*, the name of a deity worshipped by the Kanazins, a people of Hindoostan, where he has a celebrated temple, at Onor. The characters under which he is represented more resemble those of a monkey than of a man.

RAMULOSE LEAF, in *Botany*. See LEAF.

RAMUNDA, or ROMLA BODA, in *Geography*, a town of Sweden, in Nericia.

RAMURAH. See RAMGUR.

RAMUS, PETER, in *Biography*. See RAMISTS.

RAMUS, in *Anatomy*. This word, signifying *branch*, and the term *ramification*, are used in describing the arteries, veins, and nerves, the divisions and subdivisions of which bear some analogy to the branching of a tree. In the same way we speak of *trunks* of arteries, &c. and describe them as *branching out*.

RAMUS, in the *Anatomy of Plants*, a name given to the first or lateral branches, which go off from the petiolum, or middle rib of a leaf. The subdivisions of these are called *furculi*; and the final divisions of these into the most minute of all, are by some called *capillamenta*: but in general, both these kinds are comprehended under the name of *furculus*.

RAMUSIO, or RANNUSIO, GIAMBATISTA, in *Biography*, an early collector of voyages and travels, the son of Paolo, an eminent lawyer, descended from a learned and distinguished family of Venetian citizens, was born at Venice in 1485. He was in early life deputed by the state upon public business to Switzerland, Rome, and France; and in the latter country he so much ingratiated himself with Lewis XII., that he was by him caused to travel through almost the whole of his kingdom. As a reward for his services, he was made secretary of the council of ten at Venice, which post he at length resigned; and returning to Padua, employed himself in compiling his great work, "Raccolta delle Navigazioni e de Viaggi," which was published at different periods between the years 1554 and 1559, in three volumes folio. He had prepared a fourth volume, which was burnt at the printer's. Ramusio died at Padua in 1557; of course, a part of his work was given to the world after his decease. Ramusio was author of a treatise "De Nili Incremento." He was a man of great learning, and was extremely conversant in history, geography, and the ancient languages: he had some knowledge in astronomy, and held a correspondence with many learned men and well informed persons, both in Italy and Spain. It was by their assistance, and at the desire of Fracastoro, that he composed

the work already mentioned. This work was a collection of all the voyages and travels that had hitherto been published; in which he gave translations of those in foreign languages; and he prefixed dissertations, in which he diligently examined the pretensions of different authors, comparing them with one another.

RAN, in our *Old Writers*, is used for open and public robbery, so manifest that it cannot be denied. "Ran dicitur aperta rapina quæ negari non potest." Lamb. 125. Leg. Canut. cap. 58. Hence it is to this day vulgarly said of one who takes the goods of another injuriously and violently, that he has taken or snatched all he could *rap* and *ran*.

RAN, twenty cords of twine, wound on a reel; and every cord fo parted by a knot, as to be easily separated.

RANA, in *Geography*, a town of Austria; 12 miles S. of Aigen.—Also, a town of Austria; 13 miles S.S.W. of Zwettl.

RANA, or *Oranoi*, one of the Sandwich islands, in the North Pacific ocean, situated about three leagues from Mowee and Morotoi, and lying to the S.W. of the passage between these islands. The country to the south is high and craggy; but the other parts of the island had a better aspect, and appeared to be well inhabited. It produces very few plantains, and bread-fruit trees; but abounds in roots, such as yams, sweet potatoes, and tarrow. The number of inhabitants is estimated at 20,400. Its S. point is in lat. 20° 46'. E. long. 203° 8'. Cook's Third Voyage, vol. iii.

RANA, in *Surgery*. See RANULA.

RANA, in *Zoology*, the frog, a genus of the class Amphibia, of the division Reptiles, of which the generic character is: Body four-footed, naked; it generally has no tail, the hind legs are longer than the fore. This genus differs from the *Lacerta* (see the art. LIZARD), in having a shorter body, broader, thicker head, and in general no tail. The animals of it feed on insects; they are full grown about the fourth year, and seldom live beyond the twelfth. Their fore-feet are mostly cleft, having four toes: their hind-feet are palmate and five-toed; they are extremely falacious, sticking to the female for days and weeks: the tadpole is excluded from the egg without feet, but with a tail resembling a fish's, which drops off as the legs are protruded; in this state they have likewise a sort of gills and lungs, and many have a small tube on the lower lip, by which they can affix themselves to other bodies; near the left eye is a vesicle, from which they discharge water: in breeding time, the fore-thumb of the male is warty: toads, as we all know, are filthy in their aspect, and live in damp, obscure, dark places, and crawl out only by night: their eggs are in a long chain: frogs are more active, and more about by day; these lay their eggs in a confused mass.

Dr. Shaw, in his entertaining and instructive *Zoology*, says this genus may be divided into three sections; viz. 1. Frogs, commonly called *Rana*, with light active bodies, and which leap when disturbed. 2. Slender-limbed frogs, *Hyle*, *Calamita*, or *Rana arborea*, viz. such as have light bodies, very slender limbs, and toes terminating in flat, circularly expanded tips, enabling the animal to adhere at pleasure to the surface even of the smoothest bodies. Several of this division actually reside on trees, adhering by their toes to the lower surfaces of the leaves and branches. 3. Toads, *Bufones*, or such as have heavy bodies, short thick limbs, and which rather crawl than leap when disturbed.

Gmelin has given a different arrangement, which, according to our usual custom, we shall follow in this ar-

ticle. He divides the genus into three sections, viz. A, those with warty and puffed up bodies; and short legs: these are *toads*. B, those with bodies rather oblong, smooth and with longer legs: these are *frogs*, properly so called. And C, whose hind feet are very long; and whose claws are lenticulate. Dr. Shaw enumerates more than fifty species, but Gmelin describes only thirty-six.

Section A.—*Body warty, puffed up: shorter Legs.*

Species.

PIPA; Surinam Toad. The toes of the fore-feet of this species are unarmed, four-cleft; those of the hind-feet are clawed and palmate.

This hideous and deformed animal inhabits the waters of Guiana, and is actually eaten by the natives. The male, after the exclusion of the eggs, collects the mass together, and finears it over the back of the females with its paws, where they are received into small cells, impregnated by the males and closed up; after some time the perfect young are excluded from those hollow tubercles on the back of the female.

The size of the *Pipa* considerably exceeds that of the common toad; the head is flat, broad, and very short; the beak is spatula-shaped; the eyes very small and remote; neck very short, wrinkled; the body is orbicular, flat, with a hard cartilaginous skin; the fore toes are round, and the hind ones very long, connected by an undivided membrane. This species was first made known to the Europeans about the latter end of the 17th century.

MUSICA; Musical Toad. The specific character of this is, that it has gibbous shoulders that are dotted; the body is varied with lurid and brown; the fore-feet are cleft, and the hind-feet are subpalmate and five-toed, with scarcely any claws. It inhabits the fresh waters of Surinam: it is larger than the common toad: in the evening, and during the whole night, it keeps up a continual musical kind of croaking; hence it takes its name.

*BUFO; Common Toad. Body lurid and brown: of this animal there are three varieties, as follows: the first has its back of an olive colour; and an unequal yellowish-red band down the side: the body of the second is marked with confluent green spots and warts on the spots of the same colour, those of the intervals red, the spaces between bicoloured. The third is particularly distinguished for its size, being much less than the others. This of all the European toads seems to be the most universally known. It is found in shady places, in gardens, woods, and fields, and frequently makes its way into cellars, or any obscure recesses in which it may occasionally conceal itself, and where it may find a supply of food, or a security from too great a degree of cold. In the early part of spring, like others of this genus, it retires to the waters, where it continues during the breeding season, and deposits its ova or spawn in the form of double necklace-like chains or strings of beautifully transparent gluten, and of the length of three or four feet, in each of which are disposed the ova in a continued double series throughout the whole length, having the appearance of so many small jet-black globules or beads; being in reality no other than the tadpoles or larvæ convoluted into a globular form, and waiting for the period of their evolution, or hatching, which takes place in the space of about fourteen or fifteen days, when they break from the surrounding gluten, and like the tadpoles of frogs, swim about in the water, and are nourished by various animalcules, gluten, leaves of water-plants, &c. &c. till, having arrived at their full growth, the legs &c. are formed, the tail gradually

gradually becomes obliterated, and the animals leave the water, and betake themselves to the surface of the ground. This generally happens early in the autumn, at which period it is not uncommon to find such numbers of the young animals in some particular places, that their appearance has frequently given rise to the vulgar idea of their having been showered from the clouds.

The toad is an animal too well known to require any very particular description of its form. It may be necessary to observe, that it is always covered by tubercles, or elevations on the skin, of larger or smaller size in different individuals, and that the general colour of the animal is an obscure brown above, much paler and irregularly spotted beneath. The toad, however, is occasionally found of an olive cast, with darker variegations; and in some specimens, more especially in the earliest part of summer, the shoulders and limbs are marked with reddish spots, while a tinge of yellow often pervades the under parts both of the limbs and body.

The toad arrives at a considerable age; its general term of life being supposed to extend to fifteen, or even twenty years; and Mr. Pennant, in his *British Zoology*, gives us a curious account, communicated by Mr. Arscott, of Teholt, in Devonshire, of a toad's having lived, in a kind of domestic state, for the space of more than forty years, and of having been, in a great degree, tamed, or reclaimed from its natural shyness or desire of concealment; since it would always regularly come out of its hole at the approach of its master, &c. in order to be fed. It grew to a very large size, and was considered as so singular a curiosity, that even ladies, laying aside their usual aversion and prejudices, requested to see the favourite toad. It was, therefore, often brought to table, and fed with various insects, which it seized with great avidity, and without seeming to be embarrassed by the presence of company. This extraordinary animal generally resided in a hole beneath the steps of the house door, fronting the garden; and might probably have survived many years longer, had it not been severely wounded by a raven, which seized it before it could take refuge in its hole, and notwithstanding it was liberated from its captor, it never again enjoyed its usual health, though it continued to live above a year after the accident happened.

The toad is looked upon with great aversion by the major part of mankind, and it must be confessed, that its appearance is disgusting, yet the eyes are remarkably beautiful, being surrounded by a reddish gold-coloured iris, the pupil, when in a state of contraction, appearing transverse.

We shall conclude the history of this animal, with mentioning the very extraordinary circumstance of its having been occasionally discovered inclosed, or imbedded, without any visible outlet, or even any passage for air, in the substance of wood, and even in that of stone or blocks of marble. "For my own part," says Dr. Shaw, "I have no hesitation in avowing a very high degree of scepticism as to these supposed facts, and in expressing my suspicions that proper attention, in such cases, was not paid to the real situation of the animal. That a toad may have occasionally latibulized in some part of a tree, and have been in some degree overtaken or inclosed by the growth of the wood, so as to be obliged to continue in that situation, without being able to effect its escape, may perhaps be granted: but it would probably continue to live so long only as there remained a passage for air, and for the ingress of insects, &c. on which it might occasionally feed: but that it should be completely blocked up in any kind of stone or marble, without either food or air, appears entirely incredible, and the

general run of such accounts must be received with a great many grains of allowance for the natural love of the marvelous, the surprize excited by the sudden appearance of the animal in an unsuspected place, and the consequent neglect of minute attention at the moment, to the surrounding parts of the spot where it was discovered."

* **RUBETA**; the Natter Jack. Of this the vent is obtuse; and it has a yellow line on the back; the body beneath is spotted with black, but above it is of a dirty yellow, clouded with brown, and covered with porous pimples of unequal sizes. This species frequents dry and sandy places, and is found on Putney Common, and near Reevesby-Abbey in Lincolnshire, where it derives its trivial name. It never leaps, neither does it crawl, with the slow pace of a toad, but its motion is more like running. Several are frequently found together, and like others of the genus they appear in the evening.

GIBBOSA; Gibbous Toad. Body oval, convex, with a longitudinal cinereous dentate band. A variety has its back marbled with red and yellowish-ash; the belly is yellow, spotted with black. The first is found in divers parts of India, the second at Surinam.

BOMBINA; Laughing Toad. Belly orange, spotted with sky-blue; the pupil is triangular. Gmelin gives three varieties of this species; *viz.* 1. That which is distinguished with a black belly, marked with clear white spots and points. 2. One which is brown with white spots; the sides and round the joints are red. 3. One which is distinguished for its loud sonorous voice. It is found in the fenny parts of Germany and Helvetia; leaps like a frog; emits a clear sound like a man laughing: it a good deal resembles the common toad, but is small, black, and every where rough, with dots on the upper part, and variegated beneath, with transverse wrinkles under the neck.

SALSA; Salt Toad. Above of a dirty olive colour, but beneath it is white, spotted with black. This species is found in the stagnant waters of Berchtesgaden, and is less than the *R. arborea*, hereafter to be noticed; it avoids the light, is inodorous, and emits no liquid from its minute perforated warts: the legs are marked with brown bands, beneath it is yellow.

VENTRICOSA; Tumid Toad. The mouth of this is femi-ovate, and the throat ovate. A variety is marked with pale white pustules. It is found in South America, and in some parts of India. The body is brown and orbicular; the tubercles on the top of the neck longitudinally disposed; the back has three longitudinal wrinkles; the flanks are tumid and dilated.

MARINA; Marine Toad. Shoulders tumid; eye-lids warty, conchate; the hind feet are subpalmate: there is a variety, which is spotted with brown; beneath it is shaded with livid, the neck and shoulders are spotted with grey. This is found in various parts of America, and is more than six inches long. Its body is yellowish-grey, with a few rather tawny spots: the warts are distinguished with an elevated bay spot in the middle: the protuberances of the shoulders are oval, smooth, and porous; the vent is surrounded with wrinkled radii; the hind toes are connected only as far as the first joint, the last joint is fringed with a bay membrane.

BRASILIENSIS; Brasil Toad. Yellowish-ash, with red waved spots, beneath smooth.

ARUNCO; Chili Toad. All the feet of this species are palmate. It inhabits, as its name imports, the waters of Chili: in its size it resembles the *R. temporaria* described below: on the hind toes there is a slight appearance of claws.

RANA.

LUTEA; Yellow Toad. The body of this is yellow; all the feet are subpalmate. This is also found in Chili, and much resembles, in its habits, the *R. efculenta*, but is much less; the last joints of the toes are not connected.

MARGARITIFERA; Pearled Toad. Body brown-red, sprinkled with pale red spots.

CORNUTA; the Horned Toad. This takes its specific name from the circumstance of having its eye-lids horned. It inhabits Virginia and Surinam, and of the whole tribe it is the most deformed. It is said, indeed, to surpass all animals in ugliness. It is thus described: the head is large, and rounded before; the mouth is excessively large; the eye-lids are soft, mucronate, trifid at the point; the eyes are seated in the middle; the body is of a greenish-brown, with broad longitudinal whitish stripes on the back; the legs are transversely fasciate with brown: when full grown, the back, the thighs, and vent, are spiny.

SITIBUNDA; Desert Toad. The specific character is, that above it is ashy-glauous, varied with blackish-green spots, beneath of a dirty white; the hind feet are semi-palmate, with the appearance of seven toes. It inhabits the dry deserts near the Ural, sometimes hides itself in holes, and crawls out in the evening; it resembles the common toad, but is somewhat larger.

VESPERTINA; Siberian Toad. This has a transverse spot between the eyes, forked behind, and other spots running obliquely from the eyes to the nose; the body above is cinereous, with longitudinal subconfluent brown spots, varied with different shades of green; beneath it is dashed with a whitish-ash. As its trivial name imports, it inhabits Siberia, and is about the size of a common toad; it leaps slowly; the head is short; the body above is sprinkled with subwartly papillæ.

RIDIBUNDA; Joenlar Toad. Body brown, spotted above with cinereous; the dorsal line is yellow, or greenish; beneath it is smooth, whitish; haunches brown, spotted with milk-white. The head of this species is broad; the upper eye-lid is convex, sprinkled with pores; the apertures of the ears are flat; the back is porous; the sides are marked with obsolete warts; the fore thumb is divaricate, thick at the base; the next toe shorter than the rest; the hind limb sub-fasciate; the hind feet have a callus within, resembling a sixth toe; the toes have a wart beneath, near the joints.

This species is found in great numbers near the rivers which empty themselves into the Caspian sea; it never ventures on the dry land; it is very large, and frequently weighs more than half a pound; it resembles the *R. temporaria*, but is broader and shorter; its voice in the evening is like that of a man laughing.

VARIABLES; Changeable Toad. Colour variable; back and sides gibbous; warts yellowish in the centre; it is very small on the middle of the back, and larger on the most prominent part of the flanks. It inhabits the shady places in Germany, and is only about two inches long: in its habits, it holds an intermediate place between the toad and frog; when full awake its body is white, with green spots; in the heat of the sun it is entirely cinereous; when asleep, the spots are only cinereous, and when torpid the body has a flesh-coloured cast.

The head is rounded, and the mouth without teeth; the margin of the upper jaw is doubled; the tongue is fleshy, thick, placed far back, the base obscurely bifid, very entire at the tip; it has hardly any upper eye-lid, the lower one is folding; cavities of the ears white; the warts resemble teats, very numerous on the groin; the chin is marked with prominent dots; the colour, when preserved in spirits, is yellowish, and above it is of a pale olive; the fore feet are three-

toed, beneath they are emarginate, the thumb is larger; the second toe of the hind feet is very long.

Section B.—*Body more oblong, smooth; Legs longer.* Frogs.
Species.

TYPHONIA; Hurricane Frog. Of this species, the distinguishing characteristic is, that the lobes of the ears are oval. It inhabits America, and is said to make a noisy croaking before hurricanes and whirlwinds. The back is marked with four longitudinal wrinkles, elevated points, and black spots; the hind toes are narrow, without claws, the second is very long.

PENTADACTYLA; Maekarel Frog. All the legs are fasciate, five-toed; body veined, the dorsal streaks transverse, the lateral ones are ocellate. There is a variety which is brown; the fore feet have four toes, with the rudiment of a fifth; the hind feet have five toes, with the rudiment of a sixth.

OCCELLATA; Ocellate Frog. The ears are marked with an ocellate spot; feet with claws, the hind ones sub-palmate. It inhabits America.

PIPIENS; Clamorous Frog. This is green, with numerous ocellate spots, surrounded with a yellowish ring. This species is smaller than the green frog, but, in its general habits, it bears a considerable resemblance to that animal. It is a native of North America, and frequents rivulets and ditches of water, and is so strong and vigorous, that it is said it can leap to the distance of five or six yards. In the spring and beginning of summer, it is said to indicate the approach of rain by the peculiar sound which it emits. In the living animal the ears are of a shining gold colour; the region of the anus is very much wrinkled; the third fore toe from the thumb longer than the rest; the body resembles that of the esculent, or green frog, but the hind thighs are longer; the shanks are longer still, and hind feet are longer than these, marginate on each side; the toes are connected nearly to the tip, the fourth is longer than the rest.

BICOLOR; Blue and Yellow Frog. Colour blue, ochreous beneath, feet unwebbed; toes flattened and orbicular. This elegant species is of a moderate size; it measures more than four inches in length. The whole of the upper surface is of a beautiful blue, while the under parts are of a pale orange, or ochre colour. The head is large, the mouth wide, and the tip of the nose truncated. All the toes are furnished with a large orbicular tip, and beneath each of the joints there is a process or tubercle. The upper parts of the female have a deeper shade of violet than those of the male. It is supposed to be a native of Surinam.

MAXIMA; the Great Frog. All the feet are palmate, as well as the toes, fasciate; body veined and variegated; the top of the back obliquely spotted. Bands of the legs in pairs, approximate, above confluent.

ALPINA; Alpine Frog. This is entirely black, and inhabits the declivities of the mountains in Austria.

VENULOSA; Veined Frog. Feet cleft; the body veined with confluent spots. It inhabits India and South America.

VIRGINICA; Virginian Frog. Cinereous, spotted with red, beneath it is yellowish; the back is five-angled, with as many stripes. It is found in Virginia.

* **TEMPORARIA**; or Common Frog. The back of this is flattish and sub-angular. There is a variety, which is of a dirty olive colour, with large warty spots, the head above plain, beneath whitish; twice the size of the common frog. Both are found in this country, and the latter also in Persia; it lives, during the spring, in water, among toads, and in the summer

summer on land, at which time it is silent; it feeds on various insects, and is the prey of ducks and cranes, croaks very much when in muddy ditches; the variety makes, by night, a noise like that of an angry man.

Of all the European species this is the most common. The general colour is of an olive-brown, variegated on the upper parts of the body with irregular blackish spots. The patch beneath each eye, which reaches to the setting on of the fore-legs, seems to constitute one of the principal specific distinctions. The under part of the body is of a pale greenish colour, and obscurely spotted. But it ought to be observed, that the colour of the frog varies at different seasons of the year, and perhaps in different places. Towards the end of summer, for instance, the colours are much brighter; and as this species frequently casts its skin, the cuticle falling off irregularly from different parts of the body, produces considerable variations in the intensity of the colours.

The frog has a light elegant form and a lively appearance; the limbs are well calculated for its peculiar motions, and the hind feet being strongly webbed, enable it to swim well. The frog, it is said, does not reach its full size till it is five years old, and it lives from twelve to fifteen years. It retires during the heat of summer to the water, and in winter it becomes torpid, and is generally found in the soft mud at the bottom of stagnant waters, or in the cavities beneath their banks, where it remains till the return of spring.

The frog, as well as many other of the reptile tribe, is extremely tenacious of life. It survives, for a considerable time, the loss even of some of its essential organs, and it has been found to exist for several days when entirely confined under water.

The frog deposits its spawn in the month of March. This is composed of a gelatinous transparent mass, including the ova or eggs, in each of which is imbedded the embryo or tadpole, which has then the appearance of a round black globule. The period of hatching varies according to the temperature of the season, but it is commonly in about a month or five weeks. In its progress the egg becomes gradually larger, and before the tadpole is excluded, it is seen in motion within the surrounding gluten. When they are first hatched, their only food is the remains of the gluten in which they were included. A few days afterwards, if they are minutely examined, a pair of ramified branchiæ, or temporary organs, may be observed on each side of the head, which after a short time disappear. The tadpole, which is so extremely unlike the animal in its perfect state, seems to consist only of a head and tail. The head is large, black, and roundish; the tail is slender, and margined with a broad transparent fin. The motions of the tadpole are very lively. Its food consists of duck-weed and other small water plants, with different kinds of animalcula. The mouth is furnished with very minute teeth, and when the tadpole has reached a certain size, it may sometimes be heard gnawing the edges of the leaves on which it feeds. By means of a sucker placed between the lower jaw, with which the animal in this state is furnished, it can attach itself at pleasure to the under surface of aquatic plants. When it is very young, it sometimes hangs from this part by means of a glutinous thread, similar to some small slugs.

The internal structure of the organs of the tadpole is very different from that of the future animal. In no respect is this difference greater than in the disposition of the intestines, which are coiled in the form of a flat spiral, like a cable. The first change which appears on the tadpole is at the end of five or six weeks after it is hatched. It is about this time that the hind legs first appear; and gradually in-

creasing in length and size, they are succeeded about two weeks afterwards by the fore legs. These latter, indeed, are formed at an earlier period beneath the skin, and are sometimes protruded, and again drawn back by the animal, through a small hole on each side of the breast, before their complete evolution. The tail now gradually decreases, and afterwards more rapidly, so that in the space of a day or two, it is quite obliterated. After this change, the animal leaves the water, and covers the banks in myriads. The sudden appearance of such multitudes of young frogs, has probably induced the groundless but popular belief, of their having fallen from the clouds in showers. The frog having now arrived at its perfect form, it changes entirely the nature of its food. It lived formerly on vegetables, now it depends solely for its existence on animal food. It lives chiefly on small snails, worms, and insects. To seize its prey, the structure and position of the tongue are remarkably well fitted. It is of considerable length, and is attached to the fore part of the mouth; and when at rest it lies backwards. The extremity is bifid, and secretes a glutinous matter, so that in this way it can secure its prey, by darting out its tongue with great celerity, and to some distance from the mouth. This it does with so instantaneous a motion, that it is scarcely perceptible to the eye.

MARGINATA; Bordered Frog. The sides of this are marginate, and the feet cleft. It inhabits India and South America.

* ESCULENTA; Esculent, or Edible, or Green Frog. Of this species the distinguishing characteristics are, that it is of an olive colour, spotted with black, with three yellowish lines on the back; the abdomen is whitish.

Of all the European frogs this is the largest species. The general appearance is very like that of the *R. temporaria*, but it is larger in size, and of an olive-green colour, strongly marked on the upper part of the body with roundish black spots. The limbs are elegantly marked with transverse bands of the same colour. Three distinct pale yellow stripes run from the tip of the nose down the whole length of the back; the middle one being slightly depressed, but the two lateral ones are considerably elevated. The head is proportionably larger than that of the common frog.

The green frog is rare in England, but is very common in France, Italy, and Germany, where it is employed as an article of food.

This species, it is observed by naturalists, does not leave its winter retirement till a much later period than the common frog; and in those countries where it is used as food, it is worth while to attend to this fact: for if they are pretended to be brought to market at an earlier period, the common frog, and sometimes even toads, must be substituted. During the breeding season, the croaking of the male is so loud, that it may be heard at a great distance; and in those places where they are numerous, it becomes so intolerable to those who are unaccustomed to hear them, that they are often deprived of sleep. At this time, too, a large insected globular vesicle is protruded from each side of the head of the male. The globules of spawn in the green frog are proportionally smaller than in the former species: they have somewhat of a yellowish cast. The progress of the tadpole, towards the evolution of the perfect animal, is considerably slower in this species. The fore legs do not appear before October, and the animal does not assume its perfect shape till the beginning of November. The tail at this time begins to decrease, and in the space of four days entirely disappears.

This species is extremely voracious, seizing, it is said, on young

young birds of different kinds, mice, and even ducklings, and, as it does with the rest of its prey, swallowing them whole. At the end of four years it has reached its full growth. It begins to breed the year following, and the period of its life is sometimes extended to sixteen years.

AUSTRALISIA; Australian Frog. The body of this is brown above, beneath blueish; the sides are speckled with ochre colour; the toes of the fore feet are spiny. It inhabits New Holland. The second toe of the hind foot is very long; the claws are red.

PARADOXA; Paradoxical Frog. This is of a yellowish and olive colour, variegated with rufous bands; the hind legs or thighs are obliquely streaked.

In its general form this species resembles the *R. temporaria*. The oblique longitudinal stripes on the hind legs constitute the principal mark of distinction. There are four toes on the fore feet, and they are unwebbed; the hind feet have five toes, and are deeply palmated to the very ends of the toes. Near the shortest toe there is an oblong callus, forming a spurious one. The upper jaw is beset with a row of small denticulations. This species is a native of South America, and is more common in Surinam than in other places.

Naturalists, says Dr. Shaw, have been extremely puzzled with regard to the real nature of what has been taken for the tadpole of this frog. At one time it was considered by Linnæus as a species of lizard, and therefore arranged by him under the genus *lacerta*. At another time he has placed it under the present genus, with the specific name *piscis*. It was described by Edwards under the denomination of the frog-fish of Surinam. The structure of the animal, which has been the subject of so much discussion, shews clearly that it is the larva or tadpole of a frog; and it is supposed, with no small degree of probability, that the differences in the accounts given of this animal by naturalists have arisen from the different stages of its progress, in which it has been found. But as this tadpole is so much larger in size, in proportion to the perfect animal, than any other species yet known, it may be the larva or tadpole of some of the larger species, and not that of the *R. paradoxa*, which is but a small frog.

C. Hind Feet very long; the Claws lenticulate.

ARBOREA; Tree-Frog. The body of this species is green, beneath granulate; feet cleft. Gmelin enumerates five varieties of this species. 1. Those which have four toes to their fore feet, and five to those that are behind; the knees are warty beneath. 2. Those that are of a green colour, with a straight yellow line on each side. 3. The body of this variety is reddish. 4. Of this it is brownish-green. 5. The slenderness of the body marks this variety.

"In the beauty of its colours," says Dr. Shaw, "as well as in the elegance of its form, and agility of its movements, the tree-frog exceeds every other European species. It is a native of France, Germany, Italy, and many other European regions, but is not found in the British islands. Its principal residence, during the summer months, is on the upper parts of trees, where it wanders among the foliage in quest of insects, which it catches with extreme celerity; stealing softly towards its prey, in the manner of a cat towards a mouse, and, when at the proper distance, seizing it with a sudden spring, frequently of more than a foot in height. It often suspends itself by its feet, or abdomen, to the under parts of the leaves; thus continuing concealed beneath their shade. Its size is smaller than any European frog, except the *R. bombina*. Its colour, on the upper parts, is more or less bright in different individuals; the ab-

domen is whitish, and marked by numerous granules; the under surface of the limbs is reddish; and the body is marked on each side by a longitudinal blackish or violet coloured streak, separating the green of the upper parts from the white colour of the lower: the inferior edge of this dark lateral stripe is tinged with yellow. The body is smooth above, and moderately short or plump; the hind legs are very long and slender; the fore feet have four, and the hind feet five toes, all of which terminate in rounded, flat, and dilated tips, the under surface of which, being soft and glutinous, enables the animal to hang with perfect security from the leaves of trees, &c. The skin of the abdomen is also admirably calculated by nature for this peculiar power of adhesion, being covered with small glandular granules, in such a manner as to fasten closely even to the most polished surface; and the animal can adhere at pleasure to that of glass, in whatever position or inclination it be placed, by merely pressing itself against it.

Though the tree-frog inhabits the woods during the summer months, yet, on the approach of winter, it retires to the waters, and there submerging itself in the soft mud, or concealing itself beneath the banks, remains in a state of torpidity; and again emerges in the spring, at which period it deposits its spawn in the waters, like the rest of this genus. The male at this period inflates its throat in a surprising manner, and exerts a very loud and sharp croak, which may be heard to a vast distance. The spawn is deposited about the end of April, in small clustered masses; the inclosed globules or embryos being of a pale yellowish-brown colour. The tadpoles become perfect frogs, by the total decay of the tail, about the beginning of August; and soon begin to ascend the neighbouring trees, where they continue to reside during the remainder of the warm season; as do likewise the parent animals, after the breeding season is past. During their residence among the trees, they are observed to be particularly noisy on the approach of rain; so that they may be considered, in some measure, as a kind of living barometers; more especially the males, which, if kept in glasses, and supplied with proper food, will afford an infallible preface of the changes of weather.

LEUCOPHYLA; White-spotted Frog. Body smooth, hoary, with oblong milk-white spots; the fore feet are lobate, the hind feet palmate. It inhabits America, and weighs only about forty-six grains. Eyes of a fine golden colour, and between these, on the sides and middle of the back, there are oblong white spots; the haunches are slender.

SQUANTIGERA; Scaly Frog. In this a scaly band reaches half-way round the back; the sides and throat have folds; the fore feet are semi-palmate, the hind feet are palmate. This is about two inches long, and is supposed to be an inhabitant of America. The body is varied with grey and brown in thick aggregate specks, and a few spots down the hind part of the back, in a serpentine direction; the band consists of minute, sub-pellucid, rhomboid, imbricate scales; the hind limbs are twice as long as the fore.

BOANS; Croaking Frog. Body smooth, with continuous dots beneath; feet palmate. There are two varieties. 1. The body above is of a blueish lead-colour. 2. The body of this is inclining to orange. It is found in America, and differs only from the tree-frog in having the feet webbed, and the body marked with white spots.

RANA Arborea, the *Tree-Frog*. See **RANUNCULUS Viridis**, and the preceding article.

RANA Piscatrix. See **LOPHIUS Piscatrix**, and **SEA-Devil**.

RANARIDL, in *Geography*, a town of Austria; 11 miles S. of Aigen.

RANASAGUR, a town of Hindoostan, in Bahar; 18 miles W. of Arrah. N. lat. $25^{\circ} 37'$. E. long. $84^{\circ} 31'$.

RANCAGUA, a jurisdiction of South America, in Chili. It derives its name from the inhabitants living in single houses, without the appearance of a village; every family lodging in their lonely cottage, four, six, or more leagues from each other. It is not, however, without a capital, consisting of about 50 houses, and between 50 and 60 families, most of them being Mestizos, though their cast is not perceivable by their complexion. The whole jurisdiction may contain about 1000 families, Spaniards, Mestizos, and Indians. Ulloa's Voyage, vol. ii.

RANCE, ARMAND-JOHN LE BOUTHILLIER DE, in *Biography*, the institutor of the order of La Trappe, was of noble descent, and born at Paris in the year 1626. At a very early period he exhibited an extraordinary genius for classical and polite learning; and at the age of 10 he had read many classical works, in the Greek as well as the Latin languages, and is said at that early period to have understood Homer. When he was only 13 years of age, he prepared for the press a new edition of Anacreon, with notes, that displayed considerable talent and research. This was published in 1639. Four years previously to this, he had received the clerical tonsure, and had been nominated a canon of Notre Dame at Paris. He was promoted by the king to the sinecure priory of Boulogne, near Chambor; and he was subsequently promoted to three different abbeys, among which was that of La Trappe, and to other places of honour and trust in the church. He studied divinity at the Sorbonne, and in 1651 he was ordained priest; and in less than three years, the degree of doctor of divinity was conferred upon him by the faculty of the Sorbonne. Having thus completed his studies, he entered into the world, and, like one broken from his shackles, he devoted himself eagerly to its honours, pleasures, and gaieties. He soon became a favourite at court, and was appointed almoner to the duke of Orleans, and one of the deputies of the second order in the assembly of the clergy in 1655. On a sudden, and for a cause that never was well understood, he became disgusted with the world, and resolved to renounce for ever its pleasures, enjoyments, and vanities. No sooner had the abbé de Rancé formed the resolution than he withdrew to his estate in the country, to deliberate concerning the mode of life which he should pursue. Having made up his mind to embrace the monastic life, he sold his estate, and bestowed the money which it produced on the Hôtel-de-Dieu at Paris. He also resigned all his benefices and dignities, excepting his priory of Boulogne, and the abbey of La Trappe; the latter of which he retained by a special permission of the king, in order to introduce into it a reformation of the statutes and discipline. He took the habit, and made his profession in the year 1664, and set about establishing the gloomy and austere discipline of monkery in its full perfection. The place itself seemed peculiarly adapted to the horrid system which he established, being the most gloomy, barren, and desolate spot in the whole kingdom of France. Here the days of the monks were constantly spent in prayers, tears, contemplation, silence, the perusal of holy books, the hardships of bodily labour, and the practice of the most rigid austerities. All other designs and occupations, however laudable and excellent in themselves, they were to regard as vain and sinful to persons of their order. The least relaxation, or amusement of the most innocent nature, they were not allowed; and they were prohibited from engaging

at all in literary studies. Strange! that a mind stored with liberal knowledge, and distinguished by good taste, should have been so far perverted by superstition and fanaticism, as to devise or sanction such regulations.

That the world might be acquainted with the discipline of his community, he published "A Treatise on the Sanctity and Duties of the Monastic State." As de Rance advanced in years, the severe discipline to which he strictly conformed, rendered him so infirm, that, finding himself unequal to the duties of his post, he resigned it into the king's hands, but was permitted to appoint his successor. At length, worn out with infirmities and mortifications, and lying on a bed of ashes and straw, he died in 1700, in the 74th year of his age. He was author of a great number of theological and other pieces, among which may be mentioned "Moral Reflections on the Four Evangelists;" "The Constitution and Rules of the Abbey of La Trappe," in 2 vols.; and "A Discourse on Purity of Intention." Moreri.

RANCE, in *Geography*, a river of France, which runs into the sea near St. Malo.

RANCHANO, a small island near the coast of Darien, in the Pacific ocean.

RANCHERIA, a town of South America, in the viceroyalty of Granada, and province of St. Martha; 20 miles N.E. of Hacha. N. lat. 11° . W. long. $72^{\circ} 36'$.—Also, a small island in the Pacific ocean, near the coast of Veragua. N. lat. $7^{\circ} 50'$. W. long. $82^{\circ} 16'$.

RANCHERIAS, a name given, in the province of Panama, to assemblages of Indian huts under the jurisdiction of a village. These rancherias are situated to the southward, in the small chasms or breaches of the mountains.

RANCID, in *Rural Economy*, from the Latin *rancidus*, of *rancio*, to be rank, a term applied to substances, which have contracted a strong offensive smell and taste by keeping, as bacon, butter, and all fat substances are apt to do. It would be a very useful discovery, to find out any easy simple method of preventing this effect from taking place.

RANÇON, in *Geography*, a river of France, in the department of the Lower Seine, which runs into the Seine, at Caudebec.—Also, a town of France, in the department of the Upper Vienne; 8 miles E. of Bellac.

RANCONET, AIMAR DE, in *Biography*, a learned and worthy magistrate, who flourished in the 16th century, was born at Bordeaux, in which city his father was an advocate of parliament. Having received the advantages of a good education, he became deeply skilled in the Roman law, to the study of which he joined that of philosophy, mathematics, and antiquities. Having been some time a counsellor in the parliament of Bourdeaux, he was raised to the post of president of the fourth chamber of inquests in that of Paris. The religious contentions of the time were fatal to him. When the cardinal of Louvain assembled the parliament of Paris, to procure its opinion concerning the punishment of heretics, Ranconet brought the works of Sulpicius Severus, and read aloud the passage in which that writer censures the execution of Priscilian; upon this the prelate caused him to be imprisoned in the Bastille, where he died of grief in 1559, at the age of 60. His latter days had been singularly unfortunate. He was reduced by want to be a corrector of the press to the Stephenes; he saw his daughter die on a dunghill, and his son executed, and his wife was killed by lightning. This learned man published scarcely any thing in his own name, but contributed much to the labours of others. He is said to have had the chief part in the valuable treatise, "De Verborum Significatione," and in the "Formulæ" of Briffon; and Pithou asserts,

asserts, that he compiled the Dictionary that bears the name of Charles Stephens. He wrote "Le Tresor de la Langue Françoise, tant ancienne que moderne." Moreri.

RANÇONNIERES, in *Geography*, a town of France, in the department of the Upper Marne; 9 miles W. of Bourbonne.

RANDAL, Dr. JOHN, in *Biography*, organist, doctor in music, and music professor in the university of Cambridge. He was brought up in the king's chapel, was one of the children of that choir who first performed in Handel's oratorio of Esther, at the house of Bernard Gates, master of the boys in James-street, Westminster, on Wednesday, February 23, 1731, when it was performed in action, previous to its having been heard in public, or any where but at Cannons, the magnificent feat of the duke of Chandos, for whose chapel it was composed in 1720.

Randal was never rated very high in his profession: he was regarded as a slight organ-player, and had never distinguished himself as a composer. He obtained his degree at the installation of the duke of Grafton in the university of Cambridge, for which he composed the ode written by Mr. Gray, to the astonishment of all the musical profession, by undertaking to have it performed by the musicians resident in the university, without putting his grace to the expence of additional hands and voices from London, as Drs. Greens and Boyce had thought necessary on former occasions at Cambridge, and Dr. William Hayes at Oxford.

As Dr. Randal's professional life was unmarked by talents, his death, which happened in 1799, was hardly noticed, except by the candidates for the professorship, and his organist's places.

RANDALSTOWN, in *Geography*, a post-town of Ireland, in the county of Antrim, in the neighbourhood of which is Shanes castle, the seat of lord O'Neill. It is situated on the river Maine, to the northward of lough Neagh. Randalstown is 4 miles N.W. from Antrim, and 88 N. by W. from Dublin. Before the union, it was represented in parliament. Carlisle, &c.

RANDANS, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the district of Riom; 12 miles N.E. of Riom. The place contains 1047, and the canton 7996 inhabitants, on a territory of 130 kilometres, in 11 communes.

RANDASALMI, a town of Sweden, in the government of Kuopio; 52 miles S. of Kuopio.

RANDAZZO, a town of Sicily, in the valley of Demona; 25 miles W. of Taormina. N. lat. 37° 57'. E. long. 15° 4'.

RANDEER, a town of Hindoostan, in Guzerat, on the Taptec, opposite to Surat.

RANDEGG, a town of Austria; 8 miles N.N.E. of Bavarian Waidhoven.

RANDERADT, a town of France, in the department of the Roer; 10 miles N.W. of Juliers. N. lat. 50° 59'. E. long. 6° 8'.

RANDERS, a town of Denmark, in North Jutland, on the Gulden. This town is reduced, and has now only one parish church, a grammar-school, an hospital, and a chapel near the town. The chief articles of trade consist of leather gloves, salmon, earthen-ware, and strong beer. It was formerly well fortified; 20 miles E. of Viborg. N. lat. 56° 28'. E. long. 10° 3'.

RANDERSACKER, a town of the duchy of Wurzburg, on the Maine; 2 miles S. of Wurzburg.

RANDIA, in *Botany*, was so named by Houstoun and Linnæus, in honour of Mr. Isaac Rand, F.R.S., an apothecary in London, who filled the place of lecturer and de-

monstrator of botany in the Chelsea garden, from the year 1722 to 1739. He published in 1730 an octavo index of the official plants of that collection, 518 in number, specifying the part of each used in physic. He also printed, in 1739, a general catalogue of the Garden. His name often occurs among the botanists of that period. The *Randia*, however, of which two supposed species are defined in Linn. Sp. Pl. 213, 214, by the names of *mitis* and *aculeata*, both West Indian shrubs, is now sunk in *GARDENIA*; see that article, where we have suggested a doubt, possibly not well founded, of the propriety of this measure. Both species of *Randia* are united by Willdenow, Sp. Pl. v. 1. 1230, on the authority of Swartz, as well as in Ait. Hort. Kew. v. 1. 370, under the name of *Gardenia Randia*. This plant, sent by Houstoun to Miller, before the year 1733, does not appear to exist in our stores at present. Its form may be seen in Browne's Jamaica, 143, t. 8. f. 1. That author says the pulp of the berries stains paper or linen of a fine permanent blue, which resists the action of soap and of acids. The shrub is frequent in the low lands of Jamaica, on the most barren clay soil.

RANDNITZ, in *Geography*, a town of Bohemia, in the circle of Schlan; 12 miles N.N.E. of Schlan. N. lat. 50° 23'. E. long. 14° 24'.

RANDOLPH, THOMAS, in *Biography*, an English poet of great celebrity, was born at Newnham, in Northamptonshire, in 1605. He was educated at Westminster school, and having completed his course, he was elected to Trinity college, Cambridge. He shewed an early turn for poetry, and at ten years old wrote "The History of the Incarnation of our Saviour," in verse. He acquired an unfortunate, and, to him, a fatal habit of conviviality, which diverted him from the pursuit of any profession, and which led him to waste his scanty patrimony, and his health, in the company of wits and men of pleasure in the metropolis. He died in his 30th year, to the great regret of those who admired his poetry and loved his company. He possessed an excellent genius, and had his life been extended, it has been thought he might have attained to a very high rank among the poets of his age. His miscellaneous poems were collected after his death by his brother, who published them at Oxford, in 1640. They have been, but not of late years, several times reprinted. He likewise composed six dramatic pieces of the comic class, one of which, "Hey for Honesty, down with Knavery," was taken from the *Plutus* of Aristophanes. His pieces are said to be some of the best in the manner then prevalent, which consisted in playing with words and thoughts, and connecting remote ideas by fanciful resemblances. His expressions are often elegant, and his verses harmonious. His friend, sir Christopher Hatton, caused, at his own expence, a monument of white marble to be erected over his grave, the inscription on which, in Latin and English verse, was made by Peter Hausted. Biog. Brit.

RANDOLPH, JOHN, a learned prelate of the church of England, descended from a respectable family in Kent, was born July 6th, 1749. He was the younger son of Dr. Randolph, formerly president of Corpus Christi college, Oxford, who died in March 1783, after having presided over the college for the long space of 35 years. The president's father was recorder of Canterbury, and had several sons, among whom was Dr. Francis Randolph, principal of Alban Hall, Oxford. The whole family have been remarkable for their orthodox zeal and attachment to the established religion of the country. The subject of this article became a student of Corpus Christi college, Oxford, where he took his several degrees, that of D.D. he had by diploma in 1783. Pre-

viously to this he had been appointed prelector of poetry, proctor, and in 1782 Regius professor of Greek. In this same year he was made prebendary of Salisbury, canon of Christ-church, and Regius professor of divinity; and in 1783 rector of Ewelme. In 1799 he was elevated to the bishopric of Oxford, from which he was translated to that of Bangor in 1807, and then to the metropolitan see of London in the year 1809. Notwithstanding these high preferments he passed a great part of his life in the university of Oxford, and it was generally believed that when he was elevated to the see of Oxford, the university was complimented with the nomination by the crown. His lordship was author of many single sermons, and charges delivered on different occasions: also of "De Græcæ Linguae Studio Prælectio habita in Scholâ Linguarum," 1783, and "Concio ad Clerum in Synodo Provinciali Cantuariensis Provinciae ad D. Pauli," 1790. His lordship was a zealous promoter of the *National schools* in opposition to those founded by Lancaſter, and he was understood to be a violent opponent to the bible society, and to the spread of what has been termed Sectarism. One of his last works was a Report of the Progress made by the National Society, to which the general committee referred in terms of gratitude, at their first meeting after his lordship's decease, in the following terms; "whose latest employment had been to state, for the information of the public, the progress of a work to which he had contributed his time, his labour, and his counsels, the committee could not fail to entertain a common sentiment of profound regret for the loss which they have sustained, and to cherish in their minds the liveliest recollection of the service which has been so successfully fulfilled by him in this second report. They wish, therefore, to add to this document, designed for general circulation, their sense of what is due from the public, and themselves, to the memory of one who was a constant and assiduous promoter of this salutary institution, from its first establishment to the last hour of his life.—The committee trust, that this testimony, though limited to a single object in the large field of pastoral duty in which he was incessantly engaged, may serve to denote the benefits which have resulted from his prompt, unwearied, and effectual exertions." The following is the character drawn of him by Mr. archdeacon Jefferson, and which alludes to his zeal for the church of which he was an active member. "Fearless now of being censured for mercenary adulation, or reproved by unconscious merit, a just tribute may be paid to the character of that departed and exalted prelate, who is, and will be, most lamented where he was best and most entirely known. This opportunity, therefore, is willingly embraced of offering a heart-felt condolence to the ministry of the diocese on the affecting and important loss, which, in these perilous times of contending sects and unsettled opinion, has arisen to them, and to the church:—To them, in the premature privation of a diocesan, firm in his support of ecclesiastical authority, but considerate in its application; eminently versed in the letter of ecclesiastical law, but liberal in its practical construction, reluctant in interference, but determined in duty, slow in the profession of service, but prompt in its execution; disinterested in patronage, unwavering in measures, correct in judgment, attentive in counsel, and kind and compassionate to distress:—To the church, in the premature privation of a father, diligent in her rites and services, but unostentatious in piety and devotion; sound and unrelaxing in her doctrines and faith, but discreet in zeal, and comprehensive in charity; ever vigilant in defending her interests, ever forward in asserting her privileges, and ever able in the assertion and the defence." The bishop died suddenly on the 28th of July 1813. He was one of the governors of the

Charter-house; trustee of the British Museum; dean of the Chapel royal; visitor of Sion college; and provincial dean of Canterbury. Gent. Mag.

RANDOLPH, in *Geography*, a post-town of America, in Massachusetts, formed of the S. precinct of Brantree, in Norfolk county, in the year 1783; 15 miles S.E. of Bolton. The inhabitants are mostly farmers, but manufacture large quantities of shoes for market.

RANDOLPH, a county of Hillsborough district, in North Carolina, bounded N.E. by Orange, and N.W. by Guilford. The number of inhabitants is 10,112, and they are mostly Quakers; the other denominations are Presbyterians, Baptists, Methodists, and Universalists. Their good land produces 40 or 50 bushels of Indian corn, or 20 of wheat, *per* acre. The chief town is Ashborough.

RANDOLPH, a county of Virginia, bounded N. by Monongalia, and S. by Pendleton. The number of inhabitants is 2854.

RANDOLPH, a post-town in Orange county, Vermont, being the 4th town W. of Thetford, on Connecticut river. The number of inhabitants is 2255. White river, by its two branches, waters the E. and W. side of the town. It has a large bed of iron ore, two forges, and a slitting mill. The congregational meeting-house has a steeple, and is large; 47 miles from Rutland.

RANDOLPH, a county of the Indiana territory.

RANDOLPH, a town of Morris county, in New Jersey, containing 1271 inhabitants.

RANDOM, a township of Essex county, in Vermont, W. of Brunswick.

RANDOM *Island*, a small island in Trinity bay, near the E. coast of Newfoundland. N. lat. 48° 15'. W. long. 53° 40'.

RANDOM-*Shot*, a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly, or point-blank.

The utmost random of any piece is about ten times as far as the bullet will go point-blank; and the bullet will go farthest when the piece is mounted to about forty-five degrees above the level range.

The space or distance of the random is reckoned from the platform to the place where the ball first grazes.

RANDOW, in *Geography*, a river of Brandenburg, which runs into the Ucker; three miles S. of Uckermonde.

RANDS, a lake of Norway, in the province of Aggerhuus, 35 miles long, and two broad; 20 miles N. of Christiania.

RANDSBERG, a town of Sweden, in West Gothland; 76 miles E. of Uddevalla.

RANDYCHOAR, a town of Bootan; 18 miles N. of Beyhar.

RANEA, a town of West Bothnia; 60 miles W. of Tornea.

RANELAGH, *Rotunda* and *Gardens*, built and opened for musical performances and public amusements in 1742. The building was erected in the spacious garden belonging to the residence, at Chelsea, of lord Ranelagh, one of the ministers of Charles II., when paymaster of the army.

It was planned by the late Mr. Lacey, afterwards joint-patentee of Drury-lane theatre with the great actor Garrick.

At the first opening of this stupendous building, several experiments were made in placing the orchestra, in filling it, and in the time of performance, before it was settled as an evening promenade. The orchestra was at first placed in the middle of the rotunda. The performance was in a morning; and oratorio chorusses chiefly furnished the bill of fare. Sir John Barnard complaining to the magistrates, that

that the young merchants and city apprentices were frequently deduced from their counting-houses and shops by these morning amusements, they were prohibited, and the doors opened at six o'clock in the evening. The performance, however, did not begin till eight o'clock, but was ended at ten.

It was intended to rival Vauxhall, and was little injured by bad weather; as the company, at such times, had a safe and pleasant retreat into the rotunda, and as few went thither but in carriages.

Its success as an evening's amusement remained undiminished more than 40 years. It was ruined by the late hours to which it was gradually brought by fine folks, who, at length, never came thither till past ten o'clock, when the musical performances were over, and sober people used to return home before eleven o'clock to their supper, which enabled them and their servants to go to bed, and rise, at their accustomed time.

But, at length, persons of rank and fashion made a debauch of this innocent amusement, and went to it and departed from it as late as at a masquerade. This precluded all that had any thing to do themselves, or any employment for their servants in the morning, and so much refined the company, that at midnight there had been seldom sufficient money received at the entrance, to cover the expences of the lamps, the terms of admission being only 3s., for which, besides a good concert by the best performers in London, the company was furnished with excellent rolls, butter, and tea. In the year 1803 it was shut up, and only used occasionally for a masquerade, a festival, or an exhibition of fire-works. But since the period just-mentioned, the building has been pulled down, and the materials sold piecemeal, as was the case at Cannons, the splendid mansion of the duke of Chandos, (or *Palazzo*, as it would have been called in Italy,) and the ground is now (1809) of no other utility than occasionally to drill and exercise the Chelsea volunteers.

RANES, in *Geography*, a town of France, in the department of the Orne; 10 miles S.W. of Argentan.

RANESTAD, a town of Sweden, in Angermannland; 50 miles N.N.E. of Hernofand.

RANFORCE RING. See REINFORCED Ring.

RANG, in *Geography*, a town of Sweden, in the province of Skonen; 11 miles S.S.W. of Lund.

RANGA, in *Hindoo Mythology*, one of the many names of Siva, the personification, according to the Hindoo mythologists, of the destructive or changing form of the deity. (See SIVA.) The epithet Sri, meaning holy, or divine, or blessed, prefixed, has given this name to the capital of Mysore; Sri Ranga-pattan being the city of the blessed Ranga, altered by Europeans to Seringapatam. See SRI.

RANGALORE, in *Geography*, a town and fortress of Hindoostan, in the circar of Cicacole; 38 miles W. of Cicacole.

RANGAMATTY, a circar of Bengal, bounded on the N. by Bootan and Assam, on the E. and S. by Assam, and on the W. by Baharbund, Bettreband, and Goollah; about 40 miles long, and from 10 to 40 broad. Rangamatty, the capital, is 128 miles N.N.E. of Moorshedabad, and has a celebrated pagoda. N. lat. 26° 8'. E. long. 90° 6'.

RANGANJA, a town of Bengal; 15 miles N.E. of Chittigong.

RANGAPALEAM, a town of Hindoostan, in Coimbatore; eight miles N.N.E. of Daraporum.

RANGAPILLA, a town of Hindoostan, in the Carnatic; six miles N.E. of Pondicherry.

RANGASUNDRUM, a town of Hindoostan; 15 miles W. of Tinevelly.

RANGE, in *Gunwery*, the path of the ball, or the line it describes from the mouth of the piece to the point where it lodges. The flight of a shot is distinguished, by artillerymen, into three different ranges, of which the first is called the *point-blank*, the second the *random-shot*, and the third the *ricochet*, or rolling and bounding shot. The first, or point-blank, is to suppose a piece stood upon a level plain, and laid level, then the distance between the piece and the point where the shot touches the ground first, is called the *point-blank range* of that piece; but as the same piece ranges more or less, according to a greater or less charge, the point-blank range is to be understood to be that, when the piece is loaded with that charge which is commonly used in action.

This range is much less than the greatest range, or random-shot; but the piece cannot be levelled, or, as it is generally expressed, *pointed* at an object intended to be battered, if that object is not within the distance of the point-blank range; for beyond that the shot is very uncertain, therefore rarely used in the sea-service, and on land only when the shot cannot fail of doing great execution in the place on which it falls.

In ricochet firing, the piece is only elevated from three to six degrees, and loaded with a small charge, in order that the ball may be bounded, and roll along the inside of the parapet. The shot, thus discharged, goes rolling and bounding, killing and maiming, or destroying all it meets in its course, and creates much more disorder by going thus slowly, than if thrown from the piece with greater violence. See CANNON, GUN, and PROJECTILE.

RANGE of a Projectile, Amplitude of the. See AMPLITUDE.

RANGE, Point-blank. See POINT-blank.

RANGE, in a Ship, denotes a sufficient length of the cable, drawn up on the deck, before the anchor is cast loose from the bow, to let it sink to the bottom, without being interrupted, that the flukes may be forced the deeper into the ground, by the additional weight which the anchor acquires in sinking. For this reason, the range, which is drawn up out of the tire, ought to be equal in length to the depth of the water, where the ship anchors.

RANGER, a sworn officer of the forest, whose business it is to walk daily through his charge, to drive back the deer out of the purlieus or disafforested places into the forest lands; and to prevent all trespasses done in his bailiwick at the next court held for the forest.

The ranger is made by the king's letters, and has a fee paid yearly out of the exchequer, and certain fee-deer. In the Charta de Foresta mention is made of twelve kinds of rangers. It is now principally a honorary and sinecure employment; but the holders sometimes likewise receive pay.

RANGES, in *Ship Building*, horned pieces of oak, like belaying cleats, but much larger, bolted to the inside of a ship, in the waist, for belaying the tacks and sheets. Also those pieces of plank fixed between the ports, with semi-circular holes in them for keeping shot in.

RANGIFER, in *Zoology*, a variety of the CERVUS *Tarandus*; which see.

RANGING, in *War*, the disposing of troops in a condition proper for engagement, or for marching.

In *Building*, the side of a work that runs straight, without breaking into angles, is said to *range*, or *run range*.

RANGING out a canal, denotes determining or setting out on the ground the lines which are to be occupied by its middle and sides.

RANGLE, in *Falconry*, is when gravel is given a hawk to bring her to her stomach.

RANGOON, in *Geography*, a sea-port town of the Birman

RANGOON.

Birman empire, situated on a branch of the Irrawaddy, called the Rangoon river, which forms the only communication that the Pegue river has with the sea. The town, in its present state, has been extended by increasing trade and consequent population far beyond the limits which formerly comprehended Rangoon, as it was originally founded, in 1755, by Alompra, the sovereign of the Birman empire. Rangoon, or Dzangoon, which signifies victory achieved, was denominated Dagon, before Alompra took it, and laid the foundation of the present town. Here stood, in former days, a large and populous city, called in the Pali, or sacred language, Singouterra; the site of which Alompra diligently explored, and raised on its ruins the present flourishing sea-port of the Pegue dominions. Dagon, often called Shoe-Dagon, or the golden Dagon, is a name peculiar to the temple; a noble edifice, three miles distant from the banks of the river. (See DAGOUNG.) Rangoon stretches along the bank of the river about a mile, and is not more than a third of a mile in breadth. The city, or miou, (miou being a term applied either to a city or a district,) is a square surrounded by a high stockade, in the manner of the country, and on the N. side it is further strengthened by an indifferent fosse, across which a wooden bridge is thrown; in this face there are two gates, in each of the others only one. Wooden stages are erected in several places within the stockade, for musqueteers to stand upon in case of an attack. On the S. side, towards the river, which is about 20 or 30 yards from the palisade, there are several huts, and three wharfs, with cranes for landing goods. A battery, of twelve cannon, six and nine-pounders, raised on the bank, commands the river; but the guns and carriages are in such a wretched condition, that they could do little execution. Close to the principal wharf are two commodious wooden houses, used by the merchants as an exchange, where they usually meet in the cool of the morning and evening, to converse, and transact business. The streets of the town are narrow, and much inferior to those of Pegue, but clean and well paved; there are numerous channels to carry off the rain, over which strong planks are laid, to prevent an interruption of intercourse. The improvement of the town has been very much owing to the activity of the descendant of a Portuguese family, named Jaunsee, of low origin, but advanced at length to the important office of Shawbunder, or intendant of the port, and receiver of the port-customs. Under his direction and influence, the streets were paved, several well built wooden bridges were constructed, and also a wharf, which, extending into the river, and raised on posts, enables the ships to deliver and receive cargoes without the assistance of rivercraft; under his direction also a spacious custom-house has been erected. This is the only lay building in Rangoon that is not constructed of wood, it is composed of brick and mortar, and the roof covered with tiles; within, there is a number of wooden stages for the reception of bale goods. The houses, in general, are raised on posts from the ground; the smaller supported by bamboos, the larger by strong timbers. All the officers of government, the most opulent merchants, and persons of consideration, live within the fort; shipwrights, and people of inferior rank, inhabit the suburbs; and one entire street, called Taekally, is exclusively assigned to common prostitutes, who are not permitted to dwell within the precincts of the fortification. Swine are suffered to roam about the town at large; they do not belong to any particular owners, but are regarded as servants of the public, or common scavengers; as they go under the houses and destroy the filth. The Birmans are also fond of dogs, numbers of which infest the streets; the

breed is small, and very noisy. The borders of the terrace on which the temple of Dagoung is raised, are planted with shady trees in regular rows; and from this eminence there is a beautiful and extensive prospect; the Pegue and Rangoon rivers are seen winding through a level woody country, and the temple of Syriam, little inferior to others at Pegue and Rangoon, stands near the junction of the streams. The road leading from the city to the temple is formed with care, a wide causeway in the centre throwing off the rain to the sides; and numberless little spaces are ranged along the edge of the road, in which are niches to receive small images of their divinity Gaudma. Several kioums or monasteries lie in this direction, generally removed at a short distance from the public way, under the shade of pipal or tamarind trees. The Birmans being, like other inhabitants of the east, fond of processions, scarcely a week passes in which there is not a religious display at Rangoon; either a funeral of some person who leaves sufficient to defray the expence of a pompous public burning, or the ceremony of admitting youths into the convents of the Rhahaans, on which occasion parents and friends spare no expence in entertainments and presents to the Rhahaans. See RHAHAANS.

The population of Rangoon is considerable; there are 5000 registered taxable houses in the city and suburbs; so that if each house be supposed to contain six people, the estimate will amount to 30,000. Having long been the asylum of insolvent debtors from the different settlements of India, it is crowded with foreigners of desperate fortunes, who find from the Birmans a friendly reception, and generally support themselves by carrying on a small trade. The exchange, if it may be so called, exhibits a motley assemblage of merchants, such as few towns of much greater magnitude can produce; Malabars, Moguls, Persians, Parsees, Armenians, Portuguese, French, and English. The members of this discordant multitude, engaged in various branches of commerce, are not only permitted to reside under the protection of government, but likewise enjoy the most liberal toleration in matters of religion. They celebrate their several rites and festivals, totally disregarded by the Birmans, who have no inclination to make proselytes. In the same street may be heard the solemn voice of the Muezim, calling pious Islamites to early prayers, and the bell of the Portuguese chapel tinkling a summons to Romish Christians. Processions meet and pass each other without giving or receiving cause of offence. The Birmans never trouble themselves about the religious opinions of any sect, nor disturb their ritual ceremonies, provided they do not break the peace, or meddle with their own divinity Gaudma; but if any person commit an outrage, which the Mussulmen, in their zeal for the true faith will sometimes do, the offender is sure to be put into the stocks; and if that does not calm his turbulent enthusiasm, he is bastinadoed into tranquillity.

The Parsees, the Armenians, and a small proportion of Mussulmen, engross the largest share of the trade of Rangoon; and individuals from their number were frequently selected by government to occupy employments of trust, that related to trade and transactions with foreigners, the duties of which the Birmans conceive that such persons could perform better than themselves. These people, particularly the Armenians, naturally behold with a jealous eye any ordinance of a commercial nature, that may tend to diminish their influence, and deprive them of that dictatorial power, which they assume and exercise over all merchants and mariners that resort to Rangoon; but of none are they so apprehensive as of the English: a connection with whom might teach the Birmans to transact foreign business without their assistance, and give them a more adequate sense of their own interest.

The

The French have long maintained an agent at Rangoon, and are thoroughly acquainted with the advantages which the country of Pegue affords. The imports into Rangoon from the British settlements in the years 1794—5, amounted, according to Mr. Symes, to more than twelve lacks of rupees, about 135,000*l.* sterling; these consisted chiefly of coarse piece goods, glass, hardware, and broad cloth, the demand for the last article being considerable; and returns were almost wholly made in timber. Teak, the most durable wood that is known, and best adapted for the construction of ships, is produced in the Birman and Pegue empire in inexhaustible abundance. The river of Rangoon is equally commodious for the construction of ships; the spring tides rise 20 feet in perpendicular height; the banks are soft, and so flat, that little labour is necessary for the formation of docks: vessels of any burden may be built. Nature, says Symes, has liberally done her part to render Rangoon the most flourishing sea-port of the eastern world. The entrance of the river, about twelve miles below Rangoon, and the banks on each side, bear a near resemblance to those of the Ganges; but the navigation is much more commodious. The channel is bold and deep, from six and a half to eight fathoms, uninterrupted by shoals or inequality of foundings. At this place the breadth of the river is estimated to be from three quarters to one mile. On the bank of the river, opposite to Rangoon, is a considerable town, called Maindu, the residence of the governor of the province of Dalla. This government is entirely distinct from Rangoon, on the east side. The city of Dalla, from which the province takes its name, is said to be on the west side of the China Buckier river, and was formerly a place of considerable importance. The town of Maindu is composed of one long street; at the east end is a creek, which goes all the way to Bassein, and has twelve feet depth of water, at high tide; on the west side is a smaller creek, on the bank of which stands a village called Mina-Shunrua, or the village of prostitutes, being wholly inhabited by women of that description. Rangoon lies in N. lat. 16° 47'. E. long. 96° 9'. Symes's Embassy to Ava, in 3 vols. 8vo. See *BIRMAN Empire*.

RANGSIO, a town of Sweden, in Helplingland; 15 miles W.N.W. of Soderhamn.

RANGUANA, a small island in the bay of Honduras, near the coast of Mexico. N. lat. 16° 25'. W. long. 88° 52'.

RANHADOS, a town of Portugal, in the province of Beira; 18 miles N.W. of Castel Rodrigo.

RANINA, *Arteria et Vena*, in *Anatomy*, the artery and vein situated on the inferior surface of the tongue. See *ARTERY* and *VEIN*.

RANINAL VESSELS, *Bleeding from*. See *FRÆNUM LINGUÆ*, *Division of*.

RANISH, in *Geography*, a small island near the W. coast of Scotland. N. lat. 57° 55'. W. long. 5° 5'.

RANK, a due order, or a place allotted a thing suitably to its nature, quality, or merit.

Kings are persons of the first rank on earth. In cavalades, processions, &c. every person is to observe his rank.

RANK, in *Military Discipline*, denotes a series, or row of soldiers, placed side by side; a number of which ranks form the depth of the squadron or battalion, as a number of files does the width.

When infantry is drawn up three deep, the first rank is called the *front* rank; the second, the *centre* rank; and the third, the *rear* rank.

To *close the rank*, is to bring the men nearer; to *open* it, is to set them farther apart. To *double the ranks*, is to throw

two into the space of one, by which the files are thinned. See *DOUBLING*.

RANK, in the *Army and Navy*, is used for the order of *precedence*; which see.

In the army the officers in the life-guards are entitled to the rank of lieutenant-colonel, when they obtain or purchase a majority, provided they are of seven years standing. Their commissions in this case run major and lieutenant-colonel. But if an officer should not have completed either of those periods, he obtains the rank of major only until its completion. A lieutenant-colonel attains to the rank of full colonel if he has been seven years major, or twenty-one years in the British service. Cornets in the life-guards rank as sub-lieutenants in their own corps, and as first lieutenants in the army. The English fuzileers enjoy the same privilege. Sub-lieutenants in the Welsh fuzileers, rank only as second lieutenants in the army. Marines do the same.

Officers of the regular forces command the officers of equal degree belonging to the other services. Officers of the militia, fencibles, yeomanry cavalry, and volunteer corps, rank together, according to the dates of their respective commissions. These regulations are subject to some exceptions, specified in the articles of war. Officers of the militia rank generally with the regular forces as junior of their respective commissions. An ensign in the guards ranks no higher than an ensign in the regulars. The chief of the engineers ranks as colonel; director, as lieutenant-colonel; sub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain-lieutenant; sub-engineer, as lieutenant; practitioner-engineer, as ensign.

In the navy the admiral or commander-in-chief of his majesty's fleet has the rank of a field-marshal; admirals, with the flags on the top-mast-head, rank with generals of horse and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commodores with broad pendants, as brigadier-generals; captains of post-ships, after three years from the date of their first commission, as colonels; other captains, commanding post-ships, as lieutenant-colonels; captains, not taking post, as majors; and lieutenants, as captains.

RANK, *Brevet*, rank without pay, nominal distinction, which sometimes entitles the holder of it to command in mixed service. The brevet rank in the militia is confined to the colonels and adjutants of the several corps in that establishment. The former receive the brevet rank of colonels in the army whilst actually embodied for service, and command all lieutenant-colonels in the line when they do duty together. Adjutants in the militia may have the brevet rank of captain, provided they have served five years as lieutenants in the militia, or in other forces on the British establishment. In the line, an adjutant who has the rank of captain, may command as such when there is no superior officer on the parade, or for duty. This is not the case in the militia. No adjutant, let his brevet rank of captain be ever so ancient, can command the youngest captain of a company. The same difference prevails with respect to the captain-lieutenancy; which is literally brevet rank. In the regulars, a captain-lieutenant, the instant he is promoted to a company, takes rank according to the date of his first commission, and, as we have observed, may be major by brevet; but no captain-lieutenant can ever avail himself of that seniority to the prejudice of a captain of a company in the militia; nor can an officer in the latter establishment take advantage of his standing, when he quits one regiment to serve in another, even in time of war, although he may have the requisite qualifications in both counties.

Brigade majors rank with captains, provided they have that

that rank in the army, independent of their staff appointment. But aids-de-camp do not possess any rank in that capacity with regard to the army. The latter constitute a part of the general's family, and are paid out of his allowance; they are in fact the mere carriers of his orders in the field, and his domestic inmates at home, &c. The former belong to the brigade, and are a necessary part of its effective force. It has been judiciously ordained, that both the one and the other should be regular officers.

There is likewise a sort of brevet rank which exists in the several regiments belonging to the British service, and is confined to the rank and file, or corporals and private soldiers. Thus a lance-serjeant is a corporal who does the duty of serjeant without the pay or emoluments of the latter; and a lance-corporal is a private soldier who does the duty of corporal. So that *lance*, which comes from *lanfquenet*, and ought therefore to be written *lans-serjeant*, &c. is the abbreviation of that word, which signifies a private soldier, and is derived from the German, and when put before serjeant or corporal, points out, that a private soldier has the brevet rank of one of those situations. Captains of companies appoint or reduce lance-serjeants or corporals, according to their judgment.

RANK, in respect of ships. See **RATE**.

RANK and File, denote men carrying the fire-lock and standing in the ranks. Thus corporals are included in the return which is made under that head.

RANKS and Files, are the horizontal and vertical lines of soldiers, when drawn up for service.

RANK Keel, in *Ships*. See **KEEL**.

RANK Modus, in *Law*. See **MODUS**.

RANK is also a term provincially applied to signify any sort of crop of large growth, standing thick or close on the ground, as corn, pease, beans, &c. and even trees in woods. The term is often used to denote corn or grass crops, which are of such strong growths as to be laid down or lodged.

RANKAH, in *Geography*, a town of Bengal; 25 miles W.N.W. of Palamow.

RANKERAH, a town of Hindoostan, in Candeish; 25 miles S. of Burhanpour.

RANKNESS in *Cheese*, in *Rural Economy*, a term signifying its strong pungent quality arising from the impurity of the rennet or steep, either in consequence of neglect of the vessels holding it, the want of salt, or the imperfect separation of the curdy matter from the whey, by which fermentation and partial putrefaction occur and produce this taste. See **CHEESE** and **DAIRYING**.

RANKPORE, in *Geography*, a town of Hindoostan, in Guzerat; 45 miles E. of Radunpour.

RANNEE, a town of Hindoostan, in Orissa; 30 miles S.S.W. of Balasore.

RANNEL-BAUK, in *Rural Economy*, a word provincially used to signify the wooden bar or bauk laid across the cottage chimney, for hanging the pot-hooks on, &c.

RANNIGUNGE, in *Geography*, a town of Bengal; 76 miles N.N.E. of Dacca.

RANNING, a town of the duchy of Wurzburg; five miles N. of Schweinfurt.

RANNISERAI, a town of Hindoostan, in Allahabad; 35 miles N.W. of Gazypour.

RANNUTSCH, a town of Thibet; 36 miles E. of Jemlah. N. lat. $30^{\circ} 42'$. E. long. $82^{\circ} 15'$.

RANNY, in *Rural Economy*, a provincial word, applied to the small field-mouse.

RANNY Bednore, in *Geography*, a town of Hindoostan,

in the circar of Sanore; 20 miles W. of Bijnagur. N. lat. $15^{\circ} 18'$. E. long. $75^{\circ} 37'$.

RANNYCOTTA, a town of Thibet; 35 miles S. of Gangotri.

RANNYDEE, a town of Bengal; 11 miles S. of Curuckdeagh.

RANNYGONG, a town of Hindoostan, in Dowlatabad; 15 miles S.S.W. of Amednagur.

RANNYGUNGE, a town of Bengal; 35 miles N. of Dinagepour.

RANNYPOOKRA, a town of Bengal; 30 miles W.N.W. of Rogonatpour.

RANO, a small island in the N. part of the gulf of Bothnia. N. lat. $65^{\circ} 43'$. E. long. $22^{\circ} 52'$.

RANRAN, a town of Cochinchina, and the capital of a province. N. lat. $12^{\circ} 30'$. E. long. $108^{\circ} 56'$.

RANSACKEN, a town of the duchy of Wurzburg; 3 miles S. of Wurzburg.

RANSOM, a sum of money paid for the redemption of a person out of slavery, or for the liberty of a prisoner of war.

With regard to prisoners of war, it is allowed that there is no obligation of releasing those who are detained as such, till after satisfaction has been obtained. Whoever makes a just war has a right, if he thinks proper, to detain his prisoners till the end of the war; and then, in releasing them, he may justly require a ransom, either as a compensation for a peace, or, if the war continue, for diminishing his enemy's prisoners, at the same time that he strengthens him with the return of soldiers. Prisoners of war, among European nations, are exchanged or ransomed during the war; and this is generally stipulated in a previous cartel. If sovereigns at war have agreed on a cartel for the exchange or ransom of prisoners, they are faithfully to observe it no less than every other convention; but if, as was formerly the general practice, the state leaves to every prisoner, at least during the war, the care of redeeming himself, such particular conventions offer many questions, of which some of the principal are the following. He who has acquired a lawful right of demanding a ransom from his prisoner, may transfer his right to a third person. This was practised in the last ages. But as the person taking a prisoner is obliged, for the sake of his reputation, to treat him with justice and humanity, he is not to transfer his right, in an unlimited manner, to one who might probably abuse it. When he has agreed with his prisoner, concerning the price of the ransom, he may transfer the right to whom he pleases. On the conclusion of an agreement made with a prisoner for the price of his ransom, it becomes a perfect contract, and cannot be receded from, under a pretence that the prisoner is discovered to be richer than was imagined; for there is no manner of necessity that he should be rated according to the wealth of a prisoner, because that is not the scale for measuring the right of detaining a prisoner of war. But it is natural to proportion the price of the ransom to the prisoner's rank and character; the liberty of an officer of distinction being of greater consequence than that of a private man, or inferior officer. If the prisoner has not only concealed, but disguised his rank, it is a fordid fraud, and gives a right for annulling the agreement. If a prisoner, having agreed on the price of his ransom, dies before payment, it has been queried whether this price be due, and whether the heirs are obliged to discharge it? Unquestionably, says Vattel, they are obliged to it, if the prisoner died in the possession of his liberty; for, from the moment of his release, in consideration of which he had promised a sum, this sum becomes due, and does not at all belong to his heirs; but if he had

not obtained his liberty at the time of his death, it can be no debt to him, or to his heirs, unless the agreement was otherwise: and he is not reputed to have received his liberty, till he is absolutely permitted to depart free; when neither he whose prisoner he was, nor the sovereign, opposed his release and departure. If indeed he has only been permitted to take a journey for applying to his friends, or his sovereign, in order to obtain the means of ransoming himself, and he dies before he is possessed of his full liberty, before his final discharge from his parole, nothing is due for his ransom. If, after agreeing on the price, he is detained in prison till the time of payment, and he dies before, the debt is paid by his death, and does not affect his heirs; such an agreement on the part of him, who detains his prisoner, being no more than a promise of giving him his liberty for a certain sum paid down. A promise of buying and selling does not suppose the purchaser to pay the price of a thing, if it happen to perish before the bargain is concluded. But if the contract of sale be perfect, the purchaser shall pay the price of the thing sold, though it should happen to perish before the delivery of it, provided there was no fault or delay in the seller. For this reason, if the seller has absolutely concluded the agreement of the ransom, and from that time owns himself a debtor for the stipulated sum, remaining no longer as a prisoner, but for the security of the payment, his intervening death does not extinguish the debt: the ransom agreed on remains still due. If the agreement says, that the ransom shall be paid on a certain day, and the prisoner happens to die before that day, then the heirs are bound to discharge it; for the ransom was due, and the day was assigned, only, as the term for payment. Upon the same principles, strictly speaking, it follows, that a prisoner, released on condition of procuring the release or discharge of another, should return to prison, in case the latter happens to die before he could procure him his liberty. Such an unfortunate case, however, is entitled to regard, and equity seems to require that this prisoner should continue in the enjoyment of liberty, provided he pays a just equivalent; it being now out of his power to purchase it precisely at the price agreed on. If a prisoner fully set at liberty, after having promised, but not paid, his ransom, happen to be taken a second time, it is evident that, without being exempted from paying his first ransom, if he is willing to be set at liberty, he must pay a second ransom. On the contrary, though the prisoner has agreed for the price of his ransom, if before the execution of the compact, before he is set at liberty in virtue of it, he be retaken by his party, he owes nothing. It is here evidently supposed, that the finishing hand was not put to the compact, and that the prisoner had not acknowledged himself debtor for the rate of his ransom. He whose prisoner he was, had, as it were, only made him a promise of selling, and he had promised to purchase; but the purchase and sale had not actually passed into effect; the property was not actually transferred. The property belonging to a person does not pass to him who takes him prisoner, unless at the same time he seizes on such things. Of this there is no doubt, especially in our times of moderation, when prisoners of war do not fall into slavery. And even by the law of nature, the property of a slave's goods does not, without some other reason, pass to the master of a slave. There is nothing in slavery of which this can itself be the natural effect. If a man obtain a power over the liberty of another, does it follow that he has likewise a right over his property? Therefore, if an enemy has not stripped his prisoner, or the latter has found means to conceal something from his search, what he has preserved should belong to him, or he may employ it towards the

payment of his ransom. At present even prisoners are not always stripped. The death of a prisoner puts a period to the right of him who had taken him; therefore an hostage, given for the procuring of a person's liberty, is to be released the moment the prisoner expires; and if the hostage dies, the prisoner is not released by such death. The reverse of this is true, if one, instead of being an hostage for the other, had been substituted in his stead. Vattel's Law of Nations, b. iii. ch. 17.

Formerly it was a common practice to ransom British ships, when captured by an enemy, by delivering to the enemy what was called a ransom-bill, which secured to the captor the price agreed upon, and operated as a bill of sale of the ship and cargo to the original owners, and as a protection to the ship against other cruisers of the enemy during the remainder of the voyage. A hostage was delivered to the captor, for securing to him the punctual payment of the stipulated sum. This ransom-bill, independent of the hostage, was considered as a contract of the law of nations, and obligatory upon the owners, as well as upon the captain and hostage who signed it; and actions have been often brought upon them in our courts of common law. And where the ship or goods were insured, the amount of the ransom was usually taken to be the measure of the demand of the insured upon the underwriters, in respect of the capture. But this practice of ransoming ships captured by the enemy being found to operate more to the disadvantage than for the benefit of this country, it was thought proper at length to prohibit it altogether. And therefore by stat. 22 Geo. III. c. 25. § 1. it is enacted, that it shall not be lawful for any of his majesty's subjects to ransom, or to enter into any contract or agreement for ransoming, any ship or vessel belonging to any of his majesty's subjects, or any merchandizes or goods on board the same, which shall be captured by the subjects of any state at war with his majesty, or by any person committing hostilities against his majesty's subjects. By § 2. all contracts and agreements which shall be entered into, and all bills, notes, and other securities, which shall be given by any person or persons for ransom of any such ship or vessel, or of any merchandize or goods on board the same, shall be absolutely void in law, and of no effect whatever. And by § 3. a penalty of 500*l.* is given to the informer, for every offence against the act. This statute has put an end to all questions on the law of ransoms. Marshall's Treatise on the Law of Insurance, vol. ii.

In our *Law Books*, ransom is also used for a sum paid for the pardoning of some notorious crime.

Horn makes this difference between *ransom* and *amercement*, that ransom is the redemption of a corporeal punishment due to any crime.

It is never usual to assess a larger fine than a man is able to pay, without touching the implements of his livelihood, but to inflict corporal punishment, or a limited imprisonment, instead of such fine as might amount to imprisonment for life. And this is the reason why fines in the king's court are frequently denominated *ransoms*, because the penalty must otherwise fall upon a man's person, unless it be redeemed or ransomed by a pecuniary fine (Murr. c. 5. § 3. Lamb. Eirenarch. 57.); according to an ancient maxim, "qui non habet in crumena luat in corpore." Yet, when any statute speaks both of fine and ransom, it is holden, that the ransom shall be treble to the fine at least. Dyer. 232.

RANSTADT, in *Geography*, a town of Germany, in the principality of Stolberg; 17 miles N.E. of Frankfort on the Maine.

RANSTADT, or *Mark Ranstadt*, a town of Saxony, in the

the territory of Merseburg; 10 miles S.S.E. of Merseburg. N. lat. $51^{\circ} 18'$. E. long. $12^{\circ} 14'$.

RANT, in the *Drama*, an extravagant flight of passion, overflowing nature and probability.

Lee's tragedies abound with rants; yet the wildest of them, it is observed, have frequently met with applause on the stage.

We find instances of rants, even in our severest poets. Such, *e. gr.* is that in the beginning of Ben Jonson's Cataline, where the parricide, in speaking to Rome, says, "I'd plow up rocks, steep as the Alps in dust; and lave the Tyrrhene waters into clouds, but I would reach thy head!"

RANTAMPOUR, in *Geography*, a circar of Hindoostan, in the country of Agimere, bounded on the N. by Jyenagur, on the E. by Agra, on the S. by Kottah, and on the W. by Oudipour and Sirowy.—Also, a town and fortress, being the capital of the above named circar; 86 miles E. of Agimere. N. lat. $28^{\circ} 35'$. E. long. $76^{\circ} 58'$.

RANTZAU, JOHN, in *Biography*, a general in the Danish service, was born in 1492, and at the age of 13 he entered into the army. In 1515 he began to travel into foreign countries, visiting in succession England, Spain, Germany, Italy, Greece, Syria, Palestine, and other parts of the East. In 1517 he was knighted at Jerusalem; and upon his return to Denmark, was appointed to accompany duke Christian, afterwards Christian III., on his tour to Brandenburg, and other towns of Germany. When Frederic I. accepted the crown of Denmark, he was promoted to be a general in 1553, and entrusted with the command of the troops in Holstein. He became greatly distinguished in his military character, and on various diplomatic concerns, and died in 1565. As an author he is known by the following works: "A true and brief Account of the Wars carried on in 1559, by Frederic king of Denmark, and Adolphus duke of Holstein," &c.; "Descriptio Cimbricæ," printed in Westphalen's Monumenta inedita, tom. i. Gen. Biog.

RANTZAU, in *Geography*, a county of Germany, in the duchy of Holstein, about ten miles long and six broad. It takes its name from a seat seven miles N. of Eutyn.

RANTZEN, a town of the duchy of Stiria; 6 miles N.W. of Muckrau.

RANTZENBACH, a town of Austria; 6 miles S.S.W. of St. Polten.

RANVILLE, a town of France, in the department of the Calvados; 5 miles N.E. of Caen.

RANULA, dim. of *rana*, a frog. This term is, in *Surgery*, applied to a swelling of the salivary ducts under the tongue. Whether the tumour is so named from a whimsical supposition that it bears a resemblance to a frog, or from its being fancied to oblige the patient to make a croaking noise, in attempting to articulate, is a point which surgical writers leave undetermined. The swelling is round, of a greyish colour like an hydatid, soft, compressible, indolent, and, in the early stage, almost transparent. At first, it is of about the same size as a nut, or cherry; but, by degrees, its volume becomes much more considerable. It is very frequently met with in young children: its occurrence in adults is more uncommon. It consists of a successive dilatation of the excretory tube of the submaxillary, or else of the sublingual gland, the orifice of which duct is by some cause or another stopped up, or obliterated; so that the confined saliva accumulates, becomes viscid, and ceases to flow in the usual manner. In proportion as the ranula increases, the incipient state of it having been neglected, its enlarged size raises up the tongue, and forces it backward;

the consequence of which is, that mastication, deglutition, and respiration, are obstructed. The voice becomes indistinct, and hoarse; the motion of the tongue is restrained; this organ cannot be put out of the mouth. By degrees, the incisor and canine teeth of the lower jaw are loosened; the layer of muscles, composing the lower parietes of the mouth, is depressed; and the swelling, having attained a considerable size, makes a very manifest prominence beneath the chin. In this advanced stage, that is to say, when the ranula has existed ten or twelve years, as practitioners occasionally see instances of, the appearance of the swelling is quite altered from what it originally was. The tumour is now hard, elastic, painful, ulcerated, and, as it were, sarcomatous: it is as large as a turkey's egg, and not situated at the side of the frænum, but anteriorly under the tongue, to which it is closely adherent. The mouth emits a very fetid smell; and the breathing is so much obstructed, that the patient, through fear of suffocating, is obliged to lie with his mouth wide open, when he goes to sleep.

While a ranula is recent, the fluid which it contains is a viscid saliva, resembling the white of egg, and sometimes of rather a yellow colour. In time it is gradually changed, becoming turbid and puriform; and, in certain instances, soft, friable, greyish concretions, from the size of a pea to that of an almond, commonly called salivary calculi, are found in the kind of cyst, which is produced by the dilatation of the salivary duct. These calculi essentially consist of a large proportion of the phosphate of lime, united with a mucilaginous substance; and concretions of the same kind frequently occur in the tonsils, and in the salivary glands themselves, as well as their excretory ducts. Forestus, lib. xiv. obs. 26. p. 112. Blegney, Nouvelles Découvertes, &c. tom. i. ann. 1679, p. 230. Mém. de l'Acad. de Chirurgie, tom. v. p. 464. Petit, Œuvres Posthumes, &c. tom. i. p. 188. Blasius, Obs. 14. p. 81.

A ranula, whether recent or inveterate, cannot be cured except by a surgical operation. The curative indication, in the first of these states, is to make an outlet for the fluid accumulated in the tumour, and to make an opening sufficiently capacious to let the saliva readily pass into the mouth. Merely making an incision into the swelling, or opening it with a trocar, or a seton drawn through it, are stated to be ineffectual methods. The tumour does indeed subside as soon as the aperture is made; but the edges of the wound grow together again, and the disease recurs. There is an absolute necessity for first making an incision the whole length of the swelling, and then removing, with the aid of scissors and a pair of dissecting forceps, a portion of the edges of the recent wound. This slight loss of substance prevents the return of the complaint, and always insures a free passage for the saliva; an advantage of which there is no certainty in any other mode of proceeding. By this slight operation, ranulæ in children may be cured in the course of a few days, without the least occasion for the application of any dressings whatsoever. It has been proposed to dilate the contracted orifice of the salivary duct with a probe. (Mém. de l'Acad. de Chirurgie, tom. iii. p. 460.) But this orifice is difficult of detection, and the swelling cannot be in this manner easily emptied. M. Lassus seems to entertain doubts whether Warton's canal can ever be made to resume its original state, after once being closed. Pathologie Chirurg. tom. i. p. 405.

When a ranula has existed a long while, is attended with considerable hardness, and is of large size, it is a tumour which requires to be completely extirpated. A transverse incision, parallel to the opening of the mouth, is to be made in it through its whole extent. The surgeon is then to cut

out the upper portion of the swelling, situated in front of the frænum of the tongue, to which it is also adherent, and next the inferior portion, which sometimes extends into the interspace betwixt the genio-hyoidei and genio-glossi muscles, with which it becomes confounded. A pair of forceps, a hook, scissors, and a straight bistoury, are the instruments necessary for this operation. A degree of hemorrhage always ensues. The use of a detergent gargle, made of barley-water and honey of roses, will serve to finish the cure in a very moderate space of time.

In confirmation of the latter observation, Lassus adduces the following case. A young man, aged 22, had a ranula, which had continued ever since he was born, and was equal in size to a turkey's egg. The incisor teeth of the lower jaw were loosened, and forced forward by the successive increase of the swelling. A seton had been passed quite through it, without any useful effect. The breath of the patient and his saliva were intolerably fetid. The tumour was closely adherent to the lower and anterior part of the tongue; and extending laterally, confounded itself with this organ, of which it impeded the motion. A straight, narrow bistoury was introduced into one of the openings at the side of the tumour, and carried completely across to the opposite aperture. Thus a transverse incision was made into the cavity of the disease. By means of the same instrument and a hook, the lateral portions of the swelling were removed. A profuse hemorrhage ensued, caused by the total division of the frænum, the raninal veins, and one of the raninal arteries. It was stopped by putting under the tongue a large quantity of dry lint, and by compressing the dorsum of the tongue several hours with the fingers, while the thumb was employed in compressing the parts behind the chin from below upwards. This double sort of pressure answered the purpose. No cautery was found necessary, and, by the use of detergent gargles, the patient was cured in about a fortnight.

When a ranula of long duration, situated at the side of the tongue, and of considerable size, forms a tumour, that makes its appearance outwardly towards the base of the jaw, Lassus seems to disapprove of making a free incision through the skin, for the purpose of extirpating that part of the swelling which cannot be removed through the mouth; a plan which was, in one instance, practised by Marchettis. *Obs. Med. Chirurg. obs. 31. p. 48.* See Lassus' *Pathologicæ Chirurgicæ*, tom. i. chap. 61.

RANULARES, in *Anatomy*. See RANINA.

RANUNCULACEÆ, in *Botany*, the 61st natural order in Jussieu's system, or the first of his 13th class, for whose character see GERANIA. The *Ranunculaceæ* are defined as follows.

Calyx of many leaves, sometimes wanting. *Petals* definite, mostly five. *Stamens* indefinite, except in *Myosurus*; their anthers incorporated with the filaments. *Germens* several, indefinite or definite, rarely solitary, placed on a common receptacle; each of them furnished with a style, which is rarely wanting, and a simple stigma. *Capsules*, or rarely *berries*, as many as the germens; in some instances single-seeded, and not bursting; in others many-seeded, splitting half way down, at their inner margin, into two valves, bearing the seeds at the edges. *Corculum* minute, lodged in a cavity at the upper part of the large horny *albumen*. *Stem* generally herbaceous. *Leaves* alternate; rarely (in *Clematis* and *Atragene*) opposite; some of them half sheathing the stem; some compound, pinnate or fingered; some, as is more frequently the case, simple, and these are mostly palmate or lobed, their sinuses often pale at the base. See

RANUNCULUS.

VOL. XXIX.

Jussieu divides the order in question into four sections.

SECT. 1. *Capsules single-seeded, not bursting; berries in Hydrastis.*

This section consists of *Clematis*, *Atragene*, *Thalictrum*, *Hydrastis*, *Anemone*, *Hamadryas* of Commerçon, *Adonis*, *Ranunculus*, *Ficaria*, and *Myosurus*.

SECT. 2. *Capsules many-seeded, splitting at the inner edge. Petals irregular.*

The calyx in this section is often coloured, being what Linnæus terms corolla; that author considering the petals of Jussieu as nectaries. The genera are *Trollius*, *Helleborus*, *Isopyrum*, *Nigella*, *Garidella*, *Aquilegia*, *Delphinium*, and *Aconitum*. Some species of *Delphinium* have but a single capsule.

SECT. 3. *Capsules many-seeded, splitting at the inner edge. Petals regular.*

Caltha, *Pæonia*, *Zanthorrhiza*, *Cimicifuga*.

SECT. 4. *Germen solitary. Berry of one cell, with many seeds, affixed to a single lateral receptacle.*

The only genera are *Aëæa* and *Podophyllum*, and these we feel disposed to remove to Jussieu's next order, PAPAVERACEÆ. See that article.

We cannot but remark that the *petals*, as Jussieu terms them, in *Trollius* and *Helleborus* are by no means definite, and that they greatly exceed the number five. Neither are they irregular in *Trollius*. As to the other genera of his 2d section, the parts in question are such obvious nectaries, that they can have no other function to perform, except possibly in *Aquilegia*, where their limb partakes of the nature of petals.

RANUNCULOIDES, a genus of Vaillant's, founded on the *Ranunculus hederaceus* and *aquatilis* of Linnæus, and named from its resemblance or affinity to RANUNCULUS; see that article. No one has followed Vaillant in this instance, nor is there any real mark of distinction for his supposed genus. *Ranunculoides* is, besides, the specific name of a rare British *Anemone*, but *ranunculina* would have been better Latin; as in *Helleborus ranunculinus*, Sm. Pl. Ic. fasc. 2. t. 37. Willd. Sp. Pl. v. 2. 1336. See HELLEBORUS.

RANUNCULUS, an ancient name, whose origin is as obvious as its sense is obscure. The word is, no doubt, derived from *rana*, and means a little frog. The Greeks call the same plant $\beta\alpha\lambda\alpha\chi\iota\omicron\nu$, which is nearly synonymous. Most etymologists suppose this name to allude to the native situation of the plant, in bogs and watery places, such as frogs frequent. But the original $\beta\alpha\lambda\alpha\chi\iota\omicron\nu$ of Dioscorides is the beautiful *Ranunculus asiaticus* of Linnæus, or Garden Ranunculus, which inhabits corn-fields, and does not grow in wet places; though indeed the other three species, described by that ancient writer, do; these are our *lanuginosus*, *muricatus*, and *aquatilis*. It seems possible that the divisions of the leaves in all these plants may have suggested the idea of a frog's foot, which supposition is confirmed by the English name, Crowfoot. Ambrosinus hints at a resemblance between the root and the foot of a frog, which is not, to us, by any means apparent.—Linn. Gen. 281. Schreb. 377. Willd. Sp. Pl. v. 2. 1307. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 587. Prodr. Fl. Græc. Sibth. v. 1. 380. Ait. Hort. Kew. v. 3. 351. Pursh v. 2. 391. Juss. 233. Poiret in Lamarck Dict. v. 6. 97. Lamarck Illustr. t. 498. Gærtn. t. 74. (Ficaria; Dill. Gen. 108. t. 5. Hudf. Angl. 244. Juss. 233. Ranunculoides; Vaill. Mem. de l'Acad. des Sciences for 1719, German edition, 321.)—Class and order, *Polyandria Polygynia*. Nat. Ord. *Multifloræ*, Linn. *Ranunculaceæ*, Juss.

Gen. Ch. *Cal.* Perianth of five ovate, concave, some-

what coloured, deciduous leaves. *Cor.* Petals five, obtuse, polished; with small claws. Nectary a cavity in each petal, just above the claw. *Stam.* Filaments very numerous, half the length of the corolla; anthers firmly united therewith, erect, oblong, obtuse, of two separate lobes. *Pist.* Germens numerous, collected into a head; styles none; stigmas reflexed, very small. *Peric.* none. *Receptacle* beset with extremely minute stalks, to which the seeds are attached. *Seeds* numerous, naked, irregular, uncertain in figure, with a reflexed point.

Obf. The essential mark of this genus consists, as Linnæus remarks, in the nectary, the rest of the parts being uncertain; hence he takes occasion to point out the use of adverting to that organ, which before his time had been neglected, and which his opponents accuse him of sometimes making of too much importance. The great Jussieu will not, in this obvious case, use the language, though he adopts, unacknowledged, the idea of Linnæus; nor will he allow the manifest nectaries of some of his *RANUNCULACEÆ* (see that article) to be other than petals. "Such," to use his own words, in his preface, p. 26, "is the love of undivided praise!"

The nectary in *Ranunculus*, says Linnæus, is, in some species, a naked pore; in some it is bordered with a cylindrical margin; in others closed with a notched scale. *Ficaria* of authors has only a three-leaved calyx, with a superabundance of petals. The seeds in some species are roundish; in others depressed, prickly, and fewer in number. *R. hederaceus* has but five stamens; *falcatus* has a sword-shaped point to each seed, and appendages to the base of the calyx; *sceleratus*, and a few besides, have an awl-shaped receptacle, and consequently a spiked fruit.

Ess. Ch. Calyx of five leaves. Petals from five to eight, with a honey-bearing pore in the claw of each. Seeds naked.

This extensive genus is divided into two sections, by the form of the leaves. The species are all herbaceous, generally of an acrid quality. The prevailing colour of the flowers is yellow; we know of none that are blue, except by accidental variation in *R. asiaticus*. They are plants of temperate or cold climates; some of them alpine. Linnæus, in Sp. Pl. ed. 2, enumerates twenty-eight species; the 14th edition of Syst. Veg. has forty-four, and Willdenow reckons up sixty-one. Fifteen are natives of Britain, as mentioned in Fl. Brit.; but the 11th species in that work, *parvulus* of Linnæus, must be expunged, as a mere variety of *hirsutus*, n. 8. The original number is, however, made up, by a newly-discovered Scottish species, the *alpestris*, figured in Engl. Bot. v. 34. t. 2390.

So many additions have been made to this genus by the labours of Poiret in Lamarck's Dict. v. 6, and the discoveries of Michaux and Pursh, that, with some necessary corrections, and a few communications of our own, the whole subject requires to be detailed.

SECT. 1. *Leaves simple and undivided.*

1. *R. Flammula.* Lesser Spear-wort. Linn. Sp. Pl. 772. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 387. Curt. Lond. fasc. 6. t. 37. (*R. flammeus minor*; Ger. Em. 961, and *R. flammeus ferratus*; ibid. 962.)—Leaves ovato-lanceolate, bluntish, stalked. Stem declining.—Native of watery places throughout Europe, flowering most part of the summer. Root perennial, of long simple fibres. Herb thinning, not quite smooth, very various in size and luxuriance. Stems spreading in every direction, round, leafy, hollow. Leaves many-ribbed, either entire or variously ferrated. Flowers numerous, solitary, on long stalks, of a bright golden yellow, half an inch or

more in diameter. The whole plant is of an excessively acrid burning quality, said to produce inflammation in the viscera of sheep, whence the name *flammula*, a little flame. Dr. Withering recommends the distilled water, as preferable to all other medicines, for procuring instantaneous vomiting in cases of poison.

2. *R. reptans.* Creeping Spear-wort. Linn. Sp. Pl. 773. Fl. Lapp. ed. 2. 198. t. 3. f. 5. Lightf. 289; fig. in frontispiece to v. 1. Fl. Dan. t. 108.—Leaves linear-lanceolate. Stem creeping.—About the margins of alpine lakes, on a sandy soil; common in Scotland, flowering in June and July. We have always thought this a variety of the former, as mentioned in Fl. Brit.; but Willdenow contends for the contrary. He truly asserts that it differs in having a thread-shaped creeping stem; linear entire leaves, tapering down into their footstalks; flower-stalks solitary, erect, single-flowered; and much smaller flowers. Nevertheless, we have seen so many intermediate varieties, and such a disposition in weak plants of the *Flammula* to take root at their joints, that we most incline to our original opinion, suggested first by Linnæus himself in his Sp. Pl.

3. *R. Lingua.* Great Spear-wort. Linn. Sp. Pl. 773. Willd. n. 3. Ait. n. 3. Fl. Brit. n. 2. Engl. Bot. t. 100. Fl. Dan. t. 755. (*R. flammeus major*; Ger. Em. 961. *R. longifolius*, *lingua Plinii dictus*, *foliis ferratis*; Ambros. Phyt. 459.)—Leaves lanceolate, pointed. Stem erect, many-flowered. In marshes and muddy ditches, chiefly in the northern parts of Europe; rare in England; flowering in July. Thrice the size of *R. Flammula*, and quite erect. Leaves more nearly sessile, and taper-pointed; occasionally ferrated, as in the rude cut of Ambrosinus, but not commonly so. Calyx hairy. The whole herb is more or less covered with close-pressed hairs, visible also in *Flammula*. Flowers large and brilliant, very conspicuous.

4. *R. nodiflorus.* Knot-flowered Crowfoot. Linn. Sp. Pl. 773. Willd. n. 4. Ait. n. 4. Waldst. et Kitaib. Hung. v. 2. 192. t. 176. Ait. (*R. parisiensis pumilus*, *plantaginellæ folio*; Petiv. Gazoph. v. 1. 6. t. 25. f. 4. Vaill. Mem. de l'Acad. for 1719, Germ. ed. 324. t. 17. f. 4. *R. ficulus*, &c.; Petiv. Gaz. t. 24. f. 9, is a variety.)—Leaves ovate, stalked. Flowers sessile.—In marshy places about Paris; also in Sicily; flowering in summer. A small, smooth, annual plant, varying in luxuriance, and having much the appearance of *Limnifolia aquatica*. Leaves about an inch long, various in breadth, on very long stalks. Flowers small, solitary, sessile, axillary. Seeds taper-pointed.

5. *R. filiformis.* Slender Creeping Crowfoot. Michaux Boreal-Amer. v. 1. 320. Pursh n. 4. Lamarck Dict. n. 4.—"Stem thread-shaped, creeping, jointed, almost naked. Leaves linear-awl-shaped, obtuse. Flowers axillary, solitary, stalked."—In inundated places, on the banks of the river St. Lawrence; at Hudson's bay and Labrador; flowering in June and July. This is described as a very small, slender, smooth species, very much resembling *R. reptans*, n. 2. We have seen no specimen.

6. *R. pusillus.* Diminutive Crowfoot. Pursh n. 3. (*R. Flammula*; Walt. Carol. 159. Michaux Boreal-Amer. v. 1. 321; according to Pursh.)—"Smooth. Leaves stalked; lower ones ovate, toothed; upper linear-lanceolate, toothed at the end; uppermost linear, like bractæas. Stalks alternate, solitary, single-flowered."—Native of North America. Perennial, flowering from June to August. A small species, with exceeding small flowers. Petals pale yellow. Pursh. A specimen from Kalm, unnamed, in the Linnæan herbarium, answers nearly to the above characters, and yet seems a variety of *R. abortivus*, hereafter mentioned.

7. *R. gramineus*. Grassy Crowfoot. Linn. Sp. Pl. 773. Willd. n. 5. Ait. n. 5. Fl. Brit. n. 3. Engl. Bot. t. 2306. Curt. Mag. t. 164. Bulliard. t. 123.—Leaves linear-lanceolate, glaucous, many-ribbed, sessile. Stem erect, very smooth throughout, with few flowers. Fruit globose.—Native of mountainous situations in the south of France. *Gerard*. In Italy, Column. Ecphr. 314. Withering says it was brought from North Wales by Mr. Pritchard. Willdenow mentions moist meadows in France as its native station, for which we can find no authority. The plant thrives in England in rather dry gardens, flowering in May or June, and is perennial. The grassy, broadish, glaucous leaves, and large golden flowers, readily distinguish this species. The root is tuberosous and round. Stem twelve or eighteen inches high. Calyx very smooth, spreading, not deflexed. The fruit is described as globose. We have not seen it ripe.

8. *R. pyreneus*. Pyrenean Crowfoot. Linn. Mant. 248. Willd. n. 6. Jacq. Misc. v. 1. 154. t. 18. f. 1. (*R. pumilus*, gramineis foliis; Bauh. Hist. v. 3. append. 850. *R.* n. 1180; Hall. Hist. v. 2. 77.) β . *R. plantagineus*; Allion. Pedem. n. 1445. v. 2. 48. t. 76. f. 1.—Leaves linear-lanceolate, many-ribbed, stalked. Stem erect, with one or two flowers; woolly at the top. Fruit somewhat cylindrical. Seeds with recurved beaks.—Native of the Pyrenees, as well as of the Alps of Switzerland, Dauphiny, and Carinthia. Linnæus, for a long while, confounded this with the last, and many botanists have considered them as hardly to be distinguished, but by the colour of the flowers. The leaves of the present vary greatly in breadth, being sometimes quite narrow and linear; but in variety β they are elliptical, and an inch wide. They appear to be green, not glaucous. The upper part of the stem, quite smooth in *R. gramineus*, is always hairy, and under the flower is densely woolly, in the present species. The petals are pure white. Fruit nearly cylindrical. Seeds with elongated, remarkably recurved, points. Few plants vary more in luxuriance.

A most remarkable variety, as Haller and Villars esteem it, is the *R. lacerus*, Bellardi Append. ad Flo. Pedem. 27. t. 6, of which we have a specimen from the author himself. In this the stem is branched, bearing thirteen or fourteen flowers, but its chief singularity consists in the jagged, and partly almost palmate, leaves, which nevertheless bear all the marks of casual luxuriance. We have a specimen of Allion's *plantagineus*, our variety β , which, by a tooth or two in some of the leaves, evinces an approach towards this *lacerus*; and we have another of the same with four flowers on one stem.

9. *R. parnassifolius*. Parnassia-leaved Crowfoot. Linn. Sp. Pl. 774. Willd. n. 7. Ait. n. 6. Curt. Mag. t. 386. Wulf. in Jacq. Coll. v. 1. 191. t. 9. f. 3, without leaves. (*R.* n. 1179; Hall. Hist. v. 2. 77. Herb. Davall.)—Leaves many-ribbed; radical ones roundish-ovate, somewhat heart-shaped, on long stalks; stem-leaves ovato-lanceolate, pointed, sessile.—Native of the Alps of Switzerland, Dauphiny and Carinthia, as well as of the Pyrenees, from all which countries we have received specimens. The plant is esteemed very rare, and Wulfen regrets that he lost the root and leaves of his only specimen; so that Mr. Curtis has rendered a valuable service to botanists by his excellent figure. This is a singularly elegant species, on account of its leaves, which resemble our *Parnassia*, as well as for its large and brilliant white flowers, with their rose-coloured calyx. Their stalks are woolly. Fruit ovate. Seeds obovate, obtuse, with short incurved beaks. The root is perennial, formed of copious, very long, pale fibres, as if it grew in watery places, but Haller says it inhabits stony alpine situations, being quite common in his own territory of Aigle.

10. *R. ophioglossifolius*. Serpent's-tongue Crowfoot. Willd. n. 8. (*R. ophioglossifolius*; Villars Dauph. v. 3. 731. t. 49.)—Stem simple, erect, leafy. Lower leaves ovate, or heart-shaped, many-ribbed, on long stalks; upper linear-lanceolate, sessile.—Found between Toulon and Hyeres in Provence, by M. Villars, who mentions having seen a drawing of the same plant, in the royal collection at Paris, marked *R. lesbius palustris*, *ophioglossi folio*; Tourn. Cor. 20. The root is described by Villars as somewhat bulbous, or tuberous, with many whorls of fibres. Stem erect, a foot high. Leaves smooth, rather fleshy. Flowers small, yellow, with shining petals. Seeds in a small round head. He conceives it somewhat allied to *R. Flammula*. The resemblance of the leaves, in his plate, to *parnassifolius*, seems to have induced Willdenow to range it here. We have seen no specimen.

11. *R. amplexicaulis*. Plaintain-leaved Crowfoot. Linn. Sp. Pl. 774. Willd. n. 9. Ait. n. 7. Curt. Mag. t. 266. (*R. folio plantagineis*; Ger. Em. 963.)—Leaves ovate, pointed, glaucous, clasping the many-flowered stem. Root fasciculated.—Native of the Apennine and Pyrenean mountains, but not, as far as we know, of the Swiss Alps, Haller having mistaken his n. 1179, which is *parnassifolius*, for this species. It is a hardy perennial in our gardens, not difficult of culture, yet not common, flowering in May. The herbage is glaucous. Stem erect, leafy, twelve or fifteen inches high, branched above. Leaves generally more or less fringed with soft hairs. Calyx green, smooth, concave, partly membranous and white at the edge. Petals of a pure and brilliant white. Anthers yellow, as in other species. We have never seen the ripe seeds.

12. *R. heterophyllus*. Various-leaved Slender Crowfoot. (*R. bonariensis*; Lamarck Dict. n. 9.)—Leaves stalked, toothed, heart-shaped or ovato-lanceolate, with three central ribs. Stem erect. Flowers stalked, solitary, opposite to the leaves. Seeds obtuse, granulated.—Gathered by Commerçon at Buenos Ayres, in marshy places. Root fibrous. Stem erect, a foot or more in height, slender, smooth, striated, branched, leafy. Leaves alternate, on long stalks; the lower ones ovate, or heart-shaped; the upper lanceolate, or ovate; all obtuse, more or less crenate or toothed, about an inch long, smooth, furnished with three central ribs, and several lateral branching veins. Footstalks bordered at their base; the lowermost much the longest. Flowers very small, whitish, on solitary, straight, simple, lateral stalks, an inch or an inch and half long, opposite to the leaves. Fruit ovate. Seeds obtuse, or obovate, rough with minute points. The calyx is smooth and reflexed, often remaining till the seeds are ripe.

13. *R. flagelliformis*. Long-stalked Crowfoot.—Leaves on long stalks, heart or kidney-shaped, wavy or crenate. Stem creeping, thread-shaped. Flowers stalked, solitary, opposite to the leaves. Petals ovate. Seeds obtuse, dotted.—Native of Chili and New Granada. We have specimens from Mutis and Cavanilles, but this species does not seem to be any where described. The stems are long, thread-shaped, much branched, prostrate, creeping or perhaps floating, sending out from each joint long fibrous radicles, and one or more smooth, roundish, heart-shaped or kidney-shaped leaves, hardly an inch wide; their footstalks measuring from two to three inches. Flowers very small, white, solitary, opposite to the leaves, on slender stalks, rather shorter than those of the foliage. Stamens few. Fruit rather oblong. Seeds obovate, obtuse, compressed, minutely dotted. This *Ranunculus* is perhaps most nearly akin to our British *bederaceus*, hereafter described, though very certainly distinct, and as the species are at present arranged, they must remain

at a distance. In habit and general resemblance they closely accord.

14. *R. Cymbalaria*. Small Trailing Crowfoot. Pursh n. 5.—“Leaves heart or kidney-shaped, with five blunt teeth. Stem creeping, thread-shaped. Flower-stalks solitary, mostly two-flowered. Petals linear. Fruit oblong.”—In saline marshes, near the salt-works of Onondago, New York, flowering in June and July. Perennial, somewhat resembling the following. *Flowers* small, pale yellow, sometimes white. *Pursh*.

15. *R. falsuginosus*. Salt-marsh Crowfoot. “Pallas’s Travels, small edition, v. 3, 173.” Willd. n. 11. (*R. ruthenicus*; Jacq. Hort. Vind. v. 3, 19. t. 31. *R. repens*, flore in caule singulari, foliis varie sectis; Amm. Ruth. 81. t. 13. f. 2.)—Leaves ovate, somewhat heart-shaped; toothed at the extremity. Stem creeping, thread-shaped. Flower-stalks solitary, mostly single-flowered. Petals obovate. Fruit nearly globose.—Found by Gmelin, on the banks of the Neva; Ammann; by Pallas in the salt plains of Siberia, beyond the lake Baical. The *flowers* are yellow, as big as our common Crowfoots, being more than ten times the size of the last. Their *petals* are about ten, obovate. The *root* sends out long runners, like a garden strawberry. Gmelin’s specimen is much smaller than Jacquin’s figure.

16. *R. bullatus*. Portugal Crowfoot. Linn. Sp. Pl. 774. Willd. n. 10. Ait. n. 8. (*R. lusitanicus*; Dod. Pempt. 429. *R. autumnalis* Clusii; Ger. Em. 954. *R. lusitanicus* Clusii; ib. 955.)—Leaves ovate, serrated. Flower-stalks radical, single-flowered, hairy.—Native of Portugal and the north of Africa, cultivated in England before 1640, but now scarcely seen. It flowers in May and June, and has a perennial fibrous *root*, more like Gerarde’s fig. 10 than 11. *Leaves* all radical, stalked, ovate, ribbed and veiny, somewhat hairy, strongly and unequally serrated, an inch or an inch and half long; sometimes, according to Clusius, blistered. *Flowers* yellow, on simple, hairy, upright, radical *stalks*, three or four inches long. *Petals* more than five, narrow-obovate. The old authors delineate two kinds, generally supposed to be varieties, but which may possibly be species. We have not seen either, except in a dried state.

17. *R. Ficaria*. Pilewort, or Lesser Celandine. Linn. Sp. Pl. 774. Willd. n. 12. Ait. n. 9. Fl. Brit. n. 4. Engl. Bot. t. 584. Curt. Lond. fasc. 2. t. 39. Mart. Rust. t. 21. Bulliard t. 43. (Chelidonium minus; Matth. Valgr. v. 1. 578. Fuch. Hist. 867. Ger. Em. 816.)—Leaves heart-shaped, angular, smooth, stalked. Petals numerous.—Native of waste ground throughout Europe, in moist, shady, or bushy places, flowering in the early spring. Dr. Sibthorp found it common in Greece; and there can be no doubt of its being, as all botanists have judged, *χελιδόνιον ἡ μικρόν*, the Lesser Celandine, of Dioscorides. *Root* perennial, fibrous, with many fleshy, pear-shaped, annual knobs, whose appearance gave rise to the Latin, as well as English, name of this species, and to an idea that the plant might be serviceable in the piles, which those who believe, may consult Gerarde for the mode of application. The *stems* are leafy, and mostly single-flowered. *Leaves* smooth and shining. *Flowers* stalked; with three, sometimes five, leaves to the *calyx*; and eight, occasionally ten, elliptic-oblong, highly polished *petals*, which fade to white in bright sunshine.

18. *R. frigidus*. Alpine Siberian Crowfoot. Willd. n. 13.—Radical leaves wedgeshape-ovate, five-toothed at the extremity; those of the stem sessile, palmate.—Native of the alps of Siberia. Willdenow says he received this by the name of *gracilis*, meaning *glacialis*, “with which it agrees

in the size, and perhaps colour, of the *flower*, but is abundantly distinct in the *leaves*.” Several Siberian unnamed specimens, in the Linnæan herbarium, answer exactly to Willdenow’s description. The radical leaves are several, stalked, between half an inch and an inch in length, smooth; rounded and entire at the base; abrupt and variously cut into broad blunt teeth, we might almost say lobes, at the summit. *Stem* erect, usually single-flowered, with two or three, alternate, sessile, more deeply lobed, or palmate, *leaves*. *Calyx* brown, hairy. *Petals* five, inversely heart-shaped, apparently white. The *flower* is so like *glacialis*, that we cannot but suspect the difference of the *leaves*, however great, to be but casual. At any rate, they are sometimes so deeply cut, that this species might perhaps, without violence, have been placed in the following section, next to *glacialis*.

19. *R. Thora*. Kidney-leaved Crowfoot. Poison-root of the Swifs. Linn. Sp. Pl. 775. Willd. n. 14. Ait. n. 10. Jacq. Austr. t. 442. Obf. fasc. 1. 25. t. 13. (Thora major et minor; Camer. Epit. 825, 826. Th. valdenfis, et montis Baldi; Ger. Em. 966. Pseudo aconium pardalianches; Matth. Valgr. v. 2. 430.)—Leaves kidney-shaped, abrupt, crenate, reticulated; the radical ones on long stalks. Stems with one or two flowers. Bractæas lanceolate.—Native of the alps of Switzerland, Austria, and Greece, as well as of mount Baldus, near Verona, flowering rather early in summer. It is said to have been formerly in the English gardens, but has never fallen under our observation. *Root* perennial, of thick, tapering, fleshy fibres or rather knobs. *Stem* solitary, smooth, simple, near a span high; terminating in one, rarely more, long-stalked golden *flowers*, about half an inch wide; its *calyx-leaves* lanceolate, coloured, smooth, like every other part of the plant. *Leaves* about two inches wide, and one long, rather coriaceous, strongly reticulated with veins, neatly crenate, terminating either abruptly, with a notch, or elongated into three acute, entire, triangular, central lobes; the uppermost, or floral, ones, lanceolate and entire; the radical ones only on long slender stalks. *Fruit* globular, of a few, large, tumid, ovate *seeds*, with hooked points. The *root* of this plant is reported to be extremely acrid and poisonous, its juice having been used formerly, by the Swifs hunters of wild beasts, to envenom their darts, whose wound by that means becomes speedily fatal and incurable. Hence the name, from *φθορα*, corruption, or *venem*. We can see no possible reason for distinguishing the greater and smaller kinds, even as permanent, or well-marked, varieties.

Section 2. *Leaves dissected and divided.*

20. *R. creticus*. Cretan Crowfoot. Linn. Sp. Pl. 775. Willd. n. 15. Ait. n. 11. (*R. creticus latifolius*; Clus. Hist. v. 1. 239. Ger. Em. 963.)—*β*. *R. macrophyllus*; Desfont. Atlant. v. 1. 437. Lamarck Dict. n. 19.—Radical leaves kidney-shaped, crenate, somewhat lobed; stem-leaves in three deep, lanceolate, entire segments. Stem many-flowered.—Native of Crete; cultivated in the Oxford garden in 1658, but perhaps now lost. The *root* is perennial, of many thick, tapering, fleshy fibres. *Stem* thick, moderately branched, eighteen inches, or more, in height, hairy as well as the rest of the herbage. *Radical leaves* from two to four inches long, and more in breadth, kidney-shaped, reticulated with strong veins, light green, downy, unequally divided into about seven three-cleft, or coarsely notched, shallow lobes; *stem-leaves* alternate, in three deep, oblong, obtuse, entire lobes; the base tapering or wedge-shaped. *Flowers* several, yellow, nearly as large as *R. Lingua*, n. 3. *Calyx* reflexed, ovate, loosely hairy. *β* appears, by the account of M. Desfontaines, to differ merely in having the lower

RANUNCULUS.

lower leaves more deeply lobed than usual, and somewhat less hairy.

21. *R. cassubicus*. Cassubian Crowfoot. Linn. Sp. Pl. 775. Willd. n. 16. Ait. n. 12. (*R. aconitifolius*, folio rotundo, ad radicem præfolante; Loef. Pruff. 225. t. 72.)—Radical leaves roundish-heart-shaped, crenate, undivided; stem-leaves in several deep, lanceolate, toothed and jagged segments. Stem many-flowered.—Native of Prussia and Siberia, flowering in May. Messrs. Loddiges are said to have introduced it into England, in 1794. Though the character of this approaches the last, the two plants are very different. The radical leaves of the present, though heart-shaped, are almost orbicular, their two lobes meeting each other; their margin sharply crenate, but not at all divided; their surface minutely downy. Stem much branched; smooth below; downy above; bearing several fingered, veiny, smooth, sessile leaves; the lower ones largest, many-lobed, and jagged; the upper with only three lanceolate, entire lobes. Flowers rather small, deep yellow. Calyx hairy towards the base. Fruit ovate. Seeds hairy, roundish, slightly compressed, each with a strongly revolute beak.

22. *R. auricomus*. Wood Crowfoot, or Goldilocks. Linn. Sp. Pl. 775. Willd. n. 17. Ait. n. 13. Pursh n. 9. Fl. Brit. n. 5. Engl. Bot. t. 624. Curt. Lond. fasc. 2. t. 41. Fl. Dan. t. 665. Ger. Em. 954. (*R. prima species sylvestris*; Fusch. Hist. 156. Dalech. Hist. v. 1. 1029.)—Radical leaves kidney-shaped, deeply three-cleft, crenate; stem-leaves divided to the base into linear segments. Stem many-flowered. Calyx coloured.—Native of woods and shady places, throughout Europe; also in Pennsylvania; flowering in April and May. Root fibrous, perennial. Herb of a pale pleafant green, and destitute of the acrimony usual in this genus. Stems a foot high, erect, branched, scarcely downy, except near the top. Leaves generally a little downy; the radical ones on long stalks, deeply divided into three or five, wedge-shaped, crenate, or cut lobes; the rest in many linear, entire, or partially cut, spreading divisions. Flowers terminal, erect, solitary at the top of each branch, of a bright golden hue. Calyx pale yellow, hairy, scarcely at all reflexed. Nectary a naked pore in each petal, not closed by any scale. In cold backward seasons the petals are sometimes wanting, or rather identified with the calyx, which is then dilated, and more coloured than usual.

23. *R. abortivus*. Small-flowered Virginian Crowfoot. Linn. Sp. Pl. 776. Willd. n. 18. Ait. n. 14. Pursh n. 6.—Radical leaves heart-shaped, undivided, crenate; lower stem-leaves pedate; upper in three deep linear segments. Calyx reflexed, coloured. Petals obsolete.—In wet places, by the sides of ponds and ditches, from New York to Carolina, flowering in July and August. Pursh. In ponds at Buenos Ayres. Commerfon. This species appears to have been cultivated in Chelsea garden 100 years ago, but it has, long since, disappeared, nor has any author given a figure of the plant. Its habit is most like *sceleratus*, n. 26. Root perennial, of many long fibres. Herb smooth. Stem from six to eighteen inches high, branched, leafy. Radical leaves like those of a violet, not an inch long, crenate, smooth; their stalks two inches, or more, in length: lower stem-leaves ternate, their lateral leaflets deeply divided, all cut or crenate: uppermost leaves nearly sessile, in three deep, lanceolate, entire divisions. Flowers small; yellow according to Pursh, but Commerfon, in his MSS. calls them flesh-coloured; each stands on a simple solitary stalk, half an inch or an inch long, either from the forks of the branches, or at their summits. The calyx is reflexed, large, membranous and coloured. We find scarcely any certain traces of

petals, but the plant may be variable in those parts, like *auricomus*. Stamens few. Germen large, globose.—Linnæus took his specific character, *caule subtrifloro*, from specimens not fully grown; yet he had an authentic one by him, with above thirty flowers. In Commerfon's the upper leaves are more stalked than usual.

24. *R. nitidus*. Varnished American Crowfoot. Walt. Carol. 159. Lamarck n. 68. Pursh n. 7.—“Very smooth. Stems hollow. Radical leaves roundish-kidney-shaped, bluntly crenate; stem-leaves sessile, digitate; their leaflets cut, with blunt segments. Seeds nearly globose, very smooth.”—In inundated grounds, from New York to Carolina, flowering in July and August.—Root perennial. Flowers small. Petals white. This and the foregoing one are probably only varieties. Pursh.

25. *R. trilobus*. Three-lobed Barbary Crowfoot. Desfont. Atlant. v. 1. 437. t. 113. Willd. n. 19.—Stem erect, much branched. Leaves smooth, deeply three-lobed, cut; uppermost linear, obtuse, undivided. Flower-stalks striated. Seeds compressed, tuberculated.—Gathered by Desfontaines, in moist fields, near Mayane, in Barbary. He describes it as akin to *R. parviflorus*, except in its upright growth, and smooth, deeply three-lobed leaves. The lowest leaf of all is undivided and crenate. Flowers very small, yellow, situated as in the two last. Seeds in a round head, small, compressed, orbicular with a point, covered with tubercles on both sides. To us this species seems, by its seeds, allied to *parvulus* of Linnæus, which is a variety of *hirsutus*, hereafter described.

26. *R. sceleratus*. Celery-leaved Water Crowfoot. Linn. Sp. Pl. 776. Willd. n. 20. Ait. n. 15. Pursh n. 8. Fl. Brit. n. 6. Engl. Bot. t. 681. Curt. Lond. fasc. 2. t. 42. Fl. Dan. t. 571. (*R. palustris rotundifolius*; Ger. Em. 962.)—Stem erect, much branched. Lower leaves palmate, smooth; upper ones fingered. Fruit oblong. Seeds very numerous, minute.—Found about ditches and in watery places by road sides, in most parts of Europe and North America, flowering in summer. Root annual. Herb various in size and luxuriance, of a pale shining green, juicy, very smooth, except occasional hairiness on the flower-stalks. Stem round, thick and hollow. Lower leaves larger, broader, less divided, and more stalked, than the upper; the floral ones mostly lanceolate, simple, and entire. Flowers numerous, small, yellow. Calyx deflexed, shaggy. Nectary somewhat tubular. Stamens few. Seeds very small, but excessively numerous, making a dense, oblong, obtusely rounded head. This is one of the most acrid of its tribe, raising blisters and dangerous sores in the skin.

27. *R. aconitifolius*. Aconite-leaved White Crowfoot. Linn. Sp. Pl. 776. Willd. n. 21. Ait. n. 16. Curt. Mag. t. 204. (*R. montanus quartus*; also *R. pleno flore albo*; Clus. Hist. v. 1. 236. *R. aconiti folio*; Ger. Em. 954. *R. albus multiflorus*; ib. 957. *R. albus, flore denso*; Bauh. Hist. v. 3. 844, not 860.)—Leaves veiny, smooth, in five deep, pointed, toothed lobes; the middle one three-cleft: floral leaves sessile, fingered, lanceolate, cut. Stem branched, many-flowered.—Native of the alps of Switzerland, France, Austria, &c.; a hardy and long-established perennial in our gardens, flowering in May and June; generally in a double state, as figured by Curtis. He remarks that it requires moisture, shade, and a pure air. The stem is one and a half or two feet high, partly purplish, smooth, with spreading branches. Leaves dark green, with a glaucous hue beneath; the radical ones on long stalks; the rest nearly sessile; all composed of more or less distinctly separate, often stalked, leaflets, strongly veined and coarsely toothed; the uppermost smaller, more simple, quite sessile.

Flowers

RANUNCULUS.

Flowers white, three-quarters of an inch in diameter, not very ornamental in their single wild state, but much admired when double, and formerly called Fair Maids of France. Their pearly whiteness is enhanced by the violet *calyx*.

28. *R. platanifolius*. Plane-tree-leaved White Crowfoot. Linn. Mant. 79. Willd. n. 22. Ait. n. 17. Fl. Dan. t. 111. (*R. albus*, flore simplici; Lob. Ic. 668. *R. alpinus albus*; Ger. Em. 951.)—Leaves veiny, smooth, deeply palmate, five-lobed, cut and toothed; the middle ones three-cleft: floral leaves sessile, fingered, linear-awlshaped, entire. Stem branched, many-flowered.—Native of the Alps of Germany, Norway, Switzerland, Italy, and of the Pyrenees, in shady places. Said to have been introduced into the English gardens in 1769, by Messrs. Kennedy and Lee. This is very distinct from the last, with which Linnæus originally confounded it. The *leaves* are larger, not divided quite to the base, though their lobes are more cut and jagged: the floral ones are remarkably long, slender, and entire. *Flowers* twice as large, and rather more abundant. The radical *leaves* of both have occasionally seven or nine lobes, instead of five.

29. *R. spicatus*. Spike-fruited Crowfoot. Desfont. Atlant. v. 1. 438. t. 115. Willd. n. 23.—Leaves radical, five-lobed, toothed. Stem nearly simple, hairy. Fruit cylindrical, thrice as long as the *calyx*.—Gathered by Desfontaines in marshes at Algiers. *Root* perennial, of numerous, oblong, fleshy, tapering knobs. *Stem* solitary, erect, a span high, hairy, simple, except at the top, where it divides into two or three simple single-flowered stalks; sometimes accompanied by a few *bractæas*, in three or four deep linear segments; sometimes naked. *Leaves* all radical, on hairy stalks, heart-shaped, rounded, five-lobed, strongly toothed, villous, about an inch and a half broad. *Calyx* of five ovate-oblong, coloured, hairy, spreading leaves. *Petals* five, obovate, yellow, the size of *R. acris*. *Fruit* cylindrical, slender, an inch and a half or two inches long. *Seeds* very numerous, ovate, compressed, bordered each with a hooked, prominent beak.

30. *R. paludosus*. Marsh Crowfoot. Poiret Voy. en Barb. v. 2. 184. Lamarck n. 22. Desfont. Atlant. v. 1. 439.—“Downy. Lower leaves in three deep, many-cleft, fan-shaped segments; upper simple, linear, entire. Stem branched, many-flowered. *Calyx* erect.”—Gathered by Poiret, in the borders of extensive marshes, near la Calle, and in some other parts of Barbary. *Root* fibrous, densely fasciculated. *Herb* downy, with short, close-pressed hairs. *Stems* several, eight or ten inches high, with spreading leafy branches, bearing abundance of widely-spreading, deep-yellow *flowers*, the size of the foregoing, on slender stalks of various lengths. Radical *leaves* stalked; the earliest ones ovate, undivided, deeply toothed; the rest almost pinnate, with three long, narrow, deeply cut, fan-shaped segments; those on the lower part of the stem less compound: the uppermost linear, undivided, acute, entire. *Fruit* oval, or almost elliptical, obtuse. *Seeds* oblong, smooth, compressed, scarcely pointed.

31. *R. illyricus*. Illyrian Silky Crowfoot. Linn. Sp. Pl. 776. Willd. n. 24. Ait. n. 18. Jacq. Austr. t. 222. Ger. Dod. Pempt. 428. Em. 953. (*R. grumosa radice quartus*; Clus. Hist. v. 1. 240.)—Leaves shaggy with silky hairs, linear-lanceolate, ternate, entire. *Calyx* silky, reflexed. Stem branched. Flower-stalks woolly.—Native of Hungary, France, Italy, Aultria, Thrace, and of the Swedish isle of Oeland; cultivated here in Gerarde’s time. Clusius received his specimens, from a physician of Ferrara, with the name of *R. illyricus*, which has been retained, absurdly enough, for a plant found in so many different countries,

and for which so many expressive appellations might easily have been contrived. The *root* is perennial, composed of numerous, small, round granulations. Whole herb more or less clothed with snow-white, silky, or partly cottony, down. *Stem* a foot high, or more, somewhat branched, bearing several bright lemon-coloured *flowers*, nearly the size of *R. Lingua*, their *calyx-leaves* ovate, reflexed, externally silky. *Leaves* all linear-lanceolate, entire, seldom divided; the radical ones on long stalks, ternate or pinnate; those about the middle of the stem ternate, almost sessile; upper ones simple: the usual length of each leaf or leaflet is two or three inches.—Dodonæus takes this for the second *Βελιζχιος*, or *Ranunculus*, of Dioscorides, with whose description it in some measure accords. That species is said to be extremely acrid. Hence Dodonæus, who is copied by Gerarde, supposes our plant may be the *Gelotophyllis* of Pliny, which caused those who took it to dye laughing. But this opinion depends on too many conjectures to deserve attention; even if any benefit could accrue from ascertaining the point. We must observe however that Dr. Sibthorp thought the above *Ranunculus* of Dioscorides to be our *lanuginosus*, which is a common Greek plant, and answers better to his description.

32. *R. flabellatus*. Fan-leaved Crowfoot. Desfont. Atlant. v. 1. 438. t. 114. Willd. n. 25. Sm. Fl. Græc. Sibth. t. 520, unpublished. (*R. alter saxatilis*, asphodeli radice; Column. Ecphr. 312. t. 313.)—Radical leaves undivided or twice ternate, toothed or deeply cut, stalked; upper ones ternate or simple. Stem hairy, simple below, few-flowered. Fruit elliptical.—Found by Desfontaines, near Algiers, on moist uncultivated hills, flowering in winter: by Sibthorp on the northern mountains of Greece. *Root* perennial, of many oblong, tapering, clustered fibres, rather than knobs. *Stem* a span high, hairy, somewhat divided above, and bearing two or three yellow *flowers*, the size of our common *R. bulbosus*, accompanied by deeply two or three-cleft *bractæas*. *Leaves* chiefly radical, on longish stalks; several of the earliest undivided, fan-shaped, strongly toothed; the rest deeply three-cleft, and subdivided.

33. *R. asiaticus*. Persian Crowfoot, or common Garden Ranunculus. Linn. Sp. Pl. 777. Willd. n. 26. Ait. n. 19. Mill. Ic. t. 216. Sm. Fl. Græc. Sibth. t. 518, unpublished. (*R. asiaticus*, grumosa radice; Clus. Hist. v. 1. 240—243. *Ranunculi varii*; Ger. Em. 958—960. *Βελιζχιος*; Diosc. book 2. chap. 206.)—Leaves once or twice ternate; leaflets three-cleft, cut. Stem hairy, branched. *Petals* thrice as long as the *calyx*. Fruit cylindrical.—Found by Dr. Sibthorp wild in various parts of Asia Minor, but most plentifully in the isle of Cyprus, where it still retains one of its ancient names, mentioned by Dioscorides, *αγριο-πάρσλιος*, or Wild Parsley. In the gardens of Europe it has been cultivated, ever since the latter part of the sixteenth century, under the form of innumerable varieties, chiefly double, of every variegated hue. In a wild and single state the large and splendid *petals* are of a most vivid crimson, occasionally varying to yellow. The *root* is perennial, of numerous, brown, fleshy, tapering knobs. *Stem* twelve or fifteen inches high, erect, round, downy, hoary, leafy, branched from the middle or lower part, and bearing from three to five large long-stalked *flowers*, whose *calyx* is brown, hairy, and reflexed, but one-third the length of the broad, obovate, concave *petals*. *Leaves* rather hairy, mostly stalked, variously three-cleft and notched, more or less compound; the floral ones, as usual, narrower and most simple. *Fruit* cylindrical. *Seeds* oblong, with recurved points.

34. *R. japonicus*. Japan Crowfoot or Ranunculus. Thunb. Tr. of Linn. Soc. v. 2. 337. Willd. n. 27. (*R. asiaticus*;

RANUNCULUS.

asiaticus; Thunb. Jap. 241.)—"Leaves deeply three-cleft, cut and toothed, hairy as well as the stem."—Common in ditches about Nagasaki, Jedo, and elsewhere in Japan, flowering from February to May. It is hairy in every part, except the *corolla*. The radical leaves are rounded; the uppermost divided into lanceolate segments; all three-cleft, their segments cut, toothed, acute, hairy on both sides. *Footstalks* from an inch to a foot in length. *Stems* striated, scarcely leafy, zigzag, branching into flower-stalks at the top. *Thunberg*. The above character and description are not sufficient to distinguish this species from the last, with which Thunberg originally confounded it. Something is necessary to be known respecting the *calyx*, and its relative proportion to the *petals*, as well as the form of the *fruit* and *seeds*.

35. *R. rutae-folius*. Rue-leaved Crowfoot. Linn. Sp. Pl. 777. Willd. n. 28. Ait. n. 20. Jacq. Coll. v. 1. 186. t. 6, 7. Allion. Pedem. v. 2. 49. t. 67. f. 1. (*R. præcox rutaceo folio*; Clus. Hist. v. 1. 232. Ger. Em. 965. *Ranoncolo alpino*, con foglia di Coriandro; Pon. Bald. 197.)—Leaves pinnate, ternate, many-cleft, glaucous, smooth; their segments elliptic-oblong. Stem nearly simple. Petals numerous. Calyx smooth. Seeds ovate, with straight points.—Native of the loftiest alps of Switzerland, Dauphiny, Austria, and the north of Italy, flowering early in July. The *root* is tuberous, with long, simple, stout fibres, perennial. *Herb* glaucous and smooth. *Stem* from two to five inches high, mostly simple and single-flowered, sometimes bearing two, rarely three, flowers. *Leaves* stalked, elegantly decomposed; their leaflets wedge-shaped, many-cleft; the ultimate segments oblong, slightly elliptical, bluntish. *Flowers* of a brilliant white, at first tinged with red, on long stalks. *Calyx* purplish, five-leaved, smooth. *Petals* eight or ten, very erroneously represented in the figure of Clusius and Gerard, so as to look like a syngesious flower. *Seeds* few, large, ovate, pitted, pointed, straight, spreading every way, stalked, in a round head.

36. *R. glacialis*. Alpine Hairy-cupped Crowfoot. Linn. Sp. Pl. 777. Fl. Lapp. ed. 196. t. 3. f. 1. Willd. n. 29. Ait. n. 21. Fl. Dan. t. 19. (*R. montanus purpureus*, calyce villosa, Felicis Platerii; Bauh. Hist. v. 3. b. 846. Scheuchz. Alp. v. 1. 399, and 139. t. 20. f. 1.)—Leaves ternate, three-cleft, cut; their segments elliptical. Stem nearly simple. Calyx very hairy.—Native of the highest alps of Lapland, Switzerland, Dauphiny, Germany, &c. in the neighbourhood or ice and snow, flowering in June and July. *Root* perennial, with very long strong fibres. *Stem* from three to six inches high; simple and naked in its lower part; leafy near the top, bearing one or two, very rarely three, flowers, on long, smooth stalks. *Leaves* green, scarcely hairy, rather fleshy; the radical ones more or less compound, on long stalks; their segments broader, more elliptical, and blunter than in the former. *Flowers* large and handsome, of five broad, roundish, white petals, rose-coloured or purple underneath; the *calyx* purplish-brown, singularly rough, with shining tawny hairs. When we contemplate the great diversity of subdivision in the foliage of this species, we are disposed to believe our *frigidus*, n. 18, may possibly be a mere variety. Their *flowers* precisely agree, as well as their general habit.

37. *R. Seguieri*. Sharp-leaved Alpine Crowfoot. Villars Dauph. v. 3. 737. t. 49. Willd. n. 30. (*R. Columnæ*; Allion. Pedem. v. 2. 50. t. 67. f. 3, 4. Wulf. in Jacq. Coll. v. 4. 345. *R. alpinus apii folio*, flore albo magno; Pont. Comp. 117. Seguier Veron. v. 1. 490. t. 12. f. 2, 3.)—Leaves ternate; segments wedge-shaped, subdivided, decurrent, acute. Stem branched, about three-flowered.

Calyx smooth.—Native of mount Baldus, where it was first found by Pontedera; as well as of the mountains of Dauphiny, Piedmont, and Carniola; in stony situations. This resembles some of the most luxuriant varieties of *glacialis*, but differs in the acute and decurrent segments of its leaves, as well as its smooth pale calyx; for Villars is incorrect in describing that part "externally downy." It is quite smooth, in his own and Allioni's specimens; the hairiness being confined to the top of the *flower-stalk*, where it is very dense and conspicuous; while the same part in *glacialis* is smooth, up to the base of the hairy calyx. The *petals*, and even the *nectary*, are white. Villars is surely right in removing the synonym of Columna, cited by Allioni, which we refer, with hardly any scruple, to *stellatus*, n. 32, a very different plant.

38. *R. nivalis*. Palmate Alpine Crowfoot. Linn. Sp. Pl. 778. Fl. Lapp. ed. 2. 195. t. 3. f. 2. Willd. n. 31. (Excluding the variety.)—Leaves palmate, five-lobed, spreading, entire; those of the stem sessile. Stem single-flowered, smooth. Calyx hairy, half the length of the petals.—Found by Linnæus in Lapland, by the alpine rivulets on the snowy mountains of that country. Martens had previously gathered it at Spitzbergen. The *root* is fibrous, and slender. *Stem* simple, erect or ascending, smooth, leafy, about six inches high. *Radical leaves* two or three, on long slender stalks, heart-shaped at the base, rather deeply palmate, in five broad, divaricated, obovate, entire lobes, very and quite smooth: *stem-leaves* one or two, sessile, with five deeper, longer, more lanceolate lobes; the uppermost only three-lobed, or occasionally quite undivided. *Flower* solitary, on a long, terminal, hairy stalk. *Calyx* of five ovate yellowish leaves, rough with blackish hairs. *Petals* yellow, obovate, twice the length of the calyx.

39. *R. pygmaeus*. Dwarf Small-flowered Alpine Crowfoot. Pursh n. 10. (*R. nivalis pygmaeus*; Linn. Fl. Lapp. ed. 2. 196. t. 3. f. 3. *R. lapponicus*; Fl. Dan. t. 144.)—Leaves palmate, somewhat pedate, five-lobed, spreading entire; the upper ones almost sessile. Stem single-flowered. Calyx nearly smooth, rather longer than the petals.—Native of Lapland and Labrador. Perennial, flowering in May and June. Much smaller than the foregoing. Middle lobe of the *radical leaves* very deeply separated. *Stem-leaves* less perfectly sessile, and with narrower segments, than in *nivalis*. *Flower* not a quarter the size of that species; its *petals* yellow, roundish, scarcely so long as the *calyx*, which is likewise small, and very slightly hairy.

40. *R. montanus*. Yellow Mountain Crowfoot. Willd. n. 32. Ait. n. 22. (*R. nivalis*; Jacq. Austr. t. 325, 326. Sibth. in Prodr. Fl. Græc. n. 1272? Villars Dauph. v. 3. 742. Crantz Austr. fasc. 2. 92. t. 4. f. 3, 4. R. n. 1168; Hall. Hist. v. 2. 71, excluding the references to Linnæus. *R. minimus alpinus luteus*; Bauh. Hist. v. 3. 845, two upper figures.)—Leaves five-lobed, rounded, cut; those of the stem sessile, with deep, lanceolate, entire segments. Stem single-flowered, rough with erect hairs. Calyx hairy.—Very abundant on the alps of Switzerland, Dauphiny, and Germany; not of Lapland. It was one of those many alpine plants, introduced into the English gardens in 1775, by a person sent on purpose to collect them, at the expence of Dr. Fothergill and Dr. Pitcairn. This species has been confounded with the Linnæan *nivalis*, by all writers previous to Willdenow; yet they are truly distinct. The *montanus* has remarkably long, subdivided, tuberous roots, with very long strong fibres. *Stem* hairy throughout, the hairs erect; sometimes quite leafless. Lobes of the radical leaves un-

RANUNCULUS.

equally cut and toothed, not entire. *Calyx-leaves* narrower, and less hairy. *Petals* larger, and of a deeper yellow. This is the *nivalis* of most botanists, few having seen the true Linnæan Lapland plant. The variety of *montanus* with a leafless *stem*, figured in Jacquin's t. 326, at the right hand, was taken for a new species, and called *acaulis*, by Favrod and Reynier, as appears by their dried specimens.

41. *R. Gouani*. Gouan's Pyrenean Crowfoot. Willd. n. 33. (*R. pyrenæus*; Gouan Illustr. 33. t. 17. f. 1, 2.)—Leaves five-lobed, rounded, cut; those of the stem sessile, deeply palmate; the uppermost with acute, entire lobes. Stem single-flowered, rough with deflexed hairs. Calyx hairy.—Gathered by Gouan on the Pyrenees, where it flowers soon after the melting of the snow. We have a specimen from the late M. Broussonet. This is a larger plant than the preceding, especially in its *flower*, and differs, as Willdenow remarks, in having the *stem-leaf* toothed or cut; but that character applies only to the lower one. The upper *stem-leaves*, if there be more than one, consist of entire, acute lobes. The most decisive mark of distinction appears to us in the hairs of the *stem*, below the leaves, which in Gouan's plant are either widely extended or bent downwards; in the *montanus* the hairs of every part of the *stem* are erect, or close-pressed. To this no person has hitherto adverted.

42. *R. alpestris*. Alpine White Crowfoot. Linn. Sp. Pl. 778. Willd. n. 34. Ait. n. 23. Sm. Tr. of Linn. Soc. v. 10. 343. Engl. Bot. t. 2390. Jacq. Austr. t. 110. (*R. n. 1167*; Hall. Hist. v. 2. 71. *R. montani* species prima et secunda; Clus. Hist. v. 1. 234. *R. montanus*, flore minore, & majore; Ger. Em. 964. *R. minimus alpinus albus*; Bauh. Hist. v. 3. 845, two lower figures.)—Leaves very smooth; radical ones somewhat heart-shaped, obtuse, in three deep, lobed segments; stem-leaf lanceolate, entire. Stem mostly single-flowered.—Native of the highest alps of Austria and Switzerland, and of the mountain of Clova, in Angushire, Scotland, in which last place it was discovered by the late Mr. George Don, by the sides of little rills, flowering, though sparingly, in the spring of 1809. The *roots* are perennial, with long fibres. Whole *herb* very smooth, and rather glaucous. *Stem* erect, from one to four inches high, almost always simple and single-flowered, naked, except one or two simple, linear-lanceolate, obtuse, entire *leaves*, apparently of the nature of *bractææ*. Radical *leaves* several, stalked, in three deep, subdivided, acute lobes. *Calyx-leaves* oval, smooth, edged with white. *Petals* of a pure and brilliant white. Haller says this is one of the most acrid of its tribe, blistering the skin; and yet the alpine hunters chew it, by way of refreshment.

43. *R. lapponicus*. Long-stalked Lapland Crowfoot. Linn. Sp. Pl. 778. Fl. Lapp. ed. 2. 194. t. 3. f. 4. Lapland Tour, v. 1. 156, 252.)—Leaves smooth, in three very deep, dilated, bluntly notched lobes. Flower-stalks elongated, naked, single-flowered. *Petals* the length of the smooth calyx.—This rare species, not known out of the limits of Lapland, was discovered by Linnæus in two or three different places, near the river Juchtan, flowering in June. Professor Swartz also gathered it, many years after, near Luloa. It grows in watery situations, and is very different from all others of this genus. The aspect of the plant, at first sight, recalls the idea of *Adoxa Moschatellina*. The *root* is long, thread-shaped, and creeping, throwing up here and there, from its joints, a little, short, simple, solitary, smooth *stem*, sometimes an inch or two high, sometimes scarcely distinguishable. *Leaves* one from the base, and another from the top, of the stem, on slender, weak *foot-stalks*, two or three inches in length; each *leaf* an inch or

an inch and half wide, smooth, veiny, rather fleshy, somewhat kidney-shaped, in three very deep, almost distinct, broad wedge-shaped lobes, having a few broad and rounded, blunt notches, each tipped with a minute glandular point. *Flower-stalks* from three to five or six inches high, terminating the stem, solitary, simple, naked, smooth, each bearing a small yellow *flower*, scarcely half an inch in diameter. *Calyx* of three elliptical, concave, smooth, pale, reflexed leaves. *Petals* five or six, obovate, ribbed, about the length of the calyx; their nectary closed by a scale. *Stamens* from nine to twelve. *Pistils* from six to twelve. *Seeds* in a round head, ovate, smooth, with strongly recurved points.

44. *R. hyperboreus*. Arctic Crowfoot. Retz. Scand. ed. 2. 131. Willd. n. 36. "Rottb. in Copenh. Transf. v. 10. 458. t. 4. f. 16." (*R. Fl. Dan. t. 331*, excluding the synonym of Ammann, which belongs to *salsuginosus*, n. 15. *R. n. 50*; Gmel. Sib. v. 4. 204. t. 83, b, excluding the Linnæan synonyms.)—Leaves smooth, in three deep divaricated lobes; the lateral ones cloven. Stem creeping. Flower-stalks the length of the leaves. *Petals* scarcely longer than the smooth calyx.—Native of Iceland, Greenland, Norway, and Siberia, in watery places. Gmelin and Linnæus confounded this with *hederaceus* hereafter mentioned; Gunner mistook it for *salsuginosus*, which he called *R. Ammanni*, Fl. Norv. n. 826. From both, as well as from *lapponicus*, it is very distinct. The *stems* are long and creeping, or floating, throwing out from each joint, several simple, very long, fibrous *radicles*, with a stalked *leaf*, not a quarter the size of *lapponicus*, whose lobes are by no means toothed or crenate, the lateral ones only being simply cloven. The *flowers* are small, pale yellow, solitary, each on a lateral, but not axillary, *stalk*, whose length is about equal to the adjoining leaf with its foot-stalk. *Calyx-leaves* only three or four, smooth, coloured. *Petals* about the same number, and scarcely longer, obovate. *Seeds* ovate, gibbous, with a hooked, but very short, beak.

45. *R. monspeliacus*. Montpellier Crowfoot. Linn. Sp. Pl. 778. Willd. n. 37. (*R. saxatilis*, magno flore; Bauh. Prodr. 96. Sauv. Monsp. 181.)—"Leaves in three deep crenate segments. Stem simple, villous, nearly naked, single-flowered."—Native of rocky places about Montpellier, according to Bauhin, who thus describes his plant. "Root composed of long capillary fibres. *Leaves* from the root several; on long, somewhat woolly, stalks, each leaf hardly so broad as the nail, in three small segments, which are again divided into two or three acute ones. The *stem* is about three inches high, slender, woolly, bearing one large *flower*, of a brilliant golden yellow, composed of five petals, with many reddish *stamens*." We know no authentic specimen nor figure of this plant. Linnæus has marked it as never seen by him; but a specimen sent him by Gouan, from the Pyrenees, marked *R. alpinus humilis*, magno flore, which we have been disposed therefore to consider as *R. Gouani*, n. 41, answers very well to Bauhin's description, and it is not impossible that these supposed two species are one and the same. Yet Poiret, who professes to have gathered *R. monspeliacus* at Montpellier, and in Barbary, speaks of them as distinct, though, it must be confessed, his description is hardly sufficient to establish the point in dispute.

46. *R. pensylvanicus*. Pennsylvanian Crowfoot. Linn. Suppl. 272. Willd. n. 38. Ait. n. 24. Pursh n. 11. (*R. canadensis*; Jacq. Ic. Rar. t. 105. Misc. v. 2. 343.)—Stem erect, hairy, branched. *Leaves* ternate; leaflets stalked, deeply three-cleft, jagged, toothed; hairy beneath. *Calyx* reflexed, rather longer than the round petals. Fruit cylindrical.

RANUNCULUS.

cylindrical. Seeds compressed, with straight beaks.—Native of low meadows, from Canada to Pennsylvania, but rare, flowering in July and August. This species was sent by professor Thunberg, in 1785, to Kew garden, from whence we procured a specimen the same year. Mr. Aiton makes it biennial; Jacquin and Pursh perennial. The stem, like the footstalks, is very hairy. Whole herb of a light green, two feet or more in height, branched, many-flowered. Leaflets one and a half or two inches long, strongly veined, with spreading segments. Flower-stalks terminal, longish, furrowed, rough with close-pressed hairs. Flowers small, their little, round, yellow petals not so long as the calyx, which is smooth and bent downward. Seeds in a cylindrical head, numerous, ovate, gibbous, compressed, smooth, very minutely dotted, each tipped with a short, sharp, erect, or slightly inflexed, beak. Receptacle hairy. Mr. Pursh's description does not, in every circumstance, answer to the Linnæan plant; for the flowers are not near so big as *R. acris*, nor are their stalks round.

47. *R. ternatus*. Ternate-leaved Japanese Crowfoot. Thunb. Jap. 241. Willd. n. 39.—“Calyx reflexed. Leaves all ternate; leaflets three-cleft. Stem many-flowered.”—Native of the Japanese island of Nipon, flowering in May. Nothing more is known of this species, concerning whose peculiar characters, or affinities, we can form no precise opinion.

48. *R. biternatus*. Twice-ternate Magellanic Crowfoot.—Leaves smooth, twice ternate, cut; segments ovate, acute. Stem creeping. Stalks single-flowered, the length of the leaves. Petals obovate, the length of the smooth calyx.—Gathered by Commerçon, in the straits of Magellan. No author appears to have taken up this species, of which a specimen, from Commerçon's herbarium, was given by Thouin to the younger Linnæus. The whole plant is smooth. The leaves bear a considerable resemblance to those of *R. Seguieri*, but are rather smaller, and distinctly twice ternate. The habit of the plant more accords with *lapponicus* and *hyperboreus*, however unlike at first sight. The stem is thread-shaped and creeping, sending forth, from every joint, a few fibrous radicles, a pair of upright, stalked leaves, two or three inches in height, and one flower, whose simple, naked stalk is about as tall as the leaves. This flower appears to be extremely like that of *lapponicus*, though scarcely more than half so large. The dried petals have the same opaque whiteness as is observable in that species, and others, on their upper surface, and are probably yellow when fresh.

49. *R. peduncularis*. Long-stalked Magellanic Crowfoot.—Leaves ternate, deeply cut, somewhat hairy. Stems hairy, taller than the leaves, two-flowered. Calyx reflexed, nearly smooth. Seeds globose, smooth, with recurved, hooked beaks.—Gathered by Commerçon in the straits of Magellan, with the preceding. This has a general likeness to several common European kinds, which we shall next describe, but is essentially distinct. The radical leaves are several, on hairy stalks, four inches long, their circumscription roundish, measuring an inch, or inch and half, across; the leaflets almost always quite distinct, with short partial stalks, their form wedge-like, or fan-shaped, more or less deeply cut, seldom regularly three-cleft. Stems several, erect, striated, rough, with spreading hairs; simple and naked to the height of four or six inches, then dividing into two upright, hairy, simple flower-stalks, greatly elongated, (from one to seven or eight inches), after flowering, and accompanied at their base by a solitary, stalked, deeply divided, palmate or fingered, leaf, an inch long. The flowers are much like those of *bulbosus*, or *acris*. Calyx-leaves ovate, concave, reflexed, bearing a few external hairs.

Petals yellow, wedge-shaped, striated, nearly twice as long as the calyx. Fruit globose. Seeds globose, tumid, keeled, even and smooth; their beaks rather spreading, hooked at the tip.

50. *R. bulbosus*. Bulbous Crowfoot, or Butter-cups. Linn. Sp. Pl. 778. Willd. n. 40. Ait. n. 25. Fl. Brit. n. 7. Engl. Bot. t. 515. Pursh n. 12. Curt. Lond. fasc. 1. t. 38. Mart. Ruft. t. 28. Ger. Em. 953. Lob. Ic. 666.—Leaves hairy, ternate, three-cleft, cut. Stem many-flowered. Calyx reflexed. Seeds compressed, smooth. Root bulbous.—Very common in Europe, as well as North America, in meadows and pastures, flowering throughout the summer. The root is a round, solid, perennial bulb, about an inch in diameter, increasing by offsets from the top, and sending out from its base many long stout fibres. Stems several, erect, a foot high, branched, leafy, round, hairy, many-flowered, destitute of trailing shoots or runners. Leaves stalked, variously cut, more or less hairy. Flowers terminal, solitary, on angular furrowed stalks, rough with erect, bristly hairs. Calyx hairy, bent back to the stalk. Petals nearly equal in size to *R. Lingua*, of a deep shining yellow. Nectary covered by a notched scale. Fruit globose. Seeds orbicular, greatly compressed, bordered, smooth, and even, tipped with a short blunt beak.—This is one of the most acrid, and even caustic, species. Villars says the root may be used as a blister, instead of cantharides, but not so safely. It is most active in the spring, and must not then be left on the skin more than four or six hours, for fear of leaving a dangerous spreading sore.

51. *R. hirsutus*. Pale Hairy Crowfoot. Curt. Lond. fasc. 2. t. 40. Fl. Brit. n. 8. Engl. Bot. t. 1504. Ait. n. 26. (R. Philonotis; Ehrh. Beitr. fasc. 2. 145. Herb. 116. Willd. n. 41. Lamarck Dict. n. 48. Pursh n. 13. R. sardous; Crantz Austr. fasc. 2. 84. Lamarck Dict. n. 47. R. pallidior; Villars Dauph. v. 2. 751. R. bulbosus β ; Hudf. Angl. 241. R. rectus foliis pallidioribus, hirsutis; Bauh. Hist. v. 3. p. 2. 417. R. secundus; Matth. Valgr. v. 1. 559. R. palustris, apii folio lanuginosus; Bauh. Pin. 180. Morif. sect. 4. t. 29. f. 27 and 28.)— β . R. parvulus; Linn. Mant. 79. Fl. Brit. n. 11. Willd. n. 50. Ait. n. 31. Lamarck Dict. n. 73. R. agrarius; ib. n. 46? R. minimus saxatilis hirsutus; Bauh. Prodr. 96. R. minimus apulus; Column. Ecphr. 314. t. 316. f. 1.—Leaves ternate, notched. Stem erect, branched. Calyx reflexed. Seeds orbicular, compressed with a short ascending beak, bordered; tuberculated at the sides.—Native of moist ground, in various parts of Europe, from Britain to Greece, flowering from June to October. The root is fibrous and annual. Stem erect, generally much branched, leafy, spreading, many-flowered, striated, clothed with soft, widely spreading hairs; in variety β smaller, smoother and weaker, sometimes, in a very starved state, bearing but one or two flowers. Leaves on longish, more or less hairy, footstalks, pale green, hairy, ternate, varying much in size; their leaflets wedge-shaped, sometimes deeply three-lobed, sometimes only bluntly notched; upper ones narrower and more simple, nearly sessile. Stipulas membranous, hairy, somewhat dilated, attached to the base of the footstalks. Flowers on long, terminal, furrowed, hairy stalks, solitary, smaller than in *bulbosus*. Calyx hairy, reflexed. Petals roundish; of a bright shining yellow above; paler and opaque beneath. Nectary closed by an abrupt scale. Fruit globose. Seeds lenticular, compressed, brown, with a triple-ribbed greenish border; their beaks short, ascending, very obscurely hooked; their sides studded with minute sharp tubercles, especially towards the margin, where they are often circularly arranged, as Poiret (or

RANUNCULUS.

Lamarek) describes them in his *R. agrarius*, cited above.—This species has been very little understood. It is remarkable that any botanist should confound it with *bulbosus*, or with *sceleratus*, and that Mr. Curtis, in labouring to distinguish it, did not advert to the decisive character of the tuberculated seeds, by which it approaches a very different tribe, hereafter described, consisting of *parviflorus*, *muricatus*, &c. Even Ehrhart has not noticed this circumstance. We are obliged to Mr. Edward Forster, F.L.S. for tracing out the identity of *R. parvulus* and *hirsutus*, and we cannot but prefer Curtis's original name for the species, rather than Ehrhart's pedantic one of later date. On the account of priority *sardous* perhaps ought to have been retained; but this name is founded on a very dubious opinion, that the plant of which we are speaking caused the Sardoniac laugh. Valerius Cordus, indeed, says it grows copiously in Sardinia, and it has certainly the appearance of Smallage, *Apium*; so far answering to the ancient history. But the account of Cordus seems taken from Dioscorides, whose "second *Ranunculus*" is more probably the Linnæan *lanuginosus*, a still more general plant of the south of Europe than that of which we are speaking. After all, the famous Sardinian herb, compared to Smallage, may be actually wild Smallage or Celery, *Apium graveolens*, which is sufficiently acrid and poisonous to warrant our supposition, though it becomes sweet and wholesome by culture. In this uncertainty it is surely best to call our plant *R. hirsutus*.

52. *R. palustris*. Oriental Marsh Crowfoot. Linn. MSS. (*R. orientalis palustris*, apii folio, caule subhirsuto; Tourn. Cor. 20.)—Leaves hairy, in three or five deep segments, bluntly notched, with rounded dilated sinuses. Stem erect, branched, almost leafless. Calyx spreading. Seeds ovate, compressed, very smooth, with a short recurved beak.—Native of the Levant. An oriental specimen, with Tournefort's synonym, is preserved in the Linnæan herbarium, and named *palustris*, but we can find no mention of it elsewhere. This is certainly a most distinct species, though not taken up by any recent author. The root consists of many fleshy knobs, tapering into fibres, and resembling those of *R. asiaticus*, though not so thick. Stem two feet or more in height; hairy below; much branched, and almost leafless above; the branches ternate. Leaves chiefly radical, on long hairy stalks; their outline somewhat pentagonal; heart-shaped at the base; hairy on both sides, about two inches wide; their three principal lobes spreading, deeply separated by wide rounded sinuses, and notched unequally at the extremity with broad, rounded, abrupt teeth; the upper or floral leaves are small, short, linear, undivided. Flowers, as far as we can judge, yellow, not large. Calyx hairy, spreading widely, but scarcely reflexed. Seeds in a round head, brown, shining, quite smooth, compressed, most like those of *bulbosus*, but more ovate, and with a longer, more recurved, and somewhat hooked, beak. Their edge is green, simple, not triple-ribbed as in the last.

53. *R. polyrhizos*. Many-rooted Siberian Crowfoot. Willd. n. 42. Lamarek Dict. n. 38.—Radical leaves palmate, with wedge-shaped, three-toothed segments; stem-leaves sessile, fingered. Stems many-flowered. Root fasciculated. Calyx spreading. Seeds ovate, compressed, smooth, with a blunt beak.—Native of Siberia. Root fasciculated, perennial. Radical leaves like *R. sceleratus*, three-lobed; their lateral lobes two-lobed, wedge-shaped like the leaf itself, their segments bluntly three-toothed. Stems a finger's length, simple, erect or ascending, two or three from one root. Stem-leaves sessile, fingered, wedge-shaped at the base; their segments linear, bluntish, entire. Flower-stalks two,

three, or four, long, single-flowered, round, not furrowed, very finely downy like the stem. Calyx-leaves coloured, smooth, obtuse, spreading. Petals yellow, the size of *R. Flammula*. Fruit roundish. Seeds ovate, compressed, smooth, crowned with the permanent blunt stigma. Willdenow. By the above description this species appears related, in many points, to the last, though they can hardly be the same.

54. *R. repens*. Common Creeping Crowfoot. Linn. Sp. Pl. 779. Willd. n. 43. Ait. n. 27. Pursh n. 14. Fl. Brit. n. 9. Engl. Bot. t. 516. Curt. Lond. fasc. 4. t. 38. Mart. Rut. t. 29. (*R. pratensis*, etiamque *hortensis*; Ger. Em. 951.)—Leaves ternate, three-cleft, cut, hairy. Stems ascending. Runners creeping. Flower-stalks furrowed. Calyx hairy, spreading. Seeds ovate, compressed, even.—Very common in meadows, waste ground, church-yards, neglected gardens and fields, throughout Europe. Mr. Pursh observed it in shady wet woods, particularly on the mountains, from Pennsylvania to Virginia. It flowers from June to August, and is perennial, being often a troublesome weed. Root fibrous. Besides the upright stems, which are of humble growth, leafy, branched, bearing several flowers, the root sends forth long trailing creeping shoots, whose joints produce leaves, and some shorter simpler stems. The whole herb is rough and hairy, of a dark green. Leaves stalked, ternate, more or less three-cleft, sharply cut or toothed; often marked with dark purple, or black, sometimes pale spots; the uppermost linear-lanceolate and entire. Calyx hairy, spreading, not reflexed. Petals deep yellow, generally emarginate. Nectary covered by a heart-shaped scale. Fruit globose. Seeds ovate, compressed, smooth at the sides, often hairy at the edge, their beak short and blunt.

55. *R. prostratus*. Prostrate Crowfoot. Lamarek Dict. n. 35. Fl. Francoise, n. 3. 197.—Leaves ternate, three-cleft, very hairy. Stems entirely prostrate, creeping, zig-zag. Calyx smooth.—Native of dry hilly places about Paris. Lamarek and Poiret esteem this a distinct species from the last, not only because its herbage is much smaller and more hairy, but because the stems are, even when in flower, entirely prostrate. We have never met with any thing answering to this description in England. The flowers are said to resemble *repens*, having likewise a smooth calyx. Our *repens* has hairs on that part.

56. *Q. intermedius*. Intermediate Crowfoot. Lamarek Dict. n. 44.—Lower leaves three-lobed, cut; upper somewhat fingered. Flower-stalks mostly solitary. Calyx reflexed. Seeds compressed, smooth. Root fibrous.—Found at the borders of ponds in France, about Paris and at Fontainebleau. This plant, according to Poiret, is, as it were, intermediate between *bulbosus* and *repens*, having, besides, many characters in common with *prostratus*. The root is fibrous, fasciculated. Stems several, low, scarcely branched, almost leafless except at the bottom, weak, striated, slightly downy, often forked above. Radical leaves on long stalks, almost smooth, in three rounded, often cut, lobes; the stem-leaves have three linear or lanceolate irregular lobes; the uppermost are very narrow, almost fingered. Flowers axillary, or terminal, two or three on each branch, on very long and slender, nearly smooth, stalks. Calyx-leaves reflexed at the time of flowering, as in *bulbosus*, coloured, concave, bearing some very fine long hairs. Petals of a fine yellow, striated, middle-sized. Fruit oval or globose. Seeds smooth, compressed, roundish, with a green border. We know nothing of this species but from the above description.

57. *R. lucidus*. Shining-leaved Crowfoot. Lamarek Dict. n. 36.—Leaves with three or five lobes, somewhat pinnatifid, shining, smooth. Stem erect, many-flowered. Calyx reflexed.—Supposed to be a native of the Levant; cultivated

RANUNCULUS.

in the botanic garden at Paris. *Root* perennial. *Stems* one or two feet high, branched, leafy, very smooth, tender, striated. *Leaves* alternate, stalked, widely spreading, smooth, shining as if varnished on their upper surface, divided into three or five distant dilated lobes, the two lowermost contracted at their base, unequally cut, obtuse. *Footstalks* long, somewhat downy, dilated at their base into a broad membranous expansion. *Flowers* numerous, situated at the ends, as well as in the forks, of the *branches*, on long, simple, cylindrical, rather downy *stalks*. *Calyx-leaves* coloured, smooth, concave, reflexed after the flower expands. *Petals* rather large, roundish, of a fine shining yellow. This plant has some agreement with *R. repens*, from which it differs in having entirely upright *stems* and a reflexed *calyx*, as well as shorter more dilated lobes to the *leaves*. Such is Poirét's account. This surely cannot be our *palustris*, n. 52, which has hairy *leaves*, and no resemblance or affinity to *repens*; neither could the intelligent author have overlooked Tournefort's synonym for that plant.

58. *R. polyanthemus*. Many-flowered Crowfoot. Linn. Sp. Pl. 779. Fl. Suec. ed. 2. 196. Willd. n. 44. Ait. n. 28. Lamarek n. 41. Lob. Ic. 666. (*R. fylvestris* fecundus; Dod. Pempt. 427. *R. surrectis* cauliculis; Ger. Em. 951, as to the figure. *R. fylvestris*; Tabern. Kreuterb. 107. Ic. 42. *R. napellifolius*; Crantz fasc. 3. 90. t. 4. f. 1, 1?)—Leaves in five deep, repeatedly subdivided lobes; segments all linear. *Stem* erect, many-flowered. *Flower-stalks* furrowed. *Calyx* spreading. *Seeds* ovate, bordered, compressed, smooth.—Native of moist, elevated, rich meadows, in Upland, and elsewhere in Sweden, but rarely. *Linnaeus*. In Germany, and perhaps in Switzerland, on the authority of various writers. *Root* perennial. *Stem* erect, two or three feet high, branched, many-flowered; leafy, clothed with upright, or somewhat spreading, hairs. *Radical* and lower *stem-leaves* three inches wide, on long very hairy stalks, divided to the very base into three lobes, the lateral lobes again divided almost to the base, so that the leaf may truly be called, in the first instance, five-lobed; each lobe is deeply, more or less repeatedly, cut, into three-cleft or alternate, linear, bluntish, entire, single-ribbed, spreading segments, loosely hairy on both sides, paler beneath: the uppermost leaves are nearly sessile, in about three deep, linear, entire divisions. *Flower-stalks* long, terminal, angular or furrowed, rough with upright hairs. *Flowers* large, yellow, drooping, not closing, in wet weather, according to Linnæus. *Calyx* spreading, pale, externally hairy. *Fruit* globose. *Seeds* ovate, short, compressed, smooth at the sides, bordered and roughish at the edges, tipped with a broad, short, recurved beak. We have described this from the authentic Linnæan specimen, which seems distinct from the following, and answers extremely well to the figure of Tabernæmontanus more especially, nor does it ill accord with that of Dodonæus, reprinted in Gerarde's herbal. The last-named author however certainly applies that figure to the common English *R. acris*, which he says he found double. Hence some doubt may arise whether the true *polyanthemus* was ever cultivated in England, as it seems to depend on Gerarde's authority only for a place in Hort. Kew. We have never seen it alive. Possibly it may be found in a double state in some old garden. The above description of the *leaves*, and the greater size of the whole plant, will distinguish it from *acris*. The *calyx* is hairy in both, notwithstanding Willdenow's remark to the contrary.

59. *R. acris*. Upright Meadow Crowfoot. Linn. Sp. Pl. 779. Willd. n. 45. Ait. n. 29. Pursh n. 15. Fl. Brit. n. 10. Engl. Bot. t. 652. Curt. Lond. fasc. 1. t. 39.

Mart. Ruft. t. 30. Woodv. Suppl. t. 246. Bulliard. t. 109. Curt. Mag. t. 215. (*R. hortensis* fecundus; Dod. Pempt. 426. *R. pratensis*, *surrectis* cauliculis; Lob. Ic. 665. *R. luteus*; Trag. Hist. 94.)—Leaves in three deep, wedge-shaped, many-cleft, jagged lobes; the lateral ones deeply divided. *Stem* erect, many-flowered. *Flower-stalks* round. *Calyx* spreading. *Seeds* ovate, bordered, compressed, smooth.—Native of meadows and pastures in all the more northern countries of Europe, very common in England, flowering in June and July. The double-flowered variety is frequent in gardens. The *root* is perennial, tuberous, with long simple fibres. *Stem* erect, two feet high, round, striated, rough with spreading hairs below, and with close-pressed ones above, branched, slightly leafy. *Leaves* hairy, far less divided than in the last, and with broader, wedge-shaped, by no means linear, segments: the upper ones linear, either deeply three-cleft, or simple. *Flower-stalks* round, not furrowed. *Calyx* green, spreading, hairy. *Petals* bright shining yellow. *Fruit* globose. *Seeds* much like the last.

A dwarf alpine variety was brought by Mr. Dawson Turner from wet rocks, near the summit of Snowdon, whose *stem* is but three or four inches high, and bears but one or two *flowers*. This when cultivated in a garden gradually assumes the size and habit of the common kind.

60. *R. Breynianus*. Woolly-fruited Alpine Crowfoot. Crantz Austr. fasc. 2. 91. t. 4. f. 2. (*R. Breynianus*, by mistake; Lamarek Dict. n. 59. *R. n. 1170*; Hall. Hist. v. 2. 72.)—Leaves deeply three-lobed, cut and toothed, very hairy beneath. *Stems* spreading, few-flowered. *Calyx* spreading. *Seeds* smooth. *Receptacle* woolly.—Native of the Austrian and Swiss Alps. Haller says it is the smallest of all the species. The *stems* are several, two or three inches high, oblique, simple or somewhat branched, hairy, bearing one or two *flowers*, which are of a varnished yellow. *Radical leaves* numerous, less deeply divided than in *acris*, very hairy beneath. *Fruit* globular. *Seeds* smooth, hooked. *Receptacle* woolly, which Crantz says he had not observed in other species, and by which we presume this is most essentially distinguished, particularly from the above alpine variety of *acris*. We have not met with a specimen, nor was Mr. Davall acquainted with the plant of Haller.

61. *R. lappaceus*. Bur Crowfoot.—Leaves ternate; leaflets stalked, three-lobed, sharply cut, hairy. *Stem* erect, many-flowered. *Calyx* spreading. *Seeds* ovate, keeled, reticulated, with elongated, revolute-pointed beaks.—Native of Port Jackson, New South Wales; communicated by Dr. White. This has much of the habit of *R. acris*, but is very distinct. The *stems* are a foot, or more, in height, branched, roundish, rough with close-pressed hairs. *Radical leaves* numerous, on long hairy stalks, very hairy, about the size of *acris* or *repens*, but remarkable for the partial stalks, sometimes an inch or two long, that support the leaflets, especially the terminal one; the *leaflets* are broad, wedge-shaped, more or less deeply three-lobed, coarsely and sharply cut. The lower *stem-leaves* are narrower and less cut; the upper entire and lanceolate; the uppermost of all simple and linear. *Flowers* larger than in *acris*, white in the dried specimen, but perhaps yellow when fresh, finely veined, on long, hairy, angular, terminal stalks. *Calyx* spreading, clothed with long hairs. *Nectary* covered with a wedge-shaped scale. *Fruit* globose. *Seeds* ovate, turgid, keeled, reticulated with veins, smooth, each tipped with a prominent angular beak, nearly its own length, whose point is strongly recurved, and even revolute.

62. *R. cappadocicus*. Cappadocian Crowfoot. Willd. n. 46. Lamarek Dict. n. 39. (*R. orientalis* dulcis, *doronici* radice; Tourn. Cor. 20.)—"Calyx spreading. *Flower-*

RANUNCULUS.

stalk round. Stem simple or divided. Leaves heart-shaped, three-lobed, toothed.—Native of Cappadocia. *Root* perennial, hard, the thickness of a goose-quill, and resembling the root of *Doronicum*. *Radical leaves* roundish-heart-shaped, with three very short lobes, all pointed, furnished with a few coarse teeth, and clothed on both sides with scattered close-pressed hairs. *Stem-leaf* solitary, stalked as well as the radical ones; and in the middle of the flower-stalk is a small, sessile, lanceolate, entire leaf. *Stem* a span high, clothed with close-pressed hairs, either simple, or divided above the leaf, each stalk single-flowered. *Corolla* yellow, the size of *R. polyanthemus*. *Fruit* roundish. *Seeds* compressed, hooked. *Willdenow*, from a dried specimen.

63. *R. lanuginosus*. Broad-downy-leaved Crowfoot. Linn. Sp. Pl. 779. Willd. n. 47. Ait. n. 30. Pursh n. 16. Fl. Dan. t. 397. Sm. Fl. Græc. Sibth. t. 519, unpublished. (*R. montanus hirsutus latifolius*; Bauh. Prodr. 96. *R. nemorosus hirtutus, foliis caryophyllatæ*; Loeff. Pruffl. 220. t. 71. *R. magnus* valdè hirsutus, flore luteo; Bauh. Hist. v. 3. 417. *R. n.* 1172; Hall. Hist. v. 2. 73. Βασιλαριον τριφυλον; Diosc. book 2. chap. 206.)—Leaves heart-shaped, five-cleft, lobed, notched, silky. Stem erect, many-flowered, hairy. Flower-stalks round. Calyx spreading. Seeds ovate, compressed, with elongated, revolute-pointed beaks.—Native of Germany, France, Switzerland, Carniola, Greece, and North America. Mr. Pursh observed it in old fields and meadows, from Pennsylvania to Carolina, flowering from June to October. Dr. Sibthorp found it in shady watery situations in the Peloponnesus, but most plentifully in the north of Greece, and with great reason concluded it to be the second *Ranunculus* of Dioscorides, with whose description it sufficiently well agrees, except being mild, rather than very acrid, in sensible qualities, if we may trust modern authors. Linnæus distinguishes two varieties, between which we can discover no difference, and Haller unites them. The opinion of this great Swiss botanist however loses some of its weight, by the doubt he expresses whether this plant be distinct from *R. repens*, n. 54, to which it has indeed a slight general resemblance, though differing totally in its upright stem, destitute of runners; its very soft silky leaves, by which this plant is known at once from every other European *Ranunculus*; and the revolute taper points of its seeds, which nearly agree with *lappaceus* in that respect; but the seeds themselves are compressed, and, as far as we can see, destitute of reticulated veins. The root is perennial, with many long, stout, cylindrical, fleshy fibres, or perhaps slender knobs, intermixed with capillary branched radicles. Stem 12 or 18 inches high, branched, leafy, round, clothed with long, spreading or deflexed, hairs; its base purplish, as are also the long hairy footstalks of the radical leaves. These and the lower stem-leaves are three inches wide, divided about half way down into five or seven broad, sharply notched lobes, whose close sinuses have a pale spot, with a purple stain, adjoining to their termination. The upper leaves are deeply three-cleft, with ovate and toothed, or lanceolate and entire, lobes. Flowers yellow, much like those of *acris*. Calyx hairy, spreading. Fruit globose. Seeds with awl-shaped, strongly revolute beaks, by which this species is clearly distinguishable from *repens*, *polyanthemus*, *acris*, if such a mark were necessary, and by which it forms a chain of affinity between those species and our *lappaceus*. It is somewhat remarkable that *R. lanuginosus* has not been found in Britain, and still more so, that any obscurity should envelope the botanical history of so distinct a species.

64. *R. sericeus*. Silky Crowfoot. Lamarck Dict. n. 26.—Leaves ternate, very silky; leaflets wedge-shaped, deeply

three-cleft, jagged and toothed. Stem erect, many-flowered, silky. Calyx spreading. Seeds ovate, compressed, with short erect beaks.—Gathered in the isle of Bourbon by Commerçon, from whom we have specimens. *Root*, as well as the general habit and size of the plant, like the last, but the whole herb is much more densely clothed with shining silky hairs. The leaves are ternate, some of them almost twice ternate; their lobes deeply and repeatedly cut, in a radiant manner, with sharp teeth. Flowers like the last. Fruit ovate. Seeds with broad straight beaks, longer, and not so much curved or hooked, as even those of *acris*.

65. *R. tomentosus*. Shaggy Crowfoot. Lamarck Dict. n. 70. Pursh n. 17.—Leaves downy, three-lobed or notched; the uppermost oval, entire. Stem reclining, somewhat creeping, shaggy, one or two-flowered. Calyx hispid, slightly reflexed.—Gathered in North Carolina, by M. Bosc. A small, almost creeping, very hairy plant, with fibrous roots. The stems are very low, and nearly prostrate, ascending at their extremities, two or three inches long, tender, covered with whitish tufted hairs, disposed in two rows. Leaves stalked, thick, downy, generally with three lobes, which are either distinct or confluent; some leaves are merely crenate and rounded. Footstalks long and hairy. The uppermost stem-leaf is sessile, oval, acute, entire. Flowers one or two, on terminal, unequal, simple stalks, clothed with two rows of hairs. Calyx hispid, a little reflexed. Petals white or yellowish, rounded at the end. *Poirët*. We have seen no specimen, nor did Mr. Pursh meet with the plant himself.

66. *R. marylandicus*. Maryland Crowfoot. Lamarck Dict. n. 69. Pursh n. 18. Leaves ternate, three-lobed, acute, cut, pale and nearly smooth beneath. Stem simple, almost naked, downy. Calyx smooth, reflexed. Found in shady woods, from Pennsylvania to Virginia, flowering from May to July. Pursh. Root fibrous, perennial. Stems simple, erect, downy, slender, about ten inches high; *Poirët* by mistake, as we presume, says ten feet. Leaves radical, on long downy stalks, ternate; the two lateral ones opposite, stalked; all with three confluent, lanceolate, acute, cut lobes; their upper surface green; the under paler and whitish, almost smooth. There are no other stem-leaves than what stand almost sessile, at the base of the flower-stalks, and either have three or five shallow irregular lobes, or are simply cut. Flowers two or three, terminal, on short, scarcely downy, stalks. Calyx smooth, reflexed. Petals rather large, oval, rounded at the end, pale yellow. *Poirët*.

67. *R. recurvatus*. Recurved Crowfoot. Lamarck Dict. n. 65. Pursh n. 19.—Leaves in three deep, acute, cut, wedge-shaped lobes. Stem many-flowered. Calyx and corolla reflexed. Petals nearly linear. Seeds compressed, dotted, with revolute, awl-shaped beaks.—Native of shady woods, from New York to Carolina, flowering from June to August. Pursh. We received specimens from the Rev. Dr. Muhlenberg, of Lancaster, Pennsylvania. The root is perennial. Stems a span high, very hairy; branched and leafy at the upper part. Leaves two or three inches wide, rather hairy, on very hairy stalks; their side-lobes for the most part deeply cleft. Flowers stalked, small. Calyx pale-purplish, ribbed, clothed with fine long hairs. Petals small, narrow, almost white. Fruit globose. Seeds ovate, lenticular, minutely dotted, smooth, with slender, revolute-pointed beaks.

68. *R. septentrionalis*. Smooth North-American Crowfoot. Lamarck Dict. n. 64. Pursh n. 20.—Leaves ternate, membranous, smooth, deeply lobed, acute, cut. Stem two-flowered, hairy, like the base of the footstalks. Calyx reflexed.

RANUNCULUS.

reflexed.—Native of North America. Described by Poirer from Lamarck's herbarium, and adopted by Pursh. *Root* perennial, fibrous, fasciculated. *Stems* nearly simple, hollow, eight or ten inches high, almost leafless; downy in their lower part. *Leaves* stalked, thin, smooth, composed of three stalked leaflets, the central one having three deep spreading lobes, the others often but two; all sharp, cut and toothed. There is usually but one *stem-leaf*, which is nearly sessile, ternate, with narrower segments. *Footstalks* long, slender, most hairy towards their base. *Flower-stalks* two, terminal, unequal, very slender, smooth, each bearing, about half way up, one small linear leaf. *Calyx* reflexed, coloured, smooth, except a few terminal hairs, deciduous. *Petals* pale yellow, rounded. *Fruit* small, globular. *Seeds* nearly orbicular, lenticular, with sharp straight beaks. *Poirer*.

69. *R. bifidus*. Hifpid American Crowfoot. Michaux Boreal-Amer. v. 1. 321. Lamarck Dict. n. 27. Pursh n. 21.—Very hairy, erect. Leaves ternate, sharply lobed. Stems few-flowered; leaflets below. Calyx close-pressed. Seeds obovate, with awl-shaped, inflexed beaks.—Found in wet fields, and on the banks of ditches, from Virginia to Carolina, flowering from June to August. *Root* perennial. *Flowers* small, pale yellow. *Pursh*. A specimen sent by Gronovius to Linnæus, as akin to his *lanuginosus*, but distinct, answers very well to the characters of Michaux, and we have taken from that specimen the above account of the seeds. The flower is nearly as big as *acris*. Whole herbage, especially the *footstalks*, very hairy.

70. *R. pinnatus*. Pinnated Indian Crowfoot. Poirer in Lam. Dict. n. 66.—“Downy. Leaves pinnated; leaflets lobed and cut. Branches spreading. Seeds tuberculated.”—Gathered in India by Sonnerat. *Stems* with lax, spreading, downy, striated, leafy branches. *Leaves* alternate, stalked, downy, of five or seven opposite leaflets, divided into irregular, sharp, cut, almost lanceolate, lobes. *Flowers* numerous, on long, downy, single-flowered stalks. *Calyx* coloured, not reflexed. *Petals* yellowish, of a middling size. *Seeds* orbicular, convex, moderately tuberculated on each side, and tipped with a small, thick, straightish beak. *Poirer*.

71. *R. multifidus*. Many-cleft Arabian Crowfoot.—*Forsk.* Ægypt.-Arab. 102. Lamarck Dict. n. 67.—“Leaves many-cleft; the lower ones pinnated. Stem many-flowered. Calyx the length of the corolla. Seeds ovate, acute.”—Gathered by *Forskall*, in ditches near the town of Taes. He describes the stem two feet high, erect; round in the lower part; striated above; hairy. *Fruit* oval. We have no other authority, than the authors quoted, for this species or the last.

72. *R. pedatifidus*. Radiating-leaved Crowfoot.—Leaves deeply pedatifid, with linear, obtuse, divided or three-cleft, radiating, entire segments. Stem one or two-flowered. Seeds ovate, hairy, with small recurved beaks.—Native of Siberia. Four specimens from that country are in the Linnæan herbarium, but the species, though very distinct, appears never to have been described. *Root* perennial, of many long, cylindrical, fleshy fibres, and crowned with numerous capillary remains of old footstalks. *Stem* a span high, erect, round, striated, leafy, simple or divided, clothed with long, soft, lax hairs. *Radical leaves* on long hairy stalks, deeply cut, in a pedate manner, into five, seven, or more, narrow, linear, obtuse, elegantly radiating segments, some of which are deeply three-cleft, and their lobes again cleft, others merely divided, and others undivided; all entire at the edges, and somewhat hairy on both sides, with long, lax, white hairs. The *stem-leaves* are mostly sessile, less divided; the uppermost in three, rarely

more, deep, linear, simple segments. *Flowers* apparently yellow, the size of *R. acris*. *Calyx* woolly at the base; its segments partly dilated and coloured, all shorter than the *petals*, and closely pressed to their under side. *Fruit* ovate. *Seeds* not very numerous, ovate, tumid, hairy, with short, awl-shaped, reflexed beaks.

73. *R. charophyllos*. Chervil Crowfoot. Linn. Sp. Pl. 780. Willd. n. 48. Lamarck Dict. n. 32. (*R. tenuifolius* luteus, grumosa radice, foractensis seu italicus; *Barrel.* Ic. t. 581? bad.)—Leaves thrice compound, with linear segments. Stem silky, with few flowers. *Calyx* reflexed, hairy. *Root* with tapering fleshy fibres.—Native of the south of Europe. The only certain specimen of this plant, that has ever come under our observation, exists in the Linnæan herbarium. The *root* consists of numerous, long, fleshy, gradually tapering, downy fibres. *Stem* erect, about a span high, slender, silky, slightly leafy, branched, bearing three or four flowers. *Radical leaves* several, stalked, repeatedly ternate, with numerous linear, or somewhat lanceolate, entire segments, hairy beneath. *Footstalks* an inch and half long, hairy; dilated, membranous, and ribbed at the base. *Stem-leaves* few, much less compound, and often nearly sessile. *Flowers* solitary, on long, terminal, simple, hairy, quadrangular stalks. *Calyx* strongly reflexed, coloured; externally hairy. *Petals* yellow. *Fruit* not sufficiently advanced to be described. At the back of this specimen Linnæus has written *Ranunculus lybicus, pulsatille folio, T. Cor.*; but there is no such passage in *Tournefort's Corolla*, nor any thing to which it can refer, except *R. lefbius, pulsatille folio, flore parvo*, a species unknown to us. A very different plant from the true *R. charophyllos*, was given by the abbé Pourret to the younger Linnæus, under that name. It seems rather to be *stabellanus*, n. 32, a species allied, in many points, to what we are describing.

74. *R. millefoliatus*. Milfoil Crowfoot. Vahl. Symb. v. 2. 63. t. 37. Desfont. Atlant. v. 1. 441. t. 116. Willd. n. 49. Lamarck Dict. n. 33. Sm. Fl. Græc. Sibth. t. 521, unpublished. (*R. montanus leptophyllon, aphodeli radice; Column. Ecphr.* 312. t. 311.)—Leaves thrice compound, with elliptic-linear segments. Stem silky, with few flowers. *Calyx* erect, somewhat hairy. *Root* with ovate knobs.—Native of Italy, Greece, Syria, and Barbary. The *root*, in Dr. Sibthorp's specimens, consists of many oval fleshy knobs, scarcely half an inch long, intermixed with fibres. *Columna* describes and delineates the fibres as terminating the knobs; a very material difference. The *stems*, in the Greek and Italian specimens, are simple and single-flowered; in the more luxuriant ones from Aleppo and Tunis, somewhat branched, bearing two or three flowers. The *stem-leaves* are more numerous, as well as more compound, than in the last. *Flowers* large. *Calyx* closely pressed to the corolla; sometimes nearly smooth. *Fruit* oblong. *Seeds* with small recurved beaks. We can scarcely doubt, notwithstanding the above-mentioned diversity respecting the *root*, that the synonym of *Columna* belongs to the present, rather than the foregoing, species.

75. *R. oxyperinus*. Sharp-leaved Crowfoot. Willd. n. 51. Lamarck Dict. n. 37.—“Radical leaves oblong, obtuse, deeply and unequally toothed; stem-leaves sessile, fingered, cut. Seeds awned.”—Native of Siberia, near the river Tereck. *Root* apparently annual. *Radical leaves* stalked, ovate, obtuse, with unequal deep teeth; hairy, like their *footstalks*, on both sides. *Stem* erect, branched, hairy, a foot or more in height. *Stem-leaves* digitate; the segments of the lower ones unequally pinnatifid; of the upper linear and entire. *Calyx* reflexed. *Corolla* yellow, the size of *R. bulbosus*. *Fruit* elliptical. *Seeds* rather compressed, acute,

RANUNCULUS.

acute, with upright, awl-shaped, bristly points. *Willdenow.*

76. *R. arvensis*. Corn Crowfoot. Linn. Sp. Pl. 780. Willd. n. 52. Ait. n. 32. Fl. Brit. n. 12. Engl. Bot. t. 135. Curt. Lond. fasc. 6. t. 36. Mart. Ruß. t. 56. Fl. Dan. t. 219. Bulliard. t. 117. Brugnou Mem. de l'Acad. de Turin, v. 4. 108. t. 3. (*R. arvorum*; Ger. Em. 951.)—Leaves ternate, three-cleft, with linear segments. Seeds prickly at each side. Stem erect.—Frequent in corn-fields throughout Europe, flowering in the middle of summer. *Root* fibrous, annual. *Stem* one or two feet high, much branched, many-flowered, leafy, nearly smooth. *Leaves* of a light green, slightly hairy, stalked, once or twice ternate, as well as deeply three-cleft; the ultimate segments almost linear, entire, or rarely notched. *Flowers* small, lemon-coloured, stalked, lateral and terminal. *Calyx* spreading, hairy. *Petals* obovate, veined. *Fruit* depressed. *Seeds* very large, compressed, with erect, awl-shaped, hooked beaks; their sides armed with numerous, prominent, awl-shaped prickles, largest towards the margin. From the observations of M. Brugnou, this appears to be one of the most virulent of its genus, especially when young, causing speedy inflammation and gangrene in the stomachs of sheep and oxen; who nevertheless eat it with avidity. Vinegar much diluted with water, poured down their throats, proved a quick and certain remedy. The expressed juice of the plant, given to dogs, is no less fatal.

77. *R. muricatus*. Spreading Prickly-seeded Crowfoot. Linn. Sp. Pl. 780. Willd. n. 53. Lamarck Dict. n. 75. Ait. n. 33. Pursh n. 24. Sm. Fl. Græc. Sibth. t. 522, unpublished. (*R. creticus echinatus latifolius*; Alpin. Exot. 263. t. 262. *R. Apulei quibusdam*; Clus. Hist. v. 1. 233. *R. parvus echinatus*; Ger. Em. 965. *R. palustris echinatus*; Bauh. Hist. v. 3. 846. Feuille. Peruv. 58. t. 18. f. 1.)—Leaves simple, three-lobed, notched, bluntish, smooth. *Stipulas* distantly fringed. Seeds prickly at each side. Stem diffuse.—Native of watery places in various parts of the south of Europe; frequent in Greece. It occurs also in North America, in old fields, from Virginia to Carolina, flowering in June and July, according to Mr. Pursh. The *root* is annual, consisting of numerous long fibres. *Herb* smooth and succulent, bright green. *Stems* several, various in length, spreading, and mostly procumbent, leafy, round, shining; purplish in the lower part. *Leaves* an inch and a half to three inches wide, veiny, in three rather deep lobes, broadly and irregularly notched. *Footstalks* from one to four inches, or more, in length, with a concave sheathing base, bordered with a membranous *stipula*, whose edges are regularly fringed with distant hairs. *Flowers* the size of the last, yellow, solitary, on axillary stalks, rather shorter than the leaves. *Calyx* reflexed, nearly, or quite, smooth. *Petals* obovate, almost twice as long as the calyx, at least in the European specimens, though they appear to be but of the same length in American ones. *Fruit* capitate. *Seeds* large, ovate, compressed, with broad, awl-shaped, angular, somewhat recurved beaks; their sides covered with smaller, more uniform prickles, than in *R. arvensis*. Commerçon gathered, by the sea-shore at Monte Video, a variety of this with more luxuriant herbage, and smaller flowers, of which Ventenat makes a species of the name of *ventricosus*, founding its character on the inflated bases of the *footstalks*, of which, however, we can see nothing, in our original specimens from Thouin's herbarium. Its *stipulas* are fringed precisely as in our European *muricatus*, to which we agree with Poiret in referring it, though we can scarcely do the same by the following.

78. *R. cchinatus*. Dwarf Prickly-seeded Crowfoot. Venten. Jard. de Cels t. 73. Pursh n. 25. (*R. muricatus* ?; Lamarck Dict. n. 75.)—Leaves simple, three-lobed, notched, smooth. *Stipulas* bearded at the summit. Seeds prickly at each side. Stem erect, branched.—Found by M. Bosc, near Charlestown, South Carolina. This seems to differ from the last, in its simple, short, upright stem; but more especially, if Ventenat's plate and description be correct, which we cannot doubt, in having each *stipula* crowned with a tuft of hairs, instead of being distantly fringed throughout. The *petals* are said to be larger than those of the American variety, at least, of *muricatus*; but that circumstance is of small moment here, as to a specific distinction.

79. *R. parviflorus*. Small-flowered Crowfoot. Linn. Sp. Pl. 780. Willd. n. 54. Ait. n. 34. Fl. Brit. n. 13. Engl. Bot. t. 120. (*R. hirsutus annuus, flore minimo*; Raii Syn. 248. t. 12. f. 1. Pluk. Phyt. t. 55. f. 1.)—Leaves simple, three-lobed, notched, hairy. Seeds covered, at each side, with hooked prickles; their beaks recurved. Stem diffuse.—Native of the more temperate parts of Europe. Found on banks, and in waste as well as cultivated ground, in England, where the soil is gravelly; as also in Greece, flowering in the early part of summer. The *root* is annual. *Stems* prostrate. Whole herb hairy, smaller in every part than *R. muricatus*. *Flower-stalks* opposite to the leaves. *Petals* pale yellow, scarcely longer than the spreading *calyx*, fugacious, and often imperfect. *Fruit* capitate. *Seeds* ovate, with a broad, short, hooked beak, their flat brown sides densely covered with short, hooked prickles. *R. trilobus*, Desfont. Atlant. v. 1. 437. t. 113. Lamarck Dict. n. 77, seems a variety, not of this, but of our *hirsutus*, n. 51.

80. *R. orientalis*. Spinous Oriental Crowfoot. Linn. Sp. Pl. 781. Willd. n. 55. Lamarck Dict. n. 71. (*R. leibius, pulfatilla folio, flore magno*; Tourn. Cor. 20.)—Leaves deeply lacinated, acute; all stalked. Stem branched. *Calyx* reflexed. *Fruit* cylindrical. Seeds dotted; their beaks recurved and spinous.—Native of the Levant. *Root* annual. *Stem* various in luxuriance, silky, leafy; in the Linnæan specimen much branched and divaricated, with many flowers. *Leaves* stalked, composed in general of three deeply lacinated, often pinnatifid, acute, hairy leaflets. *Flowers* large, pale yellow, on long, stout, simple, lateral or terminal, solitary, spreading stalks. *Calyx* rather spreading than decidedly reflexed, nearly smooth. *Fruit* three quarters of an inch long, slightly elliptical, obtuse. *Seeds* in many rows, compressed, minutely dotted at each side, gibbous at the base, each terminating in a very broad, rather short, compressed, recurved, spinous-pointed beak. We know of no figure of this or the following.

81. *R. grandiflorus*. Large-flowered Oriental Crowfoot. Linn. Sp. Pl. 781. Willd. n. 56. Lamarck Dict. n. 63. (*R. orientalis, aconiti folio, flore luteo maximo*; Tourn. Cor. 20.)—"Stem erect, two-leaved. Leaves many-cleft; those of the stem alternate, sessile."—Gathered by Tournefort in the Levant. We have seen no specimen. Willdenow marks this as a perennial species, and indicates his having seen it in a dried state. We regret that he did not subjoin a description of the plant, the Linnæan specific character being very insufficient. What Peiret has given is evidently compiled from the short materials furnished by Linnæus and Tournefort. The Abbé Sestini is said to have gathered *R. grandiflorus* near Constantinople; on whose authority it finds a place in Prodr. Fl. Græc. v. 1. 385.

82. *R. falcatus*. Sickle-seeded Crowfoot. Linn. Sp. Pl.

RANUNCULUS.

Pl. 781. Willd. n. 57. Ait. n. 35. Jacq. Auftr. t. 48. (*Melampyrum luteum*; Ger. Em. 90. Lob. Ic. 37.)—Leaves linear-wedge-shaped, in three deep many-cleft lobes. Seeds with sickle-shaped beaks. Stalks radical, single-flowered.—Native of corn-fields in the south of Europe, and the Levant; cultivated by Miller at Chelsea in 1739. A small annual, flowering in the early part of summer. Root thread-shaped, with a few fibres. Stem none. Leaves several, pale green, downy, about two inches long; their segments narrow and entire. Stalks simple, downy, taller than the leaves, each bearing a small yellow flower, whose calyx is erect. Fruit large, ovate, or nearly cylindrical, beset on all sides with the long, prominent, ascending, incurved, compressed, downy, spinous-pointed beaks of the seeds.

83. *R. polyphyllus*. Many-leaved Water Crowfoot. "Waldst. et Kitaibel Hung." Willd. n. 58.—"Leaves under water oblong, stalked, capillary; floating ones wedge-shaped, three-lobed; those above the water elliptical. Stem erect."—Native of the waters of Hungary. Annual. Stem nine inches high, erect; branched in the upper part. Leaves that are under water very numerous, entirely covering that part of the stem, oblong, the length of the nail, each supported by a capillary footstalk an inch long: the floating leaves small, wedge-shaped, three-lobed, entire, as long as the former, their footstalks thicker and shorter. Branches an inch long, erect, rising above the water, and bearing elliptical obtuse leaves, tapering each way, from four to six lines long, on short footstalks. Flowers extremely small, yellow. Willdenow.

84. *R. hederaceus*. Ivy Crowfoot. Linn. Sp. Pl. 781. Willd. n. 59. Ait. n. 36. Fl. Brit. n. 14. Engl. Bot. t. 2003. Curt. Lond. fasc. 4. t. 39. Fl. Dan. t. 321. Dalech. Hist. 1031. (*R. hederaceus rivulorum* se extendens, atrá maculá notatus; Bauh. Hist. v. 3. 774.)—Leaves smooth, roundish, kidney-shaped, with three or five entire lobes. Stem creeping. Stamens from five to ten. Seeds corrugated.—Native of watery places, on a sandy or gravelly soil, in England, Germany, France, &c. flowering from May to August. Roots fibrous, perennial. Stems either creeping or floating, prostrate, branched, round, smooth, and succulent. Leaves stalked, smooth, and shining, nearly uniform; often blackish in the disk. Flowers very small, on simple, axillary or lateral, stalks. Petals linear-oblong, rather exceeding the calyx in length, white, with yellow claws. Stamens scarcely ever more than ten. Fruit globose. Seeds ovate, incurved, somewhat compressed, with a very small inflexed beak, and numerous, lateral, corrugated or reticulated veins.

85. *R. aquatilis*. White Floating Crowfoot. Linn. Sp. Pl. 781. Willd. n. 60. Ait. n. 37. Fl. Brit. n. 15. Engl. Bot. t. 101. Ger. Em. 829.—Leaves capillary under water; above somewhat peltate. Stamens numerous. Seeds corrugated.—Native of pools, ditches, and rivers, throughout Europe, mantling the surface with its copious white blossoms, in the early part of summer. The roots are long, fibrous, and perennial. Stems floating under water, long, round, branched, leafy. Leaves stalked, smooth; the uppermost floating, usually peltate, with various blunt notches; the next deeply three-lobed, or even ternate; the lowermost immersed, repeatedly three-cleft, with innumerable capillary segments. Flowers floating on long simple stalks, opposite to the leaves. Petals obovate, much longer than the calyx, white, with yellow claws. Nectary tubular. Stamens thirty or more. Fruit like the last, but the seeds more numerous, and generally brittle, somewhat obovate.

Varieties, as we deem them, of this species are, 1st, that whose leaves are all immersed, and entirely capillary, figured in Ger. Em. 827. f. 3: 2dly, the *circinatus* of Sibth. Oxon. 175, figured in Pluk. Phyt. t. 55. f. 2, whose leaves are all likewise in capillary divisions, but finer and smaller than the former: 3dly, the *fluvialis* of Willdenow, n. 61, *peucedanoides* of Desfont. Atlant. v. 1. 444, figured in Fl. Dan. t. 376, whose leaves are not only in capillary segments, but considerably elongated, by the influence, as we conceive, of the running water, in which this sort is always found. The seeds indeed are not brittle, in our specimens of this last variety, but naked, as in *hederaceus*, which species agrees with every variety of *aquatilis*, in the corrugations of the seeds, as above described.

We have thus added twenty-four species to Willdenow's number, following his arrangement, for the present at least; not only for the convenience of our readers, but because it would be very difficult to make a perfect one on any known principles; the several species being allied by so many characters, and so dissimilar in others, that nothing could be more precarious than to seek the clue of nature through such a labyrinth. The seeds perhaps ought to form the basis of a specific arrangement, if they might not even lead to generic distinctions.

No small curiosity in the history of this genus is the *R. alatus*, of Poiret in Lamarck's Dict. n. 72, which, by his description, proves to be no other than *Gymnostyles pterosperma* of Jussieu. (See GYMNOSTYLES.) The *pumilus* of Poiret, n. 82, appears to us a variety of *aquatilis*, growing in shallow, and perhaps fluctuating, waters; whence, though its leaves are all deeply cut, their segments are not quite capillary, but linear and obtuse. We have Swiss specimens answering to this author's description.

RANUNCULUS, in Gardening, contains plants of the hardy, herbaceous, perennial kind, of which the species cultivated are, the Persian crowfoot, or garden ranunculus, (*R. asiaticus*); the aconite-leaved crowfoot (*R. aconitifolius*); the upright meadow crowfoot (*R. acris*); the creeping crowfoot (*R. repens*); and the embracing-leaved crowfoot (*R. amplexicaulis*). But there are other species that may be cultivated for variety.

Of the first species the varieties are exceedingly numerous, being sometimes divided into two classes, as the old Turkey kinds, and the Persian kinds, the varieties of the latter amounting to many hundreds, and being considerably more various, rich, and beautiful in colour than those of the others.

But in the former of these sorts they rise with a strong generally unbranching stalk a foot high, terminated by one large double flower, sometimes emitting one or two smaller ones from its sides, and of which there are red-flowered, scarlet-flowered, yellow-flowered, and scarlet turban-flowered, &c.; but being seldom tinged with different colours, as in the Persian kinds.

And in the latter kind the plants rise eight or nine inches high, generally branching from the bottom, producing from five or ten to twenty or more flowers on each root, and of which there are single-flowered, semi-double-flowered, full-double-flowered, large and full like a double rose, being generally filled with petals to the very centre, forming a regular globular body, of admirable elegance, of all sorts of the most beautiful colours in different varieties, and of numerous degrees of deeper and lighter shades, stripes, and tinges in the several colours. Indeed Martyn observes, that the varieties produced of late years from the seeds of semi-double flowers are unbounded; and that Mr. Maddock remarks that they are more numerous than of any other

RANUNCULUS.

other flower. Accordingly his catalogue, he says, boasts nearly eight hundred, all with their proper names: ranged under the heads of—dark and dark purple; light purple and grey, &c.; crimson, &c.; reds, &c.; rosy, &c.; orange, &c.; yellow and yellow spotted, &c.; white and white spotted, &c.; olive, &c.; purple and coffee-striped, &c.; red and yellow-striped; red and white striped.

And according to the above flower gardener a fine ranunculus should have a strong straight stem from eight to twelve inches high. The flower should be of an hemispherical form, at least two inches in diameter, consisting of numerous petals gradually diminishing in size to the centre, lying over each other, so as neither to be too close nor too much separated, but having more of a perpendicular than horizontal direction, in order to display the colours with better effect. The petals should be broad, with entire well-rounded edges; their colours dark, clear, rich or brilliant, either of one colour or variously diversified, on an ash, white, sulphur or fire-coloured ground, or else regularly striped, spotted or mottled, in an elegant manner.

In the second species there is a variety with double flowers, which has been obtained by seeds, and is preserved in many curious gardens for the beauty of its flowers. It is by some gardeners called the *Fair Maid of France*. The root is perennial, and composed of many strong fibres: the leaves are divided into fine lanceolate lobes: the four side-lobes are upon footstalks coming from the side of the principal stalk, and the middle one terminates it; they are deeply serrate, and have several longitudinal veins. The stalks rise a foot and half high, and branch out at the top into three or four divisions, at each of which there is one leaf, of the same shape with the lower, but smaller. The flowers are pure white, and very double, each standing upon a short footstalk. The flowers come forth in May.

In the third sort there is also a variety with double flowers, which is the sort most generally cultivated in the garden. It is frequently among other herbaceous perennials, under the name of *Yellow Bachelor's Buttons*.

And in the fourth species there is a variety with double flowers, which is the sort cultivated in the gardens for its ornamental effects.

Method of Culture.—The first sort and different varieties may be readily increased by the off-sets taken from the root, and new varieties may be raised from seed. In the first of these methods the off-sets should be separated from the roots in dry weather, in the latter end of summer, when the flowering is over, and the stems and leaves are declining, being placed in bags or boxes, in a dry place, till the autumn, when they should be planted out in rows six or eight inches apart, and six of them to each, in separate beds, prepared with light sandy earthy compost, to the depth of two or three feet; taking care to protect them carefully from the frost during the winter. When the buds begin to break through the ground they should be kept perfectly clear from weeds, protecting them from frosts; and when they have flowered and the stems are decayed, the root should be taken up; cleared from dirt, and placed in bags or boxes till the autumn, when they must be planted again.

But in the second mode, the seed should be collected from the best plants of the semi-double kinds, and be sown in flat pans or boxes, filled with light rich earth, in August, covering it in about a quarter of an inch thick with the same sort of earth, placing them in a shady situation, so as to have a little of the morning sun. The pots should remain here till the beginning of October, when the plants sometimes appear,

though it is often later before this happens, when they should have a more open exposure with the full sun; but when frost is apprehended, they should be removed under a common hot-bed frame, being only covered in the nights and bad weather with the glasses, guarding them well against rains and frost. In the spring following they should be exposed to the open air, being very slightly refreshed with water, having a situation to enjoy the morning sun; and when their leaves and stems begin to decay, the roots may be taken up, dried in a proper place, and then put up in bags to be planted out in the same manner as the old roots in October.

In the following summer they will produce flowers; when such as are good should be marked, and the others removed from them. The plants intended to flower should not be suffered to run to seed, as roots which have produced seeds seldom furnish fine flowers afterwards. The disappointments experienced in purchasing these roots, chiefly depend upon this circumstance.

It may be noticed that the roots intended for the borders should be planted towards the spring in little clumps or patches, three, four, or five roots in each, putting them in either with a dibble or trowel, about two inches deep, and three or four asunder in each patch, and the patches from about three to five or ten feet distance, placing them in a varied manner in the borders.

And in regard to their general culture after planting, such of the forward autumnal-planted roots of the choice sorts in beds as have shot above ground, should in winter, where convenient, have occasional shelter from hard frosts, by mats supported on low hoop arches; or in very severe weather be covered close with dry long litter, removing all covering in open weather: and in the spring, when the flower-buds begin first to advance, shelter them in frosty nights with supported mats, suffering them, however, to be open to the full air every day; but the latter plantings, that do not come up in winter, or very early in spring, whilst frosty nights prevail, will not require any protection, and all those distributed in patches about the borders must also take their chance in all weathers: those of the different seasons of planting will succeed one another in flowering from the beginning of April until the middle of June, though the May blow generally shews to the greatest perfection. After the blow is past, and the leaves and stalks withered, the roots should be taken up and dried in the shade, then cleared from all off-sets and adhering mould, putting them up in bags or boxes till next planting season, when they must be planted again, as directed above.

But in each season of planting, it is highly necessary, in the principal fine varieties, to put them either in entire new beds, or the old ones refreshed with some fresh rich earth or compost, working the old and new well together, in order to invigorate the growth of the plants.

All the other species are capable of being easily raised by the roots, which should be slipped or parted in autumn when past flowering, or in the spring before they begin to shoot, and the slips be either planted at once, where they are to remain, or in nursery-rows for a season, then planted out finally. They succeed in any common soil and situation, and may be dispersed about the different flower-borders and clumps, where they constantly remain, only trimming them occasionally; and once in a year or two, or when they have increased into large bunches, taking them up in autumn or spring, to divide them for further increase, replanting them again directly.

In saving seed for raising new varieties, it must be suffered to continue on the plant till it becomes brown and dry,

dry, then be cut off, with the heads, and spread upon paper, in a dry room, exposed to the sun, and when quite dry, be put into a bag, and hung in a dry place till it is wanted.

All these plants are highly ornamental; the first sort in beds and pots, and the other in the borders, clumps, and other parts of pleasure-grounds.

RANUNCULUS, *Globe*, in *Botany*. See HELLEBORE.

RANUNCULUS *Viridis*, in *Zoology*, the name of an animal common in many parts of the world, and usually known by the name of the *tree-frog*, or *rana arborea*.

The creature is easily distinguished from the common frog, by its being much smaller, and of a green colour. It usually sits upon the leaves of trees and shrubs, and makes a great noise in an evening; but that is rather like the singing of a small bird than the croaking of a frog.

These creatures have been kept alive many years together in glass vessels, giving them flies and other small insects: and in winter, when these are scarce, they usually become very lean and feeble; but in summer, when they are plentiful, they will grow fat again, as if at their liberty. This is esteemed a poisonous creature. Ray. See RANA.

RANZ *des Vaches*, a celebrated air among the Swifs, played upon the bagpipe by the young cow-keepers on the mountains. The air will be found on our music-plates. In the article MUSIC, the powerful effects of this tune are mentioned, from Rousseau's Dict. de Musique.

RAOLCONDA, in *Geography*, the site of a diamond-mine in Hindoostan, placed in Mr. Montresor's map about 15 geographical miles to the west of Ralicotte, and 12 from the north bank of the Kistnah, but Mr. Rennell does not know what authority he has for this position. Tavernier, who visited Raolconda, gives its distance from Golconda at 17 gos, of 4 French leagues each. He crossed a river that formed the common boundary of Golconda and Visapour, about four gos, or more, before he came to Raolconda; and this river can be no other than the Beemah, which to this day forms the eastern boundary of Visapour, and passes about 80 or 82 miles to the west of Golconda, crossing the road from it to Ralicotte. If we reckon the 82 miles at 13 gos, that is, forming a scale from the distance between Golconda and the river Beemah, each gos will be 6.3 geographical miles in horizontal distance (or nearer three than four French leagues); and Raolconda will be placed about 25 geographical miles on the W. of the Beemah, or 11 E. of Ralicotte.

RAON L'ETAPPE, a town of France, in the department of the Vosges, and chief place of a canton, in the district of St. Dié, on the Meurte; 7 miles N. of St. Dié. The place contains 2528, and the canton 5300 inhabitants, on a territory of 70 kilometres, in 5 communes.

RAUDA, or ROUDA, denoting *gardens*, an island of Egypt, in the Nile, in front of Old Cairo, about 500 yards in breadth, where is built the *Mekkiar*, signifying measure, or Nilometer, a pillar, by the gradations on which the rise of the Nile is measured.

This island is called Roudd, or gardens, because it is laid out in gardens, and inhabited only by gardeners.

RAOUTTY, a town of Hindoostan, in Malwa; 20 miles N.N.E. of Tandla.

RAPA, in *Botany*, (an ancient name, of whose etymology no plausible account has come to our knowledge,) the Turnip. See BRASSICA, species 7.

RAPAAPO, in *Geography*, a town of America, in New Jersey; 30 miles S. of Woodbury.

RAPACIOUS ANIMALS, in the general, are such as live upon prey.

Naturalists divide birds into *rapacious*, *carnivorous*, and *frugivorous*.

The characteristic notes of rapacious birds, which are the Accipitres of Linnæus, are, that they have a great head, and a short neck; hooked, strong, and sharp-pointed beak and talons, fitted for tearing of flesh; strong and brawny thighs, for striking down their prey; a broad thick fleshy tongue, like that of man; twelve feathers in their train; and twenty-four flag-feathers in each wing, and the two appendices, or blind guts, are always very short.

Rapacious birds have a membranous stomach; and not a muscular one, or a gizzard, such as birds have which live on grain.

They are very sharp-sighted, and gather not in flocks; but, generally speaking, are solitary; though vultures will fly fifty or sixty in a company.

RAPAKIVI, in *Mineralogy*, a name given to the aggregate of felspar and mica: its colour is brown, or brownish-red; it moulders by exposure to the air, but that is only when the mica is in excess. When the felspar exceeds, it forms a durable stone, called in Italy "Granitone." Kirwan.

RAPALLO, in *Geography*, a town of the Ligurian republic, situated on a bay to which it gives name; 12 miles E.S.E. of Genoa.

RAPANEA, in *Botany*, according to De Theis, its vernacular name in Guiana; though Aublet says nothing to that effect.—Aubl. Guian. v. 1. 121. Juss. 288. Lamarck Illustr. t. 122.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Berberides*, or rather perhaps *Rhamnii*, or *Sapote*; Juss.

Gen. Ch. *Cal.* Perianth inferior, minute, of one leaf, with five or six teeth, permanent. *Cor.* of one petal; tube very short; limb in five or six deep roundish segments. *Stam.* Filaments five or six, inserted into the tube at the base of each lobe of the limb; anthers oblong, quadrangular, of two cells. *Pist.* Germen superior, roundish, of five or six cells; style very short; stigma obtuse. *Peric.* Drupa globular, of one cell. *Seed* solitary, globose.

Ess. Ch. Corolla in five or six deep segments, opposite to the stamens. Anthers quadrangular. Drupa superior. Seed solitary, globose.

1. *R. guianensis*. Aubl. Guian. t. 46. (*Samara floribunda*; Willd. Sp. Pl. v. 1. 665.)—Native of thickets, in the skirts of meadows, in Cayenne and Guiana, bearing flowers and fruit in December. A small tree, whose trunk is five or six feet high, and four or five inches thick, crowned with branches; the wood white, not very compact. *Leaves* alternate, on short stalks, obovate, bluish, entire, smooth, two or three inches long, with one rib, and many transverse veins scarcely visible when fresh. *Flowers* copious, small, white, in dense lateral tufts. *Fruit* violet-coloured.—Mr. Brown, in his Prodrum Nov. Holl. v. 1. 533, speaks of this shrub as belonging to the genus MYRSINE, see that article; consequently Jussieu was most correct in hinting its affinity to his *Sapote*, an order from which Ventenat and Brown have separated their more recent one of MYRSINEE, to which we refer the reader.

RAPATEA, apparently a vernacular name of the plant in Guiana, Aubl. Guian. v. 1. 305. t. 118. Juss. 44. Lamarck Illustr. t. 226. See MNASIAM.

RAPAX, in *Ichthyology*, a name given by Schoneveldt to the *corvus piscis* of some writers, a species of chub or cyprinus, called *rappe* by the Germans, and by Gesner and others *capito fluvialis rapax*.

RAPE, RAPTUS, in *Larv*, a *ravishing*; or the having carnal knowledge of a woman by force, and against her

will. If the woman conceived, the law formerly esteemed it no rape; from an opinion, that she cannot conceive, unless she consented. But this opinion has been since questioned. Coke on Litt. lib. ii. cap. 11.

This crime, by the Jewish law, Dent. xxii. 25. was punished with death, in case the damsel was betrothed to another man; and in case she was not betrothed, then a heavy fine of fifty shekels was to be paid to the damsel's father, and she was to be the wife of the ravisher all the days of his life; without that power of divorce, which was in general permitted by the Mosaic law.

The civil law (cod. 9. tit. 13.) punishes the crime of ravishment with death and confiscation of goods; including under this crime both the offence of forcible abduction, and also that of forcibly dishonouring; either of which, without the other, is in that law sufficient to constitute a capital crime. And the stealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's edict, whether she consent, or is forced.

Rape was punished by the Saxon laws, particularly those of king Athelstan, with death; which was also agreeable to the old Gothic or Scandinavian constitution. Instead of this, another punishment was instituted by William the Conqueror, *viz.* castration and loss of eyes, which continued till after Bracton wrote in the reign of Henry III. But it was then the law, and still continues in appeals of rape, that the woman should immediately after go to the next town, and there make discovery to some credible persons of the injury she has suffered; and afterwards should acquaint the high constable of the hundred, the coroners and the sheriff, with the outrage; the time of limitation for this purpose was by stat. Westm. 1. cap. 13. extended to forty days. But there is now no time fixed; for as it is now usually punished by indictment at the suit of the king, the maxim of law takes place, *nullum tempus occurrit regi*: however, the jury will rarely give credit to a stale complaint. During the former period it was also held for law, that the woman (by consent of the judge and her parents) might redeem the offender from the execution of his sentence, by accepting him for her husband, if he also was willing to agree to the exchange, but not otherwise.

In the 3 Edw. I. by the stat. Westm. 1. cap. 13. the punishment of rape was much mitigated: the offence being reduced to a trespass; if not prosecuted by the woman within forty days; and subjecting the offender only to two years imprisonment, and a fine at the king's will. But in the 13 Edw. I. it was found necessary to make the offence of rape felony, by stat. Westm. 2. cap. 34. And by 18 Eliz. cap. 7. it was made felony without benefit of clergy; as is also the abominable wickedness of carnally knowing or abusing any woman-child, under the age of ten years; in which case the consent or non-consent is immaterial, as, by reason of her tender years, she is incapable of judgment and discretion. Sir Matthew Hale is indeed of opinion, that such profligate actions committed on an infant under the age of twelve years, the age of female discretion by the common law, either with or without consent, amount to rape and felony, as well since, as before the statute of queen Elizabeth; but the law has in general been held only to extend to infants under ten. A male infant, under the age of fourteen years, is presumed by law incapable of committing a rape; and, therefore, cannot be found guilty of it.

The civil law seems to suppose a prostitute incapable of any injuries of this kind; not allowing any punishment for violating the chastity of her who hath indeed no chastity at all, or at least hath no regard to it. But the law of England holds it to be felony to force even a concubine or harlot;

because the woman may have forsaken that unlawful course of life.

As to the material facts requisite to be given in evidence and proved upon an indictment of rape, we shall here only observe, that the party ravished may give evidence upon oath, and is in law a competent witness; but the credibility of her testimony must be left to the jury, upon the circumstances of fact that concur in that testimony: *e. gr.* if the witness be of good fame; if she presently discovered the offence and made search for the offender; if the party accused fled for it: these and the like are concurring circumstances, which give greater probability to her evidence. But, on the other side, if she be of evil fame, and stands unsupported by others; if she concealed the injury for any considerable time after she had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was possible she might have been heard, and she made no outcry; these and the like circumstances carry a strong, but not conclusive, presumption, that her testimony is false or feigned. Moreover, if the rape be charged to be committed on an infant under twelve years of age, she may still be a competent witness, if she hath sense and understanding to know the nature and obligation of an oath; and, even if she hath not, it is thought by sir Matthew Hale that she ought to be heard, without oath, to give the court information; though that alone will not be sufficient to convict the offender. And, indeed, it is now settled, that infants of any age are to be heard; and if they have any idea of an oath, to be also sworn: it being found by experience, that infants of very tender years often give the clearest and truest testimony. Blackst. Com. book iv.

The civilians make another kind of rape, called *subornatio*, *rape of subornation*, or *seduction*; which is, when a person seduces or entices a maid to uncleanness, or even marriage, and that by gentle means; provided there be a considerable disparity in age or condition between the parties. In this case, the father and mother intend their action reciprocally for the *crimen raptus*, or *subornationis*.

The French laws make no difference between the rape of violence and that of solicitation, or subornation; they make both capital. This kind of rape our laws call *Ravishment*; which see.

RAPE of the Forest, is a trespass committed in the forest by violence.

This is mentioned in the laws of Henry I. as one of the crimes cognizable alone by the king.

RAPE is also a name given to the wood or stalks of the clusters of grapes, when dried, and freed from the fruit.

The rape is used in making vinegar, serving to heat and sour the wine: but it is first put into a place to sour itself, before it be cast into the vinegar vessel; to which end, presently after the vintage, it is carefully put up in barrels, lest it take air, otherwise it would heat itself and be spoiled. There is no other way of keeping rape hitherto discovered, but to fill the vessel, in which it is contained, with wine or vinegar.

RAPE, *Rapa*, is also used for a part or division of a county; signifying as much as a *hundred*.

Though sometimes rape is taken for a division containing several hundreds. Thus Suffex is divided into six rapes, *viz.* those of Chichester, Arundel, Bramber, Lewes, Pevensey, and Hastings: every one of which, besides its hundreds, has a castle, a river, and forest belonging to it.

The like parts in other counties are called *tithings*, *lathes*, or *wapentakes*.

RAPE, in *Botany*. See *NAPUS*.

RAPE, *Broom*. (See *OROBANCHE*.) It frequently grows

to the roots of genista or broom, whence it is called *rapum genisse*, or broom rape: it is also found among corn. The herb preserved, or its syrup, is said to be of excellent use in splenetic or hypochondriac disorders, and an ointment prepared of it with swine's fat, is good for hard and scirrhus tumours.

RAPE, Wild. See **MUSTARD.**

RAPE, in Gardening, the common name of a plant of the cabbage kind. The variety called the French turnip, or *Brassica napus*, has been long cultivated upon the continent, and preferred to the common turnip as a culinary vegetable. And it has been lately noticed in the "Transactions of the Horticultural Society," that it has been brought to the principal London markets for more than twelve years past by one person only, and sold chiefly to foreigners, though, when once fully known, it will be found a very useful and acceptable root in most families, as being more delicate in its flavour than the common turnip. It is used in much the same manner. It enriches soups, and there is not any necessity for cutting away the outer skin or rind, but only to scrape it, as it is a great deal thinner than that of the turnip. When stewed with gravy it forms an excellent dish, and being white and shaped like the carrot, when laid alternately with those on a dish, they become very ornamental. The French dress them somewhat in this manner.

The roots are to be washed quite clean by means of a brush; then scraped, cutting a thin slice away from the top and bottom parts, so as to make them all of equal lengths: after which boil them in water, with a little salt, until they are tender; then put them into a stew-pan, with a gill of veal gravy, two spoonsful of lemon pickle, one of mushroom ketchup, a little mace, and salt, letting them just simmer, but by no means boil, for a quarter of an hour; afterwards thicken the gravy with flour and butter, serving the whole up quite hot. Some add a few spoonfuls of cream mixed with yolk of egg to this, just before dishing up; and others dress them in a similar manner to the above, sliced rather thinly, with Madeira, or other wines, after they have been fried to a brownish colour. See **BRASSICA.**

RAPE, in Agriculture, the name of a plant much cultivated for its seed, and also as a green food for cattle and sheep. The methods of culture and management that are necessary in raising crops of this sort, have been already described and explained. (See **COLE.**) It may, however, be here necessary to detail a few of the experiments that were made under the direction of the Dublin Society, by Mr. Whyn Baker, about the years 1769 and 1770, as they tend to throw additional light on the nature of the plant, as well as its cultivation, though the soil was not the most suitable for it. It was a shallow soil, of a strong adhesive nature when wet, and when perfectly dry, in lumps, almost impregnable; but between wet and dry, reducible. It lies upon a bed of lime-stone quarry, and has a natural declivity to the north-west; naturally very poor, and, he believes, never received any manure until he dressed it. Three acres of this land were, in 1768, under potatoes, in the ordinary method of the country, in seven-foot beds, and four-foot trenches. In 1769 they were under drilled turnips.

The frost, snow, hail, and rain which they had this year in the months of March and April, rendered it impossible to get the ground in any tolerable condition for the rape-seed before the 28th day of April. On that day twenty

broad sets were sown, with twelve ounces of rape-seed to each set or ridge. He intended to have sown it earlier, but the event will shew, that, as it was, he sowed it too early, at least upon this ground.

It was slow in coming up, and made but a poor figure until July. After which it shot forward; but instead of affording a plentiful mowing crop for the purpose of foddering cattle, it soon began to run up very fast, broke out into branches, with few and small leaves, like rape in blossom from the autumn sowing, but with strong branches and few leaves; and, in a short time after, began to grow hard, pipey, and the seed to form.

It September he began to mow it for cattle, and they ate it with great eagerness, but every day it became worse, by growing harder; insomuch, that before it was exhausted there was very great waste, as to the object of fodder, but it wonderfully raised the dung-hill, which, in his mind, is of the first moment to the farmer: for if he has manure in plenty, and disposes of it judiciously, there is hardly any thing he need to fear, except climate.

It was pretty far in October before all his rape was cut, (and the seed coming forward very fast,) although it was brought home in great profusion. It was so strong, that the mowing of it could not be accomplished with a common scythe; it would have broken an hundred; but he had by him a short strong scythe, with a thick back, intended to mow bushes and other rubbish; with this instrument he got it mowed, but not so close to the ground as he wished, it being next to impossible to mow such strong plants as these were close to the ground; and he became the less solicitous about it, as from the strength of the rape stumps and roots, and the weeds which were upon the ground, owing to the rape shooting up in tall stems, he gave up his intention of sowing the ground with wheat, as was originally intended. Hence he concludes, that the rape was sown much too early.

On the 16th of July he transplanted some of this rape in rows upon ridges four feet wide; these plants flourished much better than the former, and were at least four times the size of any of those left in the ground where they were sown. Nevertheless, these also ran to seed; but the cold nights coming on prevented their forming their seed like the former. They were vastly more sappy, and much better food for cattle.

On the 24th of July, he drilled rape-seed upon the same ground.

N^o 1. Six ridges four feet wide, and thirty-two perches long in single rows.

N^o 2. Six ridges the same length and breadth, in double rows, ten inches asunder.

It is observed, that the double and single rows were drilled alternately on the same ground, on the 18th day of July.

N^o 3. Six ridges four feet wide, and thirty-two perches long, drilled in single rows.

N^o 4. Six ridges the same length and breadth, in double rows, ten inches asunder.

He remarks, that these were sown in alternate rows, on the same ground, on the 24th of July. And that the several rows were thinned the latter end of August, and twice horse-hoed during the summer. On the third of April 1771, he had a row of each of these cut and weighed, and the produce was as follows:

Rows.	Weight.					Prod. p. Plant. acre.							
	ton.	cwt.	qr.	lb.		ton.	cwt.	qr.	lb.				
N ^o 1. Single row produced	-	-	-	-	1	2	1	11	} Sown July 18th	29	6	1	16
2. Double row ditto	-	-	-	-	1	4	3	13		32	12	2	23
3. Single row ditto	-	-	-	-	1	5	2	22	} Sown July 24th	33	14	1	26
4. Double row ditto	-	-	-	-	1	6	3	25		34	18	0	6

On the whole, it is stated, that the last sowing in July afforded considerably greater produce than the first, for the plainest reason, that the earlier we sow this seed, the sooner it runs; and consequently affords the less produce for the purpose of foddering cattle in the yards for making dung, and seems to account very strongly for the state of the first experiment.

And the double rows produced uniformly more than the single rows; and indicate that the double are to be preferred in drilling rape for foddering cattle.

The following trials are on sowing rape-seed broad-cast. On the 24th of July two acres were sown broad-cast, with ten pounds of seed to each acre, in the same field where the other experiments were carried on; but the soil not so stiff by a good deal, has abundantly fewer loose stones in it, is very shallow, and poor, to an incapability of producing any thing to profit, without great assistance of manure.

In July he manured it with the dung of his yard, consisting of that of horned cattle, horses, and swine. The dressing was indeed very high; about two smart one-horse cart-loads to a perch. He having ever found that one acre, highly improved, is much more valuable than five imperfectly handled, was the reason why he gave this poor piece so liberal a dressing.

The rape came up but slowly for a time, as he finds to be the nature of the plant, but at length it shot forward, and flourished away: but in winter it met with a fate which he was not aware of, nor did he expect. The wood-pigeons lay upon it prodigiously, and did it great damage. Some plants he observed in the frost to appear as if they had been singed: whether that was owing to the wounds given by the birds, and thereby giving the frost the greater force, or whether it was owing entirely to the severity of the frost, is not in his power to determine. However, very early in the spring this rape shot forward, and as the days lengthened the visits of the pigeons were less frequent, until they totally left it.

From this rape breaking out into blossom sooner than he expected, he is inclined to believe that the 24th of July is too early to sow it for the purpose of foddering cattle in the yard.

However, early in April he began to mow this rape for the horned cattle, such as cows, plough bullocks, young cattle, calves, and swine. They all ate it with the greatest eagerness, and were foddered with it every evening, until the 19th of May inclusive, and wheat straw in a morning, save four calves of the preceding year; and they were foddered twice a day with rape, and had straw before them also, and threw upon it vastly better than the other cattle; for no other reason, he believes, than because they were allowed more than the others: in short, they were in such order, that he dares believe the butchers would have been glad to have had them for killing.

He observes, that he need not tell the farmer how necessary it is to be frugal of provender in an harsh dry spring, as the last was, when he was like to be hard run with forty head of cattle, many of which he should actually have been obliged to sell at so improper a season, had he not been possessed of these two acres of rape. He adds, that there is yet another circumstance which renders this a truly valuable fodder. The milk of the cows increased prodigiously; and the milk and butter were as good, sweet, and well-flavoured, he thinks, in every particular, as ever he tasted in June. Even the cream for the tea appeared to be perfectly free from any foreign flavour. The cows got hay every day, in the same manner as he has in former years mentioned them to have, when feeding upon cabbages.

The simplicity of the culture for rape, for the purpose of feeding cattle, he cannot but think a particular recommendation to the farmer, and the cheapness of the seed in purchase, or the ease with which he may raise it, are objects which cannot fail, he thinks, of being persuasive to him. And all persons, who have annexed to their farms any bog, or other waste ground, the improvement of which can be executed by burning, might surely raise such quantities of rape for the purpose of mowing pasture, as would enable them to keep almost any number of cattle; by which they would not only be bringing in the waste land, but making that the foundation of improvement to their sound land, by the immense quantities of dung they might raise by this means from the waste land. Here the advantage to the cultivator would be double.

On the first day of May he had four perches of this rape measured out for weighing. It was mowed, immediately drawn home, and weighed. The four perches afforded seven hundred and two quarters: multiplying this by forty, shews the acreable produce to be fifteen tons. The quantity indeed but small. However, the season in which it is to be had renders it more than ordinarily valuable, and, he thinks, bids fair to make it an object of husbandry, as a pasture for cattle.

This year, 1770, Mr. Baker ploughed up six acres of wheat stubble, as soon as the wheat came off, harrowed it down the 12th, 13th, 14th, and 15th of September, then sowed rape-seed over the whole field, and gave it a light bush harrowing. The rape came up very thin, and made so poor an appearance in the spring, that he ploughed up the field, and sowed spring corn. This is a strong indication that but little is to be expected from sowing rape upon wheat stubble; because after the wheat comes off it seems to be too late in the year to sow rape. But something may be charged, as he observes, to the natural moisture of the soil. See COLE.

The following is the recapitulation of his experiments on rape, as pasture for cattle.

Exp.	I. April sowing.	Ran, not answering the purpose.	Produce.						
			Ton.	cwt.	qr.	lb.			
	II. Ditto transplanted.	Ran, but not so soon as the other.							
III.	July 18, sowing.	{	Single rows produced per acre	-	-	29	6	1	16
			Double rows ditto	-	-	32	12	2	23
	July 24.	{	Single rows ditto	-	-	34	14	1	26
			Double	-	-	35	18	0	9
IV.	Ditto	Broad-cast ditto	-	-	15	0	0	0	
V.	September sowing on wheat stubble ditto	-	-	-	0	0	0	0	

Rape is a great deal cultivated in some districts in the county of Essex for the seed. The system is very profitable, but this sort of crop is found to draw or exhaust the land a good deal. It is thought by some to prepare well for wheat, especially when fed off upon the land. In some places they, however, consider it more beneficial to till, after this crop

has been seeded for spring corn, than to put in wheat, which, however, is still the most common practice. Clover would certainly be better than either method.

In other places they conceive that feeding rape is much on the decline, from the general experience, that it leaves the best prepared land in an unfavourable state for oats and clover,

clover, and is consequently prejudicial to the next succeeding winter crop. Other districts think very differently on this point. In feeding the crop, the produce is here considered to be in general from twenty-nine to thirty-four bushels the acre. In the greatest crops and best seasons, in particular parts it is supposed to rise even so high as five and six quarters the acre.

In Berkshire this sort of crop is not so much cultivated as it should be, as it will succeed well on soil where turnips will not, and with equally beneficial effects to the future crops, when fed off on the ground. When employed it is usually sown and managed so as to come into a high state of perfection in the early spring months, when sheep feed is mostly scarce. It is grown by some to supply the deficiency, and found remarkably useful, one acre of it affording more feed than two of turnips.

This sort of crop is still less grown in Oxfordshire, though occasionally had recourse to, especially on the rich red land about Banbury. Some sow it in mixture with the tankard turnip feed, for the purpose of weaning lambs upon: they begin with the rape, and it teaches them to eat the turnips: it is found to be a very good food for this sort of flock.

In the county of Sussex, the South Down sheep farmers hold it in great estimation, sowing it either alone or in mixture with tares as a food for their sheep; very rarely for the purpose of feeding. The ewes and lambs are wattled upon it in the spring, and it is very generally allowed to be most efficacious, and highly nutritious to the young lambs. Some, at the lambing season, hardly allow their ewes any other food but this, as the rape is found to produce a larger supply of milk than turnips; which, it is supposed, has the effect of extending the udder, without affording any considerable flow of milk. This crop is conjectured, however, in some cases, to have the effect of causing the slipping of the lambs, where the ewes are fed upon it. But such an effect is very improbable to arise in this way; other causes may have been overlooked. In some cases on Down land ray-grass is sown with the rape for sheep feed, one gallon of rape-seed and two of ray-grass to the acre. The rape is first fed off; and after that the ray-grass rises and affords a bite for the spring season. The rape crop is usually put in about June, or the following month, one gallon to the acre. When folded off, a rood and a half is a sufficient daily consumption for a flock of six hundred sheep, or rather more.

As it has been found in the improving of peat boggy morassy lands, that what is principally wanted is a crop which can be sown and reaped in the summer months; and which may require neither labour nor attendance during the moist seasons of autumn, winter, and spring; the writer of the "Treatise on Landed Property" has suggested that fortunately, such a crop is natural to, and has long been inured to the climate of this island, as well as one of the most profitable in the agriculture of it; and that this is rape: which is not only sown, but reaped, in the very height of summer; and which is known to delight in a soil of this nature. It has, however, only lately been found capable of being raised with advantage on a crude mossy ground, as a first crop after draining, from some recent trials made in the north, after the above operation, levelling, paring and burning, and turning the ashes in. The result of which was, though the crop was too late in being put in, and the land laid in an improper manner, such as to prove clearly that rape-seed may be raised with profit as a first crop on drained moory soils. And it is thought highly probable that many extensive tracts of land, which now lie entirely waste, and as nuisances in their neighbourhoods, may through this means be improved with immense

profit to their proprietors. The experiment may be tried at a small expence. The cost of the labour and seed required for a sufficient trial are inconsiderable. The proof, it is supposed, is not whether rape will thrive as herbage, but whether it will mature its seed, on the given soil, in the given situation.

After being recompensed for the previous expences, in one or more rape crops, as there is here no danger of the exhaustion of the soil,—of impoverishing, perhaps, ten feet depth of vegetable mould, it remains to lay the foundation of more permanent profits, which is to be done by sowing grass feeds either with or over the rape crop, or by light cautious stocking after removing the stalks, as may be necessary, until there is a firmness of surface and a fitness for mixed cultivation, which may be much hastened by the use of heavy calcareous and earthy substances at any time during the process of improvement.

RAPE Cake, the refuse or cake remaining after the oil has been expressed from rape-seed. It is said to be useful as a manure. See **MANURE**.

This substance is found by chemical trials to contain a large quantity of mucilage, some albuminous matter, and a small quantity of oil. It should be kept as dry as possible before it is applied to the soil, and be employed in that way while it is in a fresh state. It is successfully applied in several ways and intentions, and affords an excellent dressing for turnips. See the next article.

RAPE Dust, the small reduced parts of the dried refuse of rape-seed, or the rape cake, after the oil has been obtained from it. This substance has been found useful as a top-dressing for crops of different kinds.

The rape cake, when reduced into powder or dust by means of a machine, has been extensively used in Norfolk; and when for turnip crops, it has been the custom to sow it some weeks before the seed of that root is put into the ground. In the practice of Mr. Coke of that district, it has, however, been found, that by having it brought into a fine powder it may be drilled from the same machine, at the same time with the turnip seed; and that, by thus delivering the manure and the seed from the same pipes and shares of the drill machine, a ton of dust does six acres in the place of three. See **TURNIP**.

In Lancashire some farmers use it with great advantage as a manure for potatoes, putting it in with the sets in the proportion of about thirty-two bushels to the statute acre; but if the ground were well prepared, and the dust carefully deposited for the reception of the sets, it is supposed, a much smaller quantity would be sufficient. It produces much luxuriance in the crops, and a very fine produce.

RAPE Oil, the oil obtained by means of expression from the seeds of this plant, in mills constructed for the purpose. The refuse oily substance of this kind may be employed as manure in mixture with rich earthy matters, with great advantage, wherever it can be procured in any quantity, at a reasonable price.

RAPÉL, in *Geography*, a river of Chili, which runs into the Pacific ocean, S. lat. 34° 8'.—Also, a town of Chili, on the forementioned river; 70 miles S. of Valparaiso.

RAPERLAH, a town of Hindoostan, in the Carnatic; 13 miles N.E. of Ongole.

RAPHA, in *Anatomy*. See **RAPHÉ**.

RAPHAEL, one of the seven archangels, who are said to be continually before the throne of God, and ready to perform his commands. We have no such name in the Old

or New Testament; but his history occurs in the book of Tobit, c. xii.

If the story of Tobit be true, it is not improbable that the angels, both good and bad, whose names do not appear to have been known before the Babylonish captivity, are figurative personages; and Raphael might only denote the salutary protecting agency of divine providence, so disposing events as to produce a happy issue.

RAPHAEL SANZIO, DA URBINO, in *Biography*, during whose life, and by the exertion of whose talents, in conjunction with those of Lionardo da Vinci, Titian, Michael Angelo, and some few others, the art of painting reached its acme in modern times, was born in the city of Urbino, on the morning of Good Friday, in the year 1483. He was descended from a respectable family, and many of his ancestors had been painters; as was his father Giovanni Sanzio, whose talents, however, did not elevate him to the first rank. He cultivated with care the inclination which his son Raphael exhibited, at an early age, for painting; and was soon repaid by the assistance he acquired from him, in several of the pictures he was employed to paint in his native city of Urbino. But finding that the taste of Raphael merited more skilful guidance than he was able to give it, he placed him under the tuition of Corradini, better known by the name of Carnevale, for a short time, till he could be received as a pupil by Pietro Perugino, at Perugia.

This master was then in very high esteem, though his style was dry and meagre, in comparison with that of Masaccio, and others of the Florentine school. It is not surprising that Raphael, endowed as he was by nature, and trained as he had been in art, should soon become the rival, rather than the pupil, of such an artist. Accordingly we find, that his aptitude for the practice of art enabled him quickly to acquire his master's manner, and that in so perfect a degree, that connoisseurs were puzzled in their judgments upon the works which proceeded from Perugino's studio; and ordinary observers completely deceived. Vasari speaks of an Assumption of the Virgin, crowned by her Son, and the twelve apostles below, round her tomb, contemplating the celestial glories; with three small pictures in the same frame below it, of the Annunciation, the Adoration of the Magi, and Simon embracing the Saviour, painted at this period by Raphael, as being wrought with extreme beauty, and precisely like the work of Perugino.

We have to lament that we are left ignorant of the time when Raphael went as a pupil to Pietro, how long he remained with him, or when he left him, or rather was left by him; as that master returned to Florence, to finish some pictures he had begun there some time before. He must certainly have been very young, from the number of pictures which he subsequently executed, previous to his going to Rome in his 25th year, and probably not more than 16 or 17, when he acquired his liberty by the departure of Perugino.

From Perugia he went to Citta di Castello, where he painted a St. Nicola crowned by the Virgin and St. Augustine, for the church of St. Augustine; and for that of St. Dominico, a picture of the Crucifixion of Christ, accompanied by angels, the Virgin, St. John, &c.; which would certainly have been considered as Perugino's, if Raphael had not set his name to them. But he was considered to have much surpassed him in another work, representing the marriage of the Virgin and St. Francisco, for the church of St. Francisco, in the same city. He acquired by these productions a great and deserved extent of fame, and thus early

entered with success that course, which conducted him to the highest pinnacle of renown as an artist.

Attached to his person by friendship, and attracted by his skill as a designer, Pinturiccio, then employed by pope Pius II. to adorn the library of the Duomo at Sienna, sought the assistance of Raphael, and engaged him to compose designs for his work. This he undertook, but proceeded only to the preparation of some of the cartoons, when his ambition and his curiosity were stimulated, and his work interrupted, by the renown spread through the country of the cartoons painted by those great rivals, Lionardo da Vinci and M. Angelo, for the council-hall at Florence. He immediately determined, in conjunction with almost all his brother artists of the day, upon going to see and form his judgment upon them for himself; and consequently left his engagement with Pinturiccio, and proceeded to Florence.

In this city he found so many attractive beauties, both of nature and art, that he resolved to fix his residence there for some time. His agreeable person and manners, combined with the extraordinary talents he had manifested, insured him friends; and he became intimate with several artists of celebrity, among whom were Ghirtandaio, St. Gallo, and Taddeo Taddi; the latter of them, a learned man, and friend of cardinal Bembo, took the youthful painter to his house and table, and thus afforded him the best introduction to the world, while he pursued his more immediate studies. This kindness the gentle heart of Raphael accepted with grateful emotion; and as he painted several pictures during his residence in that city, he presented two of them to Taddi. One of these pictures, a Madonna with the Child, and St. John bringing a little bird to him, the heirs of Taddi sold to the archduke Ferdinand Charles of Austria at a great price: the other is lost sight of. He also presented a picture to his friend Lorenzo Nasi, which afterwards found a place in the Medicean gallery, and a duplicate in that of the monastery of Valombrosa.

From Florence Raphael was recalled to Urbino, by the death of both his father and mother; and there, when he had arranged his private affairs, he was engaged by Giordano de Montefeltro, and several others, to paint religious subjects for the altars of their chapels: and among those he painted at this time, were the two little St. Georges, now in the gallery of the Louvre. These commissions he executed with great taste and delicacy; and Vasari, who enumerates them, more particularly speaks of one of Christ praying in the garden, painted for Francesco Maria, duke of Urbino, as being finished with all the neatness of a miniature. What is become of most of these pictures, it is not easy to ascertain; but it is a curious fact, that not one of them remains at this time to adorn the native city of this great artist.

Thence he returned to Perugia, and painted several pictures. For the church of the Frati de Servi, one of the Virgin, with St. John Baptist, and St. Nicholas. For that of St. Stevens, in the chapel of our Lady, he painted in fresco a picture of Christ in glory, with God the Father, surrounded by angels and six saints, three on each side. Upon this picture he wrote his name in large letters of gold, and very conspicuously, as if he himself was pleased with the performance of it. He also painted here a picture for the nuns of St. Antonio da Padua, of our Lady with the Infant upon her lap clothed, and near her St. Peter, St. Paul, Sta. Cecilia, and Sta. Catherina. The airs and attitude of the two female heads were regarded as the most tasteful work of the time, wrought with the greatest degree of beauty and grace. Above the picture, in a semicircle, was represented

represented the Almighty Father; and at the foot of it, in three compartments, were the scenes of our Lord's sufferings, *viz.* his agony in the garden, carrying his cross, and dead upon the lap of the Virgin. It is not known what is become of the centre picture, or the uppermost compartment; the lower ones formed a part of the Orleans collection. The execution of these works was performed in a style much improved upon that of Perugino; with more breadth, more softness, and more freedom and variety of action; proving that he had not ill spent the time he had devoted at Florence to the study of the works of other painters. Hence we may date the commencement of what is termed his second manner, from his first visit to that city.

Soon after he had produced these works at Perugia, that zeal for cultivation, which always accompanies true genius, led him to determine upon again visiting Florence, at that time the emporium of science and of art. Though the native strength and purity of his mind were such as to conduct him, under favourable circumstances, to his future prominent station; yet he does not appear to have been so extraordinary and original an inventor in the art itself as M. Angelo, or his great predecessor and rival, Lionardo da Vinci. He knew how to take a hint of what was offered to his view, and to cultivate and improve it to his purpose; but it yet remains a problem, whether Raphael, alone, and without the leading aid of those great and original artists, would have ever seen the sublime of painting. His power may rather be said to have consisted in ability to employ the materials furnished by their invention, *viz.* the style of Michael Angelo, in form; and of Lionardo da Vinci, in chiaro-scuro and colour; in beautiful conceptions, illustrative of the character and passions of man; and in an admirable selection of subject, and mode of conveying it.

He himself appears to have been conscious of this; for we find him in the midst of honourable employment, leaving the prosecution of it, to study and improve himself by a constant observation of the works of other renowned artists, and again repairing to Florence, where alone he could find the true source of sound cultivation, and in which he made so good use of his time, as to fit him in great measure for the glorious field of exertion which awaited him.

On his return to the renowned abode of these great artists, from whose works he sought improvement, he had a letter of recommendation and introduction from the dukes of Urbino to Pietro Soderini Gonfaloniere of the city; and was thus introduced to the best circle of improvement and information.

It would have been highly gratifying to have been enabled to trace the steps of a man so distinguished in the art, from the earliest commencement of his studies; but the neglect of dates, by his historians, counteracts every wish to follow them more closely; and the record of facts leaves us only the means of conjecture. That he began to paint original pictures very soon after he was placed with Perugino is evident, and he must then have been very young, for it is on record, that the pictures by Pinturiccio, for which he made the cartoons at Sienna, were completed in 1503, at which time he was 20. If we allow, as we reasonably may, two years for their execution, it will place his first visit to Florence in 1501, at the age of 18; and it certainly cannot have been far from that period. In every part of his life, modesty, ingenuity, and the ardour of a mind entirely devoted to his art, characterized his conduct. His industry and ingenuity seem to have kept equal pace; and the rapidity and certainty with which he must have painted, to

produce so many pictures in so short a space of time as he lived, are not the least extraordinary part of his history.

On this, his second abode at Florence, he studied deeply the works of Masaccio, and the cartoons of Angelo and Da Vinci; and attached himself in friendship to Baccio della Porta, better known by the name of Fra. Bartolomeo; than whom no one was better qualified to direct him rightly in whatever was grand and dignified, and from whose judicious information in the art of casting draperies and of colouring, Raphael evidently improved exceedingly; while he had the pleasure, in return, of communicating to his friend the principles of perspective. Yet notwithstanding these helps, he did not entirely free himself from the formal and dry manner of his master, though he painted assiduously both in portrait and history. In the former he produced the portraits of Angelo Doni and his lady Maddalena Strozzi; and in the latter he painted for Dominico Caneggiani, a Madonna, with the Infant playing with St. John brought by Elizabeth, who regards St. Joseph as he stands near, leaning both his hands upon a stick, and inclining his head towards her. This picture appears to have been re-touched, or possibly completed only in 1516, as the name of Raphael, with that date, in letters of gold, is written upon the drapery of the Virgin. He also made a cartoon during his residence in Florence for a picture which he had previously engaged to paint for the Baglioni family at Perugia, and left the city to go and paint it in the church of St. Francesco in that place. The subject of it was our Saviour carried to the sepulchre, accompanied by the Virgin, St. John, &c.; and it was exceedingly admired for the beauty and expression of the figures, and the skill and perfection of the draperies. This picture was removed from Perugia by pope Paul V., and a copy, by Cesare d'Arpino, placed in its stead: it afterwards found a station in the Borghese palace at Rome.

When Raphael had completed this work, he returned to renew his studies at Florence, and was employed by the family of Dei, to paint a picture for their altar in Santo Spirito, which he began, and conducted through the preparatory parts; and in the mean time painted another for the city of Sienna, of the Madonna in an open country, with the Child standing by her, and St. John kneeling before him, but was interrupted, in its execution, by a summons from pope Julius II. to Rome, and left it in the hands of his friend Ghirlandaio, to finish a piece of blue drapery which it wanted. This picture was afterwards sold to Francis, king of France, and is at present in the French collection, known by the name of the Belle Jardinière. The unfinished sketch of the picture begun for the Dei family, was bought, after the death of Raphael, from his heirs, by Baldassare Turini, and placed by him, in its original state, at the altar of his country church; it afterwards came into possession of the house of Buonvicini di Pescia, and was sold, by that family, to the grand duke Ferdinand, who, on removing it, placed a copy by Carlo Sacconi in its stead. This was done at night, and with the utmost secrecy, for fear of a disturbance among the populace, by whom it was highly prized.

Raphael was indebted for the high patronage of the pope, which placed him in the proper sphere for the exercise of talents such as he possessed, to the friendship of his relation Bramante d'Urbino the architect; and never was recommendation better supported by ability. Upon his arrival in Rome, in 1508, he was received with great courtesy by Julius, and the Camera della Segnatura, in the Vatican, assigned to him. He immediately began the preparation for his first picture, which was the School of Theology, better known by the name of the Dispute of the Sacrament, and in observing which, it is
worthy

worthy of remark how his mind enlarged, in regard to style in the art, as he became accustomed to consider largely of his work; and according to the field of employment which he found before him. The difference in style between one part of the picture, and that of the other, evidently points out where he began it; *viz.* on the right of the upper part, where the remains of the school of Perugino appears, and is spread through the centre, where the glory which surrounds our Saviour is represented in the Gothic manner, by rays of gold. As he proceeded, his style enlarged, and the lower part of the picture exhibits an immense improvement, and is almost equal to any of his subsequent productions.

In the same room are the pictures of the School of Athens, the Parnassus, painted in 1512, (where, surrounding Apollo and the Muses, he has introduced portraits of the great poets, both of antiquity and of his own time,) and the Jurisprudence, comprizing two subjects, one of the emperor Justinian delivering the digest of his code of laws to Tribonius, and another of pope Gregory IV. giving the decretal to a member of the consistory. Over each of these subjects, respectively, are painted circular ones of single figures, representing Theology, Philosophy, Poetry, and Justice.

When pope Julius saw the superior taste and talent with which Raphael produced the former of these works, he immediately ordered the whole of the stanze, or chambers, which it was intended to decorate, to be entrusted to him; and all that had previously been done by Perugino, Pietro del Borgo, Il Soddoma, and Bramante di Milano, to be removed. But of this order Raphael made only a partial use; preserving entire the work of his first master, and, partially, the ornamental labours of Il Soddoma.

While he was engaged upon these great works, he was not altogether indifferent to the more agreeable exercise of the pencil, and he painted for the church of the Augustines, the pictures of the prophet Isaiah, and the Sibyls who are supposed to have predicted the coming of Christ. He also painted the portrait of his great patron, Julius, now in the Louvre, and several smaller easel pictures of Madonnas, and other religious subjects. By these labours he acquired the renown they so well merited, and his manners appear to have been in perfect accordance with the beauties of his mind. His person also was handsome, and he was beloved, esteemed, and admired. Yet he continued to study, and to improve his talents, employing persons to collect specimens and make drawings from Grecian remains. Full of taste and feeling, he spared no pains to perfect his powers by a thorough knowledge of all that had been done in art, both ancient and modern. In consequence, however, the fact, related by Vasari, may be doubted, of his being admitted, while Michael Angelo was absent, to see the work of that great artist in the chapel of Sixtus IV.; the taste in which he wrought became aggrandized, and similar to that introduced by M. Angelo. About this time he painted the Galatea for Agostino Ghigi, and the Madonna di Foligno, at the desire of Sigismondo Conti, secretary of pope Julius II., for the great altar of the church at Araceli, and which is now at the Louvre.

In another chamber of the Vatican he painted four other large pictures, the subjects of which are, the miracle of Bolsenna, when the officiating priest, who doubted of the real presence in the Eucharist, is offering up the host, and perceiving, with astonishment, that it distils drops of blood; the release of St. Peter from prison; the Heliodorus; and Attila arrested, in his journey to Rome, by a vision of St.

Peter and St. Paul; these were completed in 1512, 13, and 14.

In these pictures his great improvement in colouring and style is most evident, and he continued to carry it still further into practice in another room, for which also he had composed four other subjects, known as the Incendio del Borgo; the coronation of Charlemagne by Leo III.; the same pope defending his conduct to the same emperor; and the descent of the Saracens at the port of Ostia.

Whilst Raphael was engaged on the Heliodorus, his first great patron, Julius II., died; but fortunately for the arts, if not for the tiara, he was succeeded by another, Leo X., who was even more attached to them, and more fond of the renown arising from the cultivation of whatever adorns society. By him, therefore, Raphael was ardently encouraged to proceed with his labours, and he continued to make designs for other apartments, particularly for the great hall of Constantine, as it is now called; but he did not live to execute them. The Incendio del Borgo was the last upon which he himself wrought; the rest were completed by Julio Romano. He was also employed by Leo to make the cartoons now at Hampton Court, as exemplars for works in tapestry, to be executed in Flanders, and which were completed at the expence of 70,000 crowns. Fortunately for us the originals were never returned to Rome, and were purchased afterwards by Charles I.

Upon the death of Bramante, in 1514, the superintendance of the architectural concerns of the Vatican was entrusted to Raphael, who had already exhibited his knowledge and taste in that art, by the introduction he had made of it in his pictures. He invented and began a palace for himself, and made several designs for others.

Notwithstanding the immense application necessary for the invention and completion of these important labours, together with the designs he composed for the ornamental parts, and the scriptural subjects on the ceilings and the covings of the loggia and stanze of the Vatican, he found time to execute in fresco the designs which adorn the palace of Agostino Ghigi; the capital portrait of his great friend Leo X., with the cardinals de Medici and Rossi, now in the Louvre; the St. Michael, and the vision of Ezekiel, both in the same grand depôt; a Madonna, Child, and St. Anne, for Florence; and a large picture of Christ bearing his Cross, for the monastery of St. Maria della Spasimo, at Palermo. Of this picture it is reported, that being sent on shipboard to go to Sicily, the vessel was beaten from its course by a tempest, and the mariners lost; when it drifted to Genoa, and of course its preservation was attributed to the divine influence of this great work. The Genoese chose also to suppose that the hand of God had thus pointed out their city as the proper place for its residence; and would not relinquish it for a length of time, till the papal influence interfered, when it was consigned to its original destination. He also painted the picture of St. John, which adorned the Orleans collection; and last of all, the Transfiguration; which indeed he had not quite finished when the unrelenting hand of death set a period to his labours, and deprived the world of further benefit from his talents, when he had only attained an age at which most other men are but beginning to be useful.

The immediate cause of his death is allowed to have been brought on by too great an indulgence in gallantry, and, Vasari adds, by mismanagement of his physicians, who bled him when they ought to have administered restoratives. On his death bed he made his will, leaving his favourite pupils, Julio Romano and Il Fattore, his heirs, and ordering his

burial to take place in the Pantheon (the church of Santa Maria Rotunda), where a monument still remains to his honour. He died on the same day of the year on which he was born, Good Friday, in 1520, at the age of 37, deeply lamented by all who knew his value. His body lay for a while in state, in one of the rooms wherein he had displayed the powers of his mind, and he was honoured by a public funeral; his last produce, the Transfiguration, being carried before him in the procession: and, that Rome might not be deprived of so noble a memorial of this extraordinary man, it was placed by the cardinal de Medici in the church of St. Pietro a Montorio, instead of being sent to France, as was originally intended.

Mr. Fuseli, in his edition of Pilkington, has given so discriminating and just an idea of the peculiar excellencies of Raphael, that we shall conclude our history of him by quoting it. "The general opinion has placed Raphael at the head of his art, not because he possessed a decided superiority over every other painter in every branch, but because no other artist ever arrived at uniting with his own peculiar excellence all the other parts of the art in an equal degree with him.

"The drama, or in other words the representation of character in conflict with passion, was his sphere; to represent this, his invention in the choice of the moment, his composition in the arrangement of his actors, and his expression in the delineation of their emotions, were, and are, and perhaps will be unrivalled. And to this he added a style of design dictated by the subject itself, a colour suited to the subject, all the grace which propriety permitted, or sentiment suggested, and as much *chiaro-scuro* as was compatible with his supreme desire of perspicuity and evidence. It is therefore only when he forsook the drama, to make excursions into the pure epic or sublime, that his forms become inadequate, and were inferior to those of M. Angelo: it is only in subjects where colour from a vehicle becomes the ruling principle, that he is excelled by Titian; he yields to Correggio only in that grace and that *chiaro-scuro* which is less the minister of propriety and sentiment, than its charming abuse, or voluptuous excess; and which sacrifices to the eye what was claimed in vain by the mind.

"Michael Angelo appears to have had no infancy: if he had, we are not acquainted with it: his earliest works equal in principle and elements of style the vigorous offsprings of his virility: Raphael we see in his cradle, we hear him stammer: but propriety rocked the cradle, and character formed his lips. Even the trammels of Pietro Perugino, dry and servile in his style of design, formal and gothic in his composition, he traced what was essential, and separated it from what was accidental, in figure and subject. The works of Lionardo, and the cartoon of Pifa, invigorated his eye, but it was the antique that completed the system which he had begun to establish on nature. From the antique he learned discrimination and propriety of form. He found that in the construction of the body, the articulation of the bones was the true cause of ease and grace in the action of the limbs, and that the knowledge of this was the true cause of the superiority of the antients. He discovered that certain features were fitted for certain expressions, and peculiar to certain characters: that such a head, such hands, and such feet, are the stamen or the growth of such a body, and on physiognomy established uniformity of parts. When he designed, his attention was immediately directed to the primary intention and motive of his figure, next to its general measure, then to the bones and their articulation, from them to the principal muscles or those eminently wanted, to their attendant nerves, and at last to the more or less essential

minutiæ; but the character part of the subject is infallibly the characteristic part of his design, whether it be a rapid sketch, or a more finished drawing. The strokes of his pen or pencil themselves are characteristic: they follow the direction and texture of the part; flesh in their rounding, tendons in straight, bones in angular lines.

"Such was the felicity and propriety of Raphael, when employed in the dramatic evolutions of character! both suffered when he attempted to abstract the forms of sublimity and beauty; the painter of humanity, not often wielded with success super-human weapons. His gods never rose above prophetic or patriarchal forms; if the finger of Michael Angelo impressed the divine countenance oftener with sternness than awe, the gods of Raphael are sometimes too affable or mild, like him who speaks to Jacob, in a ceiling of the Vatican; or too violent, like him who separates light from darkness, in the loggia of the same place. But though, to speak with things, he was chiefly made to walk with dignity on earth, he soared above it in the conception of Christ on Tabor, and still more in the frown of the angelic countenance that withers the strength of Heliodorus.

"Of ideal female beauty, though he himself, in his letter to count Castiglione, tells us, that from its scarcity in life, he made attempts to reach it by an idea formed in his own mind, he certainly wanted that standard which guided him in character: his goddesses and mythologic females are no more than aggravations of the generic forms of Michael Angelo. When the drama inspired Raphael, his women became definitions of grace and pathos at once. Such is the exquisite line and turn of the half-averted kneeling female with two children, among the spectators of the punishment inflicted on Heliodorus; her attitude, the turn of her neck, supplies all face, and intimates more than he ever expressed by features."

RAPHAEL, in *Geography*, a fertile and healthy district, being the westernmost in the Spanish part of St. Domingo. Its northern boundary is found in part of the French parish Gonfalves. The air round St. Raphael is very salubrious, but the town, which is in a hollow, is very hot; 10 leagues S. of Cape François.

RAPHAEL, *St., Cape*, lies at the S. end of St. Domingo, and is the S.E. limit of Samana bay.

RAPHANEA, in *Ancient Geography*, a city of Syria, between which and Arca, or Arac, a city of Judea belonging to the kingdom of Agrippa, the Sabbatical river flowed. Joseph. de Bell. l. vii. c. 24. Raphanea is, perhaps, the Arpal of scripture. 2 Kings, xviii. 34. xix. 13. H. x. 9. xxxvi. 19. xxxvii. 13. Jerem. xlix. 23.

RAPHANIA, in *Medicine*, an appellation given by Linnæus, and afterwards by Dr. Cullen and others, to a severe and fatal disease, which has been described as epidemic in Sweden at particular seasons, and imputed to the use of the *raphanus raphanistrum* of Linnæus as food.

It is not necessary to describe the symptoms of this disease in this place; since it is, in fact, the same malady which has been epidemic in various other countries of Europe, during seasons of scarcity; and has been attributed to various other species of unwholesome grain, but more especially to diseased rye, affected with the *ergot*, to the *lolium temulentum*, to charlock, &c. We have already entered at great length into the history of the symptoms and imputed causes of this formidable malady, which has been more commonly denominated *ergot*, from one of its supposed sources. (See ERGOT.) We have endeavoured also to shew, that it constituted one of the varieties of epidemic disease, described by the ancients, under the appellation of *IGNIS SACER* (which see); and that, instead of being properly imputed to the

admixture of any of these substances with the corn used for food, the disease is to be ascribed with more probability to the insufficient nourishment afforded by damaged corn, or the actual dearth of it, which usually occur together; especially as these diseases have commonly been epidemic in years of scarcity, which is the only circumstance that can be observed in common to all the epidemics described by authors. In addition to the works on ergot and ignis sacer, formerly referred to, consult, for an account of raphania, Pulteney's View of the Writings of Linnæus; Rothman's Paper, in the Amœnitates Academ. of Sweden; Tissot. Epistole Med. Pract.

RAPHANIS, in *Botany*, the name by which the Attics, among the Greeks, called the radish; for the word *raphanos*, or *raphanus*, with them, does not express the radish, but the cabbage. The Greek of all other places concurred in calling the radish *raphanos*, and the cabbage *crambe*; and it is owing to this that we have many authors who confound together these two plants, though so very unlike one another in appearance and use. It is generally to be understood, that wherever Theophrastus mentions the word *raphanos*, he means by it the cabbage; and the same being observed, in regard to all the other Attic writers, the whole danger of confusion and error will cease.

RAPHANISTRUM, a name given by botanists to the wild radish, and designed to express its affinity to the cultivated one. See *RAPHANUS*.

RAPHANUS, an ancient name for the Radish, a species of this genus, derived from *ερα*, easily, or quickly, and *επινοουμι*, to appear, or come forth, in allusion to the quickness of its vegetation.—Linn. Gen. 343. Schreb. 445. Willd. Sp. Pl. v. 3. 560. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 129. Sm. Fl. Brit. 723. Prodr. Fl. Græc. Sibth. v. 2. 32. Juss. 238. Tourn. t. 114. Lamarck Illustr. t. 566. Gært. t. 143. (*Raphanistrum*; Tourn. t. 115. Gært. t. 143.)—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquosa*, Linn. *Crucifera*, Juss.

Gen. Ch. *Cal.* Perianth inferior, erect, of four oblong, parallel, converging, deciduous leaves, gibbous at the base. *Cor.* cruciform, of four inversely heart-shaped, spreading petals, whose claws are rather longer than the calyx. Nectariferous glands four; one at each side, between the shorter stamen and the pistil; and one at each of the opposite sides between the longer stamens and the calyx. *Stam.* Filaments six, awl-shaped, erect; two opposite ones the length of the calyx; the rest as long as the claws of the corolla; anthers simple. *Pist.* Germen oblong, tumid, tapering, the length of the stamens; style scarcely any; stigma capitate, undivided. *Peric.* Pod oblong, pointed, swelling here and there, imperfectly jointed, without valves. *Seeds* roundish, smooth.

Obf. *Raphanus* of Tournefort and Gærtner has a spongy fruit, of two cells, not bursting. *Raphanistrum* of the same authors has a jointed fruit, separating at the joints.

Ess. Ch. Calyx closed. Nectariferous glands four. Pod swelling out into knobs, imperfectly jointed, without valves.

1. *R. sativus*. Common Garden Radish. Linn. Sp. Pl. 935. Willd. n. 1. Ait. n. 1. Ger. Em. 237. (*R. primus*; Matth. Valgr. v. 1. 399.)—Leaves lyrate. Pod roundish, tumid, of two cells.—The native country of this well-known plant, so commonly cultivated in gardens, is not ascertained. Linnæus mentions China; but his authority does not appear. Its chief value with us consists in the root, esteemed for its grateful pungency, mixed with a watery coolness. The shape of this part varies, from its natural spindle-like figure, to a globular one, and the colour

of the skin from purple to white. We doubt much whether the *R. niger* of Bauhin, commonly called the Black Spanish Radish, which Linnæus marks β , can belong to this species. Its firmness, and black rugged coat, seem to indicate more than a mere variety. We have not examined the herbage. The leaves of *R. sativus* are lyrate, notched, and rough, especially the lower ones; the upper part of the herb is smoother, and somewhat glaucous. *Stem* branched. *Flowers* purple, corymbose; soon racemose. *Pods* erect, tumid, juicy, pale, glaucous, smooth, slightly striated, various in length and thickness, tipped with an awl-shaped beak. Linnæus cultivated at Upsal a Chinese variety, or possibly species, whose leaves are broader and smoother, and its whole habit more lax. The oil of the seeds is said to be used in China.

2. *R. caudatus*. Long-tailed Radish. Linn. Mant. 95. Linn. fil. Plant. Rar. fasc. 1. 19. t. 10. Willd. n. 2.—Leaves lyrate. Pod compressed, of one cell, wavy, longer than the whole plant.—Native of Java, where, according to the younger Linnæus, it is cultivated, and the pickled pods known by the name of Mougri. In Sweden, as well as in England, it may be treated as a hardy annual, like the foregoing; but the present species does not occur in Hort. Kew., though Mr. Lambert met with it last year in a country garden in Wiltshire. The appearance of the plant, weighed down to the ground by its immoderately long serpentine pods, is altogether extraordinary. The lobes and indentations of the leaves are sharper than in the Common Radish, but the flowers and other parts, except the pods, scarcely betray any difference.

3. *R. Raphanistrum*. Wild Radish, or Jointed Charlock. Linn. Sp. Pl. 935. Willd. n. 3. Ait. n. 2. Fl. Brit. n. 1, α , β . Eng. Bot. t. 856. Curt. Lond. fasc. 4. t. 46. Mart. Rust. t. 71. Fl. Dan. t. 678. (*R. fylvestris*; Ger. Em. 240.)—Leaves simply lyrate. Pod round, jointed, even, of one cell.—A troublesome weed in the corn-fields of Europe, flowering in June and July. The root is annual, small, and tapering. *Stem* branched, round, glaucous, rough with prominent bristles, leafy. *Leaves* rough, lyrate; the upper ones oblong, simply toothed. *Flowers* numerous, lemon-coloured, changing to white in decay, with purple veins; sometimes the petals are white from the first. *Pods* cylindrical, or rather tapering, beaked, knobbed or imperfectly jointed, smooth, becoming striated as they ripen. In a young state they are divided into two cells, but the partition is obliterated, and confounded in one spongy mass, as they ripen. Linnæus was of opinion that the seeds of this plant caused a convulsive disease, thence termed by him *Raphania*, of which he has given a history in Amœn. Acad. v. 6. 430, with a figure, and elaborate synonymy of the plant. We have never met with any circumstance to corroborate this hypothesis.

4. *R. maritimus*. Sea Radish. Sm. Engl. Bot. t. 1643. Ait. n. 3. (*R. Raphanistrum* γ ; Fl. Brit. 723. *R. maritimus*, flore luteo, siliquis articulatis, secundum longitudinem eminentè striatis; Raii Syn. 296. *Raphanistrum siliquâ articulatâ striatâ maximâ*; Morif. v. 2. 266. Raii Hist. v. 1. 306.)—Radical leaves interruptedly lyrate. Pod round, jointed, smooth, deeply furrowed, of one cell.—Found on the sea-shore in various parts of Britain, flowering in May. The late Rev. Dr. Walker, and Mr. J. Mackay, observed it on the western coasts of Scotland; and the former cultivated this plant, till his death, as an esculent root, preferable to horse radish; he also found that cattle were very fond of the leaves. Mr. Turner and Mr. W. Borrer gathered the same on rocks, near Beachy Head, Suffex. The root is large and succulent, lasting two or three

RAPHANUS.

three years. *Stems* three or four feet high, round, roughest at the base. *Leaves* all rough, and rather sharply toothed; the radical ones interruptedly lyrate, which we have never observed in the last-described species. *Flowers* of a deeper yellow, and less veiny. *Pods* strongly jointed, and very deeply furrowed longitudinally, destitute of hairs or other roughness. There can be no doubt of this being a distinct species from the former, though generally confounded therewith.

5. *R. sibiricus*. Siberian Radish. Linn. Sp. Pl. 935. Murray Comment. Gott. for 1775. 48. t. 11. (R. n. 28; Gmel. Sib. v. 3. 266.)—*Leaves* pinnatifid, somewhat toothed. Pod round, beaded, downy, of one cell.—Native of Siberia. The seeds were sent by Professor Pallas to the Goettingen garden, where the plant flowered in June. *Root* annual, long, and slender. *Stems* from three to six inches high; or more, as the seeds ripen, ascending, leafy, hairy, simple or branched. *Leaves* sometimes elegantly and neatly pinnatifid, almost pectinate, either in a simple or interrupted manner, roughish at the edge only, sometimes more dilated, with distant and broader lobes. *Flowers* large, yellow, sweet-scented in an evening, their *petals* strongly emarginate. *Pods* inflexed, copiously and neatly beaded in appearance, rather than distinctly jointed, downy, each with a sharp taper beak.

6. *R. tenellus*. Slender Purple Radish. Pallas Trav. v. 3. append. 741. t. L. f. 3. Willd. n. 5. Ehrh. Sel. n. 38. (Chorispermum tenellum; Brown in Ait. H. Kew. v. 4. 129.)—*Leaves* smooth, oblong, toothed; the lowermost pinnatifid. Pod awl-shaped, jointed, smooth, of two cells.—Native of deserts near the Caspian sea. A hardy annual in our gardens, flowering in June and July. *Root* long, simple, tapering, and slender. *Herb* smooth, scarcely branched, leafy. *Leaves* elliptic-oblong, toothed or pinnatifid, tapering down into longish footstalks. *Flowers* small, purple. Beak of the *pod* very long and slender. The ingenious Mr. Brown separates this from *Raphanus* chiefly, as it seems, because the cotyledons are flat, not folded.

7. *R. arcuatus*. Curve-podded Radish. Willd. n. 6.—“*Leaves* oblong-lanceolate, toothed. Pod awl-shaped, curved, two-celled, smooth.”—Native country unknown. Willdenow cultivated the plant, which he describes as annual, with an erect branched *stem*, hardly a span high. *Leaves* stalked, oblong-lanceolate, very smooth, with broad shallow teeth. *Flowers* small, violet. *Pods* round, of two cells, jointed, curved, smooth, striated, with an awl-shaped beak. The figure of *Hesperis arenaria*, Desfont. Atlant. v. 2. t. 162, answers exactly to this plant, except the pods. Willdenow.

8. *R. lanceolatus*. Lanceolate Radish. Willd. n. 7.—“*Leaves* oblong-lanceolate, somewhat toothed at the apex. Pod tumid, smooth, two-celled, with a squarish beak.”—Native of the West Indies. *Stem* a foot and half high, erect, zigzag, with short branches, smooth like every other part of the plant. *Leaves* stalked, oblong-lanceolate; the uppermost lanceolate, narrow, entire; the lower ones bluntly toothed at the extremity. *Flowers* of a middling size, yellow, in a terminal cluster, six inches long. *Pods* half an inch long, with a long, obtuse, obscurely quadrangular beak. Willdenow.

9. *R. pilosus*. Hairy-stalked Radish. Willd. n. 8.—“*Leaves* lanceolate-linear, pinnatifid at the base. Stem rough with bristly hairs. Pod round, smooth, jointed, of one cell.”—Native of Guinea. *Stem* two feet, or perhaps more, in height, branched, divaricated. *Leaves* three inches long, narrow, smooth, pointed; pinnatifid at the base;

toothed in the middle; entire at the extremity. *Clusters* axillary from every leaf, of few flowers. *Pods* an inch and half long, round, jointed, of one cell, with a short beak, all of them turned one way. Willdenow.

R. erucoides, Linn. Suppl. 299, is rightly referred by Mr. Brown, in Ait. H. Kew. v. 4. 126, to *Sinapis Allionii*, Jacq. Hort. Vind. v. 2. t. 168. Willd. Sp. Pl. v. 3. 557. (See SINAPIS.) Willdenow cites it, doubtingly, under *Brassica Cheiranthus* of Villars, a very different plant; for which he also by mistake quotes Barrel. Ic. t. 1016, a synonym properly belonging to *Sisymbrium Barrelieri*.

Linnaeus once referred *Bunias Cakile* to this genus of *Raphanus*.

RAPHANUS, in *Gardening*, contains plants of the herbaceous, annual, esculent kind, of which the species cultivated is, the common garden radish (*R. sativus*).

There are several varieties; some of which have the appearance of distinct species, from their shape, size, and colour of the roots; as the *long-rooted*, which is that commonly cultivated in kitchen-gardens for its roots. Of this there are several subordinate variations: as the *small-topped*, and the *long-topped striped radish*. The *small-topped* is most commonly preferred by the gardeners near London, as they require much less room than those with large tops; for as forward radishes are what produce the greatest profit to the gardener, and these are commonly sown upon borders near hedges, walls, or pales, the large-topped sorts would be apt to grow mostly at top, and not swell so much in the root as the other, especially if the plants should be left pretty close.

The *small round-rooted*, which is not very common here, but in many parts of Italy it is the only one cultivated; the roots of this are very white, round, small, and very sweet. It is now frequently brought to the London markets in the spring, generally in bunches, and is sometimes mistaken there for young turnips: when eaten young, it is crisp, mild, and pleasant.

The large *turnip-rooted*, or *white Spanish*, which has a moderately large, spheroidal white root, and is esteemed chiefly for eating in autumn and the early part of winter. Both these sorts are commonly called indiscriminately turnip radishes.

The *black turnip-rooted Spanish*, which has a root like the preceding, white within, but with a black skin; and is greatly esteemed by many for autumn and winter eating.

There are likewise some other subvarieties of the radish noticed by gardeners, as the common *salmon radish*, and the short-topped early *salmon radish*. Also the small red *turnip-rooted radish*. Gardeners, too, often call the long-topped sort the *fallad radish*.

Method of Culture.—These are raised from seed by different sowings from the end of October till April, or the following month. They should have a light fine mould, and the more early sowings be made on borders, under warm walls, or other similar places, and in frames covered by glasses. The common spindle-rooted, short-topped sorts are mostly made use of in these early sowings, the seed being sown broadcast over the beds after they have been prepared by digging over and raking the surface even, being covered in with a slight raking. Some sow carrots with the early crops of radishes.

It is usual to protect the early sown crops in the borders, during frosty nights and bad weather, by mats or dry wheat straw, which should be carefully removed every mild day. By this means they are brought more forward, as well as form better roots. When mats are used, and supported by pegs or hoops, they are readily applied and removed.

A second more general sowing should be made in January or February. When the crops have got their rough leaf, they should be thinned out, where they are too thick, to the distance of two inches, as there will be constantly more thinning by the daily drawing of the young radishes.

When the weather is dry in March, or the following month, the crops should be occasionally well watered, which not only forwards the growth of the crops, but increases the size of the roots, and renders them more mild and crisp in eating.

And the sowings should be continued at the distance of a fortnight, till the latter end of March, when they should be performed every ten days, until the end of April or beginning of the following month. In sowing these later crops, it is the practice of some gardeners to sow cobs-lettuces and spinach with them, in order to have the two crops coming forward at the same time, but the practice is not to be much recommended, where there is sufficient room.

But in sowing the main general crops in the open quarters, the market-gardeners generally put them in on the same ground where they plant out their main crops of cauliflowers and cabbages, mixing spinach with the radish-seed as above, sowing the seeds first, and raking them in, then planting the cauliflowers or cabbages; the radishes and spinach come in for use before the other plants begin to spread much, and as soon as those small crops are all cleared off for use, hoe the ground all over to kill weeds and loosen the soil, drawing earth about the stems of the cauliflowers and cabbages.

The turnip radish should not be sown till the beginning of March, the plants being allowed a greater distance than for the common spindle-rooted sort. The seeds of this sort are apt to degenerate, unless they are set at a distance from that kind.

The white and black Spanish radishes are usually sown about the middle of July, or a little earlier, and are fit for the table by the end of August, or the beginning of September, continuing good till frost spoils them. These should be thinned to a greater distance than the common sort, as their roots grow as large as turnips, and should not be left nearer than six inches.

To have these roots in winter, they should be drawn before hard frost comes on, and laid in dry sand, as practised for carrots, carefully guarding them from wet and frost; as in this way they may be kept till the spring.

In regard to the culture of the general crops, they require very little, except occasional thinning where they are too thick, when the plants are come into the rough leaf, either by hoeing or drawing them out by hand: though for large quantities, small hoeing is the most expeditious mode of thinning, as well as most beneficial to the crop by loosening the ground; in either method thinning the plants to about two or three inches distance, clearing out the weakest, and leaving the strongest to form the crop.

In order to save the seed, about the beginning of May some ground should be prepared by digging and levelling; then drawing some of the straightest and best-coloured radishes, plant them in rows three feet distant, and two feet asunder in the rows; observing, if the season be dry, to water them until they have taken root: after which they will only require to have the weeds hoed down between them, until they are advanced so high as to overspread the ground.

When the seed begins to ripen, it should be carefully guarded against the birds. When it is ripe, the pods will turn brown: then it must be cut, and spread in the sun to dry; after which it must be thrashed, and laid up for use where no mice can come at it.

Method of Culture on Hot-beds.—This method is sometimes practised in order to have the roots early, as in January or the following month. They should have eighteen inches depth of dung to bring them up, and six or seven inches depth of light rich mould. The seed should be sown moderately thick, covering it in half an inch thick, and putting on the lights: the plants usually come up in a week or less; and when they appear, the lights should be lifted or taken off occasionally, according to the weather; and in a fortnight thin the plants to the distance of an inch and half or two inches, when in six weeks they will be fit to draw. Where there are no frames to spare, the beds may be covered with mats over hoops, and the sides secured by boards and straw-bands. And when in want of dung, if the beds be covered with frames, and the lights put on at night and in bad weather, the plants may be raised for use a fortnight sooner than in the open borders.

RAPHÉ, in *Anatomy*, a Greek term, signifying suture, applied to some parts of the body; thus we have the raphe corporis callosi in the brain (see BRAIN); raphe perinei, scroti, and penis. See GENERATION.

RAPHELENGIUS, sometimes called RAULENGHIEN, FRANCIS, in *Biography*, a learned orientalist, was born in 1539 at Lanoy, near Lille, in Flanders. He had the early part of his education at Ghent, but on the death of his father, it was intended to bring him up to trade, and for that purpose he was sent to Nuremberg. Here he had access to books, resumed his studies, and took an opportunity of going to Paris, where he made great progress in the Greek and Hebrew languages. The civil wars obliged him to quit France, and he came to England, where, for some time, he taught Greek in the university of Cambridge. After this he returned to the Low Countries, and became a corrector of the press to the celebrated printer Plantin, whose daughter he married in the year 1565. He made himself very serviceable in the printing office, especially with respect to the famous Antwerp Polyglot Bible, printed in 1571 by order of Philip II. of Spain. When Plantin removed to Leyden, he left his business at Antwerp under the care of Raphelengius, and upon his return the latter went to Leyden. The curators of the university of that place conferred upon him the professorship of Hebrew, to which was added that of Arabic. He died in 1597. His literary works were "Varie Lectiones et Emendationes in Chaldaicam Bibliorum Paraphrasin;" "Grammatica Hebræa;" "Dictionarium Chaldaicum;" and "Lexicon Arabicum." He had a son of the same name, a man of talents and learning, who published "Notes upon Seneca's Tragedies," and "Eulogies, in Verse, of fifty Persons, with their Portraits."

RAPHIA, in *Botany*, from $\rho\alpha\phi\eta$, a point or needle, so that it ought to have been *Rhaphia*, a genus of Palms, with a very pointed fruit, established by Palisot Beauvois, in his *Flore d'Oware et de Benin*, fasc. 8.

RAPHIA, in *Ancient Geography*, a famous city in the Mediterranean, between Gaza and Rhinocorura. This was perhaps Gath of the Rephiam. Raphia is famous for the victory of Philopator, king of Egypt, over Antiochus the Great, king of Syria. (3 Maccab. i. 11.) Josephus says (Antiq. l. xiii. c. 21.) that Raphia was taken by Alexander Jannæus, and after being ruined in the wars, was repaired by Gabinius. There are extant some ancient medals struck at Raphia, and some bishops of this city are found in the lists of the eastern councils.

RAPHIDIA, in *Entomology*, a genus of insects of the order Neuroptera, of which there are two species. The generic character is as follows; Mouth with a curved toothed

toothed horny mandible; the thorax is long and cylindrical; it has three stemmata; the wings are deflected; the antennæ filiform, as long as the thorax, the anterior part is elongated and cylindrical: it has four feelers, which are short and filiform; the tail of the female is terminated by a large recurved bristle.

* OPHIOSUS. The wings of this species are immaculate. It inhabits divers parts of Europe in woods, and preys on other insects.

* NOTATA. Wings with a brown marginal spot. It inhabits England, and has been thought to be only a variety of the former. The body is black; the head is also black with a testaceous spot; the legs are testaceous; the appendage of the female is as long as the body.

RAPHOE, in *Geography*, a bishopric of Ireland, in the ecclesiastical province of Armagh, which comprises the greater part of the county of Donegal, being 44 miles in length from north to south, and 32 in breadth, comprehending 515,250 Irish acres. It contains 31 parishes, in which are 32 churches. The dean, archdeacon, and four prebendaries, compose the chapter. The patronage of 6 parishes, which form the corps of the deanery, is in the crown; of 15 others, in the bishop; of 7, in the university of Dublin; and of 3, in lay hands. It is not precisely known at what time this see was founded, but it must have been as early as the ninth century, since bishops of Raphoe are mentioned at that time. Beaufort.

RAPHOE, a small post-town of Ireland, the parish church of which serves as a cathedral, where is the bishop's palace. It is 107 miles N. by W. from Dublin.

RAPHOE, a township in Lancaster county, Pennsylvania, containing 2814 inhabitants.

RAPHON, in *Ancient Geography*, a city beyond Jordan, on a brook, not far from Carnain.

RAPICIO, GROVITA, in *Biography*, an Italian man of letters, was born about the year 1480, at Chiari, in the territory of Brescia. Devoting himself to the instruction of youth in literature, he first opened a school at Bergamo, where he wrote a Latin treatise on the education of youth, which was afterwards printed at Venice. He next taught at Vicenza, and various other cities in Italy, and was for many years employed at Venice in instructing, in polite literature, the youths destined for public life, and among others, the care and instruction of the sons of cardinal Bembo were devolved upon him. Cardinal Pole, in one of his letters, speaks of Rapicio in high terms of commendation. He died at Venice in 1553. He was author of various harangues, poems, and epistles, but his chief work was entitled "De numero Oratorio," in five books, printed at Venice in 1544. "In this," says his biographer, "he minutely investigates the principles of writing the Latin language with sweetness and harmony, and he replies to Melancthon's assertion, that rules of this kind are rendered useless by our ignorance of the ancient pronunciation. Moreri."

RAPID ANN, in *Geography*, a small river of Virginia, which runs into the Rappahanock, about 10 miles above Frederickburg.

RAPID Plat, *Ile au*, a small island of Upper Canada, in the river St. Lawrence, in front of the township of Matilda, containing about 200 acres.

RAPID River, a river which runs into Hudson's Bay.

RAPIDES, a county of the territory of Orleans, containing three parishes, viz. Rapides, including 2200 inhabitants, Catahula 1164, and Avoyelles 1209.

RAPIER, properly denotes a long, ordinary, old-

fashioned cutting sword, such as those worn by the common soldiers.

The word is formed from the French *rapiere*, of the Greek $\rho\alpha\pi\iota\zeta\epsilon\upsilon$, *cadere*, to smite, or strike.

In this sense do the French still use the term; so that among them, to *take the rapier*, is to enter in the army.

RAPIER, in a modern sense among us, usually denotes a small sword, as contradistinguished from a back-sword, or cutting-sword.

RAPILLO, in *Mineralogy*, the name given by the Italians to the sand or powders (improperly called ashes) thrown from the craters of volcanoes in immense quantities, towards the conclusion of an eruption. See VOLCANO, and VOLCANIC *Products*.

RAPIN, RENÉ, in *Biography*, a Jesuit, was born at Tours in 1621. He entered the society in 1639, and was a teacher of the belles lettres in it during nine years. He became eminent by several publications in the Latin and French, and obtained a high rank among the literary characters of his time. It is, however, as a Latin poet that he is chiefly known: his didactic poem on *Gardens*, entitled "Hortorum, lib. iv." first printed in 1665, has passed through many editions, and has been regarded as one of the most elegant and classical pieces of modern Latin verse. By others it has been thought a work of art and study, rather than an effusion of poetical feeling and fancy, and treats on gardening more as a branch of rural economy than as one of the fine arts. His other Latin poems are sacred eclogues, heroic, elegiac, and lyric poems. Father Rapin died at Paris in 1687. He was no less esteemed for his virtues and amiable qualities, than admired for his talents; and he possessed all that polish and fitness for the society of the great world, which have distinguished this order from other religious communities. His works were collected and published, in 3 vols. 12mo. 1681. There is a fine edition of his "Hortorum," published by Brotier at Paris, in 1780. Rapin was great as a critic, in which line he is known by his "Reflexions sur l'Eloquence, sur la Poésie, sur l'Histoire, et sur la Philosophie;" and also by his "Comparaisons de Virgile et d'Homere," printed in 2 vols. 4to. Bayle. Moreri.

RAPIN DE THOYRAS, PAUL, well known as the historian of England, was born at Castres, in Languedoc, in 1661. He was descended from a noble family of Savoy, which came into France in the reign of Francis I. for the sake of professing the reformed religion. The subject of this article, after having received his education, went to his father, who was an advocate in the chamber of the edict at Nantes, for the purpose of studying the law. He was in due time admitted an advocate, but the chamber being suppressed in the same year, he went with his father to Toulouse. On the revocation of the edict of Nantes, in 1685, he withdrew to England, after which he went to Holland, and entered into a company of French cadets at Utrecht. In 1689 he followed the prince of Orange into England, and obtained an ensigncy in lord Kingston's regiment, which went to Ireland. He was engaged in several battles, particularly at the sieges of Carrickfergus and Limerick, and at the battle of the Boyne, and so much distinguished himself, that he obtained a captain's commission. In 1693 he was nominated governor to the son of the earl of Portland, resigned his commission to a younger brother, and received from the crown, for his past services, 100*l.* a-year. He travelled to different countries in company with his pupil, and resided with him some time at the Hague. By the death of king William he was deprived of his pension, and his engagement as private tutor being over, he retired, in 1707, to Wesel, in the duchy of

of Cleves, where he devoted himself to the composition of the history of England. Here he died in 1725. He had, previously to his decease, published in the year 1717, "Dissertation sur les Whigs et Torys," which was translated into English. His great work, "L'Histoire de Angleterre," was printed at the Hague in 9 vols. 4to. in the years 1725—6. It commences with the remotest periods, and is brought down to the proclamation of William and Mary. It has been twice translated into our own language, and was, till the appearance of Hume, the most popular history of England, and Tindal's, or rather Birch's, and other continuations, have been adapted to it. It is written in a prolix and unanimated style, but deserves the praise of much solid information. "His work," says an excellent writer, "is of great authority, on account of his perpetual references to original documents, and the ample quotations which he frequently makes from important state papers, confer upon it additional value. He has so copiously detailed the matters which were agitated in the turbulent, but prudent parliament of Charles I., as to give a clear view of the rise of those parties which to this day divide the people of England. On the dark and horrible transactions of the reign of Charles II. he perhaps throws as much light as it is now possible to obtain. In reference to that important period, he has stated historical difficulties with candour, and in discussing the merits and demerits of parties, he has weighed evidence with laudable scrupulosity." (See Shepherd's Systematic Education.) Rapin, during the collection of his materials, undertook the useful labour of making an "Abridgment of Rymer's Foedera," which was published in Le Clerc's "Bibliothèque Choisie;" and translated into the English by Mr. Stephen Whatley, and published in 1733, under the title of "Acta Regia," and in folio.

RAPINE, RAPINA, in *Larv.* To take a thing in private; against the owner's will, is properly *theft*; but to take it openly or by violence, is *rapine*, or *robbery*.

RAPINIA, in *Botany*, was so called by Loureiro, Fl. Cochinch. 127, after father René Rapin, a French Jesuit, author of an elegant Latin poem on gardens, who died in 1687, aged 66. If this writer contributed nothing to improve the science of botany, he has, doubtless, helped to promote a love of plants, and may therefore claim a botanic wreath. A Jesuit of his day is doubly entitled to respect, for having, like the good Loureiro, turned his mind to an elegant and improving pursuit, from those two corruptors of the human heart and understanding, political intrigue, and scholastic divinity; in which most of his brethren sought their temporal, and ostensibly their eternal, good. The *Rapinia* of Loureiro however, proved, on the examination of his specimens by the late Mr. Dryander, to be the *SPHENOCLEA* of other authors; and this last-mentioned name is now generally adopted. See that article.

RAPINO, in *Geography*, a town of Naples, in Abruzzo Citra; nine miles S. of Civita di Chieti.

RAPISTRUM, in *Botany*, originally the wild turnip, so called from its affinity to *Rapa*, the cultivated one. Tournefort, however, uses the word generically, for some species referred by other botanists to *Myagrum*. In this he is followed, as far as concerns *M. paniculatum*, by Gærtner, and by the writer of the present article, in the Prodr. Fl. Græc.—Tourn. t. 99. Gærtner. v. 1. 285. t. 141. Sm. Prodr. Fl. Græc. Sibth. v. 2. 1. Brown in Ait. Hort. Kew. v. 4. 74.—Class and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliquose*, Linn. *Crucifera*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of four oblong, spreading, deciduous leaves, gibbous at the base. *Cor.* cruciform, of four obovate, entire, spreading petals, whose claws are shorter

than the calyx. *Stam.* Filaments six, about the length of the calyx, the four opposite ones rather the longest; anthers simple. *Pist.* Germen oblong; style awl-shaped, the length of the calyx; stigma obtuse. *Peric.* Pouch lenticular, pointed, corrugated, of two cells, and two cohering, not spontaneously separating, coriaceous valves; partition membranous. *Seeds* roundish, solitary in each cell; cotyledons flat.

Eff. Ch. Calyx spreading. Pouch of two cells, and two convex valves, not bursting.

1. *R. paniculatum*. Panicked Rapistrum. Ait. n. 2. (*R. arvense*, folio auriculato acuto; Tourn. Inst. 211. *Myagrum paniculatum*; Linn. Sp. Pl. 894. Willd. Sp. Pl. v. 3. 409. Fl. Dan. t. 204. *Myagro similis*, siliquâ rotundâ; Bauh. Prodr. 52.)—Native of cultivated fields in various parts of Europe, from Sweden to Greece, but not, as yet, observed in Britain. *Root* annual, tapering. *Stem* about two feet high, erect, round, roughish, leafy, branched. *Leaves* oblong, acute, undivided, rough, somewhat toothed, clasping the stem with their arrow-shaped base. *Flowers* small, yellow, in numerous clusters, which become greatly elongated when in fruit. *Pouch* scarcely bigger than mustard-seed, a little abrupt, finely reticulated. One of the *seeds* is often, but not always, abortive. Mr. Brown refers to this genus the *Bunias aegyptiaca* of Linnæus, which agrees with our *R. paniculatum* in having flat, not spiral, cotyledons, but has otherwise the characters of *Bunias*.

RAPISTRUM is also a species of the *sea-cabbage*, or *crambe*.

RAPOLLA, in *Geography*, a town of Naples, in Basilicata, the see of a bishop, united to Melfi; six miles W. of Venosa. N. lat. 40° 58'. E. long. 15° 44'.

RAPORE, a town of Naples, in Principato Ultra; 9 miles E. of Conza.

RAPOSO, a town of South America, in the country of Popayan.—Also, a river of Popayan, which runs into the Pacific ocean, N. lat. 3° 48'.—Also, a small island in the Pacific ocean, near the coast of Popayan. N. lat. 4°.

RAPPAHANOCK, a large navigable river of Virginia, which rises in the Blue Ridge, and runs about 130 miles from N.W. to S.E., and enters into Chesapeake bay, between Windmill and Stingray points. It waters, in its course, the towns of Falmouth, Frederickburg, Port-Royal, Leeds, Tappahannock, and Urbonne.

RAPPE, in *Commerce*, a money of account in Switzerland, 10 of which are equal to a good batze; and 6 are equal to a plappert, shilling, or escalin. This is the case at Basle, but at Lucern the plappert is only 3 rappen, and the Zurich escalin = 3½ rappen.

RAPPE, in *Ichthyology*, a name given by some to the *capito fluvialis rapax* of Gesner, more frequently known by the name of the *corvus piscis*.

RAPPERSCHWEIT, in *Geography*, a town of Switzerland, and capital of a district to which it gives name; situated on the N. side of the lake of Zurich, over which there is a bridge, 1852 paces in length, built in 1358 by the counts of Habsburg. The town was founded in 1091, and formerly had its own counts. In 1358 it was sold to the sons of Albert, archduke of Austria. In 1464 it put itself under the cantons of Uri, Schwitz, Unterwalden, and Glarus, with a reserve of its liberties; but the cantons gradually made themselves masters of it. At the peace of Arau in 1712, its liberties were restored, though the country remains subject to the sovereignty of Zurich and Berne; 15 miles S.E. of Zurich.

RAPPIN, a town of Anterior Pomerania; 7 miles N. of Bergen.

RAPPO RAPPO, a bay on the coast of Mowee, one of the Sandwich islands.

RAPPOLTSKIRCHEN, a town of Austria; five miles S. of Tulln.

RAPPORT, Fr. in *Music*, is sometimes used for proportion, and sometimes for relation, words which will be explained in their places.

RAPPS, in *Geography*, a town of Austria, on the river Taya; four miles S.W. of Drosendorf.

RAPSO, a town of Istria; 52 miles S.E. of Capo d'Istria.

RAPTEC, a river of Hindoostan, which runs into the Dewah, five miles S.W. of Selloppour.

RAPTU HÆREDIS, in *Law*, an ancient writ which lies for taking away an heir, holding in socage; of which there are two sorts; one when the heir is married, the other when not. See RAVISHMENT.

RAPTURE, RAPURA, an extasy, or transport of mind. See EXTASY, ENTHUSIASM, RHAPSODY, &c.

RAPUNCULUS, in *Botany*, the Rampion, owes its name to a resemblance in the root to a Rape, or oblong Turnip. This root, *Campanula Rapunculus* of Linnæus, is biennial, scarcely larger than a radish, which it resembles also in shape, but the colour is white. Its flavour is sweet and mild, notwithstanding some degree of milkiness in the juices, in which it accords with other, usually bitter and acrid, species of its genus. The Rampion is now much less cultivated than formerly, and almost a stranger at our tables.

RAPUNTIUM, a name used by Tournefort and Morison for some plants referred to *Lobelia* by Linnæus. (See LOBELIA.) Gartner, having adopted Plumier's *Lobelia*, the Linnæan *Scævola*, restores *Rapunium*; but such a measure could now lead to inconvenience only.

RAPUTIA, so called by Aublet, because the plant grows in the forests of *Orapu* in Guiana. Jussieu and Lamarck have retained this curious name. Schreber has changed it for *SCOURIS*; see that article hereafter.

RARAKIT, in *Geography*, a town of the island of Ceram, at the foot of a mountain covered with trees, which serves as a harbour for pirates.

RARE, in *Physics*, denotes a body that is very porous, whose parts are at a great distance from one another, and which contains but little matter under a great deal of bulk.

In this sense *rare* stands opposed to *dense*.

The corpuscular philosophers, *viz.* the Epicureans, Gassendi's, Newtonians, &c. assert that bodies are rarer some than others, in virtue of a greater quantity of vacuity included between their pores. The Cartesians hold, that a greater rarity only consists in a greater quantity of *materia subtilis* included in the pores. Lastly, the Peripatetics contend, that rarity is a new quality superinduced upon a body without any dependence, either on vacuity, or subtiler matter.

RARECOURT, in *Geography*, a town of France, in the department of the Meuse; 10 miles S.W. of Verdun.

RAREE, a town of Hindoostan, in Concan; 20 miles N.N.W. of Goa.—Also, a town of Hindoostan, in Bahar; 11 miles N.N.W. of Durbungah.

RAREFACTION, RAREFACTIO, in *Physics*, the act by which a body is rendered *rare*; that is, is brought to possess more room, or appear under a larger bulk, without accession of any new matter.

Rarefaction is opposed to *condensation*.

Our more accurate writers restrain rarefaction to that expansion of a mass into a larger bulk, which is effected by

means of heat. All expansion from other causes they call *dilatation*.

The Cartesians deny any such thing as absolute rarefaction: extension, with them, constituting the essence of matter, they are obliged to hold all extension equally full.

Hence, they make rarefaction to be no other than an accession of fresh, subtle, and insensible matter, which, entering the parts of the body, sensibly dilates them. See this disproved under VACUUM.

It is by rarefaction that gunpowder has its effect; and to the same principle also we owe our æolipiles, thermometers, &c.

The degree to which the air is rarefiable exceeds all imagination: Merfennus, long ago, by means of an intense heat, found that air might be rarefied so as to possess more than seventy times its former space.

Mr. Boyle afterwards found, that air, by its own elasticity, and without the help of any heat, would dilate itself so as to take up nine times its former space; then 31 times; then 60; then 150: at length, by many degrees, he found it would reach to 8000 times, then 10,000, and finally to 13,679.

Such is the rarefaction of common air, from its own principle of elasticity, and without any previous condensation; but if it be compressed, the same author found its greatest space when most rarefied, is to its least when most condensed, as 55,000 to 1.

Such an immense rarefaction, sir Isaac Newton shews, is inconceivable on any other principle than that of a repelling force inherent in the air, by which its particles mutually fly from one another.

This repelling force, he observes, is much more considerable in air than in other bodies, as being generated from the most fixed bodies, and that with much difficulty, and scarcely without fermentation; those particles being always found to fly from each other with the most force, which, when in contact, cohere the most firmly. See AIR.

The members of the French Royal Academy have bestowed much attention on the different rarefactions, or rather the different rarities of the air at different heights. M. Mariotte established this as a principle, from experiments, that the different rarefactions, or condensations, of the air, follow the proportion of the weights with which it is pressed.

Hence, supposing the mercury in the level of the sea suspended to twenty-eight inches, which is the weight of the whole atmosphere; and that sixty feet height of air are equivalent to a line, or one-twelfth of an inch of mercury; so that the barometer, at the height of sixty feet from the sea, would fall a line; it is easy finding what height of air would be equal to a second, or any other line of mercury: for as twenty-eight inches of mercury one-twelfth are to twenty-eight inches, so is the height of sixty feet of air to a fourth term, which is the height of air corresponding to a second line of mercury.

And after the same manner may the height of air corresponding to each line be found; which will make a geometrical progression, the sum of which will be the whole height of the ATMOSPHERE (which see); and, of consequence, a certain part of that sum will be the height of a mountain, at whose top the barometer shall have sunk a certain quantity.

Messrs. Cassini and Maraldi, upon measuring the heights of several mountains, found, that this progression of M. Mariotte was defective; that it always gave the height of the mountains, and consequently the rarefactions, less than they really were; and from some farther experiments,

M. Amon-

M. Amontons found, that the principle will only hold in the mean rarefactions, not in the extremes. See **BAROMETER**.

RAREN, or **RARON**, in *Geography*, a town of the Valais, and capital of a tithing; 21 miles E. of Sion.

RARGIARA, a town of Hindoostan, in Bahar; 32 miles S.W. of Bahar.

RARITON, a river of America, in New Jersey, formed by two considerable streams, called the north and south branches; the one rises in Morris county and the other in the county of Hunterdon. This river passes by Brunswick and Amboy, and, uniting with the waters of the Arthurl Kull found, helps to form the fine harbour of Amboy. At Rariton hills, through which this river passes, is a small cascade, with a fall of water from fifteen to twenty feet, romantically situated between two rocks. Copper ore has been found upon the upper part of this river.

RARITON, a town of New Jersey, situated between the mouth of the N. branch of the above river and Boundbrook; 12 miles N.W. of Brunswick.

RARO, a town of Hungary; 8 miles E.S.E. of Altenburg.

RARONGHAKON, a large lake of Thibet. N. lat. $31^{\circ} 4'$. E. long. $85^{\circ} 52'$.

RARUM, *Non-Spiffum*, in the *Ancient Music*. See **APYCNON**.

RAS, in *Geography*, a town of Syria, anciently called "Conna," situated near the source of the Orontes; 24 miles N. of Balbec.

RAS Abad, or *Baba*, a cape on the coast of Arabia, in the Red sea; 10 miles S.S.W. of Jiddah.

RAS-Acon-natter. See **CAXINES**.

RAS Adder. See **Cape BON**.

RAS Ahabaz, a cape on the coast of Arabia, in the Red sea. N. lat. $18^{\circ} 19'$. E. long. $37^{\circ} 48'$.

RAS Ain, or *Ain Verdeb*, a town of Asiatic Turkey, in the province of Diarbekir; 80 miles S. of Diarbekir. N. lat. $36^{\circ} 34'$. E. long. $39^{\circ} 48'$.

RAS el Amoufse, a cape of Africa, on the coast of Algiers; 42 miles E. of cape Tennes. N. lat. $36^{\circ} 41'$. E. long. $2^{\circ} 48'$.

RAS Affab, a cape on the coast of Abyssinia, in the Red sea. N. lat. $13^{\circ} 8'$. E. long. $43^{\circ} 10'$.

RAS el Camir or *Kanfir*, or cape of the wild boar, a town of Syria, in the pachalic of Aleppo, near a cape on the sea-coast; 16 miles W. of Alexandretta.

RAS el Doar, a cape on the coast of Nubia, in the Red sea. N. lat. $21^{\circ} 21'$. E. long. $36^{\circ} 9'$.

RAS el Anf or *Enf*, i. e. cape of the Rose, a cape on the coast of Egypt, in the Red sea; without tree or herb; in the front of the point are the remains of a large temple. N. lat. $23^{\circ} 57'$.

RAS Fartach. See **FARTACH**.

RAS Fillam, a cape on the E. coast of Arabia; 18 miles S.E. of cape Mozendum. N. lat. $29^{\circ} 59'$.

RAS Ibrahim, a cape of Arabia, in the Red sea; 6 miles S. Ghunfude.

RAS Iggidid, or *Ras el Jidid*, a cape of Nubia, in the Red sea; near which is a harbour, resembling a cauldron, and round as the arch of a circle; the entrance is formed by two points, N. and S. of each other, with 18 fathoms of water, and in the harbour 13. This port is subject to no inconvenience, except from the east. N. lat. $22^{\circ} 15'$. E. long. 36° .

RAS al Mabbes, a cape of Africa, on the coast of Tripoli. N. lat. $32^{\circ} 18'$. E. long. $11^{\circ} 49'$.

RAS Mohammed, a cape on the coast of Arabia, in the Red sea. N. lat. $27^{\circ} 54'$.

RAS al Mar, a town of Persia, in the province of Segestan; 200 miles S.W. of Zareng.

RAS al Nasbef, a cape of Egypt, in the Red sea. N. lat. $23^{\circ} 16'$.

RAS Rouzé, a cape on the E. coast of Arabia. N. lat. $21^{\circ} 55'$.

RAS Viré, a cape on the coast of Arabia, forming the S. point of the gulf of Curia Muria. N. lat. $17^{\circ} 25'$.

RAS Zafrane, a cape on the coast of Egypt, in the Red sea; 32 miles S.S.E. of Suez. N. lat. $29^{\circ} 14'$.

RASA, a small island in the Indian sea, near the coast of Africa. S. lat. $17^{\circ} 8'$.

RASAIN, a town of Persia, in the province of Fars or Farsistan; 110 miles N.W. of Schiras or Shiraz.

RASAL, or **RASAL-SEM**, *Cape*, a cape of Africa, on the coast of Tripoli. N. lat. $32^{\circ} 36'$. E. long. $21^{\circ} 10'$.

RASALEMA, a river of Africa, which waters the city of Fez.

RASALGATA, **CAPE**, or *Ras Roufe*, a cape on the E. coast of Arabia. N. lat. $22^{\circ} 25'$. E. long. $53^{\circ} 15'$.

RASANT, or **RAZANT flank**, in *Fortification*. See **FLANK**.

The defence of the bastion is rasant.

RASANT Fire. See **FIRE**.

RASCA, in *Geography*, a river of Servia, which joins the Ibar; 16 miles N.E. of Jenibasar.

RASCETA, a word used by the Arabian physicians to express the wrist or ankle.

RASCH, in *Geography*, a town of Bavaria, in the territory of Nuremberg; two miles S.S.E. of Altorf.

RASCHNA, or **RIZANA**, a town of Servia; eight miles S. of Parakin.

RASCHOWITZ, a town of Bohemia, in the circle of Leitmeritz; four miles E. of Aufche.

RASCIA, a port of Servia, watered by the Rasca.

RASCINES, a town of Spain, in the province of Biscay; 21 miles S.E. of Santander.

RASE, **RASARIUM**, in our *Old Writers*, seems to have been a measure of corn now difused; toll shall be taken by the rase, and not by the heap or cautel.

RASE, in the *Manege*. *To rase*, or glance upon the ground, called in French *razer le tapis*, is to gallop near the ground, as our English horses do.

RASEB, **AL**, in *Geography*, a fortified pass in the mountains of Grand Bucharia; 60 miles N. of Vashgherd.

RASEBORG, a sea-port town of Sweden, in the gulf of Finland; 30 miles S.E. of Abo.

RASEC, a town of Persia, in the province of Segestan; 60 miles S.W. of Zareng.

RASGRAD, or **RASGRAT**. See **HRASGRAD**.

RASH, in *Clock-Work*. See **RATCH**.

RASH, in *Medicine*, an eruption or efflorescence upon the scia, thrown out in fevers, or surfeits.

RASHUA, in *Geography*. See **RASSAGU**.

RASHED, a town of Nubia, in Sennaar; 15 miles N. of Gieslim.

RASICULMO, **CAPE**, a cape on the N. coast of Sicily. N. lat. $38^{\circ} 18'$. E. long. $12^{\circ} 49'$.

RASIERE, or **RAZIERE**, in *Commerce*, a measure of corn in Dunkirk and Flanders. At Dunkirk, they have the sea rasiere, and the land rasiere; 8 of the former being = 9 of the latter; 54 sea rasieres or $60\frac{3}{4}$ land rasieres answer to 31 English quarters. Each sea rasiere contains 9884 inches, and each land rasiere contains 8786 inches; 17.40 of the former, and 19.57 of the latter, are equal (each) to 10 English

English quarters. At Dixmude 29.51 rasières are equal to 10 English quarters, and each rasière contains 5821 inches. At Gravelines 21.29 rasières are equal to 10 English quarters, and each contains 8080 inches. At Nieuport 16.93 rasières are equal to 10 English quarters, and each rasière contains 10157 cubic inches. At Ostend 16.02 rasières are equal to 10 English quarters, and each of them contains 10733 inches. At St. Omer 21.77 rasières = 10 English quarters, and each contains 7900 cubic inches. At Lisle or Lille, the rasière is divided into 8 parts; of these there are two forts, one, used for wheat or rye, the other, called rasière de Mars, for oats or beans; 38 of the former, and 40 of the latter, are reckoned for one last. The rasière of wheat weighs about 128lbs., and 41 of these are equal to 19 fetiers, Paris measure, or about 10½ English quarters; 39.64 rasières of Lisle are equal to 10 English quarters, and each contains 4339 cubic inches.

RASILIS *ÆRUGO*, in the *Materia Medica of the Ancients*, one of their kinds of verdigris. It was prepared in the following manner; they set some sharp vinegar over the fire in a strong earthen vessel, and covered it with a brass pot inverted, well cleaned, and without any vent-hole. And after some time the vessels were to be separated; and the verdigris, which was found concreted on the inside of the brass pot, was scraped off, and put up for use.

RASILITA, in *Geography*, a town of Italy, in Friuli; 26 miles S.S.E. of Friuli.

RASIN, a town of Hindoostan, in Dowlatabad; 18 miles W.S.W. of Carmullah.

RASINTA, a town of Italy, in Friuli; 14 miles N. of Udina.

RASKOW, a town of Poland, in the palatinate of Braclaw; 54 miles S. of Braclaw.

RASMAN, an island in the Red sea. N. lat. 13° 58'.

RASMEND, a mountain of Persia, in the province of Irak; 60 miles N.E. of Nehavend.

RASNO, an island in the Adriatic. N. lat. 44° 6'. E. long. 15° 25'.

RASO, or Ell of Turin, in *Commerce*, is equal to 2½ Genoese palmi, or 23½ English inches; the foot 143.2 French lines, or 3½ English inches; hence 180 Piedmontese rasi are equal to 119 English yards, and 33 Piedmontese feet = 35 English feet. At Cagliari, 166.7 rasi = 100 English yards, and each of them equal to 21.6 English inches. At Chamberry 158.5 rasi = 100 English yards, and each = 22.7 English inches. At Nice, 166.7 rasi = 100 English yards, and each = 21.6 English inches; 154.5 rasi of Turin = 100 English yards, and each = 23.3 English inches.

RASP, a coarse sort of file.

RASPACH, in *Geography*, a town of Austria; eight miles E. of Zwetl.

RASPATORIUM, (from *rado*, to scrape,) a surgical instrument with which the periosteum was, by the old practitioners, scraped from the bones, and the bones themselves sometimes rasped.

RASPBERRY BUSH, in *Botany*. See RUBUS.

For the dietetic and medicinal use of raspberries, see SUMMER Fruits.

RASPECON, in *Ichthyology*, a name given by some to the uranoscope, or star-gazer.

RASPENBURG, in *Geography*, a town of Germany, in the principality of Weimar, near which are some medicinal springs; 12 miles N. of Weimar. N. lat. 51° 13'. E. long. 11° 35'.

RASPHUYS, or *Rasp-houfe*, a celebrated work-house, or house of correction, at Amsterdam. See WORK-houfe.

RASPUGLY, in *Geography*, a town of Bengal; four miles S. of Calcutta.

RASSADES, a cluster of small islands, in the river St. Lawrence. N. lat. 48° 15'. W. long. 68° 48'.

RASSAGU, one of the Kurile or Kurilskoy islands, lying 40 versts from Mutova, and in extent about 30 versts measured either way. It has lofty mountains and steep rocky shores, with very few sandy bogs. On the mountains, here and there, is a good forest of birch, alders, and the nut-bearing pine; the vales and flats abound in herbs. On the land is no other animal besides the fox, but the cliffs of the rock afford nesting-places for all kinds of sea-birds; and the beavers and seals lie scattered on several parts of the strand. Here are no streams that yield fish. The Kurils on this island are not numerous, and some of them are baptized. N. lat. 48° 20'. E. long. 154° 14'.

RASSE CORONDE, in *Natural History*, a name given by the Ceylonese to a peculiarly fine kind of cinnamon, which is the bark of a tree, growing no where but in that island. The name they give it signifies *sharp* or *biting cinnamon*. This choice kind was formerly exported annually, in considerable quantity, by the Dutch East India company, who prohibited the mixing any other kind of cinnamon with it, under a very severe penalty. Phil. Trans. N° 409.

RASSOOLPOÛR, in *Geography*, a town of Hindoostan, in the circar of Nagore; 22 miles N.W. of Dildwana.—Also, a town of Hindoostan, in the circar of Gohud, on the Jumnah; 40 miles E. of Gohud.

RASSOVAT, or AXIOPOLI, a town of European Turkey, in Bulgaria; 24 miles N. of Driftra. N. lat. 44° 25'. E. long. 27° 37'.

RASTADT, a town of the duchy of Baden, situated on a large plain on the river Merg; the town is new, and regularly built, and the principal street is broad and handsome; 16 miles S.W. of Durlach. N. lat. 48° 52'. E. long. 8° 15'.—Also, a town of Bavaria, in the bishopric of Bamberg; five miles N.W. of Bamberg.—Also, a town of the duchy of Wurzburg; three miles S. of Melrichstadt.

RASTAGARA, a town of Egypt; 90 miles E. of Cairo.

RASTEDE, a town of Germany, in the country of Oldenburg; 11 miles N. of Oldenburg.

RASTENBURG, a town of Prussia, in the province of Natangen, founded in 1329, and after having been destroyed by the Lithuanians in 1348, was rebuilt, together with its castle, and put into a better state of defence; it is enclosed by a wall, and, in 1669, surrounded by a rampart. The burghers, most of whom are Lutherans, are about 200. The inhabitants derive their subsistence from a little commerce, brewing, agriculture, and mechanic trades; 46 miles S.E. of Königsberg. N. lat. 53° 58'. E. long. 21° 27'.

RASTICO HARBOUR, *Grand*, a bay in the gulf of St. Lawrence, on the N. coast of the island of St. John. N. lat. 46° 25'. W. long. 62° 50'.

RASTORFF, a town of Austria; seven miles E. of Elrnsprunn.

RASTOWICA, a river of Poland, which runs into the Dnieper, on the borders of Russia.

RASURA, a word used by the pharmaceutic writers to express the shavings of woods, or other hard substances, to make them readily yield their virtues by decoction. Physicians also use it to express the corrosion of acrid humours.

RASURE in a *Deed*, in *Law*. See DEED.

RASZNA, in *Geography*, a town of Servia; 24 miles N. of Niffa.

RAT, in *Zoology*. See MUS.

It has been observed that this country was formerly infested with two kinds of rats, the *house-rat* and the *water-rat*; but that it is believed that the latter, within this last half century, has destroyed the former. This is probably, however, only imaginary, since it is well known that the *house-rats* are frequently brought, in great abundance, into the different sea-ports of the kingdom, in corn, and other vessels. It seems not improbable, but that these different varieties of rats may intercopulate, and by that means the latter become *house-rats*, as there is considerable diversity in the colours of the *house-rats*, some approaching to nearly black, which is the natural colour of the *water-rat*, while the genuine *house-rat* is always of a darkish or dapple brown. In their habits they have some circumstances in which they agree, as in that of making burrows in the ground; but the *water-rat* is capable of living much in the water, and of feeding on fish and other aquatic animals, while the *house-rat* mostly lives upon grain, and other produce of that kind. The *water-rats* are also said, by Dr. Darwin, to eat the foliage as well as the seeds and fruits of vegetables, as he has seen a young rat of this kind devour a large leaf of the *water-plantain* (*alisma plantago*). They likewise, as well as the *house-rats*, are destructive of young animals, such as ducklings, goslings, chickens, and rabbits. But the great mischief which the *water-rats* produce, is in feeding on, and destroying, the roots of a great variety of vegetables, in their innumerable burrows. The above writer remembers to have seen some new-planted apple-trees taken out of the ground with nearly the whole of their smaller roots eaten, and the larger ones peeled by them. With the *house* kind, they are, likewise, extremely destructive of the food of poultry, and swine, and of course are highly detrimental near waters. It is remarked by the above able writer, that as these animals, like the dog, are of a lascivious nature, and, as some materials have a strong scent, resembling, perhaps, that of their venereal orgasm, they are liable to be attracted by such smells, as dogs are, on the same account, he supposes, inclined to roll themselves in putrid carrion; and male cats to eat *marum valerian*, and *cat-mint*. It is of this principle that rat-catchers avail themselves, and by indulging the propensity, deceive them to their destruction, by blending with their favourite foods different strong-scented substances, such as the essential oil of rhodium, or musk, with the poisonous powders of *strychnos nux vomica*, or of delphinium *stavisagria*, or perhaps of arsenic.

The first step taken by rat-catchers, in order to clear a house, &c. of those vermin, is to allure them all together, to one proper place, before they attempt to destroy them; for there is such an instinctive caution in these animals, accompanied with a surprising sagacity in discovering any cause of danger, that if any of them be hurt, or pursued, in an unusual manner, the rest take the alarm, and become so shy and wary, that they elude all the devices and stratagems of their pursuers for some time after. The place where the rats are to be assembled, should be some closet, or small room, into which all the openings, but one or two, may be secured; and this place should be, as near as may be, in the middle of the house, or buildings. It is the practice, therefore, to attempt to bring them all together in some such place before any attempt be made to take them; and even then to avoid any violence, hurt, or fright to them, before the whole be in the power of the operator. In respect to the means used to allure them to one place, they are various; one of those most easily and efficaciously practised is the trailing some piece of their most favourite food, which should be of the kind that has the strongest scent, such as

toasted cheese, or broiled red-herring, from the holes or entrances to their access in every part of the house, or contiguous buildings, whence it is intended to allure them. At the extremities, and in different parts of the course of this trailed tract, small quantities of meal, or any other kind of their food, should be laid, to bring the greater number into the tracks, and to encourage them to pursue it to the centre place, where they are intended to be taken; at that place, where time admits of it, a more plentiful repast is laid for them, and the trailing repeated for two or three nights. But besides this trailing, and way-baiting, some of the most expert of the rat-catchers have a shorter, and, perhaps, more effectual method of bringing them together, which is, the calling them, by making such a kind of whistling noise as resembles their own call, and by this means, with the assistance of the way-baits, they call them out of their holes, and lead them to the repast prepared for them at the place designed for taking them. But this is much more difficult to be practised than the art of trailing; for the learning the exact notes, or cries, of any kind of beasts or birds, so as to deceive them, is a peculiar talent, not easily attained to in other cases.

And in practising either of these methods great caution must be used by the operator to suppress, and prevent, the scent of his feet and body from being perceived; which is done by overpowering that scent by others of a stronger nature. In order to this the feet are to be covered with cloths rubbed over with *assafoetida*, or other strong smelling substances; and even oil of rhodium is sometimes used for this purpose, but sparingly, on account of its dearness, though it has a very alluring, as well as disguising effect. If this caution of avoiding the scent of the operator's feet, near the track, and in the place where the rats are proposed to be collected, be not properly observed, it will very much obstruct the success of the attempt to take them; for they are very shy of coming where the scent of human feet lies very fresh, and intimates, to their sagacious instinct, the presence of human creatures, whom they naturally dread. To the above-mentioned means of alluring by trailing, way-baiting, and calling, is added another of very material efficacy, which is the use of oil of rhodium, which, like the *marum syriacum* in the case of cats, has a very extraordinary fascinating power on these animals. The oil is extremely dear, and therefore very sparingly used. It is exhorted in a small quantity in the place, and at the entrance of it, where the rats are intended to be taken, particularly at the time when they are to be last brought together in order to their destruction; and it is used also, by smearing it on the surface of some of the implements used in taking them, by the method before described, and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is usual, likewise, for the operator to disguise his figure as well as scent, which is done by putting on a sort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a post, or such inanimate thing; which habit must likewise be scented as above, to overpower the smell of his person; and besides this he is to avoid all motion, till he has secured his point of having all the rats in his power. When the rats are thus enticed and collected, where time is afforded, and the whole in any house or out-buildings are intended to be cleared away, they are suffered to regale on what they most like, which is ready prepared for them; and then to go away quietly for two or three nights; by which means those which are not allured the first night are brought afterwards, either by their fellows, or

RAT.

the effects of the trailing, &c. and will not fail to come duly again, if they are not disturbed or molested. But many of the rat-catchers make shorter work, and content themselves with what can be brought together in one night or two; but this is never effectual, unless where the building is small and entire, and the rats but few in number.

With respect to the means of taking them when they are brought together, they are various. Some entice them into a very large bag, the mouth of which is sufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by smearing some vessel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of proper food. This bag, which before laid flat on the ground, with the mouth spread open, is to be suddenly closed when the rats are all in it. Others drive or frighten them, by slight noises or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being secured. Others, again, intoxicate or poison them, by mixing with the repast prepared for them the *cocculus indicus*, or the *nux vomica*. A receipt for this purpose has appeared, which directs four ounces of *cocculus indicus*, with twelve ounces of oatmeal, and two ounces of treacle or honey, to be made up into a moist paste with strong beer; but if the *nux vomica* be used, a much less proportion will serve than is here given of the *cocculus*. Any similar composition of these drugs, with that kind of food the rats are most fond of, and which has a strong flavour, to hide that of the drugs, will equally well answer the end. If, indeed, the *cocculus indicus* be well powdered, and infused in strong beer for some time, at least, half the quantity here directed will serve as well as the quantity before mentioned. When the rats appear to be thoroughly intoxicated with the *cocculus*, or sick with the *nux vomica*, they may be taken with the hand, and put into a bag or cage, the door of the place being first drawn to, lest those which have strength and sense remaining should escape. By these methods, when well conducted, a very considerable part of the rats in a farm, or other house, and the contiguous buildings, may be taken and destroyed. But various other methods have been practised.

In the Transactions of the Bath Agricultural Society, the following compositions are advised for destroying these mischievous creatures, and which are stated to have been attended with great success. First, to a quart of oatmeal, add six drops of oil of rhodium, one grain of musk, and two or three of the nuts of *nux vomica* finely powdered; make them into pellets, and put them into the rat-holes. This, it is said, was at first greedily eaten, and did great execution; but the wife animals, after a time, ceased to eat it. Secondly; this consisted of three parts of oatmeal and one of stave's-acre, mixed well into a paste with honey. Pieces of this paste were laid in their holes, and again did great execution. Thirdly; this is a method of destroying them by laying a large box down on its front side, with the lid supported open by a string over a pulley; and by trailing toasted cheese and a red-herring from their holes to this box, and placing oatmeal and other food in it, which they are for a few nights to be permitted to eat unmolested; and finally to watch them by moon-light, the inside of the box being painted white; and, when many of them are seen, to let down the lid; by which contrivance sixty of them are stated to have been taken at one time.

But though the usual ways of destroying rats are by traps and poison, Mr. Forbyth advises never to use arsenic, or corrosive sublimate, for that purpose, except under parti-

cular circumstances, as they are deadly poisons: *nux vomica* will, he thinks, generally answer the end as well, without the danger. He suggests it as a very good plan, to prevent accidents, to enclose the traps in cases, having holes in the ends of them large enough to admit rats, but small enough to exclude dogs, cats, &c. And that, as a bait for rat-traps, the following composition may be made use of with advantage. Take a pound of good flour, three ounces of treacle, and six drops of the oil of carraways: put them all in a dish; and rub them well together till they are properly mixed: then add a pound of crumb of bread. The traps baited with this mixture should be set as near their haunts as possible; but, for two or three days, so as not to fall or strike on the rats going in, but letting them have free liberty to go in and out at pleasure, as this makes them fearless. Some of the bait should also, he thinks, be laid at the rat-holes, and a little of it scattered quite up to the traps, and so on to the bridge of each trap, where a handful may be placed. It may also, he thinks, be proper to scent the traps with the following mixture, for the purpose of enticing the rats into them. Take twenty drops of the oil of rhodium, six or seven grains of musk, and half an ounce of oil of aniseed; put them in a small phial, and shake it well before using; then dip a piece of twisted paper or rag in the mixture, and rub each end of the trap with it, if a box trap, and put two or three drops on the bridge, leaving the paper or rag in the trap. Of whatever kind the trap is, it should be scented; but once in a twelvemonth will be sufficient. Then throw some chaff mixed with a little wheat about the bottom of the trap, in order to deceive the rats; for they are very sagacious, and will not enter a suspicious place. This will be necessary to be done only at the first time of setting the traps; for, after some rats have been caught and have watered and dunged in them, rats will enter boldly when they find others have been there before them: do not, therefore, wash or clean out the trap, as some people do before they set it again, but let the dung and urine remain in it. Keep the places where the traps are set as private as possible; and when they are set for catching, mix no bread with the bait, as the rats will, in that case be apt, to carry it away.

And it is useful, this writer remarks, when the holes are found quiet, and that no rats use them, to stop them up with the following composition. Take a pint of common tar, half an ounce of pearl-ashes, an ounce of oil of vitriol, and a good handful of common salt, mix them all well together in an old pan or pot. Take some pieces of paper, and lay some of the above mixture very thick on them; then stop the holes well up with them, and build up the mouth of the holes with brick or stone, and mortar; if this be properly done, rats will, he asserts, no more approach these while either smell or taste remains in the composition.

But with a view to destroy rats in places where traps cannot be set, it is recommended to take a quart of the above bait, then to rasp into it three nuts of *nux vomica*, and add a quarter of a pound of crumb of bread, if there was none before; mix them all well together, and lay it into the mouth of their holes, and in different places where they frequent; but first give them of the bait without *nux vomica*, for three or four succeeding nights; and when they find it agrees with them, they will eat that mixed with the nut with greediness.

However, as it is frequently found that rats are very troublesome in sewers and drains, in such cases arsenic may be used with success in the following manner. Take some dead rats, and having put some white arsenic, finely powdered, into an old pepper-box, shake a quantity of it

on the fore-parts of the dead rats, and put them down the holes, or avenues, by the sides of the sewers at which they come in; this puts a stop to the live ones coming any further: for when they perceive the arsenic, they will retire immediately; whereas, if they were put down without the arsenic, the live ones would eat them.

It is by means of arsenic, notwithstanding the above observations, that the most certain method of destroying these troublesome vermin, (provided they can be made to eat it,) takes place; which we have found to answer best, when it is prepared by being finely levigated, and mixed up with very strong old cheese and oatmeal.

In a note in the Agricultural Survey of Lancashire, it is stated, that it is greatly to be lamented that Mr. Heathcote's method of destroying rats and mice is not generally known and practised; if it were, there would be a total extirpation of those obnoxious and destructive animals; for in one night he totally destroys them (where he is employed), be they ever so numerous, as can be well attested by hundreds in the neighbourhood of Ormkirk, who have employed him. And it is added, that the composition he makes use of he puts in their holes and burrows, and from the small quantity he uses, it is astonishing it should have such an effect: it will keep good two years. It is also stated, that a farmer recommends, for the destruction of rats, one ounce of pounded quick-lime to four ounces of tallow cake, to be beaten together and made into balls, and placed in their runs, which has cleared many buildings. But it has been proved by experience, is said, that an ounce of aerated barytes finely powdered, mixed with the tallow, in place of lime, is more effectual. And it has been remarked by the author of Phytologia, with the view of destroying the water-rats, that they possess some kind of ingenuity similar to the beaver in the construction of their houses near the brinks of rivers and pools; which have two apertures, one above ground amongst the grass, and the other beneath the surface of the water; and unless they can hide their upper opening amid weeds, or grass, they forsoke the situation. Thus, if a rim, three or four feet in breadth, round a fish-pond be kept so low as to rise only two, three, or four inches above the level of the water; and if this be kept clean from high grass or weeds, the rats will desert the pond.

But after all, it is probable that this highly destructive animal, and great pest to the farmer, might be most readily exterminated by parishes uniting for the purpose, and raising certain sums of money to be applied in this way, under the direction of a proper person who is fully acquainted with the business.

In many grain and other districts in the kingdom these animals prevail very much, especially the grey kind, particularly in all those where there are no regular raised staddles or stands for the grain stacks to rest upon, which is the case in a great number. The mischief, injury, and destruction of grain which is produced in this way, is scarcely to be calculated; and they are besides very mischievous, troublesome, and inconvenient in several others; so that they should be every where extirpated as much as possible. And in corn tracts, stands or staddles should every where be provided in order to prevent mischief being done by them. See VERMIN, and STAND, Corn.

RAT, *Beaver*. See MUS *Coypus*.

RAT, *Black*. See MUS *Rattus*.

RAT, *Blind*. See MUS *Typhlus*.

RAT, *Field*. See MUS *Silvaticus*.

RAT, *Mole*. See MUS.

RAT, *Mountain*. See MARMOT *Talpinus*, &c.

RAT, *Musk*. See MUS *Zibethicus*.

RAT, *Norway* or *brown*, *mus Norwegicus*, (*Mus decumanus*) is a rat whose head, back, and sides are of a light brown colour, mixed with tawny and ash-colour; the breast and belly are of a dirty white; the feet naked, and of a dirty flesh-colour; the fore-feet are furnished with four toes, and a claw instead of the fifth: the length from the nose to the tail is nine inches, and the tail is of the same length. This animal is more strongly made than the common black rat, or *mus rattus*.

This species of rat, which is the same animal that is called in the East Indies a *bondicote*, now inhabits most parts of Europe; whither it is supposed to have been brought within the last century, in some of the India ships. It came into Great Britain about 70 or 80 years ago, but has not been known in the neighbourhood of Paris above half that time. They swarm in Petersburg, and are known in Prussia; but have not yet reached the opposite side of the Baltic, as Linnaeus takes no notice of this species. These were probably the *mures Caspii* of Ælian, which made periodical visits in great multitudes to the countries bordering on the Caspian sea, swimming boldly over the rivers, holding by one another's tail. (Ælian. Hist. An. 17. cap. 17.) They burrow, like the water rat, on the sides of ponds and ditches; swim and dive well; live on grain and fruits, but will destroy poultry and game; increase fast, producing from fourteen to eighteen young at a time; are very bold and fierce; will turn, when closely pursued, and fasten on the stick or hand that offers to strike them: they have destroyed the common black rat in most places: they inhabit the fields part of the year, but migrate in great numbers into houses, and do much mischief. The bite of these rats is not only severe but dangerous; the wound being immediately attended with a great swelling, and healing very slowly. Pennant. See MUS *Decumanus*.

RAT, *Norway*, is also a name given by some writers to the lemming, or sable moufe. See MUS *Lemmus*, and SABLE MOUSE.

RAT, *Water*. See MUS *Amphibius*.

RAT, in the *Sea Language*, is used to express a part of the sea, where there are rapid and dangerous currents, or counter-currents.

RAT-*Goose*, in *Ornithology*, the name of a small species of wild goose, common in some of the northern counties of England.

RAT-*Tails*, in the *Manege*. See ARRETS.

RAT-*Tailed*. A horse is thus called that has no hair upon his tail.

RAT-*Tailed Worms*, in *Natural History*, a species of fly-worms with long tails, resembling those of rats, whence they have their name. They are of several sizes, and found also in different places, but all change into two-winged flies, having very much the resemblance of bees, and commonly called *bee-flies*. See DRONE-*Fly*.

RAT, *Cape*, in *Geography*, a cape of Africa, in the Red sea. N. lat. 14° 55'.

RAT *Island*, a small island in Milford Haven.—Also, an island in the Red sea. N. lat. 14° 55'.—Also, a small island in the East Indian sea, near the W. coast of Sumatra. S. lat. 3° 57'. E. long. 101° 55'.—Also, a small island in the Mergui Archipelago, S.W. of Olive island.

RATA *pro* RATA. See PRO *rata*.

Onerando pro Rata *portionis*. See ONERANDO.

RATAFIA, a fine spirituous liquor, prepared from the kernels, &c. of several kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruising the cherries, and putting them into a vessel in which brandy has been long kept;

kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmegs, cloves; and to twenty pounds of cherries, ten quarts of brandy. The vessel is left open ten or twelve days, and then stopp'd close for two months before it be tapp'd.

Ratafia of apricots is prepared two ways; *viz.* either by boiling the apricots in white wine, adding to the liquor an equal quantity of brandy, with sugar, cinnamon, mace, and the kernels of apricots; infusing the whole for eight or ten days; then straining the liquor, and putting it up for use: or else by infusing the apricots, cut in pieces, in brandy, for a day or two; passing it through a straining-bag, and then putting in the usual ingredients.

RATAN, in *Geography*, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 58'. E. long 20° 39'.

RATCH, or RASH, in *Clock Work*, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, to make the clock strike.

RATCHETS, in a *Watch*, are the small teeth at the bottom of the fusee, or barrel, which stop it in winding up.

RATCHIN LORA, in *Geography*, a large lake of Thibet. N. lat. 30° 43'. E. long. 82° 27'.

RATCLIFF, a town of America, in Maryland; 22 miles S. of Salisbury.

RATE, a standard or proportion, by which either the quantity or value of a thing is adjust'd.

The rates of bread, &c. in London, are fixed by authority. See *Affise of BREAD*.

The rate of interest, as now established by law in England, is five *per cent.* The rate of interest in Italy, is three *per cent.*; in Sweden, six; in France, five; in Spain, ten; in Barbadoes, ten; in Ireland, twelve; in Turkey, twenty. Low rates of interest advance the prices of land.

The rates or fares of hackney-coachmen, chairmen, and watermen, are fixed by act of parliament. See *Hackney COACHES*, &c.

The rates of exchange, factorship, &c. are different. See *EXCHANGE*, *FACTORAGE*, &c.

RATE of a *Ship of War*, is its order, degree, or distinction, as to magnitude, burden, force, &c.

The British fleet is accordingly distributed into six rates, exclusive of the inferior vessels that usually attend on naval armaments; as sloops of war, armed ships, bomb-ketches, fire-ships, and cutters or schooners, commanded by lieutenants.

Ships of the *first* rate mount a hundred cannon, and some more, having forty-two-pounders on the lower deck, twenty-four-pounders on the middle deck, twelve-pounders on the upper deck, and six-pounders on the quarter-deck and fore-castle. They are manned with eight hundred and fifty men, including their officers, seamen, marines, and servants.

In general, the ships of every rate, besides the captain, have the master, the boatswain, the gunner, the chaplain, the purser, the surgeon, and the carpenter; all of whom, except the chaplain, have their mates or assistants, in which are comprehended the sail-maker, the master at arms, the armourer, the captain's clerk, the gunsmith, &c. The number of other officers is always in proportion to the rate of the ship. Thus, a first rate has six lieutenants, six master's mates, twenty-four midshipmen, and five surgeon's mates, who are considered as gentlemen; besides the following petty officers: quarter-masters, and their mates, fourteen; boatswain's mates, and yeomen, eight; gunner's mates and assistants, six; quarter-gunners, twenty-five; carpenter's mates, two, besides fourteen assistants; with one steward, and steward's mate to the purser.

Ships of the *second* rate carry ninety-eight and ninety

guns upon three decks; of which those on the lower battery are thirty-two-pounders; those on the middle, eighteen-pounders; on the upper deck, twelve-pounders; and those on the quarter-deck, six-pounders, which usually amount to four or six. Their complement of men is seven hundred and fifty, in which there are six lieutenants, four master's mates, twenty-four midshipmen, and four surgeon's mates, fourteen quarter-masters and their mates, eight boatswain's mates and yeomen, six gunner's mates and yeomen, with twenty-two quarter-gunners, two carpenter's mates, with ten assistants, and one steward and steward's mate.

Ships of the *third* rate carry from sixty-four to eighty cannon, which are thirty-two, eighteen, and nine-pounders. The eighty-gun ships, however, begin to lose their repute, and give way to those of seventy-four, seventy, &c. which have only two whole batteries; whereas the former have three, with twenty-eight guns planted on each; the cannon of their upper deck being the same as those on the quarter-deck and fore-castle of the latter, which are nine-pounders. The complement in a seventy-four is six hundred and fifty; and in a sixty-four, five hundred men: having in peace, four lieutenants, but in war, five, and when an admiral is aboard, six. They have three master's mates, sixteen midshipmen, three surgeon's mates, ten quarter-masters and their mates, six boatswain's mates and yeomen, four gunner's mates and yeomen, with eighteen quarter-gunners, one carpenter's mate with eight assistants, and one steward and steward's mate under the purser.

Ships of the *fourth* rate mount from sixty to fifty guns, upon two decks and the quarter-deck. The lower tier is composed of twenty-four-pounders; the upper tier, of twelve-pounders; and the cannon on the quarter-deck and fore-castle are six-pounders. The complement of a fifty-gun ship is three hundred and fifty men, in which there are three lieutenants, two master's mates, ten midshipmen, two surgeon's mates, eight quarter-masters and their mates, four boatswain's mates and yeomen, one gunner's mate and one yeoman, with twelve quarter-gunners, one carpenter's mate and six assistants, and a steward and steward's mate.

All vessels of war under the fourth rate, are usually comprehended under the general name of frigates, and never appear in the line of battle. They are divided into the *fifth* and *sixth* rates, the former mounting from forty to thirty-two guns, and the latter from twenty-eight to twenty. The largest of the fifth rate have two decks of cannon, the lower battery being of eighteen-pounders, and that of the upper deck of nine-pounders; but those of thirty-six and thirty-two guns have only one complete deck of guns, mounting twelve-pounders, besides the quarter-deck and fore-castle, which carry six-pounders. The complement of a ship of forty-four guns is two hundred and eighty men; that of a frigate of thirty-six guns, two hundred and forty men. The first has three, and the second two lieutenants; and both have two master's mates, six midshipmen, two surgeon's mates, six quarter-masters and their mates, two boatswain's mates and one yeoman, one gunner's mate and one yeoman, with ten or eleven quarter-gunners, and one purser's steward.

Frigates of the sixth rate carry nine-pounders; those of twenty-eight guns having three-pounders on their quarter-deck, with two hundred men for their complement; and those of twenty-four, one hundred and sixty men: the former has two lieutenants; the latter, one; and both have two master's mates, four midshipmen, one surgeon's mate, four quarter-masters and their mates, one boatswain's mate and one yeoman, one gunner's mate and one yeoman, with six or seven quarter-gunners, and one purser's steward.

The sloops of war carry from eighteen to eight cannon: the largest of which have six-pounders; and the smallest, viz. those of eight or ten guns, four-pounders. Their officers are generally the same as in the sixth rates, with little variation; and their complements of men are from one hundred and twenty to sixty, in proportion to their force or magnitude.

Bomb-vessels are on the same establishment as sloops; but fire-ships and hospital-ships are on that of fifth rates. If the dimensions of all ships of the same rate were equal, it would be easy to collect them into one point of view in a table; but as there is no invariable rule for the general dimensions, we shall select those of some of a late construction in each rate.

Rates.		Guns.	Length of the keel.		Length of the lower deck.		Extreme breadth.		Depth in the hold.		Burthen in tons.
			Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.

Sloop	Nautilus	16	80	7 ⁵ / ₈	98	0	27	2	12	8	316

Ships of one hundred guns, and above, and downwards to sixty-four, are termed ships of the line.

Ships of the line, frigates, and royal yachts, are commanded by post-captains; sloops of war, bombs, fire-ships, armed ships, store-ships, and armed *en flûte*, under fifty guns, by commanders; schooners, cutters, &c. by lieutenants; sloop-ships occasionally by masters; and small craft by midshipmen, who have passed for lieutenants.

Ships of the second rate, and those of the third, which have three decks, carry their sails remarkably well, and labour very little at sea. They are excellent in a general action, or in cannonading a fortress. Those of the third rate, which have two tiers, are fit for the line of battle, to lead the convoys and squadrons of ships of war in action; and, in general, to suit the different exigencies of the naval service. The fourth rates may be employed on the same occasions as the third rates; and may be also destined for service among the foreign colonies, or on expeditions of great distance; since these vessels are usually excellent for keeping and sustaining the sea. Vessels of the fifth rate are too weak to suffer the shock of a line of battle; but they may be destined to lead the convoys of merchant ships, to protect the commerce in the colonies, to cruise in different stations, to accompany squadrons, or be sent express with necessary intelligence and orders. The same may be observed of the sixth rates.

The frigates which mount from twenty-eight to thirty-eight guns upon one deck, with the quarter-deck, are extremely proper for cruising against privateers, or for short expeditions, being light, long, and usually excellent sailers. Falconer.

RATES, *Books of*. See BOOK and CUSTOMS.

RATE, *Poor*. See POOR.

RATE-TYBE. When sheep, or other cattle, are kept in a parish for less time than a year, the owner must pay

tythe for them *pro rata*, according to the custom of the place.

RATE, in *Geography*, a town of Hindoostan, in Mysore; 25 miles E. of Rattighery.

RATEEN, or RATTEN, in *Commerce*, a thick woollen stuff, quilled, woven on a loom with four treddles, like ferges, and other stuffs that have the whale or quilling.

There are some rateens dressed and prepared like cloths; others left simply in the hair; and others where the hair, or knap, is frized.

Rateens are chiefly manufactured in France, Holland, and Italy; and mostly used in linings.

The frize is a sort of coarse rateen; and the drugget is a rateen half linen, half woollen.

RATEL, in *Zoology*, a name given by the Hottentots to an animal inhabiting the Cape of Good Hope, which lives on honey, and is a great enemy to bees: hence called the *VIVERRA Mellivora*: which see. It has a blunt black nose; no external ears, but a small rim round the orifice; a rough tongue, short legs, very long claws, which are straight like those of a badger, and guttered beneath: the colour of the forehead, crown, and whole upper part of the body, is a cinereous grey; the cheeks, and space round the ears, throat, breast, belly, and limbs, black; from each ear to the tail extends along the sides a dusky line, leaving beneath another of grey. Its length from the nose to the tail is forty inches, and the tail twelve.

This animal preys in the evening, and ascends to the highest parts of the desert to look about; and will then put one foot before its eyes, to prevent the dazzling of the sun. The reason of its going to an eminence is for the sake of seeing or hearing the honey-guide cuckoo, or cuculus indicator, which lives on bees, and, as it were, conducts it to their haunts. Pennant.

RATENSTADT, in *Geography*, a town of Hungary; 16 miles S.E. of Baes.

RATESPONTE *de Mulher*, a town of Portugal, in the province of Entre Duero e Minho; 15 miles N.E. of Villa de Conde.

RATH, a word used in the composition of names of places in Ireland, as Rathdrum, &c. It signifies an intrenchment, or fort.

RATH, *ripe*, in *Agriculture*, a term applied to some early ripe corn crops, and which have a degree of redness in the straw; such as some varieties of barley, &c.

RATHANGAN, in *Geography*, a post-town of the county of Kildare, Ireland, situated on the Athy branch of the Grand Canal; 28¹/₂ miles W. from Dublin, and 5 miles N.N.W. from Kildare.

RATHCONRATH, a small town of the county of Westmeath, Ireland, which gives name to a barony. It is 44 miles N. by W. from Dublin, on the road to Laneshorough, and 6 miles W. from Mullingar.

RATHCOOLE, a small post-town of the county of Dublin, Ireland, where fairs are holden for cattle and pedlars' wares. It is on the great southern road, 7³/₄ miles S.W. from Dublin.

RATHCORMUCK, a post-town of the county of Cork, Ireland, which returned two members to the Irish parliament, before the union. It has gone much to decay, in consequence of the prosperity of Fermoy, which is little more than three miles distant. It is near the river Bride, 111 miles S.W. from Dublin, and 13¹/₂ N.E. from Cork.

RATHDOWNY, a post-town of the Queen's county, Ireland; 59 miles S.W. from Dublin.

RATHDRUM, a post-town of the county of Wicklow, Ireland, situated on the river Ovoca. It has a monthly fair

fair for flannels, of which there is a considerable manufacture. The adjoining country is very interesting, and the Wicklow copper-mines are not far distant. Rathdrum is 29 miles S. from Dublin.

RATHENAU, or RATEMAO, a town of the middle mark of Brandenburg, on the Havel; 38 miles W. of Berlin. N. lat. $52^{\circ} 38'$. E. long. $12^{\circ} 30'$.

RATHER, or NEITHER, a river of England, which runs into the Lune, four miles N. of Kirkby Lonsdale, in the county of Westmoreland.

RATHERIUS, in *Biography*, a very learned prelate in the tenth century, commenced his ecclesiastical career by embracing a monastic life at the abbey of Lobbes, or Laubes, in Flanders. Here he distinguished himself by his abilities and acquirements. In the year 928, after Hilduin had been driven out of the see of Liege, he accompanied him into Italy; and in 931 he was, by the express order of the pope, put in possession of the see of Verona. As, however; this was in direct hostility to the king of the country, he was exposed to much persecution, and at length banished from Italy. After spending five years in exile, he returned with the hope of regaining his bishopric: but he was unsuccessful, and was ordered to withdraw. He obeyed, and retired into Provence: from this place he went to the abbey of Lobbes, where the recollection of the honour, which he had formerly reflected on that establishment, secured him a welcome reception. Shortly after this, he was sent for by the emperor Otho, who placed him near the person of his brother Bruno. This prince, having been made archbishop of Cologne in the year 953, presented Ratherius to the bishopric of Liege; from which, however, he was driven in about two years. As the emperor Otho was at this time in Italy, our prelate made an effort to recover his former see of Verona. Accordingly he laid his case before a synod assembled at Pavia, which passed a decree that he should be re-established in that bishopric. His peace was soon interrupted by controversies with the clergy, who could not endure his reproofs of their irregularities and corruptions; till at length they became so irksome to him, that he determined to take his final leave of Italy. He accordingly went to France, where he purchased some estates, and obtained the abbies of St. Amand, Aumont, and of Aunay. He died at Namur, about the year 973. His works are numerous, some of which are inserted in father d'Achery's "Spicilegium." They are said to afford evident proofs of great sagacity and judgment, while they breathe throughout an ardent love of virtue. They also shew, that he was most zealous and intrepid in exposing the irregularities and vices of the times, and particularly the corrupt morals of ecclesiastics. Moreri. Moheim.

RATHFRILAND, in *Geography*, a post-town of the county of Down, Ireland. It is situated on a rising ground, and has four great straight roads leading up to it, and centering in the town. It is on the road to Downpatrick, and much frequented. The neighbourhood abounds with granite of a close texture, and fit for building. On the summit of the hill are the ruins of a castle, formerly one of the residences of the Magennis, lords Iveagh. Rathfriland is $57\frac{1}{2}$ miles N. from Dublin, and $7\frac{1}{2}$ miles N.E. from Newry.

RATHKEALE, a post-town of Ireland, in the county of Limerick. It is situated on the river Deel, and was formerly a corporation town, and of much more consequence than at present. It has several fairs, one of which for horses is much frequented, as are also its races. In the reign of queen Elizabeth, it sustained an attack of the English army. The ruins of a priory, founded by a person of

the name of Harvey, are still remaining. Rathkeale is 108 miles S.W. from Dublin, and 14 miles W.S.W. from Limerick.

RATHLACKEN, a post-town of the county of Mayo, Ireland, on the sea-coast, nor far from Rathlacken or Relakin head, and west of the entrance to Killala bay. It is 132 miles W.N.W. from Dublin, and 5 miles N. from Killala.

RATHLIN, RAGHLIN, or *Ragbery*, an island situated between the north coast of Antrim, in Ireland, and Scotland, and considered as belonging to the former. It is about five miles in length, and three quarters of a mile in breadth, being bent in an angle towards the middle. This angle lies opposite to Ballycastle, and forms a tolerable bay, called Church bay; but in a westerly wind, though the anchorage is good, few vessels can ride it out, from the swell along the coast. The number of plantation acres is about 2000, which support a population of about 130 or 140 families, amounting to about 1100 persons. The cultivated land is kindly enough, and produces excellent barley. But kelp is the great source of wealth to this island, 100 tons of which have been exported from it in one year. The horses, as well as the sheep, are small, but serviceable; and the black cattle are not large, though they do well when brought to the main land, and better soil. The inhabitants are a simple, laborious, and honest race of people, much attached to their own island, and regarding Ireland as a foreign country. The monuments of antiquity are small tumuli, in one of which, when opened, a stone coffin was found, beside which an earthen vessel stood. Within the tumuli lay a considerable number of human bones, which might have been the remains of more ignoble men than the person whose remains the coffin covered. Brazen swords and spear-heads have also been found. The remains of a fortress are visible, where Robert Bruce is said to have defended himself for some time, when obliged to fly from his country. N. lat. $55^{\circ} 20'$. W. long. $6^{\circ} 6'$.

RATHMANSDORF, a town of Silesia, in the principality of Neufs; 4 miles N.N.W. of Weidenau.

RATHOWEN, a post-town of the county of Westmeath, Ireland, near the borders of Longford; 48 miles W.N.W. from Dublin.

RATHSCHACH, or RADESCHÉ, a town of the duchy of Carniola, on the Save; 9 miles W.N.W. of Gurckfeld.

RATHSPRÆSENTGERS, in *Commerce*, silver coins of Aix-la-Chapelle, being double, single, or half pieces of 22, 16, and 8 marks. By the assay, the rathspræsentger is worse than the English standard of 11 oz. 2 dwts., by 4 oz. 2 dwts. Its weight is 4 dwts. $1\frac{1}{2}$ gr.; its content in pure silver 56.9 grs.; and its value in sterling 8d. The double of the same is worse by 2 oz. 15 dwts.; its weight 6 dwts. $23\frac{1}{2}$ grs.; its content in pure silver 116.3 grs.; and its value in sterling 1s. $4\frac{1}{4}$ d. This coin bears on one side an eagle within a circle, marked 16 on his breast, (32 on the double piece,) and within another circle the legend, REGUM CURIA PRINCIPALIS PRIMA; and next the edge, URBS AQUENSIS. URBS REGALIS. REGNI SEDES: on the other side, or reverse, an altar, with two swords and a crown over it, on the double piece; but on the single, a crown and the date within a circle: the legend on both is LOCUS CÆSARÆ CORONATIONIS; Cæsar being a general title for the emperor. Kelly's Un. Cambii.

RATI, in *Geography*, a small island in the Grecian Archipelago, near the S. coast of Nicaria.

RATIBOR, a town of Silesia, in a principality of its name, on the Oder, which here becomes navigable; 70 miles

miles S.E. of Breslau. N. lat. 50° . E. long. $18^{\circ} 5'$. The principality is bounded N. by the principality of Oppeln, on the E. by Poland, on the S. by Tefchen, and on the W. by the principality of Jagendorf. Its soil is better than that of Oppeln, as it produces a sufficient supply of wheat, rye, and barley, with fruits; and besides, it has also good pasture grounds. Its only river is the Oder, which passes through its western part; but it is abundantly watered in all its parts with streams, ponds, and lakes. It contains only three cities, and the inhabitants are universally Polish. It became a principality in 1288, and about 200 years afterward it was united to Oppeln, from which it has never been separated.

RATIFICATION, RATIFICATIO, an act, approving of, and confirming, something done by another, in our name.

A treaty of peace is never secure till the princes have ratified it.

All procuration imports a promise of ratifying and approving what is done by the proxy, or procurator: after treating with a procurator, agent, factor, &c. a ratification is frequently necessary on the part of his principal.

RATIFICATION is particularly used, in our *Laws*, for the confirmation of a clerk in a benefice, prebend, &c. formerly given him by the bishop, &c. where the right of patronage is doubted to be in the king.

RATIFICATION is also used for an act confirming something we ourselves have done in our own name.

An execution, by a major, of an act passed in his minority, is equivalent to a ratification.

RATING. See **RAITING**.

RATINGEN, or RATTINGEN, in *Geography*, a town of the duchy of Berg; 4 miles N.E. of Duffeldorp. N. lat. $51^{\circ} 15'$. E. long. $6^{\circ} 47'$.

RATINO, a town of Naples, in the county of Molise; 6 miles S.E. of Molise.

RATIO, in *Arithmetic* and *Geometry*, that relation of homogeneous things, which determines the quantity of one from the quantity of another, without the intervention of any third.

The homogeneous things, thus compared, we call *the terms of the ratio*; particularly that referred to the other, we call the *antecedent*; and that to which the other is referred, the *consequent*.

Thus, when we consider one quantity by comparing it with another, to see what magnitude it has in comparison of that other; the magnitude this quantity is found to have in comparison with it, is called the *ratio* of this quantity to that: which some think would be better expressed by the word *comparifon*.

Euclid defines ratio by a mutual relation of two magnitudes of the same kind in respect of quantity. But this definition is found defective; there being other relations of magnitudes which are constant, yet are not included in the number of ratios: such as that of the right line, to the sine of the complement in trigonometry.

Hobbes endeavoured to improve Euclid's definition of ratio, but without success: for in defining it, as he does, by the relation of magnitude to magnitude, his definition has not only the same defect with Euclid's, in not determining the particular kind of relation; but it has this farther, that it does not express the kind of magnitudes which may have a ratio to one another.

Ratio is frequently confounded, though very improperly, with *proportion*. Proportion, in effect, is an identity or similitude of two ratios.

Thus, if the quantity A be triple the quantity B; the re-

lation of A to B, *i. e.* of 3 to 1, is called the ratio of A to B. If two other quantities, C, D, have the same ratio to one another that A and B have, *i. e.* be triple one another, this equality of ratio constitutes *proportion*; and the four quantities $A : B :: C : D$, are in proportion, or proportional to one another.

So that ratio exists between two terms; proportion requires more.

There is a twofold comparison of numbers: by the first, we find how much they differ, *i. e.* by how many units the antecedent exceeds, or comes short of, the consequent.

This difference is called the *arithmetical* ratio, or exponent of the arithmetical relation or habitude of the two numbers. Thus, if 5 and 7 be compared, their arithmetical ratio is 2.

By the second comparison, we find how oft the antecedent contains, or is contained in, the consequent; *i. e.* as before, what part of the greater is equal to the less.

This ratio, being common to all quantity, may be called ratio in the general, or by way of eminence: but is usually called *geometrical* ratio; because expressed, in geometry, by a line, though it cannot be expressed by any number.

Modern authors distinguish ratio, with regard to quantity in the general, into *rational* and *irrational*.

RATIO, Rational, is that which is as one rational number to another; *e. gr.* as 3 to 4.

RATIO, Irrational, is that which cannot be expressed by rational numbers.

Suppose, for an illustration, two quantities, A and B; and let A be less than B. If A be subtracted as often as it can be from B, *e. gr.* five times, there will either be left nothing, or something. In the former case, A will be to B, as 1 to 5; that is, A is contained in B five times; or $A = \frac{1}{5} B$. The ratio here, therefore, is *rational*.

In the latter case, either there is some part, which, being subtracted certain times from A, *e. gr.* 3 times, and likewise from B, *e. gr.* 7 times, leaves nothing; or there is no such part: if the former, A will be to B as 3 to 7, or $A = \frac{3}{7} B$; and therefore the ratio, *rational*. If the latter, the ratio of A to B, *i. e.* what part A is of B, cannot be expressed by rational numbers; nor any other way than either by lines, or by infinite approaching series.

The *exponent of a geometrical ratio* is the quotient arising from the division of the antecedent by the consequent. Thus, the exponent of the ratio of 3 to 2, is $1\frac{1}{2}$; that of the ratio of 2 to 3, is $\frac{2}{3}$: for when the less term is the antecedent, the ratio, or rather the exponent, is a proper fraction. Hence the fraction $\frac{3}{4} = 3 \div 4$. If the consequent be unity, the antecedent itself is the exponent of the ratio: thus, the exponent of 4 to 1, is 4. See **EXPONENT**.

If two quantities be compared, without the intervention of a third; either the one is equal to the other, or unequal: hence, the ratio is either of *equality* or *inequality*. If the terms of the ratio be unequal, either the less is referred to the greater, or the greater to the less: that is, either the less to the greater, as a part to the whole, or the greater to the less, as the whole to a part. The ratio, therefore, determines how often the less is contained in the greater, or how often the greater contains the less; *i. e.* to what part of the greater the less is equal.

The following distinctions of ratios are sometimes found in early authors.

The ratio which the greater term has to the less, *e. gr.* 6 to 3, is called the *ratio of the greater inequality*: the ratio which the less term has to the greater, *e. gr.* 3 to 6, is called the *ratio of the lesser inequality*.

This ratio corresponds to quantity in the general, or is admitted

RATIO.

admitted of by all kinds of quantities, discrete or continued, commensurable or incommensurable: but discrete quantity, or number, does likewise admit of another ratio.

If the less term of a ratio be an aliquot part of the greater, the ratio of the greater inequality is said to be *multiplex*, multiple; and the ratio of the less inequality, *submultiple*.

Particularly, in the first case, if the exponent be 2, the ratio is called *duple*; if 3, *triple*, &c. In the second case, if the exponent be $\frac{1}{2}$, the ratio is called *subduple*; if $\frac{1}{3}$, *subtriple*, &c.

E. gr. 6 to 2 is in a triple ratio; because 6 contains two thrice. On the contrary, 2 to 6 is a subtriple ratio; because 2 is the third part of 6.

If the greater term contains the less once, and over and above an aliquot part of the same; the ratio of the greater inequality is called *superparticularis*, and the ratio of the less *sub-superparticularis*.

Particularly, in the first case, if the exponent be $1\frac{1}{2}$, it is called *sesquialterate*; if $3\frac{1}{2}$, *sesquitercial*, &c. In the other, if the exponent be $\frac{2}{3}$, the ratio is called *subsesquialterate*; if $\frac{2}{4}$, *subsesquitercial*, &c.

E. gr. 3 to 2 is in a sesquialterate ratio; 2 to 3 in a subsesquialterate.

If the greater term contains the less once, and over and above several aliquot parts; the ratio of the greater inequality is called *superpartiens*; that of the less inequality is *sub-superpartiens*.

Particularly, in the former case, if the exponent be $1\frac{2}{3}$, the ratio is called *superbipartiens tertias*; if the exponent be $1\frac{3}{4}$, *supertripartiens quartas*; if $1\frac{4}{5}$, *superquadripartiens septimas*, &c. In the latter case, if the exponent be $\frac{2}{3}$, the ratio is called *subsuperbipartiens tertias*; if $\frac{2}{4}$, *subsupertripartiens quartas*; if $\frac{2}{5}$, *subsuperquadripartiens septimas*.

E. gr. the ratio of 5 to 3 is *superbipartiens tertias*; that of 3 to 5, *subsuperbipartiens tertias*.

If the greater term contains the less several times, and besides, some quota part of the same; the ratio of the greater inequality is called *multiplex superparticularis*; and the ratio of the less inequality, *submultiplex subsuperparticularis*.

Particularly, in the former case, if the exponent be $2\frac{1}{2}$, the ratio is called *dupla sesquialtera*; if $3\frac{1}{2}$, *tripla sesquiquarta*, &c. In the latter case, if the exponent be $\frac{2}{3}$, the ratio is called *subdupla subsesquialtera*; if $\frac{2}{4}$, *subtripla subsesquiquarta*, &c.

E. gr. the ratio of 16 to 5 is *tripla sesquiquinta*; that of 4 to 9, *subdupla subsesquiquarta*.

Lastly, if the greater term contains the less several times, and several aliquot parts of it besides; the ratio of the greater inequality is called *multiplex superpartiens*; that of the less inequality, *submultiplex subsuperpartiens*.

Particularly, in the former case, if the exponent be $\frac{5}{3}$, the ratio is called *dupla superbipartiens tertias*; if $3\frac{2}{3}$, *tripla superbiquadripartiens septimas*, &c. In the latter case, if the exponent be $\frac{2}{3}$, the ratio is called *subdupla subsuperbipartiens tertias*; if $\frac{2}{4}$, *subtripla subsuperquadripartiens septimas*, &c.

E. gr. the ratio of 25 to 7 is *tripla superquadripartiens septimas*; that of 3 to 8, *subdupla subsuperbipartiens tertias*.

These are the various kinds of *rational* ratios; the names of which, though they occur but rarely among the modern writers (for in lieu of them they use the smallest terms of the ratios, *e. gr.* for *duple* 2 : 1, for *sesquialterate* 3 : 2); yet are they absolutely necessary to such as converse with the ancient authors.

Clavius observes, that the exponents denominate the ratios of the greater inequality, both in deed and name; but

the ratios of the less inequality, only in deed, not in name; but it is easy finding the name in these, if you divide the denominator of the exponent by the numerator.

E. gr. if the exponent be $\frac{5}{8}$, then $5 : 8 = 1\frac{1}{8}$; whence it appears, the ratio is called *subsupertripartiens quintas*. As to the names of irrational ratios, nobody ever attempted them.

Same, or *identic* ratios, are those whose antecedents have an equal respect to their consequents, *i. e.* whose antecedents divided by their consequents, give equal exponents. And hence may the identity of irrational ratios be conceived.

Hence, first, as oft as the antecedent of one ratio contains its consequent, or whatever part it contains of its consequent, so oft, or such part of the other consequent does the antecedent of the other ratio contain: or, as oft as the antecedent of the one is contained in its consequent, so oft is the antecedent of the other contained in its consequent.

Secondly, if A be to B as C to D; then will A : B :: C : D; or A : B = C : D. The former of which is the usual manner of representing the identity of ratios, the latter is that of the excellent Wolfius; which has the advantage of the former, in that the middle character, =, which denotes the sameness, is scientific; *i. e.* it expresses the relation of the thing represented, which the other, ::, does not. See CHARACTER.

Two equal ratios, *e. gr.* B : C = D : E, we have already observed, constitute a proportion: of two unequal ratios, *e. gr.* A : B and C : D, we call A : B the *greater*, if A : B > C : D; on the contrary, we call C : D the *lesser*, if C : D > A : B.

Hence, we express a greater and less ratio thus: *e. gr.* 6 to 3 has a greater ratio than 5 to 4; for, $6 : 3 (= 2) > 5 : 4 (= 1\frac{1}{4})$. But 3 to 6 has a less ratio than 4 to 5; for $\frac{3}{6} = \frac{1}{2} > \frac{4}{5}$. Compound ratio is that made up of two or more other ratios, which the factum of the antecedents of two or more ratios has to the factum of their consequents. Thus, 6 to 72 is in a ratio compounded of 2 to 6, and 3 to 12.

Particularly if it be compounded of two, it is called a *duplicate* ratio; if of three, a *triplicate*; if of four, *quadruplicate*; and, in the general, *multiplicate*, if it be composed of several similar ratios. Thus 48 : 3 is a duplicate ratio of 4 : 1 and 12 : 3.

RATIO, *Additive*. See ADDITIVE.

RATIO, *Alternate*. See ALTERNATE.

RATIO, *Ordinate*. See ORDINATE.

RATIO *Modularis* and *Modulus*, were terms introduced into use by Cotes, but more modern authors do not use them always in the same sense: according to Cotes, the modulus in logarithms is that number which connects any system of logarithms with the hyperbolic system, or that number by which the hyperbolic number of a logarithm must be multiplied, or by the reciprocal of which it must be divided, in order to transform it to another system; and this modulus is, therefore, always the reciprocal of the hyperbolic logarithm of the radix of that system to which the modulus belongs.

This is what Cotes calls the modulus, to whom we owe the introduction of the term; and the reciprocal of it he calls the *ratio modularis*: but some modern authors, as Lagrange, &c. use the term modulus to denote the ratio modularis of Cotes.

The modulus of the hyperbolic system is 1, this being the reciprocal of the hyperbolic logarithm of 2.71828182, the radix of this system; and the modulus of the common logarithmic

logarithmic system is .43429448, which is the reciprocal of 2.3025809, the hyperbolic logarithm of 10, the radix of this system.

It is shewn under the article LOGARITHMS, that

$$\log. a = \frac{(a - 1) - \frac{1}{2}(a - 1)^2 + \frac{1}{3}(a - 1)^3, \&c.}{(r - 1) - \frac{1}{2}(r - 1)^2 + \frac{1}{3}(r - 1)^3, \&c.}$$

where r is the radix, and may be assumed at pleasure, and the reciprocal of this whole denominator is called the modulus. In the hyperbolic system the whole denominator is assumed 1, which makes $r = 2.71828182$; and in the common system r is assumed 10, and the whole series becomes $= 2.3025809$, which is the reciprocal of the modulus; and since, in the former case, we have

$$\text{hyp. log. } a = (a - 1) - \frac{1}{2}(a - 1)^2 + \frac{1}{3}(a - 1)^3, \&c.$$

it follows also that in any other

$$\text{hyp. log. } r = (r - 1) - \frac{1}{2}(r - 1)^2 + \frac{1}{3}(r - 1)^3, \&c.$$

whatever be the value of r ; therefore, in every system, the modulus is the reciprocal of hyp. log. of the radix. See LOGARITHMS.

RATIO, *Denominator of a.* See DENOMINATOR.

RATIO, *Properties of.*—1. Ratios similar to the same third are also similar to one another; and those similar to similar, are also similar to one another.

2. If $A : B :: C : D$; then, inversely, $B : A :: D : C$.

3. Similar parts P and p have the same ratio to the wholes T and t ; and if the wholes have the same ratio, the parts are similar.

4. If $A : B :: C : D$; then, alternately, $A : C :: B : D$. And hence, if $B = D$, $A = C$; hence, also, if $A : B :: C : D$; and $A : F :: C : G$; we shall have $B : F :: D : G$. Hence, again, if $A : B :: C : D$; and $F : A :: G : C$; we shall have $F : B :: G : D$.

5. Those things which have the same ratio to the same, or equal things, are equal; and *vice versa*.

6. If you multiply any quantities, as A and B , by the same, or equal quantities; their products D and E will be to each other as A and B .

7. If you divide any quantities, as A and B , by the same or equal quantities, the quotients F and G will be to each other as A and B .

8. The exponent of a compound ratio is equal to the factum of the exponents of the simple ratios.

9. If you divide either the antecedents or the consequents of similar ratios, $A : B$, and $C : D$, by the same E ; in the former case, the quotients F and G will have the same ratio to the consequents B and D ; in the latter, the antecedents A and C will have the same ratio to the quotients H and K .

10. If there be several quantities in the same continued ratio $A, B, C, D, E, \&c.$ the first A is to the third C , in a *duplicate* ratio; to the fourth D , in a *triplicate*; to the fifth E , in a *quadruplicate*, &c. ratio of the ratio of the first A , to the second B .

11. If there be any series of quantities in the same ratio, $A, B, C, D, E, F, \&c.$ the ratio of the first A to the last F is compounded of the intermediate ratios $A : B, B : C, C : D, D : E, E : F, \&c.$

12. Ratios compounded of ratios, of which each is equal to each other, are equal among themselves. Thus the ratios $90 : 3 :: 960 : 32$, compounded of $6 : 3 :: 4 : 2$, and $3 : 1 :: 12 : 4$; and $5 : 1 :: 20 : 4$.

For other properties of similar or equal ratios, see PROPORTION.

RATIOS, *Reduction of.*—It is obvious that there is a variety of cases in which the real ratio of two quantities may be expressed in terms too great to be applied to any useful purpose; of which we have an example in the construction of planetariums, and similar astronomical instruments. The ratios of the times in which the several planets perform their sidereal revolutions, are expressed in very large numbers, far exceeding the number of teeth that can be introduced into the machinery of a planetarium; and it, therefore, becomes necessary to find smaller numbers, which, though they do not express the true ratio, may approximate as near to the truth as the state of the case will admit. Another instance, in which a reduction of the ratio of large numbers to others expressed in lower terms becomes necessary, occurs in the calendar; for, according to the common reckoning, the year is supposed to be 365 days, whereas it is known to be nearly 365 days 6 hours; it, therefore, becomes necessary to have some means of expressing the ratio between the true and the assumed length of the years, in order that, by a proper intercalation, we may preserve an uniformity in the seasons, with reference to the months, as we should otherwise find the shortest day transferred to the middle of June, and the longest to the month of December.

This reduction of ratios is best performed by means of *continued Fractions*, of which a sketch is given under that article, as also under the article *Indeterminate Analysis*, but which we shall probably treat at greater length in a supplement to the present work, on which account it is not our intention to enter much into the rationale of the theory in this place, but merely to state the rules by which the required reduction is to be performed.

To reduce a ratio expressed in large numbers, to others nearly equivalent, but represented in simpler terms.

Rule 1.—Divide the greater of the two numbers by the less; then the divisor by the remainder, and so on, as in finding the greatest common measure of two numbers, and reverse the several quotients, which may be denoted by $a, b, c, d, \&c.$

2. Write down the several quotients, thus; $a, b, c, d, e, \&c.$ from which the series of converging fractions or ratios will be derived as follows; *viz.* the first fraction will have unity for its numerator, and the first quotient, a , for its denominator; the second will have the second term, b , for its numerator, and for its denominator $ab + 1$; and the numerators of all the succeeding fractions will be found, by multiplying the numerator last obtained, by the succeeding quotient in the above series, and adding to the product the preceding numerator. And the denominators are obtained by precisely the same rule, merely changing the word numerator into denominator.

In this rule we have supposed the ratio to be less than 1, or the numerator less than the denominator; if the denominator be less than the numerator, it must be reversed, making the numerator what we have called the denominator, and the denominator the numerator.

The last fraction of this series will be the same as the original fraction proposed, and the others will be so many approximate or converging fractions, each of which will approach nearer to the original fraction than the preceding one, and nearer than any other fraction whose terms are not expressed by greater numbers. This rule may be exhibited analytically as follows:

Let $\frac{A}{B}$ be the proposed fraction, and $a, b, c, \&c.$ the quotients obtained by the divisions as above, then the converging

RATIO.

verging fractions will be $\frac{1}{a}, \frac{b}{ab+1}, \frac{bc+1}{(ab+1)c+a},$
 $\frac{(bc+1)d+b}{[(ab+1)c+a].d+ab+1},$ &c. which will be found
 to agree with the preceding rule; and these fractions will
 be alternately greater and less than that proposed, which will
 be the last of the series.

Let us illustrate this rule by an example. Required a
 series of converging fractions towards $\frac{314159}{100000}$, which is
 the fraction commonly employed for expressing the ratio of
 the diameter to the circumference of a circle.

Operation by Division.

```

100000)314159(3 = a
      300000
      ---
      14159)100000(7 = b
            99113
            ---

                                    4
                                    ---
                                    0
    
```

Having thus obtained our quotients, the several fractions
 will be easily formed by the preceding rule; thus,

$$\frac{3}{1}, \frac{7}{7}, \frac{15}{106}, \frac{1}{113}, \frac{25}{2931}, \frac{1}{3044}, \frac{7}{2423}, \frac{4}{100000}$$

the last of which is the same as the original fraction. These
 fractions are formed according to the preceding rule, which
 will be understood from one example; thus, the fifth frac-
 tion is formed from the two preceding fractions as follows:

$$355 \times 25 + 333 = 9208 \text{ numerator,}$$

$$113 \times 25 + 106 = 2931 \text{ denominator,}$$

and all the others are obtained in the same manner.

Each of these fractions represents an approximate ratio
 towards the original one, and each of them nearer than
 any preceding fraction in the series, and nearer than any
 fraction expressed in less numbers, or than any fraction
 having a less denominator than the succeeding fractions.

Thus, $\frac{3}{1}$ is a nearer approximation than any fraction whose

denominator is less than 3, and $\frac{355}{113}$ nearer than any frac-

tion whose denominator is less than 2931; &c.

Our original fraction exhibited the ratio usually employed

to denote the ratio of the diameter to the circumference
 of a circle, and amongst our approximations we find some
 of those commonly employed by former writers; as 7 to
 22, being that given by Archimedes; 106 to 333, which
 is another ratio formerly used; also 113 to 355, being that
 invented by Peter Metius. Each of these ratios is alter-
 nately too small and too great, to express the ratio of the
 diameter to the circumference of the circle. Thus, 1 to 3
 is too small a ratio, 7 to 22 too great, 106 to 333 too small,
 and 113 to 355 too great; and so on.

We may therefore divide the above series into two distinct
 classes, one of which shall exhibit the ratios all in excess,
 and the other all in defect, which will stand as follows:
viz.

Ratios in defect.

$$\frac{3}{1}, \frac{333}{106}, \frac{9208}{2931}, \frac{76149}{24239}$$

Ratios in excess.

$$\frac{22}{7}, \frac{355}{113}, \frac{9563}{3044}, \frac{314159}{100000}$$

And between every two consecutive fractions we may now
 interpolate as many fractions of the same kind, as is one
 less than the number of units in the quotients from which
 it was formed. If we write the first of the above series,
 with the corresponding quotients above their terms, we
 shall have

$$\begin{array}{cccc} 15 & 25 & 7 & \\ 3 & 333 & 9208 & 76149 \\ 1 & 106 & 2931 & 24239 \end{array}$$

We may therefore interpolate, between the two first
 fractions, fourteen others, which will possess the same pro-
 perty as the principal fractions above, *viz.* of approxi-
 mating nearer to the true ratio than any other fractions
 expressed in less terms, but all in defect. Between the
 second and third we may interpolate twenty-four fractions:
 and between the third and fourth, six: all of them less
 than the proposed ratio. But if we take the second se-
 ries and their corresponding quotients, they will stand
 thus:

$$\begin{array}{cccc} 1 & 1 & 1 & 4 \\ 22 & 355 & 9563 & 314159 \\ 7 & 113 & 3044 & 100000 \end{array}$$

which shews, that no fraction can here be interpolated
 either between the first and second, or between the second
 and third; but there may be three interpolated between
 the third and fourth, which will, of course, be all in ex-
 cess. This interpolation is performed as follows: to the
 numerator and denominator of the less fraction add, once,
 twice, three times, &c. the numerator and denominator of
 the principal fraction which interposes between the two,
 which will form the interpolated fractions required. Thus,

because $\frac{76149}{24239}$ is the principal fraction interposed between
 $\frac{9563}{3044}$ and $\frac{314159}{100000}$, the intermediate or interpolated frac-
 tions will be

$$\begin{array}{r} \frac{9563 + 76149}{3044 + 24239} = \frac{85712}{27283} \\ \frac{9563 + 2.76149}{3044 + 2.24239} = \frac{161861}{51522} \\ \frac{9563 + 3.76149}{3044 + 3.24239} = \frac{238010}{75761} \end{array}$$

RATIO.

And in the same manner we may interpolate fourteen fractions between $\frac{3}{1}$ and $\frac{333}{106}$; twenty-four between $\frac{333}{106}$ and $\frac{9208}{2931}$; and six between $\frac{9208}{2931}$ and $\frac{16149}{24339}$.

Having thus explained the nature of the operation, we shall enter into detail in the following example.

Example 2.—According to M de la Caille, the solar year is $365^d 5^h 48^m 49^s$, and consequently longer by $5^h 48^m 49^s$ than the common year of 365 days. If this difference were exactly 6 hours, it would make one day at the end of four common years: but if we wish to know exactly at the end of how many years this difference will produce a certain number of days, we must seek the ratio

between 24^h and $5^h 48^m 49^s$, which we find to be $\frac{86400}{20929}$, so that at the end of 86400 common years, we must intercalate 20929 days, in order to reduce them to tropical years.

Now as the ratio of 86400 to 20929 is expressed in very high terms, let it be required to find ratios in lower terms, as near this as possible.

For this purpose, we must perform upon these numbers the same operations as in the preceding case; thus:

$$\begin{array}{r}
 20929 \overline{)86400} (4 = a \\
 \underline{83716} \\
 2684 \overline{)20929} (7 = b \\
 \underline{18788} \\
 2141 \overline{)2684} (1 = c \\
 \underline{2141} \\
 543 \overline{)2141} (3 = d \\
 \underline{1629} \\
 512 \overline{)543} (1 = e \\
 \underline{512} \\
 31 \overline{)512} (16 = f \\
 \underline{496} \\
 16 \overline{)31} (1 = g \\
 \underline{16} \\
 15 \overline{)16} (1 = h \\
 \underline{15} \\
 1 \overline{)15} (15 \\
 \underline{15}
 \end{array}$$

From which quotients we derive the following converging fractions, viz.

$$\frac{4}{1}, \frac{7}{7}, \frac{1}{8}, \frac{3}{31}, \frac{1}{39}, \frac{16}{655}, \frac{1}{694}, \frac{1}{1349}, \frac{15}{20929}$$

Now we see from the above fractions, that the simplest intercalation is that of one day in four common years, which is the foundation of the Julian calendar; but that we should approximate with more exactness, by intercalating only 7 days in the space of 29 common years, or 8 in the space of 33 years, and so on.

It appears farther, that as the fractions $\frac{4}{1}, \frac{29}{7}, \frac{33}{8}$, &c. are alternately less and greater than the fraction $\frac{86400}{20929}$, or

$\frac{24^h}{5^h 48^m 49^s}$, the intercalation of 1 day in 4 years would be too much, of 7 days in 29 years too little, of 8 days in 33 years too much again, and so on; but each of these intercalations will be the most exact, that it is possible to make in the same space of time.

Now if we arrange in two separate series, the fractions that are less, and those that are greater, than the given fractions, we may insert or interpolate between certain of those fractions, as in the preceding examples.

Taking first those fractions that are less than the given one, and their corresponding quotients, we shall have,

$$\frac{1}{1}, \frac{1}{8}, \frac{15}{694}, \frac{15}{20929}$$

Hence it appears, that the only interpolation that can be performed is between the two fractions $\frac{2865}{694}$ and $\frac{86400}{20929}$;

which will admit of 14 intermediate fractions; which being supplied, as in the former example, gives the following series of converging fractions, each less than the fraction originally proposed, viz.

$$\begin{array}{cccccc}
 \frac{4}{1} & \frac{33}{8} & \frac{161}{39} & \frac{2865}{694} & \frac{8434}{2043} & \frac{14003}{3392} \\
 \frac{19572}{4741} & \frac{25141}{6090} & \frac{30710}{7439} & \frac{36279}{8788} & & \\
 \frac{41848}{10137} & \frac{52986}{12835} & \frac{58555}{14184} & \frac{64124}{15533} & & \\
 \frac{69633}{16882} & \frac{75262}{18231} & \frac{80831}{19580} & \frac{86400}{20929} & &
 \end{array}$$

And as the last fraction is the same as the given fraction, it is evident that this series cannot be carried farther: hence, if we choose to admit these intercalations only in which the error is too much, the simplest and most exact will be those of 1 day in 4 years, or of 8 days in 33 years, or of 39 in 161 years, and so on.

Let us now consider the decreasing fractions:

$$\frac{7}{29}, \frac{3}{128}, \frac{16}{2704}, \frac{1}{5569}, \frac{1}{1349}$$

Here it appears, that we may place 6 fractions before the first, 2 between the first and second, 15 between the second and third; but between the third and fourth no such fraction can be inserted.

These interpolations being made, we shall have the following series of decreasing fractions, viz.

$$\begin{array}{cccccc}
 \frac{5}{1} & \frac{9}{2} & \frac{13}{3} & \frac{17}{4} & \frac{21}{5} & \frac{25}{6} \\
 \frac{29}{7} & \frac{62}{15} & \frac{95}{23} & \frac{128}{31} & \frac{289}{70} & \frac{450}{109} \\
 \frac{611}{148} & \frac{772}{187} & \frac{933}{226} & \frac{1094}{265} & \frac{1255}{304} &
 \end{array}$$

RATIO.

$$\frac{1416}{343}, \frac{1577}{382}, \frac{1738}{421}, \frac{1899}{460}, \frac{2060}{499},$$

$$\frac{2221}{538}, \frac{2382}{577}, \frac{2543}{616}, \frac{2704}{655}, \frac{5569}{1349},$$

which are all less than the proposed fraction, and expressed in less terms; and each of which is nearer than any other fraction that can be expressed in less terms.

Hence we conclude, that if we only attend to the intercalations in which the error is too small, the simplest and most exact are those of 1 day in 5 years, of 2 days in 9 years, of 3 days in 13 years, of 4 days in 17 years, and so on.

In the Gregorian calendar, only 97 days are intercalated in 400 years; but it is evident, from the preceding table, that it would be much more exact to intercalate 109 days in 450 years.

But it must be observed, that in the Gregorian reformation, the determination of the year given by Copernicus was made use of, which is $365^d 5^h 49' 20''$; and substituting

this instead of the fraction $\frac{86400}{20929}$, we shall have $\frac{86400}{29060}$, or

rather $\frac{540}{131}$; whence we may find, by the preceding method, the quotients 4, 8, 5, 3; and from them the principal fractions

$$\frac{4}{1}, \frac{8}{8}, \frac{5}{41}, \frac{3}{131};$$

which, except the two first, are quite different from those before determined. However, we do not find amongst these fractions $\frac{400}{97}$, which is that adopted in the Gregorian

calendar; and this fraction cannot even be found among the interpolated fractions, which might be inserted in the two series, $\frac{4}{1}, \frac{169}{41}$, and $\frac{33}{8}, \frac{540}{131}$: for it is evident that it

could only be between the last two fractions, between which, because of the number 3, (the corresponding quotient,) there can be but two fractions interpolated, which

are $\frac{202}{49}$, and $\frac{371}{90}$: whence it appears, that it would have

been more exact, if, in the Gregorian reformation, they had only intercalated 90 days in the space of 371 years.

If we reduce the fraction $\frac{400}{37}$, so as to have for its

numerator the number 86400, it will become $\frac{86400}{20952}$, which

estimates the tropical year at $365^d 5^h 49' 12''$.

In this case, the Gregorian intercalation would be quite exact; but as observations shew that the year is shorter than this by more than $20''$, it is evident that, at the end of a certain period of time, we must introduce a new intercalation.

If we adopt the determination of de la Caille, it follows, as the denominator 97 of the above fraction, viz. $\frac{400}{97}$, lies be-

tween the denominators of the fifth and sixth principal

fractions already found, that, from what has been stated above, the fraction $\frac{161}{39}$ will be nearer the truth than

$\frac{400}{97}$. But as astronomers are still divided with regard to

the exact length of the year, we shall refrain from giving a decisive opinion on this subject. For more on the reduction of ratios, see Lagrange's Additions to Euler's Elements of Algebra.

RATIOS, *Prime and Ultimate*, is a species of computation, which we owe to the fertile genius of Newton. The ancients, in order to extend the geometry of right lines to curvilinear figures, had recourse to the method of *exhaustions*, in which they made use of what is called the *reductio ad absurdum* method, which, though logical, is extremely tedious, and to avoid which, Cavalierius proposed his method of *indivisibles*, published in 1635 under the title of "*Geometria Indivisibilibus*," in which he was followed by Dr. Wallis and others of the 17th and 18th centuries. In this method every line was supposed to consist of a number of other lines indefinitely small; every curve was considered as a polygon of an indefinite number of sides, each side being indefinitely small; a solid was supposed to consist of an infinite number of plane sections, or of indefinitely thin laminæ, and so on; suppositions which in many instances led those, who adopted them, into errors and inconsistencies, which indeed it was very difficult to avoid.

To obviate both the tediousness of the ancients, and the inaccuracy of the moderns, Newton introduced his method of *prime and ultimate ratios*, the foundation of which is contained in the first lemma of the first book of his "*Principia*." Many difficulties have been started, and much controversy concerning the proof of it; all of which would have been avoided, had either the author or his readers observed, that he is in reality laying down the definition of a term, viz. *being ultimately equal*, and not proving a proposition. Taking, therefore, this first lemma for a definition, it may be illustrated as follows.

Let there be two quantities, one fixed and the other varying, so related to each other, that, 1st, the varying quantity continually approaches to the fixed quantity; and, 2dly, that the varying quantity never reaches or passes beyond that which is fixed: 3dly, that the varying quantity approaches nearer to the fixed quantity than by any assigned difference. Then is such a fixed quantity called the *limit* of the varying quantity; or, in other words, the varying quantity may be said to be *ultimately equal* to the fixed quantity. These three conditions may be expressed more distinctly thus. 1. The difference between the varying quantity and the fixed quantity must continually decrease. 2. This difference must never become either nothing or negative. 3. This difference must become less, in respect of the fixed quantity, than by any assigned ratio; or the difference between the two quantities must become a less part of the fixed quantity than any fractional part that is assigned, however small the fraction expressing such part may be. Wherever these properties are found, the fixed quantity is called the *limit* of the varying quantity, or the varying quantity is said to be *ultimately equal* to the fixed quantity. The last expression, however, must not be understood in its strict literal sense, there being no *ultimate state*, no particular magnitude, that is the *ultimate magnitude* of such a varying quantity. Under the word quantity in this definition, must be included not only numbers, lines, &c., but more especially ratios considered as a peculiar species of quantity; but as the con-

RATIO.

consideration of ratios which have limits is difficult, we shall begin with examples of other quantities.

1st. Let there be formed a series, whose first term is 1; second, $\frac{1}{2}$; third, $\frac{1}{4}$; fourth, $\frac{1}{8}$, and so on; every term being half the preceding one, *viz.*

$$1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \&c.$$

and let the sum of an indefinite number of terms in this series be considered as continually increased by the accession of a new term; thus, the sum of the two first is $1\frac{1}{2}$, of three terms is $1\frac{3}{4}$, of four terms is $1\frac{7}{8}$, &c. I say then, that the varying sum of the terms of this series continually approximates to the fixed number 2, as its limit. For the difference between 1, 2, 3, &c. terms and the number 2, will be the

numbers $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \&c.$ successively, *in in-*

finitum. Here it is evident, that the terms in this last series, which express the successive differences between the increasing sum of the former series and the number 2, first, continually decrease; and secondly, no term in this series of differences can become either nothing or negative; and thirdly, we may continue this series of successive differences, till we arrive at a term which shall be a less part of the fixed number 2, than any fractional part of it that can be assigned; or so that this difference shall be less, when compared with the number 2, than any ratio assigned. The number 2, therefore, having the conditions laid down in the definition, is to be called the limit of the sum of the terms of the

infinite series $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \&c.$

And the same is to be understood of any other infinite series; *viz.* if a number can be found having the above conditions, that series is said to have a limit; and the finding of this limit, is what is to be understood when mathematicians speak of finding the sum of such an infinite series.

No number less than 2, for instance $1\frac{1}{2}$, can be taken for the limit; for, in this case, it will not answer the second condition of the definition. In the above example, the sum of four terms of the series is equal to $1\frac{7}{8}$, and the sum of five terms exceeds it; therefore, the difference between this sum and the number $1\frac{1}{2}$ proposed as a limit is, in the former case zero, and in the latter negative. Neither can any number greater than 2, as for example 3, be taken for the limit, because here the last condition will be wanting; for if the sum of any assigned number of terms be less than 2, that sum must always want more than unity of the number 3, and consequently cannot approach nearer to 3, than any assigned quantity, as 1.

In like manner the sum of the series $1, \frac{1}{3}, \frac{1}{9}, \frac{1}{27}, \&c.$ continued *in infinitum*, will be $1\frac{1}{2}$; the series of successive differences being $\frac{1}{2}, \frac{1}{6}, \frac{1}{18}, \frac{1}{54}, \&c.$ *in infinitum*.

Now, in order to make the preceding example general, let $a; b$ express the common ratio of any series of numbers in continual proportion, whose first term is unity, I say then, if a be greater than b , such a series will have for its

limit the quantity $\frac{a}{a-b}$; or, in other words, the sum of all

the terms of such an infinite series will be $\frac{a}{a-b}$.

For the terms of this series will be $1, \frac{b}{a}, \frac{b^2}{a^2}, \frac{b^3}{a^3}, \frac{b^4}{a^4}, \&c.$

Whence the sum of 1 term is 1
of 2 terms $1 + \frac{b}{a}$
of 3 terms $1 + \frac{b}{a} + \frac{b^2}{a^2}$
of 4 terms $1 + \frac{b}{a} + \frac{b^2}{a^2} + \frac{b^3}{a^3}$

Let each of these sums be subtracted from the limit $\frac{a}{a-b}$, and we have the successive differences $\left(\frac{b}{a-b}\right),$

$\left(\frac{b}{a-b} \cdot \frac{b}{a}\right), \left(\frac{b}{a-b} \cdot \frac{b^2}{a^2}\right), \left(\frac{b}{a-b} \cdot \frac{b^3}{a^3}\right), \&c.$ or

if n be any assigned number of terms, the difference between the sum of that number of terms and the limit

$\frac{a}{a-b}$, will be $\frac{b}{a-b} \cdot \frac{b^{n-1}}{a^{n-1}}$. Whence we may observe, 1st,

that as the number of terms whose sum is required increases, this difference continually decreases, because $\frac{b}{a}$, being a

fraction less than unity, its powers continually decrease.

2dly. This difference can never become nothing or negative; as the powers of a fraction, though they decrease, being always real and affirmative.

3dly. This difference may become less in respect of $\frac{a}{a-b}$, than by any assigned ratio.

For $\frac{a}{a-b} : \frac{b}{a-b} \cdot \frac{b^{n-1}}{a^{n-1}}$ as $a^n : b^n$; or as $\frac{a^n}{b^n}$ to 1; or as

$\left(\frac{a}{b}\right)^n$ to 1: and since $\frac{a}{b}$ is greater than 1, and n inde-

terminate, the former term of the ratio may become greater than any assigned quantity, and therefore the ratio itself less than any ratio assigned.

The quantity $\frac{a}{a-b}$, having, therefore, the required condi-

tions, is the limit of the above series, or is equal to the sum of all the terms continued *in infinitum*.

What has been proved above may be shewn more concisely by dividing a by $a-b$, in the manner of division in algebra, for the quotients will be the very series proposed in the example: for instance,

$$\begin{array}{r} a-b \overline{) a} \quad \left(1 + \frac{b}{a} + \frac{b^2}{a^2} + \frac{b^3}{a^3} + \&c. \right. \\ \underline{a} \\ b \\ \underline{b} \\ b^2 \\ \underline{b^2} \\ b^3 \\ \underline{b^3} \\ b^4 \\ \underline{b^4} \\ b^5 \\ \underline{b^5} \\ b^6 \\ \underline{b^6} \\ b^7 \\ \underline{b^7} \\ b^8 \\ \underline{b^8} \\ b^9 \\ \underline{b^9} \\ b^{10} \\ \underline{b^{10}} \\ b^{11} \\ \underline{b^{11}} \\ b^{12} \\ \underline{b^{12}} \\ b^{13} \\ \underline{b^{13}} \\ b^{14} \\ \underline{b^{14}} \\ b^{15} \\ \underline{b^{15}} \\ b^{16} \\ \underline{b^{16}} \\ b^{17} \\ \underline{b^{17}} \\ b^{18} \\ \underline{b^{18}} \\ b^{19} \\ \underline{b^{19}} \\ b^{20} \\ \underline{b^{20}} \\ b^{21} \\ \underline{b^{21}} \\ b^{22} \\ \underline{b^{22}} \\ b^{23} \\ \underline{b^{23}} \\ b^{24} \\ \underline{b^{24}} \\ b^{25} \\ \underline{b^{25}} \\ b^{26} \\ \underline{b^{26}} \\ b^{27} \\ \underline{b^{27}} \\ b^{28} \\ \underline{b^{28}} \\ b^{29} \\ \underline{b^{29}} \\ b^{30} \\ \underline{b^{30}} \\ b^{31} \\ \underline{b^{31}} \\ b^{32} \\ \underline{b^{32}} \\ b^{33} \\ \underline{b^{33}} \\ b^{34} \\ \underline{b^{34}} \\ b^{35} \\ \underline{b^{35}} \\ b^{36} \\ \underline{b^{36}} \\ b^{37} \\ \underline{b^{37}} \\ b^{38} \\ \underline{b^{38}} \\ b^{39} \\ \underline{b^{39}} \\ b^{40} \\ RATIO.

And it may be further confirmed by multiplying the proposed series by $a - b$, for the product will be a , all the terms except the first destroying each other.

We may also observe, that if every term of the foregoing series be multiplied by any number c , it will become $c +$

$$\frac{bc}{a} + \frac{b^2c}{a^2} + \frac{b^3c}{a^3} + \&c.;$$

a series having the same ratio, but whose first term is c ; and it is therefore evident, that, in this case, to find the sum of all the terms, we must multiply

$$\text{the former limit by } c, \text{ whence it will become } \frac{ac}{a-b}.$$

Before we begin to consider ratios, it may not be amiss to caution the reader against confounding the terms of a ratio with the ratio itself: the terms of a ratio may vary in some cases through all degrees of magnitude, and yet the ratio remain constant or invariable. In other instances, varying the terms *in infinitum*, likewise varies the ratio *in infinitum*; while in others, though varying the terms may also vary the ratio, yet the last ratio can never exceed certain limits.

Let x be any varying quantity; make $4x^2 + 3x = A$, and $2x^2 + x = B$, then will A and B also be varying quantities, as depending upon x ; when x vanishes, A and B will both vanish; when x is infinite, they will be both infinite. I say then the ratio of A to B , while x decreases *in infinitum*, approximates to the ratio of 3 to 1.

For, first, A is to B , as $4x^2 + 3x$ is to $2x^2 + x$, or as $4x + 3$ to $2x + 1$; where it is obvious, that as x decreases, the quantities $4x$ and $2x$ also decrease, and consequently the ratio of $4x + 3$ to $2x + 1$, or of A to B , approaches to that of 3 to 1. Secondly, the ratio of A to B can never exceed 3 to 1. For $6x^2 + 3x$ is to $2x^2 + x$, as 3 to 1; but $4x^2 + 3x$ is a less quantity than $6x^2 + 3x$, therefore $4x^2 + 3x$ is to $2x^2 + x$, or A is to B in a less ratio than $6x^2 + 3x$ to $2x^2 + x$; that is, less than the ratio of 3 to 1. Lastly, the ratio of A to B will approach nearer to the ratio of 3 to 1, than any assigned difference. For in the terms of this ratio, $4x + 3$ to $2x + 1$, the varying parts $4x$ and $2x$, by diminishing x , may become less than any assigned quantity, while the other parts, 3 and 1, remain the same; therefore the ratio of A to B will approach nearer to the ratio of 3 to 1, than by any assigned difference.

In like manner the ratio of A to B , while x increases *in infinitum*, approximates to the ratio of 2 to 1, as its limit.

For since A is to B as $4x + 3$ to $2x + 1$, or as $4x + \frac{3}{x}$

to $2 + \frac{1}{x}$, it is obvious, that as x increases, the quantities

$\frac{3}{x}$ and $\frac{1}{x}$ decrease, and consequently the ratio of $4 + \frac{3}{x}$

to $2 + \frac{1}{x}$, or of A to B , approaches to the ratio of 4 to 2,

or of 2 to 1. For $4x^2 + 2x$ is to $2x^2 + x$, as 2 is to 1; but $4x^2 + 3x$ is a greater quantity than $4x^2 + 2x$, therefore $4x^2 + 3x$ is to $2x^2 + x$, or A is to B always in a greater ratio than 2 to 1. Lastly, the ratio of A to B will approach nearer to that of 2 to 1, than by any assigned

difference. For in the terms of this ratio, $4 + \frac{3}{x}$ and $2 + \frac{1}{x}$,

the variable parts $\frac{3}{x}$ and $\frac{1}{x}$, by increasing x , may become

less than any assigned fraction, while the parts 4 and 2 remain the same; therefore the ratio of A to B will approach nearer

to the ratio of 4 to 2, or 2 to 1, than the assigned difference. Hence then we see that though diminishing x , and consequently diminishing the terms A and B , we increase their ratio, and on the contrary increasing these terms, by increasing the quantity x , we decrease their ratio; yet there is a limit both to the increase and decrease of this ratio, although there be none to the terms themselves which compose it.

The ratio of 3 to 1, which limits the ratio of A to B , when these terms decrease *in infinitum*, is called the *ultimate ratio* of the evanescent quantities A and B . The ratio of 2 to 1, which is their other limit, is called the *ultimate ratio* of the quantities A and B increasing *in infinitum*.

Another example of a similar kind we have as follows. Let x be a varying quantity, and d a constant one, then will $x + d$ and x be two varying quantities capable of all degrees of magnitude, I say that the ratio of $x + d$ to x , while x increases, will continually decrease, but not beyond a certain limit, which is the limit of equality. On the contrary, if x decrease, the ratio of $x + d$ to x will continually decrease more and more *ad infinitum*, and never

come to a limit. For $x + d$ is to x , as $1 + \frac{d}{x}$ to 1; now

as x increases, the fraction $\frac{d}{x}$ decreases, and may become

less than any assigned fraction; but the number 1, which is the other part of the antecedent of this ratio, remains the same, as does likewise the consequent, therefore the

ratio of $1 + \frac{d}{x}$ to 1, continually approximates to a

ratio of equality. Secondly, it can never reach that ratio,

because $\frac{d}{x}$ has always some magnitude, and consequently

$1 + \frac{d}{x}$ always greater than 1. It therefore can never reach

the ratio of equality, and much less can it pass it, so as to become a ratio *minoris inaequalitatis*, or a ratio in which the antecedent is less than the consequent. Lastly, the varying

fraction $\frac{d}{x}$, as x increases, will become less than any assigned

fraction, while the other part of the antecedent, and likewise the consequent of this ratio, remain the same. There-

fore the ratio of $1 + \frac{d}{x}$ to 1, will approach nearer to the

ratio of equality, than by any ratio that can be assigned, however small such ratio may be; therefore the ratio of

equality is the limit of the ratio of $1 + \frac{d}{x}$ to 1, and

consequently the limit of the ratio of $x + d$ to x , which continually decreases, while the terms which compose this ratio continually increase *in infinitum*.

If x decrease then $\frac{d}{x}$ will increase, and may become greater

than any assigned number, while the other part of the antecedent, and likewise the consequent, remain invariable;

therefore the ratio of $1 + \frac{d}{x}$ to 1, and consequently the

ratio of $x + d$ to x , as x decreases, will become greater than any assigned ratio whatever, having no limit to its increase.

We may farther observe, that though the terms of this ratio, viz. $x + d$ to x , never approximate nearer to each other, their constant difference being d , yet the ratio of the terms approximates to the ratio of equality; that is, though the terms get no nearer in their difference, yet, if we may be allowed the expression, they get nearer in their ratio. The difference of the terms, and the ratio of the terms, are ideas very distinct from each other, and in no wise to be so connected, but that one may vary whilst the other is constant. Although the ratio of equality may strictly be called the *limit of the varying ratio* of the quantities $x + d$ and x , yet the terms of this ratio can never be strictly said to be equal, nor *ultimately equal*, as that supposes an ultimate state in which they are equal; nor equal when they *vanish into infinity*, or, when they pass out of finity into infinity. There is no finite quantity next to infinity, no number, for instance, which is the next number to infinity. Nor is there any step from a state of *nothingness* into finite existence; there is no fraction so small as to be the very next fraction to nothing; no fraction can be assigned so small, but another fraction may be assigned that is smaller. Neither can we say, in strictness, that two infinitely great numbers with a finite difference are equal, it being a proposition obviously absurd and contradictory. There is no such thing in nature as an infinitely great number; and it is contradictory to say of any two numbers, both that they have a difference, and that they are equal. Whoever considers that the idea of infinity is a general or abstract idea, that the idea of number is always particular, that infinity is a *property* of numbers, a *property* of extension, &c. itself, will readily perceive that these and such like expressions have no literal meaning. (See Locke, b. ii. ch. 16. and ch. 17.) As to the metaphorical use of them, to avoid circumlocution, or the introduction of new terms, it may be allowed, when once the literal meaning has been explained, in this, as well as on various other occasions both in science and in common life.

When the difference between any two quantities decreases, so as to become a less fractional part of the one of them than any assigned fractional part whatever; or when the difference between the terms of a ratio becomes less in respect of one of them (the greater for example) than any assigned ratio, this may be expressed by saying, that such difference *vanishes* in respect of that *greater* quantity.

But if the difference between two terms vanish in respect to one of them, it will also vanish in respect of the other. It is true that at any assigned time, when the terms have a particular magnitude, the difference between the terms will always be a less fractional part of the greater term than it is of the less term; but as this difference continually decreases, it will become the same fractional part of the less term that it was before of the greater, however small that fractional part of the greater term may be; therefore, if the difference vanish with regard to one of them, it will vanish also with regard to the other. We may, therefore, instead of the third condition of our definition, say, that "the difference must vanish in respect either of the fixed or of the varying quantity, since one of these implies the other."

The above is true as well for the case of two variables, as for one fixed and one variable, though both of such variables increase or decrease without limit. Thus, in the example above given, in which the terms were $x + d$ and x , and where x is continually increasing, the terms themselves both continually increase; for in this instance it is obvious, that if the difference vanish with respect to one of the terms, it will also vanish with respect to the other. Let x be to d , at any assigned point of time, as n is to 1, and d at that instant of

time will be the $\frac{1}{n+1}$ -th part of the greater term, and the

$\frac{1}{n}$ -th part of the less term: now, though the contemporary

value of these fractions can never be equal, yet in succession the value of the latter fraction will become whatever the former

has been; therefore, if $\frac{1}{n+1}$ become less than any assigned

fraction, so will $\frac{1}{n}$ likewise; and thus, if the difference

vanishes with respect to one of the terms, $x + d$, so will it also vanish with respect of the other, x . And the same would be true if the terms were x and $x - d$, all things else being as before.

Again, if x by decreasing vanish with respect to some fixed quantity n , then will x , multiplied by a given number n , or $n x$, vanish in respect of a ; or, which is the same, if x vanish in respect of a , so likewise will the quantity $n x$; bearing to a the assigned ratio of n to 1. For though at any particular point of time x is a smaller fractional part of a than $n x$, yet x can be no assigned fractional part of a whatever; but by farther diminishing x , the quantity $n x$ may become the same fractional part of a that x was before. If, then, x may become equal to, or less than, any assigned fractional part of a , so likewise may $n x$; that is, if x vanish in respect of a , so likewise will $n x$.

For a like reason, if x vanish in respect of any quantity, it will likewise vanish in respect to that quantity multiplied or divided by any number; or it will vanish in respect of a quantity, bearing to a any assigned ratio, as that of m to 1. Thus, if x vanish in respect of a , it will also vanish in respect of $3 a$, $2 a$, $\frac{1}{2} a$, &c. Or, if any fraction vanish in respect to the diameter of a circle, it will likewise vanish in respect of the radius. For whatever part of the diameter the line x may be at any assigned point of time, let x farther decrease, till it be half what it was at that assigned time, and it will now be the same part of the radius that it was before of the diameter; and the same with various other lines and quantities. We have shewn, in the preceding part of this article, that the ratio which two quantities bear to each other may have a limit, although the terms themselves may increase or decrease perpetually without limit. 1. If the terms approximate towards each other; 2, if the less never pass the greater; and, lastly, if their difference vanish in respect of either term, then the limit of their varying ratio is that of equality: and this, whether the terms themselves are such, as by increasing they both become greater than any assigned quantity, or, which is more common, such as by decreasing become less than any assigned quantity, or as it is called, *infinitely small*. Because the idea of the terms of a ratio is less abstract than that of the ratio itself, it is more usual to say that the terms themselves in this case are ultimately equal, though, strictly, it is the ratio only of the terms that comes to a limit, for the terms themselves are supposed to increase or decrease without limit, or as we commonly say, *ad infinitum*.

Prop.—In a circle whose centre is C, (*Plate XIII. Analysis, fig. 9.*) radius CA, diameter Aa, let AB be the chord, FB the sine, and AD the tangent of the arc AB. I say, that while the arc AB continually decreases without limit; 1st, the sine continually approximates to the tangent; 2dly, the sine never exceeds the tangent; 3dly, their difference will vanish in respect of either sine or tangent.

First; BF : DA :: CF : CA, but while the arc decreases, CF approximates to CA; BF approximates to

D A.

D A. 2dly. C F can never exceed C A; therefore B F can never exceed D A. 3dly. The arc continually decreasing without limit, vanishes in respect of the diameter, which is fixed; therefore the chord A B, which is less than the arc, likewise vanishes in respect of the diameter A a. But A a : A B :: A B : A F; therefore, if A B vanishes in respect of A a, A F will vanish in respect of A B; and much more will A F vanish in respect of A a; but if A F vanish in respect of A a, it will also vanish in respect of $\frac{1}{2}$ A a, or C A.

Now C A : C F :: A D : F B, and by division of proportion C A : A F :: A D : A D - F B. Therefore, as A F vanishes in respect of C A, so does A D - F B (the difference of the sine and tangent) vanish in respect to A D the tangent, and consequently in respect of F B the sine. Whence we see, that while the arc continually decreases without limit, the sine approximates to the tangent; 2dly, the sine never exceeds the tangent; 3dly, although the sine and tangent both vanish in respect of the radius, yet their difference vanish in respect of these quantities themselves. Therefore the ratio of equality is the limit of the varying ratio which the sine and tangent have to each other, while they both decrease perpetually without limit, or it is their *ultimate ratio*, or, as we may say, they are *ultimately equal*. The sine is less than the chord; for in the right-angled triangle A F B, the side B F is less than the hypotenuse A B; the chord is less than the arc; this is self-evident, the chord being a straight line, and the arc a curve, both terminated by the same points A and B. The arc is less than the tangent; for from the point D draw another tangent to the circle in H; and the lines A B H, A D H, will be terminated by the same points A and H; and will have the concavities turned the same way; therefore the included arc A B H will be less than the sum of the two equal tangents D A and D H; consequently half that arc, or A B, will be less than half the sum of the tangents A D.

Cor. 1.—Hence the sine, chord, arc, and tangent, are all ultimately in a ratio of equality. This may appear because the chord and arc are included between the sine and tangent, but perhaps more plainly thus. Of these four quantities, *viz.* the sine, chord, arc, and tangent, the sine is the least, and the tangent the greatest; therefore, the difference between the sine and the tangent is greater than the difference between any other two of these four quantities. If, therefore, the greatest of all those differences vanish in respect of the least of all those quantities, much more will the difference between any other two of these four quantities vanish in respect of the quantities themselves.

Cor. 2.—Join B a, and in the right-angled triangle B F a, the hypotenuse B a is greater than the side F a; therefore A a - B a is less than A a - F a, or than A F; but while the arc A B decreases continually without limit, A F vanishes in respect of A a; much more then does A a - B a, the difference A a and B a, vanish in respect of A a; therefore the ultimate ratio of A a to B a is that of equality; and the ultimate ratio of $\frac{1}{2}$ A a, or B C to B A, is that of 2 to 1. See other applications of these principles in Ludlam's "Rudiments of Mathematics," from which the preceding article has been abstracted; Newton's "Principia," bb. i.; Smith's "Fluxions;" and Saunderfon's "Algebra."

RATIO, in our *Law Writers*, is used for a judgment given in a cause.

Hence, *ponere ad rationem* is to cite one to appear in judgment. Walsingham. 88.

RATIO Status, *Ratione di stato*. See REASON of State.

RATIO *Victus*. See VICTUS.

RATIOCINATION, the act of reasoning.

RATION, or RATIAN, in the *Army*, a pittance or proportion of ammunition, bread, drink, or forage, distributed to each soldier for his daily subsistence.

Some write the word *racion*, and borrow it from the Spanish *racion*; but they both come from the Latin *ratio*. In some parts they call it a *reason*.

The horse have rations of hay and oats, when they cannot go out to forrage. See FORRAGE.

The rations of bread are regulated by weight. The ordinary ration of a foot soldier is a pound and a half of bread *per* day. The officers have several rations, according to their quality, and the number of attendants that they are obliged to keep.

When the ration is augmented on occasions of rejoicing, it is called a *double* ration.

The ships' crews have also their rations or allowances of biscuit, water, &c. proportioned according to their stock. The usual ration at sea, particularly among the Portuguese, &c. is a pound and half of biscuit, a pint of wine, and a quart of fresh water *per* day; and each month an arrobe, or thirty-one pounds of salt meat, with some dried fish and onions.

RATIONABLES EXPENSE, *Reasonable Expenses*. The commons in parliament, as well as the proctors of the clergy in convocation, were anciently allowed *rationabiles expensas*; that is, such allowance as the king, considering the prices of all things, shall judge meet to impose on the people to pay for the subsistence of their representatives.

This in the 17th of Edward II. was settled at ten groats *per* day for knights, and five for burgesses: afterwards, four shillings a day for knights, and two shillings for burgesses; which was then deemed an ample retribution, both for expences, for labour, attendance, neglect of their own affairs, &c. See BURGESS, and KNIGHTS of the Shire.

RATIONABILI Parte Bonorum, a writ which lies for the wife, against the executors of her husband, denying her the third part of her husband's goods, after debts and funeral expences paid.

Fitzherbert quotes Magna Charta, and Glanville, to prove, that, by the common law of England, the goods of the deceased, his debts first paid, should be divided into three parts; of which his wife is to have one, his children a second, and the executors a third; adding, that this writ lies as well for the children, &c. as the wife. Such is the general law of Scotland at this day. And whatever may have been the custom of late years, in many parts of the kingdom, or however it was introduced in derogation of the old common law, the ancient method continued in use in the province of York, the principality of Wales, and the city of London, till very modern times; when in order to favour the power of bequeathing, and to reduce the whole kingdom to the same standard, three statutes have been provided; the one 4 & 5 W. & M. c. 2. explained by 2 & 3 Ann. c. 5, for the province of York; another, 7 & 8 W. III. c. 38. for Wales; and a third, 11 Geo. I. c. 18. for London (see *Custom of London*); whereby it is enacted, that persons within those districts, and liable to those customs, may, if they think proper, dispose of all their personal estates by will; and the claims of the widow, children, and other relations, to the contrary, are totally barred. Thus is the old common law now utterly abolished throughout all the kingdom of England, and a man may devise the whole of his chattels as freely as he formerly could his third part or moiety. Blackst. Com. b. ii.

Recco de RATIONABILI Parte. See RECTO.

RATIONABILIBUS DIVISIS, is a writ that lies where two lords have signories joining together, for him that finds his waste encroached upon, within the memory of man, against the encroacher, thereby to rectify the bounds of the signories: in which respect, Fitzherbert says, it is of the nature of a writ of right.

RATIONABILIS DOS, a third part of such lands and tenements as the husband was seised of at the time of the espousals, with which his wife was formerly endowed by the common law, if no specific dotation was made at the church porch. See **DOWER** and **JOINTURE**.

RATIONAL, REASONABLE. See **REASON**.

RATIONAL Fable. See **FABLE**.

RATIONAL Fractions, in *Arithmetic* and *Analysis*, are those fractions into which no surd or radical quantity enters; as $\frac{7}{8}, \frac{19}{27}, \frac{x^2 + 1}{x^3 + 1}, \frac{x^2 + x^2 + ax}{x^3 + bx^2 + cx},$ &c.

The decomposition of rational fractions into simple fractions, that is, the decomposition of them into other fractions whose sum is equal to that proposed, is an important problem, as connected with the integral calculus, or inverse method of fluxions, which was first investigated by Leibnitz, but has since been much extended and simplified by the researches of Euler, La Grange, La Croix, and other eminent analysts.

The decomposition of numeral fractions into their partial fractions, is, perhaps, rather a subject of curiosity than utility, yet as connected with, and leading to, the decomposition of rational algebraic fractions, it may not be amiss to give here a sketch of the process by which it is accomplished, previous to entering upon the latter subject.

On the decomposition of rational numeral fractions, into others having prime denominators.

It is to be observed, that this can only be effected in the case of a composite denominator, or rather, there will be no difficulty in any other case, as it will require only a separation of the numerator into any parts at pleasure, the sum of which is obviously equal to the fraction proposed; we shall therefore only consider those fractions having composite denominators, which are to be resolved into others having prime denominators; and even in this case there may be fractions that will not admit of decomposition, as will appear from what follows. This decomposition is effected, when possible, by

means of the indeterminate analysis; viz. let $\frac{m}{n}$ be the given

fraction, and suppose, in the first instance, that its denominator consists of two prime factors, or $n = ab$, it will then

be to find $\frac{m}{ab} = \frac{p}{a} + \frac{q}{b}$, or $aq + bp = m$; p and q

being the required numerators of the two partial fractions, and which values of p and q are easily found from the above equation $aq + bp = m$, on the principles explained under the article **INDETERMINATE Analysis**, subject however to the same limitation there mentioned; viz. the above equation is always possible, provided $m > ab - a - b$, but in other cases it may or may not admit of solution.

If the given fraction be $\frac{m}{abc}$, then we may first resolve it into two fractions, and one of these into

two others; thus, let $\frac{m}{abc} = \frac{p}{ab} + \frac{q}{c}$, then we have $apq + cp = m$, from which equation p and q may be found.

Again, let $\frac{p}{ab} = \frac{r}{a} + \frac{s}{b}$, which gives $as + rb = p$,

whence r and s may be determined, and we shall thus obtain

$\frac{m}{abc} = \frac{r}{a} + \frac{s}{b} + \frac{q}{c}$, as required. In all these cases

it is obvious, that the fraction may be decomposed into partial fractions, in as many different ways as the indeterminate equation on which it depends admits of different answers.

Example.—Find two fractions, having prime denominators, whose sum shall be equal to $\frac{19}{35}$, or to $\frac{19}{7 \cdot 5}$.

Let the required fractions be $\frac{p}{7} + \frac{q}{5}$, then $\frac{5p + 7q}{35}$

$= \frac{19}{35}$; therefore $5p + 7q = 19$, whence $p = 1$, and

$q = 2$ (see **INDETERMINATE Analysis**); and consequently

the required partial fractions are $\frac{1}{7}$ and $\frac{2}{5}$.

Example 2.—Find three fractions, whose sum is equal to $\frac{401}{315}$.

The three factors of 315 are 5, 7, 9, which are of necessity the denominators of the required fractions. Suppose

then first, that $\frac{401}{315} = \frac{p}{35} + \frac{q}{9}$, whence we have $9p +$

$35q = 401$, which gives $p = 29$, and $q = 4$; therefore

$\frac{401}{315} = \frac{29}{35} + \frac{4}{9}$. Again, let $\frac{29}{35} = \frac{r}{7} + \frac{s}{5}$, or $5r +$

$7s = 29$; this gives $r = 3$ and $s = 2$, so that $\frac{29}{35} = \frac{3}{7} + \frac{2}{5}$,

and consequently $\frac{401}{315} = \frac{2}{5} + \frac{3}{7} + \frac{4}{9}$, as required. And

in the same manner the decomposition may be obtained in any other case, which falls within the limits above stated.

On the decomposition of rational algebraic fractions, and its application to the integral calculus.

Let $\frac{N}{D} = \frac{a + bx + cx^2 + dx^3 + \&c. \dots px^{m-1}}{a' + b'x + c'x^2 + d'x^3 + \dots p'x^{m-1} + q'x^m}$

be any rational fraction, whose decomposition into simple fractions is required, and whose numerator is at least one degree lower than its denominator, to which form it may always be reduced by division, if it should present itself under a different form.

The denominator of this fraction, from the known theory of equations, may be supposed to be made up of as many simple factors as is equal to the highest power of x contained in it, and which factors may be found by determining the roots of the equation formed by putting the whole denominator equal to zero. Let therefore $a' + b'x + c'x^2 + d'x^3 + \dots x^m = 0$, and suppose the roots of this equation to be $r, r', r'', r''', r''', \&c.$, and we shall have $a' + b'x + c'x^2 + d'x^3 + \dots x^m = (x - r)(x - r')(x - r'')(x - r'''), \&c.$

And therefore our proposed fraction $\frac{N}{D}$ may now be put

under the form

$\frac{N}{D} = \frac{a + bx + cx^2 + dx^3 + \dots px^{m-1}}{(x - r)(x - r')(x - r'')(x - r'''), \&c.}$

and these factors are now to form the denominators of the

RATIONAL FRACTIONS.

the simple fractions sought. Let $A, A', A'', A''', \&c.$ represent their numerators, so that

$$\frac{N}{D} = \frac{A}{x-r} + \frac{A'}{x-r'} + \frac{A''}{x-r''} + \&c. \frac{A^{(n-1)}}{x-r^{(n-1)}}$$

Reduce now these several simple fractions to a common denominator by the usual rule, and add their several numerators together; then comparing the co-efficients of the like powers of x in the numerator of this new fraction, with those in the numerator proposed, we shall obtain sufficient equations for determining the proper values of $A, A', A'', A''', \&c.$ and the decomposition will be effected as proposed. This will be better understood from a partial example.

Let us therefore assume the fraction $\frac{6x^2 - 4x - 6}{x^3 - 6x^2 + 11x - 6}$, which it is required to resolve into its simple fractions.

Here the roots of the denominator, by making it equal to zero, are 1, 2, and -3, whence the proposed equation may be put under the form

$$\frac{x^3 - 4x - 6}{(x-1)(x-2)(x+3)} = \frac{A}{x-1} + \frac{A'}{x-2} + \frac{A''}{x+3}$$

which being reduced to a common denominator, and added together, give

$$\frac{x^3 - 4x - 6}{x^3 - 6x^2 + 11x - 6} = \frac{A(x-2)(x+3) + A'(x-1)(x+3) + A''(x-1)(x-2)}{x^3 - 6x^2 + 11x - 6}$$

whence

$$\begin{aligned} A + A' + A'' &= 6 \\ A + 2A' - 3A'' &= -4 \\ 6A + 3A' - 2A'' &= 6 \end{aligned}$$

from which we readily draw $A = 1, A' = 2, A'' = 3$; so that the required fractions are

$$\frac{1}{x-1} + \frac{2}{x-2} + \frac{3}{x+3}$$

If therefore the fluent of $\frac{(6x^2 - 4x - 6)\dot{x}}{x^3 - 6x^2 + 11x - 6}$ were required, we might immediately reduce the problem to finding the fluents of $\frac{\dot{x}}{x-1} + \frac{2\dot{x}}{x-2} + \frac{3\dot{x}}{x+3}$, which are known, being hyp. log. $(x-1) + 2$ hyp. log. $(x-2) + 3$ hyp. log. $(x+3) = \text{hyp. log.} [(x-1)(x-2)^2(x+3)^3]$

The same method may be employed for all rational fractions, whose denominators are resolvable into unequal simple factors, but as this cannot be generally effected when the highest power of the variable quantity exceeds the fourth degree, we are necessarily limited in our application of the rule, in consequence of the imperfection which still attends the general solution of equations. In the case, however, of equal factors in the denominator, a different process is required, which we will explain, after illustrating the above rule by two or three examples.

Required the fluent of $\frac{(1+x)\dot{x}}{x-x^2}$ by resolving it into its simple fractions.

Here the factors of the denominator being x and $1-x$, we make

$$\frac{(1+x)\dot{x}}{x-x^2} = \frac{A\dot{x}}{x} + \frac{A'\dot{x}}{1-x} = \frac{(A + (A' - A)x)\dot{x}}{x-x^2}$$

whence $A = 1$, and $A' - A = 1$, or $A' = 2$, therefore

$$\text{fluent } \frac{(1+x)\dot{x}}{x-x^2} + \text{flu. } \frac{\dot{x}}{x} + \text{flu. } \frac{2\dot{x}}{1-x}$$

which are known.

Required the fluent of $\frac{(x-1)\dot{x}}{1-4x+2x^2}$, or of $\frac{\frac{1}{2}(x-1)\dot{x}}{\frac{1}{2}-2x+x^2}$.

Here, by making $x^2 - 2x + \frac{1}{2} = 0$, we have $x = 1 \pm \frac{1}{2}\sqrt{2}$; make, therefore,

$$\begin{aligned} \frac{(\frac{1}{2}x - \frac{1}{2})\dot{x}}{\frac{1}{2} - 2x + x^2} &= \frac{A\dot{x}}{x-1-\frac{1}{2}\sqrt{2}} + \frac{A'\dot{x}}{x-1+\frac{1}{2}\sqrt{2}} \\ &= \frac{A(x-1+\frac{1}{2}\sqrt{2})\dot{x} + A'(x-1-\frac{1}{2}\sqrt{2})\dot{x}}{\frac{1}{2} - 2x + x^2} \end{aligned}$$

Here we have $A + A' = -\frac{1}{2}(1 - \frac{1}{2}\sqrt{2})A + (1 + \frac{1}{2}\sqrt{2})A' = -\frac{1}{2}$, whence we have $A = -\frac{1}{4}$, and $A' = -\frac{1}{4}$, therefore fluent of $\frac{(x-1)\dot{x}}{x-x^2} = \text{flu. } \frac{-\frac{1}{4}\dot{x}}{x-1+\frac{1}{2}\sqrt{2}}$

+ $\frac{-\frac{1}{4}\dot{x}}{x-1-\frac{1}{2}\sqrt{2}}$, which are known.

We have hitherto considered the factors of the denominators of the proposed fractions to be all unequal; when any number of them are equal, a little difference in the operation is then required; for it is obvious that if two of our

fractions were of the same form, for example $\frac{A}{x-r} + \frac{A'}{x-r}$,

these two would form, in fact, but one fraction $\frac{A+A'}{x-r}$, which leads us to no useful result.

In case of equal factors, therefore, we must proceed as follows: let the proposed fraction be

$$\frac{a + bx + cx^2 + dx^3 + \dots + qx^{m-1}}{(x-p)^n(x-r)(x-r')(x-r'') \&c.}$$

Assume it equal to

$$\frac{B}{(x-p)^n} + \frac{B'}{(x-p)^{n-1}} + \frac{B''}{(x-p)^{n-2}} + \dots + \frac{B^{(n-1)}}{x-p} + \frac{A}{x-r} + \frac{A'}{x-r'} + \frac{A''}{x-r''} + \&c.$$

Where the upper line represents the fractions due to the n equal factors, and the lower those due to the $\frac{m}{n}$ unequal factors.

Let now these fractions be reduced to a common denominator, and the co-efficients equated as before, which will give us the required values of the several numerators sought.

Example.—It is required to convert $\frac{1-5x}{(1-x)(1+x)^2}$ into its equivalent simple fractions.

$$\begin{aligned} \text{Assume } \frac{1-5x}{(1+x)^2(1-x)} &= \frac{B}{(1+x)^2} + \frac{B'}{1+x} + \frac{A}{1-x} \\ &= \frac{B + (1+x)B'}{(1+x)^2} + \frac{A}{1-x} = \end{aligned}$$

$$\begin{aligned} \frac{B(1-x) + B'(1-x^2) + A(1+2x+x^2)}{(1+x)^2(1-x)} &= \\ \frac{B + B' + A + (2A-B)x + (A-B')x^2}{(1+x)^2(1-x)} &= \end{aligned}$$

RATIONAL FRACTIONS.

whence
$$\begin{aligned} B + B' + A &= 1 \\ 2A - B &= -5 \\ A - B' &= 0 \end{aligned}$$

therefore $B = 3, B' = -1, \text{ and } A = -1,$
consequently

$$\frac{1 - 5x}{(1+x)^2(1-x)} = \frac{3}{1+x^2} - \frac{1}{1+x} - \frac{1}{1-x}$$

We have in both the preceding cases extended the calculation to a greater length than it is necessary to observe in practical cases, in order that the reader might see distinctly the principles on which the decomposition depends. We shall now furnish him with an easier practical method, which we have extracted from Bonnycastle's Algebra, vol. i.

1. When the factors of the denominator of the given fraction are all unequal, or of the form

$$\frac{N}{D} = \frac{A}{x-r} + \frac{A'}{x-r'} + \frac{A''}{x-r''} + \frac{A'''}{x-r'''} + \&c.$$

take that which constitutes the denominator of the simple fraction which is to be found, and let S denote the product of all the remaining fractions; then if the root or value of x, in that factor, be substituted for x in the formula $\frac{N}{S}$, it will give the numerator of the fraction required.

2. If some of the factors are equal and others unequal, or of the form

$$\frac{N}{D} = \frac{A}{x-r} + \frac{A'}{x-r'} + \&c. \dots + \frac{B}{(x-p)^n} + \frac{B'}{(x-p)^{n-1}} + \&c.$$

let S denote the product of all the factors in the denominator, except one, as before; then find the simple fractions due to the unequal fractions as above, and for those of the equal factors proceed as follows:

1. $B = \frac{N}{S}$, taking x in N, and $S = p$.
Let $Q = \frac{N - BS}{x-p}$, then
2. $B' = \frac{Q}{S}$, taking x in Q, and $S = p$.
Let $Q' = \frac{Q - B'S}{x-p}$, then
3. $B'' = \frac{Q'}{S}$, taking x in Q', and $S = p$.
Let $Q'' = \frac{Q' - B''S}{x-p}$, then
4. $B''' = \frac{Q''}{S}$, taking x in Q'', and $S = p$.
&c. &c.

Which operation being performed, the sum of the fractions thus obtained, together with the former, will give all the simple fractions into which the given fraction is resolvable.

Example 1.—It is required to convert the rational fraction $\frac{1+x^2}{x-x^3}$ into its equivalent simple fractions.

Here $\frac{1+x^2}{x-x^3} = \frac{A}{0+x} + \frac{A'}{1-x} + \frac{A''}{1+x}$; whence, by the preceding rule,

$$A = \frac{N}{S} = \frac{1+x^2}{1-x^2} = 1; \text{ being } 0 = x$$

$$A' = \frac{N}{S} = \frac{1+x^2}{x+x^3} = 1; \text{ being } 1 = x$$

$$A'' = \frac{N}{S} = \frac{1+x^2}{x-x^3} = -1; \text{ being } 1 = -x.$$

The required fractions are therefore

$$\frac{1}{x} + \frac{1}{1-x} - \frac{1}{1+x} = \frac{1+x^2}{x-x^3}$$

Example 2.—It is required to convert the rational fraction $\frac{N}{D} = \frac{1}{x^3(1-x)^2(1+x)}$ into its equivalent simple fractions. Here

$$\frac{N}{D} = \frac{A}{1+x} + \frac{B}{x^2} + \frac{B'}{x} + \frac{B''}{x} + \frac{C}{(1-x)^2} + \frac{C'}{1-x};$$

whence for $1+x$, the first factor, we have

$$A = \frac{N}{S} = \frac{1}{x^3-2x^2+x} = \frac{1}{4}, x \text{ being } = -1$$

$$B = \frac{N}{S} = \frac{1}{1-x-x^2+x^3} = 1, x \text{ being } = 0.$$

$$\text{Let now } Q = \frac{N - BS}{x+p} = \frac{x+x^2-x^3}{x} = 1+x-x^2$$

$$B' = \frac{Q}{S} = \frac{1+x-x^2}{1-x-x^2+x^3} = 1, x \text{ being } = 0.$$

$$\text{Let } Q' = \frac{Q - B'S}{x-p} = \frac{2x-x^3}{x} = 2-x^2$$

$$B'' = \frac{Q'}{S} = \frac{2-x^2}{1-x-x^2+x^3} = 2, x \text{ being } = 0.$$

Again, for $(1-x)^2$

$$C = \frac{N}{S} = \frac{1}{x^3+x^1} = \frac{1}{2}, x \text{ being } = 1.$$

$$\text{Let now } R = \frac{N - CS}{x-p} = \frac{1 - \frac{1}{2}x^3 - \frac{1}{2}x^1}{x-1} = 1+x+x^2 + \frac{1}{2}x^3$$

$$C' = \frac{R}{S} = \frac{1+x+x^2 + \frac{1}{2}x^3}{x^3+x^1} = \frac{3}{2}, x \text{ being } = 1.$$

Therefore $\frac{1}{x^3(1-x)^2(1+x)} = \frac{1}{x^3} + \frac{1}{x^1} + \frac{2}{x} + \frac{1}{2(1-x)^2} + \frac{1}{4(1-x)} - \frac{1}{3(0+x)}$, as required.

It is obvious, as we have before stated, that this decomposition of rational fractions must necessarily be affected as to its general application, by the imperfection of the theory of equations, which will not admit of a practical resolution of the denominator into its simple factors in all cases. It will also further appear, that, in case of any of the roots being imaginary, the same will necessarily enter into the numerators of the simple fractions. But this difficulty may be avoided: for since the imaginary roots of equations always enter in pairs, and the product of such pairs of roots being always real, being of the form

$$x^2 + 2\alpha x + \alpha^2 + \beta^2,$$

we may, instead of resolving the fractions into the simple fractions $\frac{A}{x-r}, \frac{A'}{x-r'}, \frac{A''}{x-r''}, \&c.$ resolve it into as many

of these fractions as it has rational simple factors, and into as many fractions of the form $\frac{Bx+C}{x^2 + \alpha x + \alpha^2 + \beta^2}$, as it has

pairs of imaginary factors, and then proceed as before.

We

We cannot extend our remarks to a greater length in this article; we must, therefore, refer the reader who wishes to see these principles more completely developed, to Euler's *Analysis Infinitorum*, vol. i. ch. 2 and 11; to La Croix's *Algebra*, and his *Calcul Differentiel et Calcul Integral*. See also Bonnycastle's *Algebra*, and Simpson's *Fluxions*.

RATIONAL or *true horizon*, is that whose plane is conceived to pass through the centre of the earth; and which therefore divides the globe into two equal portions, or hemispheres. See **HORIZON**.

It is called the *rational horizon*, because only conceived by the understanding; in opposition to the *sensible* or apparent horizon, which is visible to the eye.

RATIONAL integer, or *whole number*, is that of which unity is an aliquot part. See **NUMBER**, and **ALIQUOT part**.

RATIONAL mixt number is that consisting of an integer, and a fraction; or of unity, and a broken number.

Commensurable quantities are defined by being one to another as one rational number to another.

For unity is an aliquot part of a rational number; and a fraction has some aliquot part common with unity; in things, therefore, that are as a rational to a rational number, either the one is an aliquot part of the other, or there is some common aliquot part of both; therefore they are commensurable.

Hence, if a rational number be divided by a rational, the quotient is always a rational.

RATIONAL Physicians, in ancient medical history, the physicians of the *dogmatic* sect, who stood in opposition to the *empiric* sect; the former appealing to certain theoretical principles in the application of remedies, while the latter rested entirely upon experience, and disclaimed all knowledge of first principles. The tenets of both these sects have been handed down to us by a classic author, Celsus, and have been given at length under a former article. See **EMPIRIC**.

RATIONAL Quantity, or *number*, a quantity or number commensurable to unity.

Supposing any quantity to be 1, there are infinite other quantities, some of which are commensurable to it, either simply, or in power: these Euclid calls *rational quantities*. The rest, that are incommensurable to 1, he calls *irrational quantities*, or *surds*.

RATIONAL Ratio. See **RATIO**.

RATIONAL Soul. See **SOUL**.

RATIONALE, a solution or account of the principles of some opinion, action, hypothesis, phenomenon, or the like. Hence,

RATIONALE is also the title of several books. The most considerable is the "Rationale of Divine Offices," by Guil. Durandus, a celebrated school-divine, bishop of Mende, finished in 1286, as he himself tells us. See **PRINTING**.

RATIONALE also denotes an ancient sacerdotal vestment, worn by the high-priest under the old law; and called by the Hebrews, *חֹשֶׁן*, *hoshchen*; by the Greeks, *λογίον*; by the Latins, *rationale* and *pectorale*; and by the English translators, *breast-plate*.

The rationale was a piece of embroidered stuff worn on the breast, about a span square. Du-Cange describes it as a double square of four colours, interwoven with gold, and set with twelve precious stones in four rows, on which were engraven the names of the twelve tribes, and fastened to the shoulder by two chains and two hooks of gold. The form of the rationale was prescribed by God himself, Exod. xxxviii. 15—29.

A rationale appears also to have been anciently worn by the bishops under the new law. But authors are in doubt

about its form; some will have it resemble that of the Jews; others take it to be only the pallium.

RATIONALIS, an officer mentioned in several ancient inscriptions.

Lampridius, in the life of Alex. Severus, uses *rationalis* as synonymous with procurator.

The *rationales* were intendants or surveyors under the emperors; and though Lampridius pretends they were first established by Severus, it is evident there were some under Augustus.

RATIONARIUM, among the Romans, a book which contained the accounts of the empire. It was otherwise called *brevarium*. See **BREVIARY**.

RATIONIS ENS. See **ENS**.

RATIONIS Distinctio. See **DISTINCTIO**.

RATIONIS Os, in *Anatomy*, the bone of the forehead, otherwise called *os frontis*.

RATISBON, or **REGENSPERG**, in *Geography*, an imperial city of Germany, in the circle of Bavaria, and capital of a bishopric of the same name, situated at the conflux of the Regen and of the Danube. The town is large, populous, and fortified; and was anciently the capital of Bavaria, and the residence of its dukes. The emperor Frederic I. annexed it to the empire. This town is a staple, but neither its manufactures nor trade are very considerable; corn, wood, and provisions, are sent by the Danube to Vienna. The number of inhabitants is about 24,000; 62 miles N.E. of Augsburg. N. lat. 48° 55'. E. long. 12° 50'.

The bishopric of Ratibon comprehends about 1383 parishes; and was founded, as it has been supposed, by St. Boniface, in the year 736. The seat of the bishop is at Ratibon, where, however, he has no jurisdiction.

RATISKA, a town of Immeritia; 35 miles N.E. of Cotatis.

RATKAI, GEORGE, in *Biography*, born in 1613, of a noble family, in Hungary, entered into holy orders, and was made canon of the church of Zagrab. He obtained the esteem of the viceroy of Croatia, John Draskovitz, who engaged him to compose the history of that province, and gave him free access to its archives. He accordingly published, in 1652, a very learned work, entitled "Memoria Regum et Banorum regnorum Dalmatiæ, Crotiæ, Slavoniæ, inchoata ab origine sua usque ad annum." Gen. Biog.

RATLINES, or, as the seamen call them, *Rutlins*, or *Ratlings*, are certain small lines which traverse the shrouds of a ship horizontally, at regular distances above the dead-eyes upwards, and forming a variety of ladders, whereby to climb to any of the mast-heads, or descend from them. Hence the term seems to be derived from *raib*, an obsolete word, signifying a *bill*. In order to prevent the rattling from slipping down by the weight of the failors, they are firmly attached by a knot, called a *clove-but*, to all the shrouds, except the foremost or aftmost; where one of the ends, being fitted with an eye-splice, is previously fastened with twine-thread or pack-thread. Falconer.

RATNO, in *Geography*, a town of Lithuania, in the palatinate of Brzesc; 50 miles S.E. of Brzesc.

RATOATH, a poor village of the county of Meath, Ireland, which, before the union, had its representatives in parliament. It gave name to a barony, and is 12½ miles N.W. by N. from Dublin.

RATOLY, a town of Hindoostan, in the circar of Gohud; 25 miles S.E. of Raat.

RATONES, a small island in the river La Plata, near Monte Video.

RATSCHA,

RATSCHA, or RETZKA, a fortress of Sclavonia, on the N. side of the Save, opposite to the mouth of the Drin; 35 miles S.W. of Peterwardein.

RATSCHITZ, a town of Moravia, in the circle of Brunn; 10 miles N.E. of Brunn.

RATSUR, a town of Hindooftan, in the circar of Aurungabad; 65 miles E. of Aurungabad.

RATTAK, a town of Bengal; 14 miles S.S.E. of Curruckpour.

RATTAN. See RUATAN.

RATTAN Canes. See CANES.

RATTELSDORE, in *Geography*, a town of Bavaria, in the bishopric of Bamberg; 9 miles N. of Bamberg.

RATTEN. See RATEEN.

RATTEN, in *Rural Economy*, a provincial word, used to signify a rat.

RATTENBERG, in *Geography*, a town of the county of Tyrol, with a citadel on the Inn; 16 miles E.N.E. of Innsbruck.

RATTKOW, a town of the duchy of Holstein; 6 miles N.N.E. of Lubeck.

RATTLE, among the *Ancients*, a musical instrument called by the Romans *crepitaculum*.

Mr. Malcolm takes the tintinnabulum, crotalum, and sistrum, to have been only so many different kinds of rattles.

The invention of the rattle is ascribed to the famous mathematician Archytas; whence Aristotle calls it *Αρχυτας πλάγυγ*, Archytas's rattle. Diogenianus adds the occasion of the invention; viz. that Archytas, having children, he contrived this instrument to prevent their tumbling over things about the house. So that how much soever some instruments have changed their uses, the rattle, we are sure, has preserved its original application.

RATTLE, or *Rattel*, in *Commerce*, a weight in Arabia; a rattle of coffee contains, at Betelsagui, $14\frac{1}{2}$ vakias, and a farcel, or frazil, of 10 maunds, or 20 rattles, contains 290 vakias; a farcel weighs 20lb. 6oz. 4 dr. avoirdupois, and a bahar of 40 farcels = $815\frac{1}{2}$ lb. avoirdupois; 10 farcels in Betelsagui are equal to 7 in Mocha; 16 vakias of dates, candles, and iron, are reckoned to a rattle; but of all other sorts of goods 15 vakias make a rattle. The rattle is used in the bazar, or market, only. At Jiddah, another sea-port of Arabia, in the Red sea, the bahar contains 10 frazils, 100 maunds, or 500 rattles, and the rattle 15 vakias. The bahar weighs $222\frac{1}{2}$ lb. English troy, or 183lb. avoirdupois; and the maund 29 oz. $4\frac{1}{2}$ dr. avoirdupois. Kelly's Un. Cambist.

RATTLE-Grafs. See RHINANTHUS.

RATTLE-Net. See WOLF Net.

RATTLE, Red. See PEDICULARIS.

RATTLE, Yellow. See RHINANTHUS.

RATTLE-SNAKE. See SNAKE.

RATTLE-SNAKE Root, Senegaw. See MILK-wort.

RATTLE-SNAKE Root, Dr. Witt's, a species of *Prenanthes*; which see.

RATTLE-SNAKE Weed, a species of *Eryngium*; which see.

RATTLE-SNAKE Islands, in *Geography*, a cluster of small islands at the western extremity of lake Erie.

RATTLE-SNAKE Mountains, mountains of New Hampshire; 38 miles N. of Concord.

RATTLING in horses, a term applied to a disagreeable noise produced in them by the entrance of the air between the internal parts of the sheath and the prepuce or covering, principally taking place in trotting or going fast.

RATTONNEAU, in *Geography*, a small island at the

entrance of the harbour of Marseilles, which has a fortress erected in the 17th century by the duke of Guise.

RATTRAY HEAD, a cape of Scotland, on the N.E. coast of the county of Aberdeen; 7 miles N. of Peterhead. N. lat. $57^{\circ} 12'$. W. long. $1^{\circ} 44'$.

RATULAH, a town of Hindooftan, in Oude; 15 miles N.E. of Fyzabad.

RATWAH, a town of Hindooftan, in the circar of Gohud; 27 miles E. of Gwalior.

RATZE, in *Commerce*, the name of a small coin, struck at Friburgh, &c. nearly of the same value with the *blare*, which, in France, is worth two sols and a denier.

RATZEBUR, in *Geography*, a town of Hinder Pomerania; 14 miles S. of New Stettin. N. lat. $53^{\circ} 30'$. E. long. $16^{\circ} 14'$.

RATZEBURG, a town of Germany, which gives name to a principality, situated on an island in a large lake; the lake is 30 miles long, and 9 broad, and boats pass by it to Lubeck with goods and passengers. It was burnt by the Danes in 1693, and since that disaster the streets have been regularly laid out, and the houses are built after the Dutch manner. In the market-place is the regency-office, and here is held the chief court of justice and the consistory; the garrison is quartered in barracks; 20 miles S. of Lubeck. N. lat. $53^{\circ} 43'$. E. long. $10^{\circ} 46'$. The principality of the same name is situated between Mecklenburg and Saxe-Lauenburg, and extends about 10 miles each way. The soil is fertile, and produces a considerable quantity of wheat, besides feeding a number of cattle. It was converted from a bishopric into a principality by the peace of Westphalia. It belongs to Mecklenburg-Strelitz.

RATZENSTEIN, a town of the duchy of Stiria; 5 miles S. of Windisch Gratz.

RATZKNITSCHA, a town of Hungary; 10 miles N.N.W. of Cskathurn.

RAVA. See RAWA.

RAVALEMENT, Fr. equivalent, among organ-builders and harpsichord-makers, to *compass* in English. The complete set of keys, or whole system of musical sounds, (said Rousseau in 1768,) instead of confining itself to four octaves, like common keyed-instruments formerly, extends now to five octaves, adding a fifth below double C, and a fourth above C in alt., including five octaves between the lowest F and the highest. (This was the common compass of our harpsichords made by Tabel, Kirckman, and Shudi, long before 1768.) The word *ravalement* is confined to keyed-instruments; there are no others of so extensive a compass as five octaves. But in the year 1777, when Dr. Burney first composed and published duets "à quatre mains," or for two performers on one instrument, the ladies, at that time wearing hoops, which kept them at too great a distance from each other, had a harpsichord made by Merlin, expressly for duets, with six octaves; extending from the octave below double C in the base, to the octave above C in alt. in the treble. And as duets à quatre mains have been composed by all the great masters in Europe since that time, instruments with additional keys are now become general. At first it was only in the treble that the compass was extended, except in the instrument above-mentioned by Merlin; but at present notes are added in the base to complete the six octaves: and, indeed, the additional notes in the base are better worth having for particular effects, than those in the treble; which often, from the shortness of the strings and feeble vibration, more resemble the tone of wood than wire; whereas the tone of those in the base of large piano fortes, by the best makers, is so rich and full, that

that each sound below double F resembles that of an organ-pipe in slow notes, more than the transient tone of a string.

Rouffeu very justly observes, that almost all instruments are limited in their compass *below*, except harps and instruments with keys. The violoncello can go no lower than double C, its 4th string, nor the violin below G. The flute and hautbois descend only to D and C. But the notes in alt. have been extended in the acute to sounds that are seldom in tune, and never pleasing. Like rapid notes of difficult execution, they *surprize*, and the performer's dexterity is applauded; but neither the harmony nor the melody of very high or rapid sounds can excite rapture like those of moderate quickness, when produced with feeling and expression, in the middle of the scale.

RAVALSHE, in *Geography*, a town of Sweden, in West Gothland; 24 miles N.W. of Uddevalla.

RAVANA, in *Hindoo Mythology*. See RAVENA.

RAVANAK, in *Geography*, a town of European Turkey, in Macedonia; 16 miles E.S.E. of Saloniki.

RAUAND, a town of Persia, in the province of Ker-man; 105 miles E. of Sirgian.

RAVA-POU, in *Botany*, Rheede Hort. Malab. v. 4. 99. t. 48, a plant erroneously cited by Linnæus for his very different *Nyctanthes hirsuta*. See GUETTARDA *Speciosa*.

RAUCA AVIS, in *Ornithology*, the name of a bird described by Nieremberg, as common about the lakes and rivers of America, and of the kingfisher kind, but nearly as large as a duck, and black on the crown, and white on the breast and belly. Its neck is naturally very long in proportion to its body, yet it can occasionally contract and shorten it in a very wonderful manner. It is a native of Mexico, and is esteemed very good for the table. Mr. Ray has placed this among the birds, the accounts of which he is distrustful of.

RAUCH, in *Geography*, a town of Germany, in the lordship of Schwarzenberg; 10 miles S.W. of Scheinfeld.

RAUCHENEGER, a town of Austria; 2 miles W. of Baden.

RAUCHT, a town of Russia, in the government of Viborg, near lake Ladoga; 44 miles S.E. of Viborg.

RAUDANAGUR, a town of Bengal; 30 miles E. of Rangur.

RAUDEN, a town of Prussia, in the palatinate of Culm; 10 miles N.E. of Culm.—Also, a town of Silesia, in the principality of Ratibor; 12 miles N.E. of Ratibor.

RAUDNIZ, a town of Bohemia, in the circle of Schlan; 12 miles N.N.E. of Schlan.—Also, a town of Bohemia, in the circle of Chrudim; 16 miles N.N.W. of Chrudim.

RAUDRI, a name of the Hindoo goddess *Parvati*, consort of *Siva*, the destroying power. In this character she may be considered as his *Sakti*, or energy in his form of *Rudra*, or Fate. *Rudri*, and *Rudrani*, are other modes of writing this name of the goddess in her avenging character, in which she does not apparently differ much from her attributes, as *Sakti* of *Mahakala*; under which name, and the others occurring in this article, distinguished by italics, farther and sufficient information may be sought. See also TRISAKTI-DEVI, and TAMASI.

RAUDTEN, in *Geography*, a town of Silesia, in the principality of Wohlau; 18 miles N.W. of Wohlau. N. lat. 51° 30'. E. long. 16° 15'.

RAVEL BREAD, a sort of bread, called also *blackwhylof*, as being of a middle fineness betwixt white and brown.

RAVELIN, in *Fortification*, was anciently a flat bastion, placed in the middle of a curtain.

RAVELIN is now a detached work, composed only of two faces, which make a salient angle, without and sometimes with flanks; and raised before the curtain on the counterscarp of the place; serving to cover it and the joining flanks from the direct fire of an enemy.

A ravelin is a triangular work, resembling the point of a bastion, with the flanks cut off. (See *Plate V. Fortification*, fig. 4. lit. i i i. &c.) Its use before a curtain is, to cover the opposite flanks of the two next bastions. It is used also to cover a bridge or a gate, and is always placed without the moat.

What the engineers call a ravelin, the soldiers generally call a demi-lune, or half-moon. See DEMI-LUNE.

There are also *double* ravelins, which serve to defend each other. They are said to be double when they are joined by a curtain.

Ravelins, or half-moons, are constructed by setting off 50 toises from the re-entering angle O of the counterscarp (*Plate VII. Fortification*, fig. 4.) on the capital O L of the ravelin, or on the perpendicular produced, and from the point L drawing lines to the shoulders A, B; whose parts L M, L N, terminated by the counterscarp, will be the faces M O, O N, the semi-gorges of the ravelin required. Others will have the faces of the ravelin to terminate on those of the bastions within three toises of the shoulders, in which case the ravelins cover the flanks better than the others. The ditch before the ravelin is 12 toises, and its counterscarp parallel to the faces of the ravelins, and made in a circular arc before the salient angle. When the ravelins are made with flanks, the faces should terminate those of the bastions, at least 5 toises from the shoulders. These flanks are made by setting off 10 toises from the extremities of the faces, and from the points thus determined, the flanks are drawn parallel to the capital of the ravelin. When redoubts, or keeps, are formed in the ravelin, this is done by setting off 16 toises from the extremities of the faces, on the semi-gorges from N to b, and from M to a; and from the points b, a, the faces are drawn parallel to those of the ravelin: the ditch before this redoubt is 6 toises, and its counterscarp parallel to the faces. This work should be covered in the faces by a wall, a foot or two thick, furnished with loopholes for the musketry to fire through; and it will serve to secure a retreat for the troops who defend the ravelin; they may thus prevent the enemy from making a lodgment in the outward part of the ravelin, or at least greatly obstruct their attempts for this purpose. Nor can they be drove from this place, until the enemy has erected a battery, and brought cannon on the ravelin to batter the redoubt. When the *counterguard* (which see) is placed before the ravelin, 40 toises are set off on the capital of the ravelin from its salient angle to the salient angle of the counterguard, and 10 on the counterscarp of the ditch. For the construction of crown-works before the ravelin, see HORN-work. Within the ravelin are constructed a rampart of about 16 or 20 yards, and a parapet of about 6 yards: ramps are also annexed in the slope of a rampart, and a barbet, when it is proper, is constructed in a salient angle. In wet ditches, where the troops pass from the town to the ravelin in boats, it is proper to make, in the gorge of the ravelin, a kind of harbour, where the boats may be covered from the fire of the enemy. In dry fosses, there should be ramps or stairs in the gorge of the ravelin, to preserve a free communication, if the bridges should be broken down by the enemy's shot. The celebrated general Coehorn, in the ravelins which he built at Bergen-op-zoom, contrived a very good defence for the covered way before the faces of the bastions, by making retired flanks in the breasts of the ravelin, where

one or two cannon might be placed as secure from the enemy's fire as those behind the orillon of a bastion. See *Military CONSTRUCTION*.

RAVELLO, in *Geography*, a sea-port town of Naples, in Principato Citra, the see of a bishop, united to Scala; 11 miles W.S.W. of Salerno. N. lat. 40° 39'. E. long. 12° 10'.

RAVELWATER, a river of the county of Antrim, Ireland, rising in the mountains in the northern part, and flowing through Ravel glen to the river Main.

RAVEN, CORVUS, in *Astronomy*. See **CORVUS**.

RAVEN, *Corvus corax* of Linnæus, in *Ornithology*, a large bird of the crow kind, well known throughout the world, as being found in all climates, and all regions. The colour of the whole bird is black, finely glossed with a rich blue, the belly excepted, which is dusky. The ravens build in high trees, or upon the ruins of lofty buildings in the neighbourhood of great towns, being held in the same veneration as the vultures are in Egypt, and for the same reason; for devouring the carcases and filth that would otherwise prove a nuisance. They lay five or six eggs, of a pale greenish colour, marked with small brownish spots. There are many fabulous stories of the longevity of the raven; but birds are in general long lived, and the crow kind not less so than the rest. The raven is a very docile bird, and may be taught to speak, as well as to fetch and carry. In clear weather, ravens are remarked to fly in pairs at a great height, making a deep loud noise, different from the common croaking; and their scent is remarkably good. See **CORVUS *Corax***.

The quills of a raven are used in tuning the lower notes of a harpichord, when the wires are set at a considerable distance from the sticks.

It is rare to find this creature white, yet it happens sometimes. Boyle mentions one. There was also one shewn to the Royal Society some years ago. Boyle's Works abr. vol. ii. p. 46.

RAVEN, *Night*, an English name for a heron, which flies in the night, and makes a very odd and hoarse noise. It has been applied by some to the bittern, or *ardea stellaris*, but improperly, belonging of right to the smaller grey heron, called *nycticorax*. See **HERON**.

RAVEN, *Sea*, or *Corvorant*. See **CORVUS *Aquaticus***.

RAVENA, in *Hindoo Mythology*, is the name of a celebrated king of Lanka, or Ceylon. Such was his prowess, and the oppression which he exercised over his subjects, that it became necessary for Vishnu, the preserving power of the deity, to descend on earth for his destruction, and the relief of the suffering world. He accordingly became incarnate in the person of Rama; and the wars that ensued between the forces of the tyrant and the divine general, for the recovery of Sita, his ravished spouse, are the subject of the fine epic poem, the *Ramayana*; under which article of this work, and under *Rama*, and others thence referred to, the poem, and the historical traditions connected with these points, are sufficiently described and discussed.

Although obscured by mythological fables, these persons and wars are admitted to have had historical existence; and some important points of chronology hinge upon them. We have, therefore, in this and other articles, noticed at some length the legends connected with these subjects.

In the Hindoo theogony, the origin of Ravena is thus related. Two ethereal warders of Vishnu's palace carried the pride of office so far as to insult the seven Maharshis, (see **MAHARSHI**, or **RISHI**,) who had come to offer their adorations. The offended sants pronounced an imprecation on the insolent warders, condemning them to be *adho-*

yoni, or *born below*, thrice in mortal forms, before they could be re-admitted into the divine presence. The imprecation of a Rishi, even if provoked by a god, is scarcely to be averted; and the offenders, in consequence, appeared in their first birth as Hiranyaksha, or golden-eyed, and Hiranyakshipu, or clad in gold; secondly, as Ravena and Kumbhakarna; and lastly, as Kanfa and Sifupala.

The history, if such it may be called, of Ravena, Rama, &c. is perpetually alluded to in Hindoo writings; the *Ramayana*, containing an infinity of such legends, being one of the most popular works of the East. Ravena, or Ravana, has become a generic name for a tyrant. He is also called *Dafagriva*, or the ten-necked; he being usually represented with that number of heads, and twenty hands, symbolical of sapience and prowess. A couplet in the *Ramayana* may be thus translated. "Where Ravana is, the sun loses his force, the winds cease to blow, the fire ceases to burn: the rattling ocean, seeing him, stills its waves." Such are the hyperbolic relations of his potency, obtained by the usual process of self-inflicted austerities. So ardent was he in this irresistible species of merit, that he offered to Siva nine of his ten heads successively; and thus extorting the favour of the condescending deity, pleased with such an important sacrifice, he obtained a promise, with some equivocal stipulations, of whatever he should desire. This sort of austerity is called *Tapas*, under which word some account is offered of various modes of practising it. The gods and demi-gods, alarmed at Siva's promise, besought him to recall it. But such conduct is deemed unbecoming in deities, who, however, do not scruple to evade the performance of their promises by deceit or prevarication: and, on this occasion, Nareda was deputed to sound Ravena as to what he would demand, which, as usual, was universal dominion, &c. Nareda artfully persuaded Ravena that Mahadeva (or Siva) was drunk, and had promised him what he could not perform: whereupon the vindictive giant tears up Kailasa, the paradise of Siva, which, being contrary to the stipulations, releases Siva from his promise, and he consents to the destruction of Ravena, which is brought about by the avatara, or descent, of Vishnu in the person of Rama. From this story we are told to learn that all worldly affairs are the predestined ordainments of providence; whose will, that any event should take place on earth, includes presciently all the routine and detail of its accomplishment; although we only see the links of a chain of causes leading naturally to its effect.

We will here add an extract from the Hindu Pantheon, whence a considerable part of this article is taken, shewing how unceasingly the mythological machinery of that poetical people is introduced into their popular works. The names distinguished by capitals imply that articles are given under those words, in this work; and a reference may be made to them for any desired information.

"Respecting Ravena," says the author of the publication adverted to, "I will notice but one more tale, as related to me by a Brahman; who, unable fully to make me feel the poetical beauties, or comprehend the morality of the *Ramayana*, blushed while he developed its follies; which, in conformity with popular taste, or if taken separately, are apparently very numerous; although it must be confessed, they are so contrived as to be intimately connected with the main action of the poem. The following idle tale is of this description: but I shall not here explain the causes that led to the predicament, or the consequences that ensued.

"Ravena, by his power and infernal arts, had subjugated all

all the gods and demi-gods, and forced them to perform menial offices about his person and household. INDRA made garlands of flowers to adorn him withal. Agni, or PAVAKA, was his cook. SURYA, regent of the sun, supplied light by day; and SOMA, regent of the moon, by night. VARUNA, the Hindoo Neptune, purveyed water for the palace. KUVERA, their Plutus, furnished cash. The whole NAVA-GRAHA (the nine planetary spheres, including RAHU and KETU) sometimes arranged themselves into a ladder, by which, they serving as steps, the tyrant ascended his throne. BRAMA (for the great gods were there also, and I give this anecdote as I find it in my memoranda, without any improved arrangement) was a herald, proclaiming the giant's titles, the day of the week, month, &c. daily in the palace; a sort of speaking almanac. MAHADEVA, in his character or incarnation of KANDEH-RAO, performed the office of barber, and trimmed the giant's beards. VISHNU had the honourable occupation of instructing and drilling the dancing and singing girls, and selecting the fairest for the royal bed. Ganefa, or POLLEAR, had the care of the cows, goats, and herds. VAYU swept the house. YAMA washed the linen. And in this manner were all the gods employed in the menial offices of Ravena, who rebuked and flogged them in default of industry and attention. Nor were the female divinities exempted: for PARVATI, in her form of SATWI, was head Aya, or nurse, to Ravena's children. LAKSHMI and SARASWATI were also among them, but it does not appear in what capacity. Earthly kings and queens were also forced into this degrading servitude, to the number of ninety-six royal families; as is said to be detailed in the RAMAYANA. But I have some doubt if such a relation be actually in this shape, in that poem: this we shall see, when its other books are translated and published. In my abstract of it, however, such a godly predicament seems essential to the main action; RAMA being thereby impelled by every consideration of piety and duty to immediate and energetic measures, for the relief and liberation of the degraded divinities."

Ravena, as we have noticed, is surnamed Dasagriva, or the ten-headed. He is also called Vifravana, or son of Vifrava, the father likewise of Kuvera. The brothers are sometimes named Pulastya, or Paulastya. (See these articles.) Another of his names is equivalent to lord of Rakshasas, a race of malignant beings, common agents in the hands of superhuman tyrants for the annoyance of the virtuous portion of mankind, or thwarting the beneficent views of the gods. Many specific varieties of these demons are enumerated in the first book of the Ramayana, as aiding Ravena in defence of himself and his kingdom of Lanka. In pictures illustrative of the Ramayana, which are very common throughout India, they are depicted especially ill-favoured, painted green, red, blue, &c. and engaged in fierce combats with Rama's simian soldiery. Several legions of these Rakshas, each of 14,000, were destroyed by Rama. See RAKSHA.

RAVENALA, in *Botany*, Adanf. Fam. des Plantes, v. 2. 67. Jussl. 62. See URANIA.

RAUENBACH, in *Geography*, a town of Germany, in the principality of Anspach; four miles S.S.W. of Anspach.

RAVENGLASS, a market-town and sea-port in the parish of Muncaster, Allerdale ward, above Darwent, county of Cumberland, England, is situated on the Solway Frith, near the confluence of the rivers Esk, Mite, and Irt. Though possessing many advantages for trade, it is but a poor place, and chiefly supported by its oyster fishery, for which it is much celebrated. This town stands at the dis-

tance of 57 miles S.S.W. from Carlisle, and 287 N.W. by N. from London. The manor originally constituted part of the barony of Egremont, but was granted by Richard Lucy to the Penningtons, from whom the present owner, lord Muncaster, is lineally descended. The market day is Saturday, weekly; and there are two annual fairs, one of which is held on the eve, day, and morrow, of St. James, and is remarkable for the ceremonies attending its proclamation and continuance. On the first day, the earl of Egremont, or his proxy, attends, accompanied by the serjeant of the borough of Egremont, with the insignia, called the Bow of Egremont; by the foresters, with their bows and arrows; and by all the tenants of the forest of Copeland, who hold their estates by the special service of attending the earl, or his representative, during the fair. On the third day, at noon, the earls, officers, and tenants of the forest, depart, after proclamation; and lord Muncaster, and his tenants, take formal re-possession of the place, and the day is concluded by horse-racing, and various rustic diversions.

Near Ravenslafs, on the northern bank of the river Esk, stands Muncaster-house, the seat of lord Muncaster; and east from it, on the opposite side of the river, are seen ruins of considerable magnitude, respecting which no historical documents are known to exist. They are now called the *city of Barnscar*; and its foundation is ascribed, by tradition, to the Danes, who are said "to have gathered for its inhabitants the men of Drig, and the women of Beckermont," whence the popular saying, "let us go together like lads of Drig and ladies of Beckermont." These ruins extend about three hundred yards in length from east to west, and 100 in breadth, from north to south; and are enclosed, except at the east end, by a wall, nearly three feet in height. "There appears," says Hutchinson, "to have been a long street, with several cross ones; the remains of the housesteads within the walls are not very numerous; but on the outside they are innumerable, especially at the fourth side and west end. The circumference of the city, and suburbs, is nearly three computed miles; the figure is an oblong square. There is an ancient road through the city, leading from Ulpha to Ravenslafs. About the year 1730, a considerable quantity of silver coin was discovered in the ruins of one of the houses, concealed in a cavity formed in a beam." A History of the County of Cumberland, &c. by William Hutchinson, F.S.A., two vols. 4to. Beauties of England and Wales, vol. iii., 1802, by John Britton and Edward Wedlake Brayley.

RAVENNA, a very ancient city of Italy, in the department of the Amone, seated on the river Mentone, near the Adriatic. This city, as Strabo informs us, was built by the Thefalians, on several islands, long before the war of Troy, and they were driven out by the Tuscans. In the time of this Greek writer, it was situated in the midst of a marsh, and attached to the continent, and in process of time the Po accumulated mud and sand, so that the land was raised and the sea removed to a greater distance. The same writer informs us, that it was made a Roman colony by Augustus; and Dion says, that a fleet of 250 vessels was stationed in this port by that prince, from which circumstance it was called "portus classis," or the port of the fleet. He stationed, says Suetonius, one fleet at Misenum, and another at Ravenna, for guarding the upper and lower sea. Tiberius repaired its walls, and erected some new gates, which still bear an inscription to this purpose. Trajan also contributed towards embellishing this city. Honorius made it the place of his residence, both before and after Alaric had captured and burned Rome. When Odoacer made a conquest of Italy, he resided at Ravenna, and sustained here a siege

of three years, at the termination of which he was taken and slain by Theodoric. Theodoric fixed the seat of his empire in this place, and adorned it with magnificent churches and palaces, and re-constructed the aqueduct of Trajan. His daughter Amalafoutha, and his grandson Athalaric, contributed towards the improvement of this city. When the Goths were driven from Italy by Narfes, general of the emperor Justinian, he was made governor of Ravenna; and having continued in this station for 16 years, he was recalled by Justin II., successor to Justinian; and in the year 567 he was succeeded by Longinus, who took up his residence at Ravenna, under the title of exarch. (See EXARCH.) The famous battle of Ravenna was fought near this town between Gaston de Foix, duke of Nemmes, and nephew of Louis XII. and the army of pope Julius II., Ferdinand, king of Spain, and the Venetians, in which the former young general, being only 24 years of age, having killed between 16 and 18,000 of the enemy, proved victorious, though he himself was killed by too ardently following the pursuit. This happened on Easter-day 1512. The French, enraged by the loss of their brave general, took Ravenna by storm, and pillaged the city with such severity that it has never recovered. On the road to Forli, by the banks of the little river Ronco, three miles from the city, a cross shews the spot where Gaston de Foix was killed. Fresh water has always been so scarce at Ravenna, that it has occasioned a pleasant epigram by Martial. This city was of late the capital of Romagna, with the title of an archbishopric. It has produced several persons of eminence, as Faustinus, often mentioned by Martial; the sophist Aspafius, who lived under the reign of Alexander Severus; Cassiodorus, chancellor to Theodoric, king of the Goths in Italy; pope John XVII.; Peter Damien, cardinal of Offa, and several others. Ravenna was also the seat of many councils at successive periods. The three last councils, in 1311, 1314, and 1317, were summoned for the purpose of reforming the corrupted manners of the ecclesiastics, which were, in those days, very debauched. It is now a mean and inconsiderable town; the houses are old and in a ruined state, and the number of inhabitants scarcely amounts to 14 or 15,000. In the time of the Romans, it was seated on a kind of bay formed by the Adriatic, and its harbour was celebrated; but it is now three miles from the sea. The mud thrown up by the tide having formed a tract of land, which is cultivated, and on which the city itself has been enlarged towards the sea. The air is insalubrious; but has been somewhat amended by conveying along the sides of the city the rivers Mentone and Ronco, which carry off the fetid water from the marshy grounds. It contains several churches, and 24 convents; 42 miles E. of Bologna. N. lat. $44^{\circ} 27'$. E. long. $11^{\circ} 5'$.

RAVENPOINT, a headland of the county of Wexford, Ireland, at the N. side of the entrance into Wexford haven. N. lat. $52^{\circ} 23'$. W. long. $6^{\circ} 18'$.

RAVENSARA, in *Botany*, a barbarous appellation, altered by Sonnerat from the Madagascar name of the plant, *Raven-sara*, or *Voaravend-sara*, meaning, it seems, a good leaf, and applying to the aromatic qualities, and economical uses, of the leaves. Hence Jussieu was induced to contrive the apt generic name *Agathophyllum*, from *αγαθος*, good or profitable, and *φυλλον*, a leaf; under which this genus ought to have been described in its proper place, in our first volume. But one of our predecessors has, by mistake, referred the reader to *Raven-sara*, as a genuine Linnæan name, attributing *AGATHOPHYLLUM* to professor Martyn; see that article. To correct this error, and supply the consequent deficiency, we subjoin an account of the tree in question, under its proper and received denomination.

AGATHOPHYLLUM. Juss. 431. Schreb. 806. Willd. Sp. Pl. v. 2. 842. Mart. Mill. Dict. v. 1. Lamarck Illustr. t. 825. (Raven-sara; Sonnerat Ind. Occ. v. 2. 226. Euodia; Gærtner t. 103. Lamarck Illustr. t. 404.)—Class and order, *Dodecandria Monogynia*. Nat. Ord. uncertain, perhaps akin to the *Lauri*, Juss.

Gen. Ch. *Cal.* Perianth inferior, very small, abrupt, entire, permanent. *Cor.* Petals six, ovate, inserted into the calyx, somewhat villous on the inside. *Stam.* Filaments twelve, broadish, very short, alternately inserted into the base of the petals and the inside of the calyx; anthers roundish. *Pist.* Germen superior, very small; style very short; stigma downy. *Peric.* Drupa nearly globose, umbilicated. *Seed.* Nut the shape of the drupa, tipped with a small abrupt point, divided internally half way, into six coriaceous cells; kernel convex above, six-lobed below, one lobe being received into each cell.

Ess. Ch. Calyx abrupt, entire. Petals six, inserted into the calyx. Drupa superior, nearly globose. Nut with six incomplete cells. Kernel solitary, with six lobes.

Obf. Schreber, by a casual oversight, describes the fruit as crowned with the calyx, though he justly terms the germen superior.

1. *A. aromaticum*. Willd. n. 1. (Raven-sara aromatica; Sonnerat Ind. Or. v. 2. 226. t. 127. Euodia Raven-sara; Gærtner v. 2. 101.)—Native of Madagascar. A large and tufted, somewhat pyramidal tree, with a reddish aromatic bark, and heavy, hard, inodorous, white wood, intermixed with red fibres. *Leaves* alternate, stalked, simple, obovate, entire, generally obtuse; smooth on both sides; pale and rather glaucous beneath; single-ribbed, of a firm or coriaceous texture. *Flowers* very minute, numerous, in axillary panicles about the ends of the branches, shorter than the leaves. *Fruit* an inch in diameter, solitary at the end of each branch, so that, as Sonnerat remarks, one would think the flowers had grown on a different tree; the panicles being obliterated, probably, in consequence of one flower alone, in each, bearing fruit. The tree produces fruit at the age of five or six years, which is ten months in coming to perfection. The inhabitants of Madagascar gather it at the age of six or seven months, as being, in that state of growth, more fit for use as a spice. The kernel, when fresh, has a fine aromatic odour, but its taste is bitter, and so highly acrid as to burn the throat very disagreeably. The leaves are also very aromatic, and being made into a sort of garlands, are left for a month in the open air to dry; after which they are plunged, for four or five minutes, into boiling water, and then dried, either in the sun, or by a fire. The fruits are treated in the same manner. The flowers appear in January or February. The dried leaves, as well as the fruit, of this tree, are said to partake of the flavours of the four most esteemed spices. They have not, however, come into use as an article of commerce, though some of the French, resident in Madagascar, have endeavoured to call the attention of their countrymen to this object. Gærtner found the odour of the fruit, though agreeable, too weak to promise much utility.

RAVENSBERG, in *Geography*, a county of Germany, lying between the bishoprics of Munster, Osnaburgh, and Paderborn, the principality of Minden, and the counties of Schauenberg and Lippe. The soil is in some parts sandy, but in others, especially towards the principality of Minden, it produces corn, flax, and hemp; coal is found in some of the mountains, and good stone for building. Its name is derived from that of an ancient castle, and it had formerly its own counts. It lately belonged to the king of Prussia; but by the peace of Tilsit was transferred to the kingdom of Westphalia.

Westphalia. The approaching congress (1814) may possibly fix its future destination.

RAVENSBURG, a town of Bavaria, which anciently belonged to the Guelphs, counts of Altorf; but it was an imperial town before the time of king Rodolphus, and continued such till the year 1802, when it was given, among other indemnities, to the elector of Bavaria. The Roman Catholics and Lutherans are united with regard to the temporal and spiritual concerns of the place, and the magistracy is shared betwixt them. They have one church in common; but the Lutherans are exclusively possessed of another, and the Roman Catholics have also two parish-churches; 21 miles N.E. of Constance. N. lat. 47° 41'. E. long. 9° 38'.

RAVENSBURG, a town of the Rhenish palatinate, on the Elfs; 16 miles W. of Heilbronn.

RAVENSBUURN, a small stream of England, which runs into the Thames between Greenwich and Deptford.

RAVENSCROFT, THOMAS, in *Biography*, an active English musician and publisher, who flourished from the beginning of the 17th century to 1635. He was the editor and composer of the best collection of psalm tunes in four parts, which had till then appeared in England. He was a bachelor of music, and a professor not only well acquainted with the practice of the art, but seems to have bestowed much time in the perusal of the best authors, and in meditation on the theory.

This book, published in small octavo, 1621 and 1633, contains a melody for every one of the hundred and fifty psalms, many of them by the editor himself, of which a considerable number is still in use; as Windsor, St. David's, Southwell, and Canterbury. There are others, likewise, which are sung by the German, Netherlandish, and French Protestants. To these the base, tenor, and counter-tenor parts have been composed by twenty-one English musicians: among whom we find the names of Tallis, Dowland, Morley, Bennet, Stubbs, Farnaby, and John Milton, the father of our great poet. The tunes which are peculiar to the measure of the 100th psalm, the 113th, and 119th, were originally Lutheran, or perhaps of still higher antiquity. And though Ravenscroft has affixed the name of Dr. John Dowland to the parts which have been set to the 100th psalm, yet, in the index, he has ranked the melody itself with the French tunes; perhaps from having seen it among the melodies that were set to the French version of Clement Marot and Theodore Beza's Psalms, by Goudimel and Claude le Jeune. Ravenscroft, in imitation of these harmonists, always gives the principal melody, or, as he calls it, the *playn-song*, to the tenor. This part, indeed, he sometimes erroneously terms *Fa-burden*. This is a corruption of *faux-bourdon*, and *falso bordon*, which originally implied such simple harmony as arises from a series of thirds and sixths to the base. His publication is, in some measure, historical: for he tells us not only who composed the parts to old melodies, but who increased the common stock, by the addition of new tunes; as well as which of them were originally English, Welch, Scots, German, Dutch, Italian, French, and imitations of these.

No tunes of triple time occur in Claude le Jeune, and but five in Ravenscroft: the principal of which are Cambridge, Martyrs, Manchester, and the 81st. This last is still much used, and often played by chimes: it is called an imitation of a foreign tune, and has the name of Richard Allison prefixed to it. Muller's German edition of the psalm tunes at Frankfort is exactly that of Claude le Jeune, in two parts only; except that he has transposed some of the melodies, and inserted easy leading and connective notes, to assist, not only the finger, but sometimes the tunes them-

selves; which, without them, would now be very bald and uncouth. Many of these old melodies are still sung to German hymns as well as psalms.

In 1614 Ravenscroft published "A briefe Discourse of the true, but neglected, Use of characterizing the Degrees by their Perfection, Imperfection, and Diminution in measurable Musicke, against the common Practice and Custome of the Times," 4to.

Ravenscroft had been educated in St. Paul's choir, under Mr. Edward Pierce, and was particularly conversant with old authors; he, therefore, wished to revive the use of those proportions in time, which, on account of their intricacy, had been long discontinued.

Ravenscroft practised these exploded doctrines ineffectually, though to his Discourse he added examples to illustrate his precepts, expressed in the harmony of four voices, concerning the pleasure of the five usual recreations of hunting, hawking, dancing, drinking, and enamouring. He was not always very successful in his attempts at imitative harmony; and melody was then so crude and uncouth throughout Europe, as to afford little assistance in imitative strains.

Ravenscroft was also the author of a collection of songs, entitled "Melcimata, Musical Phancies, fitting the Court, City, and Country Humours, in three, four, and five Voyces," published in the year 1611.

RAVENSCROFT, JOHN, one of the waits of the Tower Hamlets, and in the band of the Goodman's-fields playhouse, was a ripieno violin; yet, notwithstanding so humble a station, he was a performer of sufficient abilities to lead in any such band as that just mentioned; and could perform with great firmness a concerto of Corelli, or an overture of Handel. He was in great request at balls and dancing parties; but excelled most others, not only in *playing* hornpipes with the true sailor's *slang*, but in *composing* them: and there are two of his compositions, that a tar, if he had any leg to stand on, would irresistibly be impelled to dance, the moment he heard them.

RAVENSPUR, or **RAVENSER**, in *Geography*, was formerly a noted sea-port at the mouth of the Humber. It is celebrated by our historians for the descents of Henry IV. A.D. 1399, and of Edward IV. A.D. 1471, when these princes came to contend for the crown of England. It was shortly after, however, swallowed up by the ocean, together with many villages in its vicinity. The precise spot on which it stood is now unknown; but it is usually supposed to have been placed very near to Spurn Head, the Ocellum Promontorium of Ptolemy. For some additional account of the coast here, see PATRINGTON.

RAVENSTAIN, a town of Saxony, in the circle of Erzgebürg; 8 miles N.N.W. of Wolkenstein.—Also, a town of Hinder Pomerania; 7 miles E.S.E. of Zachan.

RAVESTAIN, a town of Brabant, on the S. side of the Meuse, the capital of a signiory, including 14 towns and villages; 15 miles N.E. of Bois le Duc.

RAVI, a name, in Sanscrit, of Surya, the Hindoo regent of the sun. It means the *Riser*, and has perhaps other meanings. See SURYA.

RAVIERES, in *Geography*, a town of France, in the department of the Yonne; 27 miles E. of Auxerre.

RAUJESHI, a circar of Bengal, bounded N. by Rajemal, E. by Bettooriah, S. by Mahmudshah, Shahjole, and Kishenagur, and W. by Birboom and Hindooa; about 55 miles long, and 18 broad. The capital is *Moorshedabad*; which see.

RAVILLE, a town of France, in the department of the Moselle; 5 miles S. of Bouley.

RAVILLY, a small town of the county of Carlow, Ireland, in the barony of the same name. It is situated on the river Slaney, 3 miles S. from Baltinglafs, and 32 S. by W. from Dublin.

RAVINA, a town of European Turkey, in Albania; 52 miles E. of Valona.

RAVINE, in *Field Fortification*, a deep hollow, usually formed by a great flood, or long continued running of water; frequently turned to good purposes in the field.

RAVIS, the same with *raucedo*. See **HOARSENESS**.

RAVISHMENT, in *Law*, denotes an unlawful seducing either a woman, or an heir in ward; for which there is a remedy by a writ of ravishment, or action of trespass *vi & armis, de filio vel filia raptò vel abducto*, in the same manner as the husband may have it *de uxore raptà et abducta*, on account of the abduction of his wife. This action lay at the common law; and thereby the husband shall recover, not the possession of his wife, but damages for taking her away: and by statute Westm. I. 3 Edw. I. c. 13. the offender shall also be imprisoned two years, and fined at the pleasure of the king. Both the king and the husband may, therefore, have this action; and the husband is also entitled to recover damages in an action on the case against such as persuade and entice the wife to live separate from him, without a sufficient cause.

Sometimes it is also used in the same sense as *rape*; which see.

RAVISHMENT de Gard, is a writ which anciently lay, and still lies, for the guardian in focage against him who took from him the body of his ward, or pupil: but then he must account to his pupil for the damages he so recovers. It is expressly provided by statute 12 Car. II. c. 24. that testamentary guardians may maintain an action of ravishment, or trespass, for recovery of any of their wards, and also for damages, to be applied to the use and benefit of the infants.

RAVITZ, or **RAWISCH**, in *Geography*, a town of the duchy of Warsaw, most of the inhabitants of which are Lutherans: it has a considerable manufacture of cloth; 24 miles S. of Posen.

RAVIUS, or **RAVE**, **CHRISTIAN**, in *Biography*, a learned German Orientalist, was born at Berlin in the year 1613. From a very early period he was attached to the study of the eastern languages, and after spending eight years in different universities on the continent, he came over to England in the year 1658, and took up his residence at the university of Oxford. He brought with him recommendations from Vossius, and other learned men; and was invited to Dublin by archbishop Usher, primate of Ireland, who settled upon him a handsome stipend, and engaged him to take a voyage into the East, for the purpose of collecting ancient manuscripts. About the same time he was invited by cardinal Richelieu to enter into his employment for a similar purpose, which he declined, having already accepted the proposals of Usher. In 1639 he became acquainted with our countryman, the learned Edward Pococke, at Constantinople, where he improved himself in many languages, to which he had already applied his talents; and made himself master of the Turkish, Arabic, and Persian languages. In the mean time he did not neglect the main object of his mission, but collected more than 300 choice manuscripts. For this service he was, on his return, amply rewarded. In 1642 he taught the Oriental languages at Gresham college, in London. During the following year he went to Holland, and was appointed professor of the Oriental languages at Utrecht. We find him again in England in 1648, when he took the covenant, and was made

fellow of Magdalen college, Oxford, by the parliamentary visitors. In the course of a few months he left England, and went to Sweden, where he obtained the appointment of professor of the Oriental languages at the university of Upsal. This place he was obliged to leave about the year 1657; the revenues, that ought to have been devoted to the Upsal professors, having been applied towards defraying the expences of the war between Sweden and Denmark. After this he for some time filled the chair of Oriental literature at the university of Kiel, and from thence he removed to occupy the same professorship at Frankfort on the Maine. He died in 1677, about the age of 64. His works are very numerous, of which the following are titles of the principal: "Obiectatio ad universam Europam pro dicendis Rebus et Linguis Orientalibus, ac conjuganda Africæ atque Asiæ Eruditione," 1644; "Orthographiæ et Analogiæ vulgo Etymologiæ Ebraicæ Delineatio, juxta vocis partes abstractas;" "A Discourse of the Oriental Tongues, viz. Hebrew, Samaritan, Chaldee, Syriac, Arabic, and Ethiopic," 1649; "Concordantiarum Hebraicarum et Chaldaicarum Epitome;" "Chronologia Biblica nova;" "Epistolæ variae ad doct. Viros." He gave also to the world a translation, from the Arabic language, of Apollonius's Conic Sections. He had a brother, named John Ravius, who was professor of philosophy at Rostock, about the year 1638. In 1664-5 he was appointed counsellor and librarian to the elector of Brandenburg. He was author of "Commentarius in Cornelium Nepotem," 1635; "Summa Studiorum pro Nobilitate Danica;" "Aphorismi Militares," and other learned works.

RAULIN, **JOHN**, a French writer in the 15th century, was born at Toul in the year 1443. He pursued his studies at the university of Paris, where he obtained the degree of D.D. in 1480, and afterwards filled the professor's chair in theology with great distinction. He was elected grand master of the college of Navarre, and founded a good library in that seminary. Becoming dissatisfied with the world, he embraced the monastic life at the abbey of Cluny, in Burgundy, in 1497. He died in 1514, at the age of 71. He attracted much attention as a preacher, and several of his sermons have been published, which exhibit striking specimens of the bad taste which prevailed in France in the 15th century. The works of this author were collected, and published at Antwerp, in 6 vols. 4to., 1612. They are accompanied with a curious and valuable collection of "Letters," that illustrate the history, manners, and sentiments of the age in which he lived. They were first published after his death, in quarto, in 1521, under the title of "Joannis Raulin Epistolæ Illustrium Virorum." Moreri.

RAULT, **FELIX**, the favourite performer on the German flute at Paris, in 1770; where we heard him ourselves with as much pleasure as a flute can give, by neat execution, perfect intonation, and a mellifluous embouchure. M. Laborde has rendered his biographical article interesting by a detail of his professional merits and private character.

"M. Felix Rault was born at Bourdeaux, in 1736. He was the son of Charles Rault, of the king's band, and first bassoon at the opera. Felix was received there in 1753, and in the king's band in 1768. His talents are so well known at Paris, as to be above praise. Since Blavet's time, no one has brought the art of playing upon the German flute to such perfection, especially in accompanying the voice; a much more difficult art than playing concertos of great execution, generally well studied at home previous to performance. But such study is useless to Rault; for no

one reads music more readily and with more facility, or gives it more meaning, than this performer. The beauty of his tone, the precision of his execution, the richness of his embouchure, however extraordinary, merit still less praise than his personal qualities, which endear him to all his acquaintance." Laborde.

RAUMO, in *Geography*, a sea-port town of Sweden, in the province of Finland, on the E. coast of the gulf of Bothnia; 50 miles N. of Abo.

RAUNPIKED, in *Rural Economy*, a provincial word used to signify stag-headed, among trees, as an old overgrown oak, having the stumps of the boughs standing out.

RAURAH, in *Geography*, a town of Thibet; 26 miles N. of Jemlah. N. lat. $31^{\circ} 2'$. E. long. $81^{\circ} 40'$.

RAURAVA, a Sanscrit word meaning *dreadful*, and a name of one of the Hindoo hells; they reckoning twenty-one of these receptacles for sinners. Naraka is called Mahaurava, or most dreadful.

RAURIS, in *Geography*, a town of the archbishopric of Salzburg; 32 miles S. of Salzburg.

RAUSCHENBERG, a town of Hesse; 4 miles N. of Marburg. N. lat. $50^{\circ} 53'$. E. long. $8^{\circ} 53'$.

RAUSHENBERG, a town of Germany, in the principality of Culmbach; 7 miles N.N.E. of Neutadt.

RAUSNITZ, a town of Moravia, in the circle of Brunn; 10 miles E. of Brunn.

RAUTA LAMBI, a town of Sweden, in the government of Kuopio; 27 miles S.W. of Kuopio.

RAUTENBURG, a town of Prussian Lithuania; 27 miles W. of Tilsit.—Also, a town of Prussia, in the province of Samland; 36 miles N.E. of Königsberg.

RAUTERN, a town of Austria; 6 miles W.N.W. of Drosendorf.

RAUTIO, a town of Sweden, in the government of Ulea; 36 miles S. of Brahestad.

RAUTPOUR, a town of Hindoostan, in Allahabad; 18 miles N.N.W. of Corah.

RAUTY DUNGAREE, a town of Hindoostan, in Guzerat, on the coast; 50 miles S.W. of Noanagur.

RAUTY-Mummy, or *Rauty-muddum*, *stone-mummy*, a name given by the people of the East Indies to a kind of fossil substance, much valued for its medicinal virtues. It is of the nature of the felenites, and is found upon the high rocks, and supposed to be generated of the dew which falls from the heavens; but this is an idle opinion, and the formation of it is evidently the same with that of the European rhomboidal felenites. They beat it to powder, and after boiling it in milk, they give it in cases of the venereal kind. In a common clap, they give half a scruple, night and morning.

RAUVEE, in *Geography*, a river of Asia, which rises on the borders of Thibet, and joins the Chunaub in the country of Lahore, 28 miles N.E. of Moultan. The Rauvee is the "Hydraotes" of Alexander, and though it is represented as a noble river, it is somewhat inferior in bulk to the Chunaub. Its sources are in the mountains near Nagorkote, a famous place of Hindoo worship; and it enters the plains near Shahpour (called also Rajapour), from whence the famous canal of Shah Nahr was drawn to Lahore, $48\frac{1}{2}$ common cosses in length. The space between the Rauvee and Chunaub, at their entry on the plains, is about 54 geographical miles; and they gradually approach each other during a course of 170 miles. The junction of the Rauvee with the Chunaub (or rather the Chunaub and Behut collectively) is effected nearly midway between Toulumba and Moultan. The Ayin Acbaree allows 27 cosses between the junction of the Behut

and Chunaub, and that of the Rauvee with the Chunaub; but this distance must be applied to the course of the river, not to the road by land. When these three rivers are united, they form a stream equal to the Indus itself, at the place of confluence; which is from 20 to 30 miles below Moultan. Rennell.

RAUWOLFIA, in *Botany*, was so named by Plumier, in memory of Leonard Rauwolf, a native of Augsburg, and a pupil of Rondelet. He sailed from Marseilles, in 1573, for the Levant, and performed a laborious and dangerous journey through Syria, Mesopotamia, Palestine and Egypt; of which he has left an account in German, full of curious information relative to medical and other rare plants, with several wooden cuts. He died physician to the Austrian army, at Hatvany, in Hungary, in 1606, according to Dryander, *Bibl. Banks. v. 395*, though Haller says 1596. The latter writer mentions his being obliged to quit his country on account of his religion, which was Protestant. His splendid herbarium, once the property of queen Christina, and of Isaac Vossius, is preserved in the university of Leyden. From it Gronovius composed his *Flora Orientalis*.—Linn. Gen. 115. Schreb. 160. Willd. Sp. Pl. v. 1. 1217. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 64. Juss. 148. Plum. Gen. 19. t. 40. Lamarck Illustr. t. 172. Gært. t. 52.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Contorta*, Linn. *Apocineae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, minute, with five segments, permanent. *Cor.* of one petal, valver-shaped; tube cylindrical, globular at the base; limb in five deep, roundish, emarginate, oblique segments. *Stam.* Filaments five, shorter than the tube; anthers erect, simple, acute. *Pist.* Germen roundish; style very short; stigma capitate. *Peric.* Berry nearly globose, marked with a furrow along one side, of one cell. *Seeds* two, convex at the base, tapering at the summit, compressed, divided, more or less completely, into two cells.

Est. Ch. Corolla oblique, valver-shaped. Stamens included. Berry globose, with two seeds, each of two cells.

1. *R. nitida*. Shining Rauwolfia. Linn. Sp. Pl. 303. Hort. Cliff. 75. t. 9. Willd. n. 1. Ait. n. 1. (*R. tetraphylla angustifolia*; Plum. Ic. 232. t. 236. f. 1.)—Leaves in fours, lanceolate, pointed, very smooth and shining. Flowers axillary or terminal, cymose.—Native of mountainous woods in the West Indies. A *shrub* about twelve feet high, erect, very smooth and shining, abounding with viscid milk. *Leaves* four together at each joint of the branches, spreading, on short stalks, lanceolate, with a blunt point, entire, unequal in size, from two to five inches, or more, with one rib, and many fine transverse parallel veins. *Flowers* small, white, inodorous, in axillary, rarely terminal, stalked cymes, shorter than the leaves. *Fruit*, according to Jacquin, at first yellow, then purplish-black, thrice the size of a pea, milky. Linnæus tells us his figure in the Hortus Cliffortianus was drawn by Ehret, from a plant in the Chelsea garden; so that this *Rauwolfia* must have flowered under Miller's care, in the year 1736. In Ait. H. Kew. a later date is given. The corolla in the figure just mentioned is more concave in the limb, as well as more notched, than Plumier represents it.

2. *R. glabra*. Smooth Rauwolfia. Cavan. Ic. v. 3. 50. t. 297. Willd. n. 2.—Leaves alternate, ovato-lanceolate, smooth. Cymes opposite to the leaves, of few flowers.

Native of New Spain. The whole plant is smooth. *Stem* shrubby, a yard high, with pliant, round, leafy branches. *Leaves* scattered, rounded at the base, rather pointed, single-ribbed, two or three inches long, on shortish *footstalks*. *Flowers* small, white, about four together, in small cymes or clusters,

clusters, opposite to the leaves. *Berry* obovate, with only one seed; at least in garden specimens, which very probably differ in those respects from wild ones. This species flowered at Madrid from August to October.

3. *R. canescens*. Hoary Rauwolfia. Linn. Sp. Pl. 303. Willd. n. 3. Ait. n. 2. (*R. hirsuta*; Jacq. Amer. 47. *R. tetraphylla latifolia*; Plum. Ic. 232. t. 236. f. 2.)—Leaves in fours, elliptic-obovate, acute, downy. Flowers axillary or terminal. Segments of the corolla obtuse.—Native of dry, sunny, bushy places in the West India islands, as well as on the neighbouring continent. It was cultivated by Miller at the same time with the first species. We received a specimen in flower, from the stove at Kew, in June 1807. Jacquin says this species varies greatly in the size of all its parts, according to soil and situation, and in the height of its stem from one to eight feet. The young branches, flower-stalks, footstalks, and both sides of the leaves, are clothed with short dense pubescence, which almost entirely disappears by culture, though the upper side of the footstalks continues rough with bristly glands. The leaves are from one and a half to two inches long, obovate, more or less inclining to elliptical, acute, unequal. Flowers in small, axillary, downy, stalked tufts, or umbels. Corolla green with a tinge of red, its segments obtuse. Fruit cloven at the top, first red, then black, containing two seeds, as Jacquin well describes it. One cell of each seed is usually, according to him, abortive.

4. *R. tomentosa*. Downy Rauwolfia. Jacq. Amer. 48. Obf. fasc. 2. 9. t. 35.—Leaves in fours, obovato-lanceolate, downy, tapering at each end. Flowers axillary or terminal. Segments of the corolla acute.—Native of rocky places about Carthage; sometimes on the stone walls of the town. Jacquin alone seems to have known this species, which principally differs from the last, as far as we can judge, in having white flowers, the segments of whose corolla are ovate and acute. The leaves moreover are rather tapering at each end; but that circumstance varies. Fruit the size of a pea, first red, then black. We have seen no specimen.

5. *R. Pulparia*. East Indian Rauwolfia. Roxb. MSS.—Leaves in threes, elliptical, bluntly pointed, smooth and shining. Flowers terminal, in forked panicles. Corolla many times longer than the calyx. Sent by Dr. Roxburgh, from Calcutta, with the above name. We rely on him for the genus, having seen no fruit. This shrub is smooth in nearly every part, with round branches. Leaves about three inches long, and above one broad, coriaceous and shining; their transverse veins very fine and numerous. Flower-stalks very minutely downy, as well as the imbricated bractæ, and keeled pointed segments of the calyx. Corolla apparently white, with a red tube, which is near three quarters of an inch long, cylindrical, swelling at the top: segments of the limb rounded.

RAUWOLFIA, in *Gardening*, contains plants of the tender, exotic, shrubby kind for the stove, of which the species cultivated are: the shining rauwolfia (*R. nitida*); and the hoary rauwolfia (*R. canescens*).

Method of Culture.—These may be increased by the seeds or berries, which should be sown in pots filled with light mould, in the autumn or spring, plunging them in a mild hot-bed. When the plants have attained some growth, they should be removed into separate pots, and have the management of other exotic stove plants. They may likewise be raised by layers and cuttings, laid down or planted out in pots, plunged in the hot-bed in the spring and summer months, till they have stricken root, being afterwards managed as those from seed.

They afford much ornament and variety in hot-house collections, both in their foliage and flowers.

RAUZAN, in *Geography*, a town of France, in the department of the Gironde; 9 miles S.S.E. of Libourne.

RAUZZINI, VENANZIO, in *Biography*, a native of Italy, who, when he arrived here in 1774, to succeed Millico at the opera, was a beautiful and animated young man, with a soprano voice. He was an excellent musician, having studied counterpoint with as much application as the art of singing: so that he may truly be said not only to know his own business, but that of a maestro di cappella; having been as able to compose an opera as to perform a principal part in it. “*Piramo e Tisbe*,” and “*La Veltale*,” may be instanced in proof of this assertion.

His voice was not very powerful when he came hither from Munich, where we first knew him; and where he had enjoyed the highest favour several years. His taste, governed by science, was correct and exquisite. His voice, though not of great volume, was sweet, clear, flexible, and extensive; being in compass more than two octaves. But he is supposed to have injured his chest in early youth by a rage for counterpoint. He played the harpsichord neatly, accompanied well, and had real genius for composition, which inclined him to devote that time to the pen and the improvement of his hand, which, perhaps, in his station, would have been more usefully bestowed in nursing and exercising his voice.

It was some time before the extent of his merit and science were known in this country, and favoured by the public. Nothing can so speedily convey the merits of a singer to an audience, as a great and powerful voice. However, his taste, fancy, knowledge, and delicacy, together with his beautiful person, and spirited and intelligent manner of acting, before the first season was over, gained him general approbation and favour. And since he has quitted the stage, and made Bath his residence. Though he has been long obliged to discontinue singing in public, it is not too much to say that he has disseminated good taste throughout the kingdom, by the numerous scholars he has taught among the nobility and gentry, as well as by those whom he has prepared for public patronage, professionally.

RAW, in *Agriculture*, any sort of plant, substance, or material, which is in a green, unripe, or undigested condition, or which is employed in its more fresh and crude state; as, for instance, dung before it has been much reduced, and lost many of its nutrient principles or properties by the process of fermentation. See DUNG.

RAW Cream, in *Rural Economy*, such as is raised in the natural way, not scalded or clouted.

RAW Hide. See HIDE.

RAW Lands, in *Agriculture*, a term applied to wet, cold, heavy lands, which are unfit to receive the seed.

RAW Silk. See SILK.

RAWA, or RAVA, in *Geography*, a town of the duchy of Warfaw, late capital of a palatinate of the same name. The castle is appropriated for the confinement of state prisoners; 45 miles S.W. of Warfaw. N. lat. 51° 55'. E. long. 20° 17'.

RAWA, a town of Poland, in the palatinate of Belz; 18 miles S.W. of Belz.

RAWA. See RAVA.

RAWAK, a small island in the Pacific ocean, near the N. coast of the island of Waygoo, with which it forms a harbour. E. long. 131° 15'.

RAWAPSKITCHWOCK, a small westerly branch of Machias river. See MACHIAS.

RAWAY, or Bridge-town, a truly commercial village of Middlesex county, New Jersey, on Raway river, four or five miles S.W. of Elizabeth-town, and 75 from Philadelphia.

phia. It contains a post-office, a presbyterian church, and about 50 or 60 houses.

RAWDON, a town of Nova Scotia, 40 miles from Halifax, containing about 50 or 60 houses.

RAWDON, a township of the county of Hastings, in Upper Canada, N. of Sidney.

RAWLINSON, CHRISTOPHER, in *Biography*, of Cork-Hall, in Lancashire, was born in 1677, educated in Queen's college, Oxford, and died in 1733: he was much attached to Saxon and Northern literature, and published an edition of "King Alfred's Translation of Boethius de Consolatione," 8vo. 1698.

RAWLINSON, RICHARD, a distant relation of the preceding, a learned antiquarian, was the son of Sir Thomas Rawlinson, knight, and once lord mayor of London. He was educated at St. John's college, Oxford, and was admitted to the degree of doctor of the civil law in 1719. He devoted himself to antiquarian pursuits, and made large collections for a continuation of Wood's *Athenæ Oxonienses*, and *History of Oxford*, and published the life of that industrious antiquary. The principal work of Mr. Rawlinson was "The English Topographer," or, An historical account of all the pieces that have been written relating to the ancient natural history or topographical description of any part of England, 1720. He published the "Latin Letters of Abelard and Heloise," and "A Translation of Du Fresnoy's New Method of Studying History," 2 vols. 8vo. He died at Islington in 1755, and by his will ordered that his heart should be deposited in the chapel of St. John's college, Oxford. That university was indebted to him for various benefactions of books, manuscripts, medals, &c. as well as landed property, and an endowment for an Anglo-Saxon lecture.

RAWLLOW, in *Geography*, a town of Hindoostan, in Palnaud; 27 miles W.S.W. of Timerycotta.

RAY, JOHN, in *Biography*, whom Haller terms the greatest botanist in the memory of man, and to whose transcendent merits we have already briefly adverted, in treating of the genus dedicated by Plumier to his name, see RAJANIA; was born at Black Notley, near Braintree, in Essex, Nov. 29, 1628. His father, Roger Ray, though in the humble station of a blacksmith, gave him a learned education; first at the grammar-school of his native town, at that time not very well conducted; and subsequently at Cambridge, where he entered at Catharine Hall, in his 16th year, June 28th, 1644, being designed for holy orders. In about a year and three quarters afterwards, he removed to Trinity College, where he found the young men occupied in a more liberal train of studies, with less of scholastic disputations and quibbles. Ray was fortunate in having for his tutor at Trinity, Dr. Dupont, an eminent Greek scholar, under whose fostering and partial care, he soon made up for all the deficiencies of his early education, in the learned languages, including Hebrew. By this gentleman he was always mentioned with peculiar regard. He was no less happy in a youthful literary friend and fellow-student, afterwards the celebrated Dr. Isaac Barrow. Even at this early period, Ray began to cultivate natural history; and distinguished himself by many school exercises as an orator, no less than by his general taste for study, his love of virtue, and his gentleness of manners, qualities which shone brighter and brighter to the latest period of his life. His merit occasioned him to be chosen a Minor Fellow of Trinity, along with his friend Barrow, September 8th, 1649. On taking his degree of Master of Arts, he became a Major or Senior Fellow; and afterwards, October 1st, 1651, Greek Lecturer of the college. At the end of two years he was ap-

pointed Mathematical Lecturer, and in two years more, October 2d, 1655, Humanity Reader. He subsequently filled several respectable offices in his college, as Junior Dean, College Steward, &c., and during his residence in the university, became tutor to many gentlemen of rank and fortune, who were sensible of their obligations to him; amongst whom the most eminently distinguished by personal worth, and congeniality of talents with himself, was Mr. Francis Willughby, of Middleton-hall in Warwickshire, so well known by his posthumous works on Birds and Fishes, edited by the affectionate care of Ray.

At this period it was usual for young men of ability and learning, though not in orders, to deliver sermons, and common-place readings, as they were called; not only in the chapels or halls of their own colleges, but even before the university body, at St. Mary's church. In these Ray eminently distinguished himself. He was among the first who ventured to lead the attention of his hearers, from the unprofitable subtleties of scholastic divinity, and the trammels of Aristotelian philosophy, to an observation of nature, and a practical investigation of truth. The rudiments of many of his subsequent writings originated in these juvenile essays, particularly his celebrated book on the "Wisdom of God manifested in the Works of the Creation," known all over the world by its numerous editions and translations, and universally admired for its rational piety, sound philosophy, and solid instruction. This book is the basis of all the labours of following divines, who have made the book of nature a commentary on the book of revelation; a confirmation of truths, which Nature has not authority, of herself, to establish. In it the author inculcates the doctrine of a constantly superintending Providence; as well as the advantage, and even the duty, of contemplating the works of God. This, he says, is part of the business of a sabbath day, as it will be, probably, of our employment through that eternal rest, of which the sabbath is a type. Archbishop Tennison is recorded to have told Dr. Derham, that "Mr. Ray was much celebrated, in his time, at Cambridge, for preaching solid and useful divinity, instead of that enthusiastic stuff, which the sermons of that time were generally filled with." Two of his funeral discourses are mentioned with particular approbation; one on the death of Dr. Arrowsmith, master of his college; the other on that of one of his most intimate and beloved colleagues, Mr. John Nid, likewise a Senior Fellow of Trinity, who had a great share in Ray's first botanical publication, the *Catalogus Plantarum circa Cantabrigiam nascentium*, printed in 1660; which may be considered as the prototype of his *Synopsis*, hereafter mentioned. Indeed before this little volume appeared, its author had visited various parts of England and Wales, for the purpose of investigating their native plants, as he did several times afterwards; nor were his observations confined to natural history, but extended to local and general history, antiquities, the arts, and all kinds of useful knowledge. His amusing Itineraries were published, along with his life, by Dr. Derham, and a few letters to that gentleman, by the care of Dr. George Scott, F.R.S., in 1760, under the title of "Select Remains of the learned John Ray, M.A., &c." Ray's first botanical tour occupied nearly six weeks, from August 9th to September 18th, 1658. On the 23d of December 1660, he was ordained, both deacon and priest at the same time, by Dr. Sanderson, then bishop of Lincoln. In 1661 he travelled with Mr. Willughby into Scotland, returning by Cumberland and Westmoreland; and the following year, with the same companion, he accomplished a more particular investigation of Wales. How critically he studied the botany of the countries

countries he visited, is evident from the different editions of his *Catalogus Plantarum Angliæ*, and *Synopsis Methodica Stirpium Britannicarum*.

All this while Mr. Ray continued to enjoy his fellowship, and to cultivate his Cambridge connections; but in September 1662, his tranquillity was disturbed by the too famous Bartholomew act, by which 2000 conscientious divines were turned out of their livings, and many fellows of colleges deprived of their maintenance, and means of literary improvement. Among the latter was the subject of our memoir, with thirteen honest men at Cambridge besides, of whose names he has left us a list. One of them, Dr. Dillingham, was master of Emanuel college; but Ray was the only person of his own college who suffered this deprivation. The reader must not suppose that he, or perhaps any other person in this illustrious catalogue, was, in the least degree, deficient in attachment to the doctrine or discipline of the church of England, or that they had taken the oath called the Solemn League and Covenant; which Ray certainly had neither taken nor ever approved. They were required to swear to the infamous proposition, that the said oath was not binding to those who had taken it, and on this ground they conscientiously gave up their preferment. It is curious to read the apology made for Ray to Dr. Derham, on this subject, by a Mr. Brokesby—"that he was at that time absent from his college, where he might have met with satisfaction to his scruples; and was among some zealous non-conformists, who too much influenced him, by the addition of new scruples. And we may also ascribe somewhat to the prejudice of education in unhappy times." By this it appears, that the "scruples" of non-conformists were most favourable to the sanctity of an oath; and that the "unhappy times" alluded to, were more advantageous to principle, than the golden days of Charles II.; whose ministers doubtless valued the obedience, far more than the honesty, of any man; nor is this taste, by any means, peculiar to them or their profligate master.

Mr. Ray, or, as he wrote his name, for a while, about this period, Wray, having thus the world before him, made an arrangement with Mr. Willughby for a tour on the continent; and in this plan two of his pupils were included, Mr. Nathaniel Bacon, and Mr., afterwards sir Philip, Skippon. They failed for Calais in April 1663, but being prevented, by the state of political affairs, from prosecuting their journey through France, they traversed the Low Countries, Germany, &c. proceeding by Venice into Italy; most of whose cities they visited, either by sea or land; as well as Malta and Sicily; and returned, by Switzerland, through France, into England, in the spring of 1666. Mr. Willughby indeed separated from the rest of the party at Montpellier, and visited Spain. An ample account of their observations was published by Ray, in 1673, making a thick octavo volume. The travellers appear to have been diligent and acute in every thing relative to politics, literature, natural history, mechanics, and philosophy, as well as antiquities and other curiosities; but in the fine arts they assume no authority, nor display any considerable taste or knowledge. Mr. Willughby's account of Spain makes a part by itself; and a rich critical catalogue of such plants, not, for the most part, natives of England, as were observed in this tour, concludes the volume. Haller gives to Ray the credit of having discovered several species in Switzerland, previously not known as natives of that country.

Ray passed the summer of 1666 partly at Black Notley, and partly in Suffex, studying chiefly the works of Hook, Boyle, Sydenham on Fevers, and the Philosophical Transactions, "making few discoveries," says he, "save of mine

own errors." The following winter he was employed at Mr. Willughby's, in arranging that gentleman's museum of natural history and coins, and in forming tables of plants and animals for the use of Dr. Wilkins, in his famous work on a Universal Character. He now also began to arrange a catalogue of the English native plants, which he himself had gathered; rather for his own use, than with any immediate view of publication; "at present," as he wrote to Dr. Lister, "the world is glutted with Dr. Merret's bungling Pinax. I resolve never to put out any thing which is not as perfect as is possible for me to make it. I wish you would take a little pains this summer about grasses, that so we might compare notes." The above resolution of our author is, no doubt, highly commendable, but the world has rather to lament that so many able men have formed the same determination, at least in natural science. If it were universally adhered to, scarcely any work would see the light; for few can be so sensible of the defects of any other person's attempt to illustrate the works of nature, as a man of tolerable judgment must be of his own. This is especially the case with those who, like Ray, direct their aspiring views towards system, and philosophical theory. Happily he did not try this arduous path, till he had trained himself by wholesome practical discipline, in observation and experience. His first botanical works assumed the humble form of alphabetical catalogues. His and Mr. Willughby's labours in the service of bishop Wilkins, were indeed of a systematical description; and accordingly the authors themselves were, more than any other person probably, dissatisfied with their performance. They relaxed from these labours in a tour of practical observation through the west of England, as far as the Land's-End, in the summer of 1667, and returning by London, Mr. Ray was solicited to become a Fellow of the Royal Society, into which learned body he was admitted November 7th. Being now requested by his friend Wilkins to translate the "Real Character" into Latin, he undertook, and by degrees accomplished, that arduous performance, depositing his manuscript in the library of the Royal Society, where it has ever since reposed. The following summer was agreeably spent, in visits to various literary friends, and in a solitary journey to the north; for his former companion Willughby, being just married, stayed at home; there Ray joined him in September 1668, and remained for most part of the ensuing winter and spring.

The seclusion and leisure of the country, with the converse and assistance of such a friend, were favourable to the prosecution of a new subject of enquiry, which now strongly attracted the attention of our great naturalist, the theory of vegetation. The first step of the two philosophers, in this little-explored path, was an examination of the motion of the sap in trees; and the result of their enquiries, communicated to the Royal Society, appeared soon after in the Philosophical Transactions. Their experiments clearly prove the ascent of the sap through the woody part of the tree; which is easily detected by boring the trunk, at different depths, before the leaves are unfolded; and they observed also the mucilaginous nature of the flowing sap, "precipitating a kind of white coagulum or jelly, which," says Ray, in a note preserved by Derham, "may be well conceived to be the part which, every year, between bark and tree, turns to wood, and of which the leaves and fruit are made. It seems to precipitate more when the tree is just ready to put out leaves, and begins to cease dropping, than at its first bleeding." The accuracy of the leading facts recorded by these ingenious men, is confirmed by subsequent observers, who have further pursued the same subject, which is now sufficiently

sufficiently well understood. They indeed, like the rest of the world till lately, seem not to have suspected, that the sap was quiescent till their perforations in the tree were made; nor did they advert, as they ought, to phenomena dependent on the principle of life, in the vegetable body. See *CIRCULATION of the Sap*.

At this time Ray began to prepare for the press his "Collection of Proverbs," a curious book in its way, by which he is perhaps better known to the generality of his countrymen, than by any other of his literary labours. The first edition was published in 1672; but the work was subsequently much enlarged, and the author may almost be said to have exhausted his subject. From its very nature, delicacy and refinement must often be dispensed with; but this is evidently not the fault, or the aim, of the writer. His learning and critical acuteness diffuse light over the whole, and make us overlook the coarse vehicle of our instruction.

The first edition of the *Catalogue of English Plants*, already mentioned, came out in 1670, and the second in 1677. Their great author gave his work to the world with that diffidence, for which he alone perhaps could perceive any just foundation. We postpone our remarks till we speak of the same work in its systematic form hereafter.

About this period the health of Mr. Ray seems to have been considerably impaired. He refused a tempting offer to travel again on the continent, as tutor to three young noblemen; nor could the powerful attractions of alpine botany, which made a part of his prospect, overcome the reluctance to leaving home, which arose from a feeble state of body. Indeed this very reluctance, or listlessness, is accounted for, by the turn which his disorder took, as it terminated in the jaundice. After this depressing complaint had left him, he resumed, with fresh alacrity, his botanical travels at home, visiting the rich stores of the north of England, with a companion named Thomas Willughby, whose name and discoveries he afterwards, on many occasions, has gratefully commemorated. Nothing forms a more striking feature in Ray's character, than the unreserved and abundant commendation, which he always gave to his friends and fellow-labourers. We are about to narrate an event, which called forth all his affectionate feelings of this kind, as well as his most important and beneficial exertions; when, even to his own prejudice, he fulfilled the sacred duties of friendship, and delighted in adorning the bust of his friend with wreaths, that he himself might justly have assumed. On the 3d of July 1672, Mr. Willughby was unexpectedly carried off by an acute disorder, in the 37th year of his age. The care of his two infant sons was confided by himself to Mr. Ray, who was also appointed one of his five executors, and to whom he left an annuity of 60*l.* for life. The eldest of these youths was created a baronet at the age of 10 years, but died before he was 20. Their sister Cassandra afterwards married the duke of Chandos. Thomas, the younger son, was one of the ten peers created, all on the same day, by queen Anne, and received the title of lord Middleton. His early youth was much indebted to the care of his faithful guardian, who composed, for his and his brother's use, and published in 1672, a *Nomenclator Classicus*, far more exact, especially in the names of natural objects, than any that had previously appeared. The care of his pupils, and of the literary concerns of their deceased parent, now interrupted Mr. Ray's botanizing excursions, and caused him also to decline the offer of Dr. Lister, then a physician at York, to settle under his roof. Bishop Wilkins did not long survive Mr. Willughby, and his death made another chasm in the scientific and social circle of our

great natural philosopher, who felt these losses as deeply and tenderly as any man. He sought consolation in a domestic attachment, fixing his choice on a young woman, of good parentage, whose name was Margaret Oakeley, and who resided in the family at Middleton-hall. He was married at the parish church, June 5th, 1673, being then in the 45th year of his age, and his bride about 20. This lady took a share in the early education of his pupils, as far as concerned their reading English. She is said to have been recommended by her character, as well as her person, to the regard of her husband. She bore him three daughters, who, with their mother, survived him.

Ray's communications to the Royal Society became now very frequent, and extended to various subjects relative to the natural history of animals, as well as to the physiology, and even the botanical characters, of vegetables. He was, at the same time, in the course of the years 1674 and 1675, much occupied in digesting Mr. Willughby's zoological papers. These were composed in Latin, in which language the Ornithology first appeared in 1676, making a folio volume, accompanied by 77 plates, engraved, at the expence of the author's widow, from his own drawings. An English translation by Ray, with still more additions than he had supplied to the former publication, and one more plate, issued from the press in 1678. The account which Dr. Derham received from the lips of Mr. Ray, about eight months previous to his decease, respecting the primary intentions of himself and his late friend, and which is recorded in his life, p. 48, is too curious to be omitted here, as their project and its execution form an epocha in the history of natural science. "These two gentlemen," says Derham, "finding the history of Nature very imperfect, had agreed between themselves, before their travels beyond sea, to reduce the several tribes of things to a method; and to give accurate descriptions of the several species, from a strict view of them. And forasmuch as Mr. Willughby's genius lay chiefly to Animals, therefore he undertook the Birds, Beasts, Fishes, and Insects, as Mr. Ray did the Vegetables." Derham adds, that Mr. Willughby, during his short life, "prosecuted his design with as great application, as if he had been to get his bread thereby." The writer of the present article has elsewhere observed, (*Introductory Discourse*, Tr. of Linn. Soc. v. 1.) that "from the affectionate care with which Ray has cherished the fame of his departed friend, we are in danger of attributing too much to Mr. Willughby, and too little to himself." His own statement, no doubt, was correct, as to their original aims; but it is impossible not to perceive that the survivor executed or perfected what his friend, in many instances, could only have projected, or scarcely begun. Had Willughby lived, there can be little doubt of his career being as glorious in the sequel as that of his friend; and possibly, from the advantages of fortune which he enjoyed, even more widely beneficial to science. Yet who can tell that he might not have slackened his course? Though he gloriously avoided the snares of luxury and folly in his youth, who shall say that politics or ambition might not have dazzled his riper age? or that he would always have escaped that ruinous vanity, which grasps at universal knowledge, or rather at universal fame; and knowing nothing deeply, is most flattered with any praise which is least deserved. So often has this last been the case with literary men, that one cannot but mistrust a character of the fairest promise. What Ray has done, we know and can appreciate. Equal to his friend in learning, talents, and zeal, the advantages of ample fortune were compensated by the leisure and tranquillity of a sequestered country life. His duties

went hand in hand with his studies and recreations, and he enjoyed, as Haller observes, the rare felicity of giving 50 years uninterruptedly to his favourite science. His long-protracted studies, and ripened experience, enabled him to achieve what at first he could but regard at a distance, as the great object of his wishes, a systematic arrangement of the animal as well as vegetable kingdoms. Every body had, hitherto, been content with Aristotle's classification of animals, of whose imperfections Ray, daring to think for himself, could not but be aware. He invented a new one, founded on the structure of the heart. "The Harveian experiments, and doctrine of the circulation, had called the peculiar attention of philosophers to every organ which has a share in that phenomenon; and to this cause, probably, we owe the method of Ray." The mode of breathing in animals, whether by lungs or by gills, and the single or double structure of the heart, in the former case, constitute the basis of his system; which, in these particulars at least, succeeding naturalists have adopted. His subordinate characters of the principal classes evince great skill and sagacity, and the Linnæan system of Quadrupeds is highly indebted to that of our illustrious countryman.

His zoological publications indeed did not follow each other in rapid succession; for after the Ornithology had come forth in English, eight years elapsed before the *Historia Piscium* of Willughby was given, by his care, to the world. This was printed in folio, with 188 plates of fishes, in 1686, at Oxford, owing to the interest of bishop Fell, and the pecuniary assistance of the Royal Society. It does not appear why the relict of Mr. Willughby withheld, in this instance, the contributions which had so much benefited her husband's former work, and which she justly owed to his fame. It seems that the intimate connexion of Ray with this family, was much impaired by the death of lady Cassandra Willughby, the mother of his friend, about the year 1675 or 1676; when the children were taken from his tuition, and he left Middleton-hall, fixing for a short time at Sutton Cofeld, four miles distant. At Michaelmas 1677 he removed from thence to Falborne-hall, in Essex, not far from his native village. On the 15th of March following, his mother, at the age of 78, died at Black Notley, "in her house on Dewlands;" of whom he speaks with that reverence and regret, which has peculiarly marked the characters of some of the greatest and best men on the same occasion. At Midsummer 1679, he finally settled at Black Notley, for the remainder of his days, or "for the short pittance of time he had yet to live in this world," as he himself expressed it; which pittance, however, extended to more than twenty-five years.

The first fruit of our author's leisure and retirement was his *Methodus Plantarum Nova*, published in 1682, making an octavo volume. His principles of arrangement are chiefly derived from the fruit. The regularity and irregularity of flowers, which take the lead in the system of Rivinus, make no part of that of Ray. It is remarkable that he adopts the ancient primary division of plants, into trees, shrubs, and herbs, and that he blamed Rivinus for abolishing it, though his own prefatory remarks tend to overset that principle, as a vulgar and casual one, unworthy of a philosopher. That his system was not merely a commodious artificial aid to practical botany, but a philosophical clue to the labyrinth of Nature, he probably, like his fellow-labourers, for many years, in this department, believed; yet he was too modest, and too learned, to think he had brought this new and arduous design to perfection; for whatever he has incidentally or deliberately

thrown out, respecting the value of his labours, is often marked with more diffidence on the subject of classification, than any other. He first applied his system to practical use in a general *Historia Plantarum*, of which the first volume, a thick folio, was published in 1686, and the second in 1687. The third volume of the same work, which is supplementary, came out in 1704. This vast and critical compilation is still in use as a book of reference, being particularly valuable as an epitome of the contents of various rare and expensive works, which ordinary libraries cannot possess, such as the *Hortus Malabaricus*. The description of species is faithful and instructive; the remarks original, bounded only by the whole circuit of the botanical learning of that day; nor are generic characters neglected, however vaguely they are assumed. Specific differences do not enter regularly into the author's plan, nor has he followed any uniform rules of nomenclature. So ample a transcript of the practical knowledge of such a botanist, cannot but be a treasure; yet it is now much neglected, few persons being learned enough to use it with facility, for want of figures, and a popular nomenclature; and those who are, seldom requiring its assistance. A mere catalogue or index, like the works of Tournefort and Caspar Bauhin, which teach nothing of themselves, are of readier use. The *Species Plantarum* of Linnæus unites the advantages of the clearest most concise specific definition, and, by the help of Bauhin, of an universal index.

But if the fame or the utility of Ray's great botanical work has, neither of them, been commensurate with the expectations that might have been formed, a little octavo volume, which he gave to the world in 1690, amply supplied all such defects, and proved the great corner stone of his reputation in this department of science. We speak of the *Synopsis Methodica Stirpium Britannicarum*. The two editions of his alphabetical catalogue of English plants being sold off, and some pettifogging reasons of his bookseller's standing in the way of a third, with any improvements, he re-modelled the work, throwing it into a systematic form, revising the whole, supplying generic characters, with numerous additions of species, and various emendations and remarks. The uses and medicinal qualities of the plants are removed to the alphabetical index at the end. A second edition of this *Synopsis* was published in 1696, nor did its author ever prepare another. The third, now most in use, was edited twenty-eight years afterwards by DILLENIUS. (See that biographical article.) Of all the systematical and practical Floras of any country, the second edition of Ray's *Synopsis* is the most perfect that ever came under our observation. "He examined every plant recorded in his work, and even gathered most of them himself. He investigated their synonyms with consummate accuracy; and if the clearness and precision of other authors had equalled his, he would scarcely have committed an error. It is difficult to find him in a mistake or misconception respecting Nature herself, though he sometimes misapprehends the bad figures, or lame descriptions, he was obliged to consult." *Tr. of Linn. Soc. v. 4. 277.* Above a hundred species are added, in this second edition, and the cryptogamic plants, in particular, are more amply elucidated. A controversial letter from Rivinus to Ray, and its answer, with remarks upon Tournefort, are subjoined to this second edition. Much of the dispute turns upon the now obsolete distinction of plants, in a methodical system, into trees, shrubs, herbs, &c. The letters are well written, in Latin: and liberal, though perhaps hypercritical, in their style. Ray took no delight in controversy. Its inevitable

evitable asperities were foreign to his nature. We must not omit to notice that, in the preface to both editions of his *Synopsis*, the learned author, venerable for his character, his talents, and his profession, as well as by his noble adherence to principle in the most corrupt times, has taken occasion to congratulate his country, and to pour out his grateful effusions to Divine Providence. in a style worthy of Milton, for the establishment of religion, law, and liberty, by the revolution which placed king William on the throne. An honest Englishman, however retired in his habits and his pursuits, could not have withheld this tribute at such a time; nor was any loyalty ever more personally disinterested than that of Ray.

The year 1690 was the date of the first publication of his noble work on "The Wisdom of God in the Creation," of which we have already spoken, and whose sale, through many editions, was very extensive. In 1700 he printed a book, more exclusively within the sphere of his sacred profession, called "A Persuasive to an Holy Life;" a rare performance of the kind, at that day, as it would be at the present; being devoid of enthusiasm, mysticism, or cant, as well as of religious bigotry or party spirit, "and employing the plain and solid arguments of reason, for the best of purposes." His three "Physico-Theological Discourses, concerning the Chaos, Deluge, and Dissolution of the World," of which the original materials had been collected and prepared formerly at Cambridge, came out in 1692, and were reprinted the following year. A third edition, superintended by Derham, was published in 1713. This able editor took up the same subject himself in a similar performance, the materials of which, like Ray's, were first delivered in sermons, at Bow church, he having been appointed reader of Mr. Boyle's lectures.

While Ray was from time to time intent on these moral and religious performances, in which he laboured equally to impress and elucidate the truths of natural and revealed religion, as well as to enforce its precepts and duties, he was no less attentive than formerly to his systematical studies. Dr. Tancered Robinson is recorded by Derham, as having first prompted our great naturalist to undertake a *Synopsis Methodica*, or classical arrangement, of the whole animal, as he had done of the vegetable, kingdom. He even wished him to extend his attention to fossils, anticipating, in short, what Linnæus afterwards performed. Nor did he shrink from the task. Though now for some time oppressed with bodily infirmity, and particularly with very troublesome ulcers in his legs, his mind was tranquil and unimpaired. He soon finished his *Synopsis Methodica Animalium Quadrupedum et Serpentinæ Generis*, which came out in 1693, making a thin, but closely printed, octavo volume. We have already spoken of the originality of his method. The volume in question, however, is not confined to dry systematical arrangement. It enters deeply into the general and particular history of animals, their external forms, and internal structure, with abundance of entertaining and curious facts and observations. Linnæus was possessed of this book from the year 1734, and appears to have studied it well. A similar volume on birds, and another on fishes, were prepared by the author; but the manuscripts of these lay neglected in the hands of some careless or ignorant bookseller, till they were discovered by Dr. Derham, and published in 1713. They contain more of particular descriptions and histories, than of general remarks; but otherwise accord with the plan of the *Synopsis* of Quadrupeds. Many things are supplied from materials obtained since the publication of Willughby's Ornithology and Ichthyology, and several figures of fishes were added by Derham, at the

persuasion of Petiver, whose works they somewhat resemble.

Having accomplished so many great and laborious publications, our venerable naturalist began, as Dr. Derham informs us, to enjoy the thoughts of reposing from his labours. He was nevertheless ready, at the call of his friends, to revise a translation of Rauwolf's Travels, the original having even then become very scarce, besides being unintelligible to mere English readers. This translation, with some other rare tracts annexed, and a catalogue of Grecian, Syrian, Egyptian, and Cretan plants, drawn up by Mr. Ray, issued from the press in 1693. See RAUWOLFIA.

Possibly the *Stirpium Europæarum extra Britannias nascentium Sylloge*, which appeared in 1694, originated in the author's attention being recalled, by the last-mentioned publication, to the contemplation of exotic plants. In this volume he collects from Clusius, Bauhin, Columna, and others, various additions to his own discoveries, and the whole are disposed in alphabetical order. A geographical view of the plants, which he had himself gathered in his foreign travels, is subjoined; and the volume concludes with alphabetical catalogues, selected from Boccone's Sicilian plants, and other recent authors. It is in the preface to this book, that he first adverts to the system of Rivinus, not without just applause of that author's work, a copy of which had been presented to Ray. He commends the apt distribution of the genera, the clearness and conciseness of the style, the purity of the Latin, and the beauty as well as exactness of the plates. He, however, contends for the ancient distinction of plants into trees and herbs, which, as we have seen, he had himself mentioned as unphilosophical. In the rest of his criticisms, though "much may be said on both sides," and though these controversialists, like others, profit of the intricacies and anomalies of Nature, to make good their arguments, concealing themselves, like the cuttle-fish, in their ink; still we cannot but give our testimony to the greater solidity of Ray's principles, as derived from the fruits and seeds of plants, than to the seemingly more elegant ones of Rivinus, deduced from the flower; which last undoubtedly lead, in their practical application, to some paradoxical combinations. But on this subject we may say more in its proper place. (See RIVINUS.) In this preface Ray points out the importance and use of the stamens and pistils, succinctly explaining the sexual doctrine, as now universally admitted.

One advantage arose from the epistolary altercation of Rivinus and Ray, that it led the latter to revise his own system, and to republish it, in an improved state. Happy if such were more generally the fruit of contention, that each party should correct himself, instead of aggravating the defects of his adversary. Some notice is taken, in the preface to this edition, both of the system of Tournefort and that of Hermann, which last was most congenial to the principles of Ray. The work was finished in 1698, but not given to the public till 1703, recourse having been had to a Dutch bookseller, who thought it for his interest to place an English publisher's name in the title-page; a proceeding which, however harmless, shocked the honest feelings of the author; and this perhaps excited the thrifty Hollander's surprize. By his exertions, however, the book, and the fame of its author, became more widely diffused, and continental botanists were much further initiated into Ray's system than they had previously been.

But now the mortal career of this eminent man was drawing towards a close. He complained in his letters, that, so far from being able to visit the London gardens, as he wished,

in order to make observations upon plants, for the greater perfection of this last edition of his *Methodus*, he was not able to walk into his neighbouring fields. He still, nevertheless, kept up to the last his correspondence with his friends, in the vivacity and clearness of style which was natural to him. Latin and English, it is said, were equally ready to his pen. So indefatigable was he in the cultivation of the study of Nature, that within a year or two of his death, he began to collect his scattered notes for a work on Insects, and actually drew up a *Methodus Insectorum*, which was printed, soon after his decease, in a little octavo of sixteen pages, and republished in the front of his *Historia Insectorum*. This last book, comprising all his own and Mr. Willughby's descriptions of insects, came from the press in 1710, at the expense of the Royal Society, and under the superintendance of Dr. Derham. It consists of 375 quarto pages, besides an appendix of twenty-three more, on British Beetles, by Lister. Ray attributes to Willughby that part of his system which concerns insects supposed to undergo no metamorphosis. These are mostly the *aptera* of Linnæus, excluding the *crustacea*, but admitting intestinal *vermes*, earth-worms, and even leeches. All the descriptions and remarks of his departed friend are marked with the initials F.W. This work is a mass of accurate and authentic observation; but, for want of plates, has never come into popular use. Linnæus studied it much, and has often cited the descriptions, the appropriation of which is, however, too difficult and uncertain to render them of general or extensive service. Those which regard the *Lepidoptera*, and their caterpillars, are most copious.

The study of insects was probably the last that engaged the attention of this great and wise man; who, though on the verge of eternity, in the full possession of himself, and in the anticipation of the most glorious manifestations of his Creator, did not disdain or neglect to contemplate him in his least and lowest works. Such an example might serve for an occasional answer to those who affect to think the study of any of the works of God below the dignity of their philosophy; for the most inordinate vanity must look with respect on what formed the abstruse studies of so distinguished a person as Ray. His last letter to Dr. Derham, who had just been to visit him, is dated August 16, 1704. He speaks of having lately obtained Mr. Willughby's entomological papers, and describes himself as then entering on his History of Insects. How well he employed his time during the autumn, is evident from what we have related concerning this work, for he never saw another spring. He died at Black Notley, in a house of his own building, Jan. 17, 1705, in the 77th year of his age. His character is thus concisely given by Derham. "In his dealings, no man more strictly just; in his conversation, no man more humble, courteous, and affable; towards God, no man more devout; and towards the poor and distressed, no man more compassionate and charitable, according to his abilities." The friend who wrote this eulogium, in his "Life of Mr. Ray," asserts, that he was buried, according to his own desire, in the church of Black Notley; but the authors of the Biographia Britannica are probably more correct, in saying, that he declined the offer made him by the rector, of a place of interment in the chancel, choosing rather to repose with his ancestors, in the church-yard. He perhaps thought, with bishop Hall, that "the house of God ought not to be made a repository for dead carcasses." However this might be, the latter account is confirmed by the original situation of his monument, erected at the expense, in part at least, of bishop Compton. The long and elegant Latin epitaph has often been published. Its author was the Rev.

William Coyte, M.A., father of the late Dr. Coyte of Ipswich, and the original manuscript is now before us, containing the information that Ray was interred in the church-yard. In 1737, the monument in question, which seems to have been a sort of altar tomb, being nearly ruined, was restored at the charge of Dr. Legge, and removed for shelter into the church; where therefore it became a *cenotaph*, as an inscription added on this occasion terms it. Forty-five years afterwards the tomb again underwent a repair, by the care of the present Sir Thomas Gery Cullum and others, who joined a third inscription, as follows:

Tumulum hunc,
a nonnullis humanitati, et scientiæ
naturali, faventibus,
olim conditum,
et aliorum bonâ diligentia
postea restauratum, 1737,
nunc e vetustatis situ et fordibus
pauci de novo revocatur, 1792.
αιρηται επι βασην πασαι ην ταφος.

A more lasting monument was dedicated to the memory of our great English naturalist, in the genus of plants which bears his name. (See *RAIANIA*.) The opinion we have there, in few words expressed, of his high rank in botanical science, it is hoped the present more diffuse account will justify. It must be lamented that he made, as far as we can learn, no collection of dried plants, which might serve to ascertain, in every case, what he described. The great Herbariums of Buddle, Uvedale, &c. still kept in the British Museum, are indeed supposed to supply, in a great measure, this defect; they having been collected by persons who had frequent communication with Ray, and were well acquainted with his plants. Whatever he had preserved relative to any branch of natural history, he gave, a week before his death, to his neighbour Mr. Samuel Dale, author of the *Pharmacologia*. Nothing is said of his library, which was probably inconsiderable. His pecuniary circumstances were very limited, for he merely conformed as a layman to the church of England, and was unwilling to subscribe what was requisite for receiving preferment. He is recorded nevertheless to have disapproved of separatists from the national church; justly disgusted, probably, by the contentions and fanaticism he had seen throughout the greater part of his life. His principles and feelings soared far above the fastidious distinctions, which marked the orthodox or the heterodox of those times, and his mind was uncontaminated with their passions. His good sense might well lead him to regret, that those who had so lately escaped a most tremendous common enemy, should be so prone to quarrel amongst themselves. It is an honour to both these parties that they have been emulous to claim him as their ally.

In the preceding review of the literary productions of Ray, more numerous, as Haller says, than those of any other botanist, Linnæus excepted, we have been obliged to pass over several things of less note; such as his lists of native British plants, for Gibson's edition of Camden's *Britannia*; and even a variety of communications to the Royal Society. Neither have we touched on the principles of his botanical system, that subject being explained at length by our predecessor, the late Rev. Mr. Wood, under the article *CLASSIFICATION*. Those who are anxious to peruse a more full and critical investigation of his works and studies, than it has been possible to give in this place, will do well to consult Dr. Pulteney's "Sketches of the Progress of Botany in England." The "Philosophical Letters," collected and published in 1718, by Dr. Derham, containing 68 written by Ray, and

many more by his correspondents, throw much light on his character and pursuits. We cannot help remarking that his hand-writing was peculiarly fair and elegant. A specimen of it exists among Sir Henry Spelman's val and curious collection of manuscripts, now in the possession of John Patter-son. esq. late M. P. for Norwich.

The portraits of Ray are not numerous. One in oil, taken at an advanced period of his life, remains in the British Museum, and Dr. John Sims is possessed of a miniature, of an earlier date, of which its owner has given an engraving, by way of frontispiece to the first volume of the "Annals of Botany," published in 1805. The latter is rather deficient in that strength of character which appears in the more common prints, after a picture by Faithorne, often prefixed to the third edition of the *Synopsis*, and sometimes to the *Historia Plantarum*. One of these prints was engraved by Elder; the other by Vertue. Neither of them is strictly appropriated to any particular hook. That in the German edition of his "Wisdom of God in the Creation," published at Leipzig in 1732, appears to be copied from one of these, and yet is so unlike them in expression, that if it were possible, one would suppose it taken from some other portrait of the same person. Ray's Works. His Life by Dr. Derham. Haller's Bibl. Bot. Pulteney's Sketches. Aikin's General Biography. S.

RAY, in *Geography*, a town of France, in the department of the Upper Saone; 12 miles E. of Champlitte.

RAY, in *Geometry*. See RADIUS.

RAY, *Radius*, in *Optics*, a beam or line of light, propagated from a radiant point, through any medium.

Sir Isaac Newton defines rays to be the least parts of light, whether successive in the same line, or contemporary in several lines.

For, that light consists of parts of both kinds, appears hence, that one may stop what comes this moment in any point, and let pass that which comes the next; and again, one may stop what comes in this point, and let pass that in the next. Now, the least light, or part of light, which may be thus stopped alone, he calls a *ray of light*.

A ray of light is, therefore, considered as an infinitely narrow portion, or an evanescent element of a stream of light; and a pencil, as a small detached stream, composed of a collection of such rays accompanying each other. As we cannot exhibit to the senses a single mathematical line, except as the boundary of two surfaces; in the same manner, we cannot exhibit a single ray of light, except as the confine between light and darkness, or as the lateral limit of a pencil of light.

If the parts of a ray of light do all lie straight between the radiant and the eye, which is the case when it moves through the same uniform substance or a vacuum, called a medium, the ray is said to be *direct*: the laws and properties of which make the subject of optics. If any of them be turned out of that direction, or bent in their passage, the ray is said to be *refracted*: and that branch of optics which treats of these refracted rays, is called *dioptries*; which see. See also REFRACTION.

If it strike on the surface, or medium attached to the surface, of any body, and be driven back, it is said to be *reflected*: and that branch of optics which treats of these refracted rays, is called *catoptries*; which see. See also REFLECTION.

In each case, the ray, as it falls either directly on the eye, or on the point of reflection, or of refraction, is said to be *incident*: and the angle which the incident ray makes with the perpendicular to the reflecting surface at the point of incidence, is called the angle of incidence; and the angle

which the reflected ray makes with the same perpendicular, is called the angle of reflection; and also, the angle which the refracted ray makes with a perpendicular to the refracting surface produced, is called the angle of refraction.

Again, if several rays be propagated from the radiant equidistantly from one another, they are called *parallel rays*. If they come inclining towards each other, they are called *converging rays*. And if they go continually receding from each other, they are called *diverging rays*.

It is evident that the rays of light, which come from a luminous point, must fall divergingly upon any given surface; yet when the object is very distant, compared with the interval that separates these rays, the divergency of the rays becomes insensible; hence the rays of the sun, of the moon, of the stars, &c. are deemed parallel rays. When the luminous point is near, then the rays are sensibly diverging.

It is from the various circumstances of rays, that the several kinds of bodies are distinguished in optics. A body, *e. gr.* that diffuses its own light, or emits rays of its own, is called a *lucid*, or *luminous* body. If it only reflect rays which it receives from another, it is called an *illuminated* body.

This distinction, however, is not always observed; for a luminous body, in common language, means any visible object, whether it be visible by the emission of original light, like the sun, a candle, &c. or by reflected light, like the moon, or any other celestial or terrestrial object that has no native light, or that does not emit its own light.

If an object only transmit rays, it is called a *transparent* body. So that transparent bodies, such as water, glass, &c. are those through which light will pass, or through which our eyes can perceive objects situated on the other side, and all such bodies, as also a vacuum, are denominated mediums in optics.

If it intercept the rays, or refuse them passage, so that nothing can be seen through it, it is called an *opaque* body.

Hence no body radiates, *i. e.* emits rays, unless it be either luminous, or illuminated.

It is by means of rays reflected from the several points of illuminated objects to the eye, that they become visible, and that vision is performed; whence such rays are called *visual rays*.

When an eye views any object directly, some of the rays, which proceed from every perceivable point of the object, enter the eye, and the whole number of rays, or quantity of light, which thus enters the eye, is circumscribed by the rays which proceed from the extreme points of the object: and the angle which these extreme rays form at the eye is called the *visual angle*, from the magnitude of which we principally judge of the distance of a known object. Thus, if the same object is represented at different distances, it is evident that the farther the object is from the eye, the smaller will the visual angle be. Supposing also the distance between the eye and the object to remain the same, if by any means the rays of light are bent so as to enlarge the visual angle, then the object will appear larger, or it is said to be magnified; and on the contrary, if the visual angle be diminished, then the object will appear smaller, in which case it is said to be diminished.

In effect, we find that any point of an object is seen in all places to which a right line may be drawn from that point: but it is allowed, nothing can be seen without light; therefore every point of an object diffuses innumerable rays every way. Again, from other experiments it appears, that the images of all objects, whence right lines may be drawn to

the eye, are painted in the eye, behind the crystalline, very small, but very distinct.

And lastly, from other experiments, that each ray produces an image of the radiating point: and that the several rays emitted from the same point are again united in one point, by the crystalline, and other humours of the eye, and thus thrown on the retina.

It is the spissitude or closeness of the rays emitted from a luminous body, that constitutes the intenseness of the light. Yet the direction in which the rays strike the eye, has a considerable influence. In effect, a perpendicular ray, striking with more force than an oblique one, in the ratio of the whole sine to the sine of the angle of obliquity (as follows from the laws of *percussion*, which see,) a perpendicular ray will affect the eye more vividly than an oblique one, in that ratio.

If then the spissitude of the rays be equal, the intensity will be as the direction: if the direction be the same, the intenseness will be as the spissitude: if both differ, the intenseness will be in a ratio compounded of the direction and the spissitude.

Hence, first, if light be propagated in parallel rays through an unresisting medium, its intensity will not be varied by distance.

Secondly, if light be propagated in diverging rays through an unresisting medium, its intensity will decrease in a duplicate ratio of the distances from the radiant point, reciprocally.

Thirdly, if light be propagated in converging rays through an unresisting medium; its intensity will increase in a duplicate ratio of the distances from the point of concurrence, reciprocally.

Fourthly, if the breadth of an illumined plane be to the distance of the radiant point as 1 to 2,000,000, it is the same thing as if the ray struck upon it parallel: and hence, since the diameter of the pupil of the eye, when largest, scarcely exceeds $\frac{1}{4}$ th or $\frac{1}{2}$ th of an inch; the rays will fall upon it parallel as to sense, at the distance of 3860 English feet, which is nearly six furlongs. See LIGHT.

The effect of concave lenses, and convex mirrors, is to make parallel rays diverge; converging rays become parallel; and diverging rays to become more divergent.

The effect of convex lenses, and concave mirrors, is to make diverging rays become parallel; parallel rays become convergent; and converging rays to converge the more. See LENS.

The rays of light are not homogeneous, or similar, but differ in all the properties with which we are acquainted; *viz.* refrangibility, reflexivity, and colour.

It is probable that from the different refrangibility the other differences have their rise; at least it appears, that those rays which agree or differ in this, do so in all the rest. Thus, from the different sensations the differently disposed rays excite in us, we call them *red rays*, *yellow rays*, &c.

The effect of the prism is to separate and sort the different kinds of rays, which come blended promiscuously from the sun; and to throw each kind by itself, according to its degree of refrangibility and colour, red to red, blue to blue, &c.

Besides refrangibility, and the other properties of the rays of light already ascertained by observation and experiment, sir Isaac Newton suspects they may have many more: particularly, a power of being inflected, or bent, by the action of distant bodies; and those rays which differ in refrangibility, he conceives likewise to differ in this flexibility.

In passing by the edges and sides of bodies, he conceives that the rays may be bent several times backwards and forwards, with a motion like that of an eel; and that those rays which appear to fall on bodies are reflected or refracted before they arrive at the bodies: and adds, that they may be refracted, reflected, and inflected, all by the same principle acting in different circumstances. See INFLECTION and LIGHT. See also REFLECTION and REFRACTION.

Again, do not the rays, falling on the bottom of the eye, excite vibrations in the retina; which, being propagated along the fibres of the optic nerve into the brain, cause vision? and do not several sorts of rays make vibrations of several bignesses, which excite sensations of several colours, much after the manner as the vibrations of the air, according to their several bignesses, excite sensations of several sounds?

Particularly, do not the most refrangible rays excite the shortest vibrations, to make a sensation of a deep violet; and the least refrangible the largest, to make a sensation of a deep red? and the several intermediate kinds of rays, vibrations of intermediate bignesses, to make sensations of the intermediate colours?

And may not the harmony and discord of colours arise from the proportion of these vibrations; as those of sound depend on the vibrations of the air; for some colours, if viewed together, are agreeable, as gold and indigo; others disagreeable. See COLOUR.

Again, have not the rays of light several sides endued with several original properties? It is certain we find, that every ray of light has two opposite sides, originally endued with a property, on which the unusual refraction of island crystal depends, and other two opposite sides endued with that property.

Lastly, are not the rays of light very small bodies emitted from shining substances?

Such bodies may have all the conditions of light: and there is that action and re-action between transparent bodies and light, which very much resembles the attractive force between other bodies. Nothing more is required for the production of all the various colours, and all the degrees of refrangibility, but that the rays of light be bodies of different sizes; the least of which may make violet the weakest and darkest of the colours, and be the most easily diverted by refracting surfaces from its rectilinear course; and the rest as they are bigger and bigger, may make the stronger and more lucid colours, blue, green, yellow, and red. (See COLOUR and LIGHT.) Nor is any thing more requisite for the putting of the rays into fits of easy reflection, and easy transmission, than that they may be small bodies, which, by attraction, or some other force, excite vibrations in the bodies they act upon; which vibrations, being swifter than the rays, overtake them successively, and agitate them so as by degrees to increase and diminish their velocity, and thereby put them into those fits. Lastly, the unusual refraction of island crystal appears very much as if it were performed by some attractive virtue lodged in certain sides both of the rays, and of the crystal.

RAYS of Heat denote separate portions of that emanation, which proceeds from an heated body, when placed in a colder temperature, and which expands itself in every direction, provided it be not prevented by the interposition of particular substances. This appellation is adopted and thus applied, not because that emanation is certainly known to consist of separate streams, but merely for the convenience of explanation. The rays of heat are not the same with the rays of light. If this were the case, a certain quantity of

of heat ought to be accompanied with the same quantity of light; whereas it is found, that several substances emit a considerable quantity of light without any sensible heat, and others give out a considerable portion of heat without any light. But that these are two distinct powers of nature is a proposition, that has been amply illustrated, and most satisfactorily established by the discoveries and experiments of Dr. Herschel. This celebrated astronomer cautions those, who peruse the account of his experiments and observations upon them, from concluding, that in using the word rays, he means to oppose, much less to countenance, the opinion of those philosophers, who still believe, that light itself comes to us from the sun, not by rays, but by the supposed vibration of an elastic ether, every where diffused through space: he merely claims the same privilege for the rays that occur in heat, which they do not scruple to allow to those that illuminate objects. For in what manner soever this radiance may be effected, he undertakes to prove, that the evidence, either for rays, or for vibrations, which occasion heat, stands on the same foundation on which the radiance of the illuminating principle, light, is built.

Proposing to give a comparative view of the operations that may be performed on the rays that occasion heat, and of those which are known to have been effected on the rays that occasion light, he selects such facts as are well known with regard to the latter. Light, he says, both solar and terrestrial, is a sensation occasioned by rays emanating from luminous bodies, which have a power of illuminating objects; and, according to circumstances, of making them to appear of various colours. The rays of light are subject to the laws both of reflection and of refraction; but they are of different refrangibility. They are liable to be stopped in certain proportions, when transmitted through diaphanous bodies; and also to be scattered on rough surfaces. They are also supposed to have a power of heating bodies; but this is a subject "sub judice." The similar propositions, which it is his design to prove, and which by a variety of curious and well-conducted experiments he has confirmed, are such as follow. Heat, both solar and terrestrial, is a sensation occasioned by rays emanating from candent substances, which have a power of heating bodies. These rays are subject to the laws of reflection and of refraction; and they are of different refrangibility. They are liable to be stopped, in certain proportions, when transmitted through diaphanous bodies; and to be scattered on rough surfaces: and in a certain state of energy, they may be supposed to have a power of illuminating objects, which latter property remains to be examined.

In the examination of the illuminating and heating power of the prismatic colours, our author observes, that the red-making rays are very far from having the former in an eminent degree: the orange possesses more of it than the red; and the yellow rays illuminate objects still more perfectly. The maximum of illumination lies in the brightest yellow, or palest green. The green itself is nearly equally bright with the yellow; but from the full deep green, the illuminating power decreases very sensibly; that of the blue is nearly upon a par with that of the red; the indigo has much less than the blue; and the violet is very deficient. Our author infers from other experiments, that the heating power of the prismatic colours is very far from being equally distributed; and that the red rays are chiefly eminent in this respect. Allowing that the power of heating is chiefly lodged in the red-making rays, it accounts for the comfortable warmth that is thrown out from a fire, when it is

in the state of a red glow, and for the heat which is given by charcoal, coke, and balls of small coal mixed up with clay, used in hot-houses; all which throw out red light. It also explains the reason, why the yellow, green, blue, and purple flames of burning spirits mixed with salt, occasion so little heat that a hand is not materially injured, when passed through their combustions.

Having ascertained, that radiant heat is subject not only to the laws of refraction, but to those also of the different refrangibility of light, Dr. Herschel is led to surmise, that this heat consists of particles of light of a certain range of momenta, which range may extend a little farther, on each side of refrangibility, than that of light. In a gradual exposure of the thermometer to the rays of the prismatic spectrum, beginning from the violet, he found that he arrived at the maximum of light long before he came to that of heat, which lies at the other extreme. By several experiments it appears, that the maximum of illumination has little more than half the heat of the full red rays; and from other experiments our author concludes, that the full red falls still short of the maximum of heat, which perhaps lies even a little beyond visible refraction. In this case, radiant heat will at least partly, if not chiefly, consist, if the expression may be allowed, of invisible light, that is, of rays coming from the sun, that have such a momentum as to be unfit for vision. Admitting it as highly probable, that the organs of sight are only adapted to receive impressions from particles of a certain momentum, this will explain why the maximum of illumination should be in the middle of the refrangible rays, as those which have greater or less momenta, are likely to become equally unfit for impressions of sight. Whereas, in radiant heat, there may be no such limitation to the momentum of its particles. From the powerful effects of a burning lens, however, we derive information, that the momentum of terrestrial radiant heat is not likely to exceed that of the sun; and that, consequently, the refrangibility of *calorific* rays cannot extend much beyond that of *colourific* light. Hence we may also infer, that the invisible heat of red-hot iron, gradually cooled till it ceases to shine, has the momentum of the invisible rays, which, in the solar spectrum viewed by daylight, go to the confines of red, and this will afford an easy solution of the reflection of invisible heat by concave mirrors.

Our author deduces from various experiments with the thermometer abundant evidence, that there are rays coming from the sun, which are less refrangible than any of those that affect the sight. They are invested with a high power of heating bodies, but with none of illuminating objects; and on this account they have hitherto escaped notice. At the distance of fifty-two inches from the prism, there was still a considerable heating power exerted by the invisible rays, an inch and a half beyond the red ones, measured upon their projection on a horizontal plane. Moreover, the power of heating is extended to the utmost limits of the visible violet rays, but not beyond them; and it is gradually impaired, as the rays become more refrangible. The maximum of the heating power is found to be vested among the invisible rays, and it is probably not less than half an inch beyond the last visible ones. It is also shewn, that the sun's invisible rays, in their less refrangible state, and considerably beyond the maximum, still exert a heating power fully equal to that of red-coloured light; and consequently, if we may infer the quantity of the efficient from the effect produced, the invisible rays of the sun probably far exceed the visible ones in number. The general conclusion with which Dr. Herschel closes his account of one series

of experiments and his reasoning upon them, is in the following manner: "if," says he, "we call *light* those rays which illuminate objects, and *radiant heat*, those which heat bodies, it may be inquired whether light be essentially different from radiant heat? In answer to which I would suggest, that we are not allowed by the rules of philosophizing to admit two different causes to explain certain effects, if they may be accounted for by one. A beam of radiant heat emanating from the sun, consists of rays that are differently refrangible. The range of their extent, when dispersed by a prism, begins at violet-coloured light, where they are most refracted, and have the least efficacy. We have traced these calorific rays throughout the whole extent of the prismatic spectrum, and found their power increasing, while their refrangibility was lessened, as far as to the confines of red-coloured light. But their diminishing refrangibility, and increasing power, did not stop here: for we have pursued them a considerable way beyond the *prismatic spectrum* into an invisible state, still exerting their increasing energy, with a decrease of refrangibility up to the maximum of their power; and have also traced them to that state, where, though still less refracted, their energy, on account, we may suppose, of their now failing density, decreased pretty fast; after which the invisible *thermometrical spectrum*, if I may so call it, soon vanished."—"If this," continues our author, "be a true account of solar heat, for the support of which I appeal to my experiments, it remains only for us to admit, that such of the rays of the sun as have the refrangibility of those which are contained in the prismatic spectrum, by the construction of the organs of sight, are admitted, under the appearance of light and colour; and that the rest, being stopped in the coats and humours of the eye, act upon them, as they are known to do upon all other parts of our body, by occasioning a sensation of heat."

Although, as we have above stated, the rays of light and those of heat, possess many similar properties, yet Dr. Herschel has shewn, that there are some striking and substantial differences between them. The rays of heat are of a much more extensive refrangibility than those of light, as our author has clearly and incontestibly demonstrated both by reasoning and experiment: nor do those rays agree either in their mean refrangibility, nor in the situation of their maxima. Where we have most light, there is but little heat, and where we have most heat, we find no light at all. (See REFRACTION.) It is found, that the sines of refraction of the heat-making rays are in a constant ratio to the sines of incidence; but that the focus of the rays of heat in burning glasses is different from the focus of the rays of light: that of heat being farther removed from the lens than the focus of light, probably not less than a quarter of an inch: the heat at half an inch beyond the focus of light being still equal to that in the focus. Although light and heat are both refrangible, the ratio of the sines of incidence and refraction of the mean rays is not the same in both. Heat is evidently less refrangible than light. From experiments relating to the transmission of light and heat through diaphanous bodies it appears, that no kind of regularity takes place in the proportion of rays of one sort and of another, which are stopped in their passage. Heat and light seem to be entirely unconnected, and the rays that occasion them are different. We have several tables, formed from the author's experiments, and shewing the quantities of light and heat intercepted by different substances. The blueish-white and flint-glasses, *e. gr.* stop nearly three times as much heat as light, whereas the greenish crown glass stops only about one-fourth more of the former than of the latter.

From a table exhibiting the effects of coloured glasses, it appears, that a yellow glass stops only 333 rays of heat, but stops 819 of light; on the contrary, a pale blue stops 812 rays of heat, and but 684 of light. Again, a dark blue glass stops only 362 rays of heat, but intercepts 801 of light; and a dark red glass stops no more than 606 rays of heat, and yet intercepts nearly all the light, scarcely one ray out of 5000 being able to make its way through it. For the conclusions deduced from these tables, as they evince the non-identity of the rays of heat and those of light, and for the tables themselves, we must refer to the author's own paper, *ubi infra*. We are restrained by our limits from pursuing this curious subject, and from entering on a detail of Dr. Herschel's experiments, illustrating and confirming principles, the discovery of which must be allowed to be one of the greatest that has been made since the days of Newton, although the theories of some speculative philosophers might have led to it a few years earlier. Dr. Herschel was occupied in determining the properties of various kinds of coloured glass, which rendered them more or less fit for enabling the eye to view the sun through a telescope; and for this purpose it was necessary to inquire which of the rays would furnish the greatest quantity of light, without subjecting the eye to the inconvenience of unnecessary heat. He first observed that the heat became more and more considerable as the thermometer approached the extreme red rays in the prismatic spectrum; and pursuing the experiment, he found not only that the heat continued beyond the visible spectrum, but that it was even more intense where the thermometer was at a little distance without the limits of the spectrum, than in any point within it; as we have already stated. For Dr. Herschel's communications to the Royal Society on this subject, we refer to the 90th volume of the Philosophical Transactions for the year 1800, part ii. p. 255, &c. p. 284, &c. p. 293, &c. part iii. p. 437, &c.

Sir Henry Englefield has repeated Dr. Herschel's experiments with many precautions, and Mr. (sir H.) Davy was a witness of their perfect accuracy. The excess of heat beyond the spectrum was even considerable enough to be ascertained by the sense of warmth occasioned by shewing it on the hand.

It was first observed in Germany by Ritter, and soon afterwards in England by Dr. Wollaston, that the muriate of silver is blackened by invisible rays, which extend beyond the prismatic spectrum, on the violet side. It is therefore probable, that these black or invisible rays, the violet, blue, green, perhaps the yellow, and the red rays of light, and the rays of invisible heat, constitute seven different degrees of the same scale, distinguished from each other into this limited number, not by natural divisions, but by their effects on our senses; and we may also conclude that there is some similar relation between heated and luminous bodies of different kinds. See Young's Phil. Lect. vol. i. p. 639. See HEAT and REFRACTION.

M. Delaroche has found, that the rays of invisible heat traverse glass with difficulty at a temperature below that of boiling water; but that they traverse it with a facility, always increasing with the temperature, as it approaches the point when bodies become luminous, and from these experiments it would appear, that the modification, whatever it be, which must be impressed upon the invisible rays to render them more and more capable of passing through glass, makes them approach more and more to the state in which they must be when they penetrate our eyes, and occasion the sensation of vision. The same ingenious philosopher has likewise found, that the rays of heat which have passed through

through a plate of glass are proportionably more adapted to pass through a second plate; and from this circumstance we deduce a new proof of the peculiar state of these rays, and of the modification which they acquire. Messrs. Gay-Lussac and Thenard have proved that all the changes of colour produced by light may be imitated and produced by heat, and by an elevation of temperature not exceeding 212° . Other phenomena previously observed indicated, that in the comparison of the actions of heat and light in heating bodies, or producing chemical changes in them, there is a great difference in the rays of different colours. M. Rochon announced the fact amply confirmed by Dr. Herschel, that the heat produced by the different rays of the prismatic spectrum was unequal. As Dr. Herschel fixed the maximum effect beyond the red rays, and shewed, as we have already stated, that the most heating rays of the spectrum were entirely, or nearly, invisible; Dr. Wollaston, and Messrs. Ritter and Beckmann, having examined the opposite, or violet end of the spectrum, found that this likewise possessed peculiar properties, and that, beyond the violet, there are invisible rays, which possess, in greatest perfection, the power of determining chemical combinations. It has been a subject of interesting research, whether the invisible, or almost invisible rays, situated beyond the extremities of the spectrum, possess any other properties of light. *E. gr.* If the reflection of them from polished glass can give them that modification which Malus has distinguished by the name of "polarization." (See LIGHT.) M. Berthollet engaged Messrs. Malus and Berard to undertake this double object. M. Malus's death prevented his prosecution of the subject; but what he began M. Berard accomplished with the utmost possible exactness. By means of the heliostat, which Malus caused to be constructed for the philosophical cabinet of M. Berthollet, he obtained a ray of light, perfectly fixed, on which he could make experiments at pleasure. By decomposing this ray with a prism, he obtained an immoveable coloured spectrum; and by placing very sensible thermometers in the spaces occupied by the different colours, he was enabled to compare their calorific effects with the utmost certainty. He also ascertained their chemical properties by substituting, in place of the thermometers, chemical compounds easily altered. He first of all observed the calorific power of the different rays, which, it is known, are in this respect unequal. M. Rochon, who is said to have first observed this inequality, placed the maximum of heat in the yellow ray, where the illuminating power is the greatest. Dr. Herschel, as we have before shewn, placed it out of the spectrum, and beyond the red ray. The experiments of Herschel have been confirmed by those of Berard, as far as they respect the progressive heating power of the rays from the violet to the red; but he found the greatest heating power at the extremity of the spectrum itself, and not beyond it. He fixed it at the point, where the bulb of the thermometer was still entirely covered with the red ray; and he found that the thermometer sunk progressively, in proportion as the distance of its bulb from the red ray increased. When he placed the thermometer quite beyond the visible spectrum, on the spot where Herschel fixed the maximum of heat, its elevation above that of the ambient air was only one-fifth of what it had been in the red ray itself. The absolute intensity of the heat produced was likewise less in the experiments of Berard than in those of Herschel.

M. Berard wished to know if these properties would exist in each of the pencils into which the ray divides itself in passing through a rhomboid of Iceland spar. In this case both of the two spectra exhibited the same properties. In both, the calorific power diminished from the violet to the

red end; and it existed beyond the last visible red rays. In this operation the luminous molecules are polarized by the crystal. In order to determine whether the invisible rays of heat experience the same effect, M. Berard received the solar ray upon a polished and transparent glass, which polarized a portion of it by reflection. This reflected ray was then received upon a second glass, fixed in an apparatus, which permitted it to be turned round the ray under a constant incidence, and this incidence itself was determined in such a manner, that in a certain position of the glass the reflection ceased to take place. We know, from the experiments of Malus, that a glass may be always disposed in such a manner that this condition is fulfilled. Things being thus disposed, by collecting with a mirror the calorific and luminous rays reflected from the second glass, and directing them upon a thermometer, M. Berard found, that as long as light was reflected the thermometer was elevated, and of course the heat was reflected likewise; but when, from the position of the second glass, the light was totally transmitted, the heat was transmitted at the same time, and the thermometer was not elevated. In this experiment, then, as well as the preceding, the calorific principle, whatever it may be, never separates from the luminous molecules.

To the ray of solar light employed in this experiment. M. Berard substituted a pencil of radiant heat proceeding from a body hot, but not red, and even not luminous. The effect was the same as before. The thermometer rose when the second glass was so situated as to reflect light, and it did not rise when the second could not reflect light. Therefore the particles of invisible radiant heat are modified by reflection, precisely like light.

After having studied the calorific properties of the different rays of the spectrum, M. Berard examined their chemical properties. When muriate of silver, or other white salts of silver, are exposed to light, they become dark coloured very speedily. Guaiac thus exposed to light passes from yellow to green, as Dr. Wollaston observed. Gay-Lussac and Thenard discovered another action of this light still more prompt and energetic. When a mixture of oxymuriatic acid gas and hydrogen gas are exposed to the action of solar light, a detonation takes place, and water and muriatic acid are formed. These different phenomena enabled M. Berard to examine the chemical powers of the different rays of the spectrum. By exposing to the different coloured rays, pieces of card impregnated with muriate of silver, or small phials filled with the detonating mixture, he was enabled to judge of the energy of each by the intensity or rapidity of the chemical change which it produced. He found that the chemical intensity was greatest at the violet end of the spectrum, and that it extended, as Ritter and Wollaston had observed, a little beyond that extremity. When he left substances exposed for a certain time to the action of each ray, he observed sensible effects, though with an intensity continually decreasing in the indigo and blue rays. Hence we must consider it as extremely probable, that if he had been able to employ re-actives still more sensible, he would have observed analogous effects, but still more feeble, even in the other rays. To shew clearly the great disproportion which exists in this respect between the energies of the different rays, M. Berard concentrated, by means of a lens, all that part of the spectrum which extends from the green to the extreme violet; and he concentrated, by means of another lens, all that portion which extends from the green to the extremity of the red. This last pencil formed a white point so brilliant that the eyes were scarcely able to endure it; yet the muriate of silver remained more than two hours exposed to this brilliant light without undergoing any sensible

ble alteration. On the other hand, when exposed to the other pencil, which was much less bright, and less hot, it was blackened in less than six minutes. M. Berard concluded, from this experiment, that the chemical effects produced by light are not solely owing to the heat developed in the body by its combining with the substance of the body; because, on such a supposition, the faculty of producing chemical combinations ought to be greatest in those rays which possess the faculty of heating in the greatest perfection: but perhaps we should find less opposition between these two opinions, if we attended to the different results which may be produced by the same agent placed in different circumstances, and if we considered that agents of a nature quite dissimilar may determine the same combinations when they are employed.

Various hypotheses have been suggested in order to account for the properties above stated. If we wish to consider solar light as composed of three distinct substances, one of which occasions light, another heat, and the third chemical combinations; it will follow that each of these substances is separable by the prism into an infinity of different modifications, like light itself; since we find, by experiment, that each of the three properties, chemical, colorific, and calorific, is spread, though unequally, over a certain extent of the spectrum. Hence we must suppose, on that hypothesis, that there exist three spectrums one above another; namely, a calorific, a colorific, and a chemical spectrum. We must, likewise, admit that each of the substances which compose the three spectrums, and even each molecule of unequal refrangibility which constitutes these substances, is endowed, like the molecules of visible light, with the property of being polarized by reflection, and of escaping from reflection in the same positions as the luminous molecules, &c.

Instead of this complication of ideas, let us conceive simply, according to the phenomena, that light is composed of a collection of rays unequally refrangible, and of course unequally attracted by bodies. This supposes original differences in their size and velocity, or in their affinities. Why should those rays, which differ already in so many things, produce upon thermometers, or upon our organs, the same sensations of heat or light? Why should they have the same energy to form or separate combinations? Would it not be quite natural that vision should not operate on our eyes, except within certain limits of refrangibility; and that too little or too much refrangibility should render it equally incapable of producing that effect. Perhaps these rays may be visible to other eyes than ours, perhaps they are so to certain animals, which would account for certain actions that appear to us marvellous. In a word, we may conceive the calorific and chemical faculty to vary through the whole length of the spectrum, at the same time with the refrangibility, but according to different functions; so that the calorific faculty is at its minimum at the violet end of the spectrum, and at its maximum at the red end; while, on the other hand, the chemical faculty expressed by another function is at its minimum at the red end, and at its maximum at the violet end, or a little beyond it. This simple supposition, which is only the simple statement of the phenomena, equally agrees with all the facts hitherto observed, and accounts for those established by M. Berard, and even enables us to predict them. In fact, if all the rays, which produce these three orders of phenomena, are rays of light, they must of course be polarized in passing through Iceland crystal, or in being reflected from a polished glass with a determined incidence: and when they have received these modifications, they must be reflected by another glass, if it is properly

placed, to exert its reflecting energy on the luminous molecules. On the other hand, if that force is null on the visible luminous molecules, the invisible light will not be any longer reflected: for the cause which occasions or prevents reflection appears to act equally upon all the molecules, whatever their refrangibility may be. It ought, therefore, to act upon the molecules of invisible light, the condition of visibility or invisibility relating merely to our eyes, and not to the nature of the molecules which produce these sensations in us.

This mode of viewing the facts appeared to Messrs. Berthollet, Chaptal, and Biot, who made a report to the Institute on the Memoire of Berard, the most natural and simple; though the modest reserve of Berard restrained him from deciding in a case, not sufficiently examined by the test of experiment. *Annal. de Chimie*, vol. lxxxv. p. 309. or Thomson's *Annals of Philosophy*, N^o 9.

RAY, *Common*, in *Optics*, is sometimes used for a right line drawn from the point of concurrence of the two optical axes, through the middle of the right line which passes through the middle of the centres of the pupils of the two eyes.

RAYS, *Cone of*. See CONE.

RAYS, *Deflection of*. See DEFLECTION.

RAYS, *Inclination of incident*. See INCLINATION.

RAYS, *Optic*. See OPTIC.

RAYS, *Reflexibility of*. See REFLEXIBILITY.

RAY, *Principal*, in *Perspective*, is the perpendicular distance between the eye and the vertical plane or table, as some call it. See PERSPECTIVE.

RAYS, *Pencil of*. See PENCIL of Rays.

RAYS, *Pyramid of*. See OPTIC Pyramid.

RAY of Curvature, in *Geometry*, is used to signify the semi-diameter of the circle of curvature. See RADIUS and CURVATURE.

RAY, *Raia*, in *Ichthyology*. See RAIA.

RAY, *Clavated*. See RAIA *Clavata*, and THORNBACK.

RAY, *Eagle*. See RAIA *Aquila*.

RAY, *Electric or Smooth*, a species of the raia. See RAIA, TORPEDO, and *Anatomy of FISH*.

RAY, *Fuller*, *Raia fullonica*, a species of ray, deriving its name from the instrument which fullers use in smoothing cloth, the back being rough and spiny. See RAIA *Fullonica*.

RAY, *Oblong*. See RAIA and RHINOBATOS.

RAY, *Oculated*. See RAIA and MIRALETUS.

RAY, *Rough*. See RAIA *Rubus*. At Scarborough, where it is common, it is called the white hans or gullet.

RAY, *Shagreen*, called at Scarborough the French ray, is about the size of the skate, but narrower in its form than the common kinds. The upper part of the body is covered closely with small shagreen-like tubercles, resembling the skin of the dog-fish; and from the nose to the beginning of the pectoral fins is a tuberculated space. Pennant.

RAY, *Sharp-nosed*. See RAIA *Oxyrinchus*. This fish makes a snorting noise, and is supposed to be the *bos* of the ancients, which Oppian describes as the broadest among fishes, and fond of human flesh; adding, that the method it takes of destroying men is by overlaying and keeping them down by its vast weight till they are drowned. Pennant.

RAY, *Sting*. See RAIA *Pastinaca*, and PASTINACA *Marina*.

RAY, in our *Old Writers*, a word appropriated to cloth never coloured, or dyed, 11 Hen. IV. c. 6. Blount, Cowel.

RAYS, in *Botany*, the spreading marginal florets of a compound flower; see RADIUS. The same term is applied to the sub-divisions of an umbel, more properly denominated

its general and partial stalks; unless we, like Linnæus, consider the whole umbel as one aggregate flower. See *UMBELLA*, and *INFLORESCENCE*.

RAY-Grass, in *Agriculture*, an useful sort of early grass that has long been, and still is, much cultivated by the farmer in some districts. There are said to be different varieties of this grass, but that grown by Mr. Peacey, of Devonshire, has been found, on experience, much superior to the common sort. This grass has sometimes the title of rye-grass. See *LOLIUM Perenne*.

It has been remarked by the Rev. Mr. Duncan, of Kilmarnock, in the fourth volume of Communications to the Board of Agriculture, that it has been found of late that there is an annual and perennial kind; that the latter should only be sown; but that the annual seed, he thinks, affords the greatest and most palatable crop of hay, and may be sown on those light soils which more readily tend to grass, at least a considerable proportion of it should be blended with the perennial seed. He adds, that the two kinds of seeds are readily distinguished by a careful observer, as the perennial is smaller, and fairer in colour, than the annual, and likewise much lighter. Good annual seed weighs from 21 to 24 lbs. avoirdupois weight *per* bushel, but the perennial only from 16 to 18 lbs. As no distinction of these sorts was formerly made by farmers, he suggests it as probable that they have come to be known and distinguished, from the circumstance of no ray-grass disappearing wholly the first year, by which some persons have been tempted, from the high price of the seed, to allow what remained in the second year to advance to maturity, though to the great injury of the pasture. It is therefore from the seed of the second year's crop that he supposes the perennial grass has gradually originated; and its inferiority in point of substance seems, he thinks, to prove the supposition. By this means the farmer may, by allotting a small portion of good land for the purpose, supply himself with what is said to be the perennial seed, without submitting to the imposition of an extravagant price, and may probably ensure or improve upon the durability of it, by collecting seed from the third or fourth year's growth.

It is found to be an excellent grass for pasture as well as hay. It has an early, but not very abundant, foliage. It is highly relished by cattle and sheep. From its being apt to run up into flowering stems, it should be kept well fed down. From its secreting and depositing much saccharine matter in the joints of the stems, it affords a large proportion of nutritious matter for the support of animals, both in its green state and when made into hay. And it is said not to affect the wind of horses, which renders it particularly valuable for hunting and racing horses.

It has, however, been objected to by some, from the quantity of flower stems which it sends up; but this is asserted by others to be only the case when it grows in dry upland situations. It is found, of course, to vary much under different circumstances and situations.

The soils that are most suitable for it are those of the loamy and sandy kinds, but it is capable of being grown on those of the clayey sorts when not too stiff. On the two first sorts, in mixture with other grasses, it frequently becomes permanent, and affords an useful spring food, especially for sheep flock.

As it is found to produce a thick well-connected sward in soils of the rich fertile kinds, it has been supposed only suited to them, though occasionally met with in those of the poorer descriptions.

In Essex it is found very bad for the strong wet heavy lands.

But in other districts it is most sown in stiff clayey soils, where clover is liable to fail in coming up well. Some, however, find that a light soil is quite as suitable for it as one of a clayey nature; and that though it may be most sown in stiff heavy lands, it is not from the notion that lighter soils are less suited to it, but that such lands may be covered with this grass, should the clover crop not turn out well in consequence of the great stiffness of these clayey soils.

On the stiff clayey soils the proportion of seed is usually from one bushel to one bushel and a half of ray-grass, with eight or ten pounds of red clover seed, to the acre. On other soils from six to ten gallons of ray-grass, with from five to eight pounds of red clover seed, and from two to four pounds of trefoil seed, are used to the acre; some adding to these, two, three, or more, pounds of white clover seed.

In Sussex, for a layer for one or two years, they employ of ray-grass seed three gallons, and of red clover and trefoil seed each one gallon, to the acre.

But for permanent pasture the proportion is this. Of ray-grass seed four gallons, Dutch clover and trefoil seed, of each two gallons to the acre. Other different proportions are made use of in different cases.

It has been well remarked by Dr. Campbell, in the third volume of Communications to the Board of Agriculture, that when land is in a proper state of manure, ray-grass united with white clover, will form a perfect sward the latter end of the second year after it is sown. A particular field, of about five acres, that was sown with these two grasses only, was, he says, more perfectly grassed over, than others, which had the addition of trefoil and rib-grass, and which were sown at the same time. A neighbour of his, the only man in the county that had tried ray-grass, told him it would not answer, and referred him to a particular field where some had been sown. The fact was, the doctor says, that he had cropped his field with oats until it was no longer worth ploughing, and then, with his last seed, he sowed ray-grass, which certainly did not flourish. But his argument would, he thinks, have been equally conclusive against any grass or grain whatever. The ray-grass languished, and finally died away, giving place to the vegetation suited to the state of the land. If it be expected that ray-grass, or any other good grass, should thrive and produce abundant crops on exhausted or poor land, it must not, he says, be in the soil which occurs here. And he adds the following useful remarks, on converting ray-grass into hay; it is necessary to cut it at a period previous to its being so ripe as to have perfected its seed, and changed to a yellow colour; for in this case a great part of the juices of the plant, which constitute a principal part of the nutriment it is to afford, will be converted into a species of straw, and its nutritive properties be proportionably diminished. When it is made into hay, persons not acquainted with its qualities are apt to object to its apparent coarseness, which proceeds from its consisting almost entirely of flowering-stems, the ray-grass having a comparatively smaller proportion of leaves than any other grass. Whether this be a defect or a merit will, he thinks, depend upon a solution of this question: Do the stems and flowering parts of grass, or the leaves taken weight for weight, contain the greater proportion of nutriment? It does not appear, he says, that this has been determined by experiments instituted for the purpose; but it seems probable, from the stems being so much sweeter than the leaves, (which is particularly perceptible upon chewing them when about half dry,) and from those vegetables which contain much saccharine matter being particularly nutritious, that the greater proportionate quantity of

nutriment will be found to reside in the stalks; and if so, the advantages of ray-grafs will be decisive. But, however this may be, it is certain that, supposing wet weather comes on during the process of hay-making, the first part of the grafs that decays is the leaf, which soon becomes yellow, and then black, losing all pretensions to nutritive properties; in which case it is evident that almost the whole nutriment contained in the hay must reside, exclusively, in the flowering-stalks. Ray-grafs then has, in unfavourable hay-seasons, an advantage, he thinks, over all others, inasmuch as from having fewer leaves it is not so apt to be injured by a continuance of rain; and it is, besides, when in the cocks, more accessible to the air and wind from lying more open and light; and consequently not so apt to heat and mould as other grasses in similar situations and seasons. And he concludes that it certainly possesses the following valuable properties. 1. That there are few grasses so early in the spring. 2. That there are none better relished by cattle, or more nutritive. 3. That it has the power of resisting the effects of bad weather, in ticklish seasons, in a greater degree than other grasses. 4. That there is a greater facility in collecting its seed than of any other grafs.

It is supposed that the prejudices against it have proceeded, 1. From its having been sown in land not capable of producing a full crop of any good vegetable. 2. From allowing it to shoot up so far, as to have formed the seed in the flowering-stalk, before cattle have been turned into pasture, or that it has been cut for hay. Ray-grafs appears, he thinks, to partake more of the nature of grain than any other grafs. Hence, when it has perfected its seeds, it shoots out no more stalks, and but few leaves that season, as lord Kaimes has justly observed. Hence it is necessary to turn cattle into a field of this grafs early in the spring, and to keep it well under by a sufficient quantity of stock; in which case it will continue to put out fresh flowering-stalks and leaves during the whole season. 3. The hay, for the reason just assigned, should be cut before it becomes a mere straw. Common hay-grafs, being composed of grasses in various stages of growth and ripeness, admits of greater latitude than a field of ray-grafs, because many of them will generally be in a proper state for cutting, although others may have passed their prime.

He adds the following facts in support of its nutritious properties. No hay, says he, could be better relished by my horses than this was; not a particle of it was wasted by them, or left in the rack; no animals could thrive, coat, or do their work better, than they did, whilst they had this ray-grafs hay to take to. Never was there a greater contrast than when they were put to the natural hay-grafs of the country, after they had finished the other. They were literally starved into the eating of it; and in spite of an additional quantity of corn, they fell away (agreeable to his farming man's mode of expression) a limb a-piece. This year nothing can look better than his horses do upon this hay, (with which some red clover is mixed,) and this, with the addition of very little corn, and that mostly light, the tailings of oats and barley.

These facts place the utility of this grafs in a very striking point of view. And the following, given by Mr. Duncan, are of the same tendency, as he found in a comparative experiment of pieces of ground laid to pasture with it, and meadow soft-grafs alone and in mixture, that the ray-grafs portion was not only more early ready for the scythe by nearly three weeks, but the hay of it always more greedily eaten by the horses and cattle, as well as the pasture in succeeding years, on the ray-grafs division, constantly eaten

bare before the cattle stock would touch that of the soft grafs.

In the county of Essex the farmers in many places have, however, a very indifferent opinion of ray-grafs, believing it to do great injury to the land, especially when of the better kind. When sown with red clover, it does not do so well or is so good as a preparation for wheat, but it answers well for pease. In trying it mixed and unmixed with clover, some have found that when without it, it is all the better for the wheat; and that the wire-worm after ray is sure to destroy the wheat.

In weaning calves it is found extremely useful and advantageous, as it agrees very well with them, far better than tares, which are liable to run through them, or scour.

In Sussex this sort of grafs is employed in mixture with others, as a sheep-feed, with great benefit and success.

The farmers in the tillage parts of Oxfordshire also consider ray-grafs as preparing badly for wheat; they conceive that the wheat which follows will never be found so good where it is sown as where there is none. It is thought far from having any ameliorating effects on the land, as it *drains* too much. It is never sown alone by some. It makes the very worst hay, unless cut at an early period, or very young, in the opinion of many.

In Berkshire this grafs is sown in the chalk district, and found to a certainty less nutritious than many other sorts, as well as more exhausting in its nature. When intended for permanent pasture, it is found, in general, to fail in a very few years; and, unless the seed is changed, it will degenerate under any mode of management. It, however, possesses the advantage of being cheap, and of producing early seed, which are objects of no inconsiderable importance on a farm. Some find that the Peasey variety furnishes feed a fortnight or three weeks sooner than the common sort. It is seldom sown singly, but in mixture with many other artificial grasses, in proportions to suit the difference of soil. In some places it is sown with different other artificial grasses in variety, every four years, on different parts of the land, so as to prevent it getting sick of the same kind of seeds.

In the intention of hay, it should be cut early, or its juices will be much exhausted. Horses fed on this sort of hay are found to preserve their wind better than on hay of other grasses.

In Cheshire the dairy farmers do not consider it a good grafs for producing milk, on which account it is not so much cultivated; its earliness, however, has made it esteemed by many; as on almost any soil, some suppose it will be a pasture a week or ten days sooner than any other kind. And its having the property of correcting the tendency of clover to produce flatulency, renders it also highly worthy of the farmer's attention.

When for hay, if not cut early, the produce is scarcely so nutritious as straw.

This grafs-feed is sometimes sown alone, and the quantity of seeds which the plants afford, and the facility of collecting it, are probably the reasons of its being very common; while the advantages of its earliness have led to its more frequent cultivation. It is suggested, however, that several grasses, as the vernal, the fox-tail, the meadow poa, and some others, are equally as early as this grafs, and that the meadow fescue, the oat-grafs, and some others, seem to be as well deserving of the attention of the farmer.

According to the ingenious experiments on this grafs, made under the direction of the duke of Bedford, as stated in the appendix to sir Humphry Davy's Agricultural Chemistry, the results were as follow.

	lbs.	per	Acre.
The quantity of produce from a rich brown loam, taken at the time of the plant's flowering, was	7827	3	0
Weight when dry			
Weight of produce lost by drying	3322	4	13
Quantity of nutritive matter	4494	14	3
The quantity of produce taken at the time when the seed was ripe	14973	12	0
Weight when dry			
Weight of produce lost in drying	10481	10	0
Quantity of nutritive matter	643	6	7
Loss of weight in nutritive matter by taking the crop at the time of flowering, nearly half its value	337	8	8

Proportional value of the flowering grafs to that taken at the time the feed is ripe, as 10 to 11.

The quantity of latter math produce	3403	2	0
Quantity of nutritious matter	53	2	12

Proportional value of the latter math grafs to that of the time of flowering, as 4 to 10, and to that of the time the feed is ripe, as 4 to 11. See GRASS.

RAYA, in *Geography*, a river on the W. coast of Java, which runs into the sea, S. lat. 7° 27'. E. long. 107° 30'.

RAYEN, a town of the Rhenish palatinate; 11 miles N.W. of Heilbronn.

RAYGEN, or RAYHRAD, a town of Moravia, in the circle of Brunn; 8 miles S. of Brunn.

RAYLEIGH. See RALEIGH.

RAYMANGUR, a fortress of Hindoostan, in Myfore, taken in 1791 by the British troops; 15 miles E. of Nundydroog.

RAYMATLA, a river of Bengal, which runs into the bay of Bengal, N. lat. 21° 35'. E. long. 88° 49'.

RAYMON, a town of France, in the department of the Cher; 14 miles S.E. of Bourges.

RAYMOND DE PEGNAFORT, in *Biography*, a faint in the Roman calendar, was a Spaniard by nation, and born at the castle of Pegnafort, in Catalonia, in the year 1175. He received the early part of his education at Barcelona, from whence he removed to the university of Bologna, where he studied the law, took his degrees, and afterwards taught the canon law for some time with great reputation. He was afterwards called to Barcelona, by Berenger, bishop of that city, who made him a canon, and provost of his cathedral church. He held these posts in the year 1218, when he established an institution which led the way to the foundation of the *Order of MERCY*, (see that article.) In 1222 he resigned his dignities, and became a member of the Dominican order of preaching friars at Barcelona. In 1230, pope Gregory IX. sent for him to Rome, appointed him his chaplain and confessor, and devolved on him the care of carrying on the compilation of the "Decretals." The pontiff would willingly have recompensed him for his labours by presenting him with very considerable church preferment, but he chose rather the quiet of a monastery to the honours and emoluments of the richest sees in Spain and Portugal, which were offered to him. In 1238 he was called to assume the post of general of his order; but upon the plea of his infirmities, he was suffered, in about two years, to return to his monastery, where he spent the remainder of his long life. He died in 1275, having entered on the 100th year of his age. To his everlasting disgrace, he is said to have been principally instrumental in introducing the Inquisition in the kingdom of Arragon, and into Languedoc, a circumstance which probably was the means of his canonization in the year 1601. He was author of "Summa de Cassibus pœni-

tentialibus, seu de Pœnitentia et Matrimonio," which was long popular in the Catholic world, and went through numerous impressions. The best edition of it is that published by father Laget, at Lyons, in 1708. Raymond's chief work is "Lib. V. Decretalium," commencing with the papacy of Alexander III., where the decretals of Gratian terminate, which was approved by pope Gregory IX., and constitutes the second volume of the papal canon law. Moreri.

RAYMOND LULLY, a philosopher of much celebrity in the dark ages, was born at Majorca in 1234. He was brought up a soldier, and led the life of a man of pleasure. Falling in love with a young woman, who was deaf to his addresses, on account of a cancer with which she was afflicted, and which she exhibited to his view, in order to make him desist from his importunities, he was so much affected with the sight, that he retired from the world, devoting himself to pious pursuits, and in the search of a remedy for the disease with which the object of his affection was afflicted; this was the chief motive for the chemical studies for which he became so famous. He undertook a course of travels into the East, for the purpose of converting the Mahometans to the Christian faith, and incurred very great hardships, and the most serious dangers. So great was his zeal for this object, that being unable to persuade certain Christian princes to engage in it, he entered into the Franciscan order, and returned to Africa, with the hope of obtaining the honour of dying a martyr. He was accordingly thrown into prison, and after suffering much torture, and long imprisonment, he was freed through the interest of some Genoese traders, who took him on board their ship to convey him home. He died just when he had arrived within sight of his native land, in the year 1315. As a chemist, his chief object was the pursuit of the philosopher's stone, and the universal remedy for all disorders. Boerhaave, who had perused the works of Lully, speaks highly of their merit; he finds them, he says, "beyond all expectation, excellent, so that he doubted whether they could be the work of that age. So full are they of the experiments and observations which occur in later writers, that either they must be supposititious, or the ancient chemists must have been acquainted with many things which pass for modern discoveries." Lully is supposed to have derived his chemical knowledge from his travels in the East, particularly from the writings of Geber. A complete edition of all the writings attributed to him, was printed at Mentz. Raymond Lully is chiefly celebrated for an invention by which he pretended to enable any one, mechanically, to invent arguments and illustrations upon any subject, and thus to reach the summit of science at a small expence of time and labour. This "Great Art" professes to furnish a general instrument for assisting invention in the study of every kind of science. For this purpose, certain general terms, which are common to all sciences, are collected and arranged, not according to any natural division, but merely according to the caprice of the inventor. An alphabetical table of such terms was provided, and subjects and predicates taken from these were inscribed in angular spaces, upon circular papers. The essences, qualities, affections, and relations of things, being thus mechanically brought together, the circular papers of subjects were fixed in a frame, and those of predicates were so placed upon them as to move freely, and in their revolutions to produce various combinations of subjects and predicates; whence would arise definitions, axioms, propositions, varying infinitely, according to the different application of general terms to particular subjects. Such is the general idea of the Lullian art, which, however applauded by certain writers of that

that period, may be pronounced as unworthy of notice, except as a specimen of the artifice with which men frequently impose upon vulgar credulity. Enfield's History of Philosophy.

RAYMOND, in *Geography*, a township of America, in Rockingham county, New Hampshire, incorporated in 1764, containing 898 inhabitants; 12 or 14 miles W. of Exeter.

RAYMOND, or *Raymond-town*, a post-town in Cumberland county, and district of Maine, containing 825 inhabitants; 142 miles N.N.E. of Boston. The land is generally level, excepting one large hill, called Rattle-snake-hill, from its abounding with those reptiles. The greater part of the growth is pine and white oak, and the soil is difficult of culture.

RAYNAL, WILLIAM-FRANCIS, in *Biography*, a French writer of celebrity, was born at St. Genies, in the Rovergue, in 1713. He entered at a very early age among the Jesuits, and by his abilities excited high expectations of his future celebrity. His dislike of restraint induced him to quit the society in the year 1748, although he had made his profession, and had been ordained priest. He now entered his career of authorship, and distinguished himself as a political, historical, and miscellaneous writer. His first piece, published the same year in which he quitted the society, was entitled "*Histoire du Stadhouderat*;" he next published "*Histoire du Parlement d'Angleterre*," which gained him much reputation, though it had little claim to the dignified title of history, and was, moreover, tinged with many prejudices, religious and political. He also composed "*Anecdotes Littéraires*," in three vols. 12mo.; and "*Memoires de Ninon de l'Enclos*," and was much employed in the "*Mercur de France*." The great work of the abbé Raynal was entitled "*Histoire Philosophique et Politique des Etablissmens et du Commerce des Europeens dans les deux Indes*," to the composition of which he was led by his engaging in some commercial speculations, thinking them likely to turn out more profitably than literary pursuits. His history was published in 1770, and as it contained history, description, and calculation, intermixed with political and philosophical reflections, and was, through the whole, animated by an ardent spirit of philanthropy, and hatred of tyranny, civil and religious, it became popular, and the author was looked up to as one of the reformers of the age. Critics, however, soon found that, as a literary and philosophical work, it would not bear the test of examination. The style, though rich, was exceedingly declamatory; the images were frequently inflaming; and his principles vitiated by the licentiousness of his country; and the facts upon which the whole was founded were derived from incorrect or dubious documents. The author, it should seem, was soon made sensible of the imperfections of his work, and determined to improve it by travel: with this view he visited the principal commercial towns in France, and passed into England and Holland, at every place making inquiries among travellers and merchants with the most unremitting assiduity. On his return, he published at Geneva an improved edition of his work, in 10 vols. 8vo. containing many additions and corrections. Its tone was unaltered, and its attacks upon existing authorities were so bold, that the parliament of Paris ordered it to be burnt, and issued a decree for apprehending the author. He retired to Spa, whence he travelled through Germany, and after having visited all the principal places, he returned to France, and lived some time quietly in the southern provinces. At the academies of Marseilles and Lyons he founded several prizes for essays on given subjects, of which the most re-

markable was whether the discovery of America had been more useful or prejudicial to Europe.

America has now, owing to the quarrel and war subsisting between Great Britain and its colonies, become an object of peculiar interest; and the abbé Raynal, in 1781, published "*Tableau et Revolutions des Colonies Angloise dans l'Amerique Septentrionale*," which was commented upon and exposed by Thomas Paine, who was a zealous and able defender of the American cause, against the mother country.

The abbé came to Paris in the important year 1788, when the revolution was just ready to burst forth. He had not been long in the city, before the National Assembly was convoked, and one of its early acts annulled the decree passed against him; for this favour, he addressed a letter of thanks to the president, containing a retraction of certain principles contained in his work. Observing, afterwards, that the constituent assembly were occupied in decrees which he thought were violent infringements on the rights of property, and in others calculated to augment the popular effervescence, he wrote, in May 1791, a long letter of advice and remonstrance. It was soon seen that the sentiments in this letter were very different from those which were generally expected from the author of the "*Histoire Philosophique*," their tendency being to repress popular licence, and to strengthen the hands of civil authority. Raynal, like many other philosophers of that day, had aided all in his power to produce the change, at which, when put into practice, he and they were greatly alarmed. But it was now too late to return: they had shewn the people their power, had taught them their rights, which it was in vain to expect they would be induced to abandon for any arguments he could produce. In the letter referred to, he says, "I have long dared to speak to kings of their duty, suffer me now to speak to the people of their errors, and to their representatives of the dangers which threaten us. I am, I own to you, deeply afflicted at the crimes which plunge this empire into mourning. It is true that I am to look back with horror at myself for being one of those who, by feeling a noble indignation against arbitrary power, may perhaps have furnished arms to licentiousness. Do then religion, the laws, the royal authority, and public order, demand back from philosophy and reason the ties which united them to the grand society of the French nation, as if, by exposing abuses, and teaching the rights of the people and the duties of princes, our criminal efforts had broken these ties? But no!—never have the bold conceptions of philosophy been represented by us as the strict rule for acts of legislation." He next proves, that it was not the business of the assembly to abolish every ancient institution; that the genius of the French people is such, that they can never be happy or prosperous but under a well regulated monarchical government; and that if they wished not the nation to fall under the worst kind of despotism, they must increase the power of the king. Raynal was considered to be in his dotage, and himself and his writings were now disregarded. He retired in the midst of storms to Passy, where, being reduced to a state of indigence, he died in March 1794, at the age of 85. Besides the works already mentioned, the abbe Raynal published "*The History of the Divorce of Catharine of Arragon, by Henry VIII.*;" and "*A History of the Revocation of the Edict of Nantes*," in four volumes; but he committed many of his papers to the flames during the bloody reign of the monster Robespierre.

RAYNERIUS, a learned Italian monk, who flourished most probably in the 13th century, was a native of Pisa.

He

He acquired the character of a consummate divine and civilian, and was appointed professor of divinity, as well as raised to the most considerable offices of trust and honour belonging to his order. It is uncertain at what period he died. He left behind him many works, of which the chief is entitled "Pantheologia, seu, Summa universæ Theologiæ." This is a dictionary of theology, with the subjects disposed of in alphabetical order; it has been held in high estimation among the members of the Catholic communion. It has gone through several editions in folio and quarto. The last edition was printed at Paris in 1655, in 3 vols. folio, with additions of father Nicolai.

RAYNHAM, in *Geography*, a township of Massachusetts, in Bristol county, taken from Taunton, and incorporated in 1731. It contains 1154 inhabitants. Besides the great river Taunton, this township is watered by several streams, upon which are six saw-mills, three grist-mills, a furnace, a forge, and fulling-mill. Here are also numerous ponds, of which Nippaniquit, or Nippahonsit, is two miles long and one broad. In this pond millions of alewives annually resort and leave their spawn in it. An excellent kind of ore, and various kinds of fish, are found in this township. Besides the usual occupations of husbandry and mechanics, many of the inhabitants are employed in the manufactories of bar-iron, hollow ware, nails, iron for vessels, iron-shovels, potash, shingles, &c. The first forge set up in America was introduced into this town by James and Henry Leonard, natives of England, in 1652. The same family, in the 6th generation, now possess it. King Philip's hunting house stood on the northern side of Fowling pond, about one mile and a quarter from the pond. When the war broke out in 1675, which terminated in the death of the king and the ruin of his tribe, he left strict orders to all his Indians not to hurt the Leonards. Before Philip's time, Fowling pond was two miles long, and three miles and a quarter wide. But the water is now almost gone, and the large tract it once covered is grown up to a thick-set swamp of cedar and pine. The vicinity has abounded with excellent ore, which has supplied the forge for 80 years; it is, however, incapable of being wrought into iron of the best quality.

RAYNOLDS, or RAINOLDS, JOHN, in *Biography*, a learned English divine, was born at Pinhoe, near Exeter, in the year 1549. In 1562 he was admitted a student at Merton college, Oxford, whence he was removed, in 1563, to a scholarship of Corpus Christi college. In 1572, having taken his degrees in the arts, he was appointed Greek lecturer in his college, in which department he acquitted himself with great applause. Fuller speaks of him in the highest terms as a commentator of Aristotle's Rhetoric. He had hitherto been zealously attached to the Popish religion, while his brother William was equally zealous for the Reformation. The difference in their sentiments leading them to frequent conferences and disputations, they made converts of each other, William becoming a determined Papist, and John a steady Protestant. He frequently appeared in the pulpit, and was greatly admired as a preacher. In the year 1588 he was admitted to the degree of doctor of divinity, and soon afterwards the fame of his great learning induced queen Elizabeth to appoint him professor extraordinary in that faculty at Oxford; after which she gave him the deanery of Lincoln, which he held only a short time, when he exchanged it for the presidentship of Corpus Christi college, of which he was a fellow. He made this exchange from his attachment to an academical life, and his love of retirement and study. Similar motives led him afterwards to refuse a bishopric which queen Eliza-

beth offered him. He retrieved the finances of his colleges, which had been suffered to fall into dilapidation, and he restored its decayed discipline, strictly obeying the statutes himself, and compelling all the other members to observe them. After the accession of James, he was appointed, with Dr. Sparks, Mr. Chadderton, and Mr. Knewtubs, to appear on behalf of the Puritans in the pretended conferences at Hampton Court; of which we have a full account in the second volume of Neal's "History of the Puritans," by Dr. Toulmin, p. 10—20. Dr. Raynolds did not on this occasion act according to his usual spirit, and, suffering himself to be browbeaten by the royal tyrant, lost much of the respect which his character usually laid claim to. It was at the conclusion of this conference, that the king said to Dr. Raynolds and his friends, in answer to their arguments; "If this be all your party hath to say, I will make them conform themselves, or else I will harrie them out of the land, or else do worse, only hang them, that's all." When James gave directions for undertaking a new and more correct translation of the bible, Dr. Raynolds was one of the Oxford divines who were commissioned to give a new version of the four greater prophets, the book of Lamentations, and the twelve minor prophets. While employed in this great work he was seized with the gout, under which he had been a sufferer many years, and which at length proved fatal to him. In the midst of the severest pains, he persevered in the task assigned to him, and once a-week his fellow-labourers at Oxford regularly assembled in his apartments, where they compared the fruits of their respective studies, determining what appeared to them to be the most faithful translation, till they had accomplished their task. Dr. Raynolds died in the year 1607, highly respected for his erudition, his piety, his modesty, and humility. Several of his biographers speak of him in the highest terms. Wood says he was most prodigiously seen in all kind of learning, and had turned over all writers, profane, ecclesiastical, and divine, all the councils, fathers, and histories of the church. He was author of many theological works, of which we may mention "De Romanæ Ecclesiæ Idolotria, in Cultu Sanctorum, Reliquiarum, Imaginum," &c. 1596; and "Censura Librorum Apocryphorum Veteris Testamenti, adversus Pontificios," which was a posthumous work, and printed at Oppenheim, in Germany, 1611, in 2 vols. 4to.

RAYNPOUR, in *Geography*, a town of Hindoostan, in Bahar; 40 miles N.W. of Chuprah.

RAYNULLAH, a town of Hindoostan, in Bahar; 32 miles E. of Bahar.

RAYPOUR, a town of Bengal; 55 miles W.S.W. of Burdwan. N. lat. 22° 48'. E. long. 87° 5'.—Also, a large and commercial town of Hindoostan, in the country of Ruttunpour; 55 miles S. of Ruttunpour. N. lat. 21° 24'. E. long. 82° 28'.

RAYPOUR, or *Ray-Gaut*, a remarkable pass on the Beyah river, about 17 or 18 cosses from Noorpour; situated a considerable way within the level country of the Panjab.

RAYTE, or RYCHE, in *Ichthyology*, a name given by Joannes Cuba, Albertus, and others, to the common skate, or flaire. See RAIA *Batis*.

RAZANT. See RASANT.

RAZANT *Flank*. See FLANK.

RAZANT *Line of Defence*. See DEFENCE.

RAZBOINIKOVA, in *Geography*, a town of Russia, in the government of Irkutsk, on the Angara; 56 miles N.W. of Balaganiskai.

RAZBOINOI, a fort of Russia, on the Ural; 92 miles E. of Orenburg.

RAZE. See **TUMB.**

RAZE, in the *Manege*. A horse is said to have *razed*, whose corner teeth cease to be hollow; so that the cavity, where the black mark was, is filled up; that is, wholly disappears, and the age of the animal cannot be known with any degree of certainty. See **MARK.**

RAZI, in *Biography*, one of the surnames of the famous Mussulmaa Mohammed Ben Omar Ben Khatid Rei, Al Temini Al Bekri, a native of the city of Rei, in the Persian Irak, of which the word Razi is the appellative. He was born in the year of the Hegira 543, corresponding with 1148 of the Christian era, and became one of the most celebrated doctors. His knowledge was not confined to the learning usually taught in the Mohammedan schools, but it comprehended likewise the sciences imported into the East with the writings of the Grecian sages. He was, moreover, a very eloquent preacher both in the Arabic and Persian languages. By these qualifications he acquired the favour of several princes, particularly of a sultan of the Gaurid dynasty, who erected a college for him in the city of Herat in Chorasan. He was driven from this situation by the intrigues of Cadi Abdalmejid, of the sect of Keramians, who contended that the deity was corporeal, and of human shape. Having challenged Razi one day to a public disputation on the attributes of God, he was so confounded by the superior reasoning of the latter in defence of the divine spirituality, that he became his bitter enemy, and seized every opportunity of calumniating him to the sultan, as a man who, under the cloak of philosophy, concealed irreligious and impious notions. By his persuasions, the prince banished Razi from the city, but he soon repented of his rash decree, and recalled him. This happened in the year 606 of the Hegira. He was author of an "Introduction to the most subtle Mysteries for the Use of Men of Genius," in which he explains the principles of the Mohammedan philosophy; and several other pieces. "Select Astronomical Researches" have been attributed to him, but perhaps on insufficient authority.

RAZI is also the surname of a celebrated philosopher, chemist, and astronomer, called Mohamed Ben Zakaria, a native of the same city as the preceding, who flourished under the caliphate of Moctader of the dynasty of the Abassides. He died about the year 922 of the Christian era.

RAZIMIERZ, in *Geography*, a town of the duchy of Warfaw, situated between Slepzka and Posen, where the unfortunate count Patkul was broken alive on the wheel, and impaled by order of Charles XII. of Sweden in 1708.

RAZNIPNAIA, a fort of Russia, in the government of Upha, on the Ural; 56 miles S.W. of Orenburg.

RAZOIS, **PORT**, a port at the S.W. extremity of the coast of Nova Scotia, and N.E. of cape Negro.

RAZOR, a well-known edged instrument used in shaving. Heat appears to give a partial increase of tenacity to a razor's edge, probably because the edge cools fastest, contracts, and is stretched.

RAZOR-Bill, in *Ornithology*, the common English name of the alca, a web-footed bird with no hinder toes, common on our sea-shores. See **ALCA Torda**.

RAZOR-Fish, in *Ichthyology*, the *Coryphæna novacula* of Linnaeus, having the head and fins barred with blueish lines. See **NOVACULA**.

RAZOR Island, in *Geography*, a small island on the coast of Brazil; 12 miles S. of Rio Janeiro.

RAZUDA, a town of Hindoostan, in Guzerat; 40 miles E.S.E. of Chitpour.

RE', an island in the Atlantic, near the west coast of France, about 16 miles long, and 3 broad; separated from

the coast of Vendée by the straits of Breton, which are about 7 miles wide. The principal town is St. Martin de Ré. N. lat. 46° 13'. W. long. 1° 20'.

RE, in *Commerce*. See **REE**.

RE, in *Grammar*, &c. an inseparable particle, or preposition, prefixed to the beginning of words, to vary, double, or otherwise modify their meaning.

The modificative *re* was first introduced by the Latins, from whom it is borrowed into most of the modern tongues. Priscian derives it from *retro*, backwards; others rather derive *retro* from *re*; others derive *re* from the Greek *ῥεα*, *easy*; or from *ῥεω*, *I flow*.

The effect of the *re* is various: usually it signifies *again*, *reverse*, *back*; as in *re-join*, *re-lign*, *re-fume*, *re-couric*, *re-bound*, *re-cite*, *re-hear*, *re-cognize*, *re-compare*, *re-double*, *re-linguist*, &c.

Sometimes it stands for *contra*, *against*; as in *re-luctance*, *re-cumbent*, *re-cline*, &c.

Sometimes for *super*, *over*, as in *re-dundant*; sometimes for *longe*, *far*, as in *re-moving*, &c.

RE, in *Music*, the name of the second of the keys in the three hexachords of Guido, G, C, and F. See **SOLMISATION**, **GAMMUT**, **HEXACHORDS**, and **MUTATIONS**.

RE Alla Caccia, Il, the Italian title of a comic opera, taken from our "Miller of Mansfield." It was set to music for our opera-house in 1768, by Alessandri, a young composer of promising abilities. He was husband of La Guadagni, the original "Buona Figliuola" in Italy, and sister to Gaetano Guadagni, the celebrated singer. But the Miller of Mansfield was first formed into a comic opera for Paris, by Sedaine, and set by Monfigni, under the title of "Le Roi et le Fermier," in 1762.

RE Teodoro, Il, a comic opera, founded on the adventures and vicissitudes of the unfortunate Theodore, king of Corsica. The music of this drama is one of the innumerable instances of the fertility of Paisiello's pen. It had been performed all over Italy and Germany with the greatest applause, previous to its being brought on our stage. The music, that was not changed, is extremely original and pleasing, particularly the *finales*. There was a mixture of airs by Corri, Mazzinghi, and Storace; but besides destroying the unity of style, the certainty of there being merit of some kind or other in every composition of Paisiello, inclines lovers of music to lament that any of his airs should be changed or omitted.

REA, in *Geography*, a river of England, which runs into the Tame, 3 miles N.E. of Birmingham.

REA, **Lough**, a lake of Ireland, in the county of Galway, on the border of which is the town of Loughrea. See **LOUGHREA**.

REACH, in *Sea Language*, the distance between any two points on the banks of a river, in which the current flows in a straight uninterrupted course.

RE-ACTION, in *Physics*, the action by which a body acted upon, returns the action by a reciprocal one upon the agent.

The Peripatetics define re-action to be that which a passive body returns upon the agent, by means of some quality contrary to that received from it, in the same part with which the agent acted, and at the same time; as if water, while it is heated by the fire, does at the same time cool the fire.

It was known, even in the schools, that there is no action in nature without re-action; and it was a maxim among them, *omne agens, agendo reparatur*.

But the equality of the actions was not known. Sir Isaac Newton established it as one of the laws of nature, that

action

action and re-action are equal and contrary; or that the mutual actions of two bodies, striking one against another, are exactly equal, but in contrary directions; or, in other words, that by the action and re-action of bodies one on another, there are produced equal changes in each: and those changes are impressed towards directly contrary parts or ways. See *Laws of NATURE*.

Some of the school-philosophers deny any such thing as re-action, properly so called, at all; urging, that action arises only from the ratio of the greater inequality; that is, we are only to account for action the excess of action, or what the agent does more than is returned by the patient. But the equality between action and re-action sets aside this exception.

READ, in *Geography*, a river of England, in the county of Northumberland, which runs into the Tyne, 10 miles N. of Hexham.

READ Head, a cape on the E. coast of Scotland. N. lat. $56^{\circ} 35'$. W. long. $2^{\circ} 28'$.

READFIELD, a post-town of America, in Kennebec county, and district of Maine, bounded on the E. by Hallowell, and separated from Sterling on the W. by the eastern branch of the Androscoggin river; 8 miles W. of Hallowell, and 190 N.E. of Boston. It contains 1396 inhabitants.

READING, JOHN, in *Biography*, organist, first at Lincoln, then at Hackney, and finally of St. Dunstan's church in Fleet-street, London. He was a scholar of Dr. Blow, and Stanley's first master. He published Hymns early in life, for psalmodists in parochial congregations; and, lastly, a work engraved on copper, which he called "A Book of my Anthems, with a Thorough-bass, for the Organ or Harpsichord." He died in 1766, far advanced in years.

READING, in *Geography*, a borough and market-town in the hundred of Reading, and county of Berks, England, is 38 miles W. by S. from the metropolis. It is a town of considerable extent and importance, and contains, according to the parliamentary returns of 1811, 2032 houses, and 10,788 inhabitants.

Historical Events.—Reading is unquestionably of very great antiquity; but whether it is indebted for its origin to the Britons, the Romans, or the Saxons, is unknown. Conjectures, however, have been hazarded on the subject by various writers. Camden thinks its foundation ought to be referred to the Britons; Leland calls it the Pontes of Antoninus; and Dr. Beeke, the learned professor of modern history at Oxford, considers it the Calvea of Richard of Cirencester. But the circumstances which are alleged in favour of these opinions, by their respective authors, are far from being satisfactory. This place is first mentioned in history, under its present appellation, in the year 871; at which time it is described by Asser as being a fortified town, belonging to the Saxon kings, but then occupied by the Danish invaders, who had retreated hither after their defeat at Englefield. The victorious Saxons immediately invested the town; but their enemies, having received reinforcements, attacked the besiegers with such impetuosity, that, after an obstinate contest, they deemed it prudent to retire to Ashdown. Hither they were followed by the Danish forces, which were again overthrown, and driven back to Reading. Here the latter remained unmolested till the following year, when they marched to London. In the reign of Alfred, who mounted the throne of Wessex soon after this event, the Danes once more seized upon Reading, and they doubtless possessed it occasionally during their incursions in the tenth century. Throughout that long period of incessant

hostility and depredation, however, this town seems to have escaped any very serious disaster; but in 1006 it was reduced to ashes by Sweyn, king of Denmark, along with its famous nunnery, said to have been founded by Elfrida, widow of king Edgar, as an atonement for the murder of Edward the Martyr. Reading soon recovered from this disaster, and in the course of a century afterwards became a place of considerable importance. In 1121 king Henry I. laid the foundation of its magnificent abbey, in which his remains were subsequently interred, according to his own desire. Stephen, who usurped the throne after Henry's death, built a castle here, which was surrendered to his antagonist Henry Fitz-Empress, who no sooner obtained the crown, than he ordered it to be demolished; so that even the site of it is now uncertain. That monarch, however, otherwise evinced much partiality for Reading. Here he passed much of his time, and convened a parliament, as also an ecclesiastical convocation, in which Baldwin was elected archbishop of Canterbury. The abbey church was finished in this reign, and dedicated in presence of the king. In 1185 he came hither from London, to receive Heraclius, patriarch of Jerusalem, who presented him with the keys of the holy sepulchre, and the royal banners of Jerusalem, which Henry returned. In the reign of his successor, Richard I., a convention for the trial of Longchamp, chancellor and bishop of Ely, who had been appointed regent of the kingdom during the king's absence, was held here. King John also held a convention in this town, in 1206; and in 1212 a council was convened here by the pope's legate, for the purpose of effecting a reconciliation between that infatuated prince and the exiled bishops. In 1213 the king met the legate and barons at the abbey, and held a parliament. King Henry III. spent his Christmas at Reading in 1226; and twice during his reign summoned the estates of the realm hither, for the transaction of national business. He was the first monarch who granted a charter of incorporation to the town. In 1346, Edward III. held a great tournament here; and in 1359, the marriage of his son, John of Gaunt, with Blanche, daughter of Henry, duke of Lancaster, was solemnized in the abbey church. In 1384, Richard II. and his court, together with the mayor and aldermen of London, being assembled at Reading, John Northampton, the preceding mayor of that city, was convicted before them of seditious practices, and sentenced to perpetual imprisonment. In 1389 a great council was held at Reading, at which the king and his barons were reconciled by John of Gaunt. Parliaments were held here also in 1440 and 1451; in the former of which the order of nobles called viscounts was first established; and in the year following, the parliament adjourned hither from Westminster, on account of the plague. King Edward IV.'s marriage with Elizabeth, lady Grey, was first acknowledged at Reading, in 1464; on which occasion she made her public appearance at the abbey, conducted by the duke of Gloucester and the earl of Warwick. In 1466 parliament was a second time adjourned to Reading, to avoid the plague. King Henry VIII. frequently resided here, having converted the dissolved abbey into a palace. His son, king Edward VI., visited this town in 1552, when he was met by the mayor and aldermen at Coley-Crofs, and presented with two yokes of oxen; the mayor riding before him, uncovered, to the palace. The same ceremony was repeated, when Reading was visited by the bigotted Mary, and her husband, king Philip of Spain. Queen Elizabeth was a frequent visitant here, and had a seat in the church of St. Lawrence.

Early in the reign of Charles I., when the plague raged with

with great violence at London, the courts of chancery, king's bench, and common pleas, were held here, as were likewise the court of exchequer, the court of wards and liveries, and the court of requests. In 1642, Reading was a parliamentary post, but the garrison, being defective as to ordnance and ammunition, quitted the town, without resistance, on the approach of a party of the king's horse. In consequence of this event it became a royal garrison, and continued to be so till taken by the earl of Essex in April 1643, after a siege of eight days. The king, however, again recovered it in September the same year, and held it till May following, when he ordered the works to be demolished, and evacuated the town. After this event Reading was frequently occupied as the head-quarters of the parliamentary army, and was consequently much impoverished by the contributions levied upon its inhabitants for the support of the military. In 1688 the army of king James II. was quartered in this town, but quitted it on the approach of the prince of Orange. On this occasion a skirmish took place in the market-place between two detachments of horse, which terminated in favour of the Protestant interest, and is still commemorated, by bell-ringing, on the anniversary of its occurrence. Queen Anne visited Reading in 1700, when she was received by the corporation in state, and presented with forty broad pieces of gold in an elegant purse made for the occasion.

Municipal Government.—Reading claims the honour of having been originally constituted a guild, by charter from Edward the Confessor. This claim, however, is extremely questionable; and at all events we feel convinced that the ancient guild was nothing more than an association of mechanics and tradesmen for their individual benefit. The first monarch who conferred upon Reading the privilege of separate jurisdiction was Henry III., in the 37th year of his reign. His charter was subsequently confirmed by all his successors, but without any material alterations, till the reign of Henry VI., when the corporation is first mentioned by the title of the mayor and burgessees. Thus it continued to be designated till queen Elizabeth divided the burgessees into capital and secondary, and declared the mayor and them to be a common council for the borough. That princess further conferred upon the corporation considerable estates. Charles I. authorized aldermen to be elected, and invested the mayor and them with ample powers for the government of the town. This charter was confirmed, after the restoration, by his son Charles II., and is the one under which the corporation now acts. By it the officers are declared to be a mayor, twelve aldermen, and the same number of capital burgessees; the mayor, and his deputy, (the preceding mayor,) the senior alderman, the bishop of Salisbury, and his chancellor, being justices of the peace for the borough, and empowered to hold sessions, and a court of record. The recorder is an officer added by Charles II., who likewise first acknowledged the town-clerk. Reading sent members to parliament from the time of the earliest records. Before 1716 the right of election was vested in the freemen not receiving alms, and in the inhabitants paying scot and lot; but in that year it was limited, by a decision of the house of commons, to the inhabitants paying scot and lot only. The number of voters is estimated at 560, and the mayor is the returning officer. The spring assizes for the county are held at this town, as are likewise the Epiphany sessions, but the summer assizes are held at Abingdon, and the Michaelmas, either there or at Reading, as the magistrates may judge most convenient.

Reading is a town of considerable extent, situated on both banks of the river Kennet, which separates itself into

several branches in passing through the town. It contains three parishes, St. Giles, St. Mary, and St. Lawrence, and is divided into five wards, called the High-ward, New-ward, Minster-ward, Old-ward, and London-ward, for each of which a constable is appointed. Formerly it was a place of great trade in woollens, but that manufacture fell to decay during the seventeenth century, and has never since revived. At present the chief manufactured products are, coarse linens, (such as sheeting, fail-cloth, floor-cloth, and sacking goods,) gauze, crapes, muslinets, ribbons, hat-bands, shoe-lirings, and other similar articles. These afford employment to a great portion of the inhabitants among the lower orders; but the principal support of the town arises from its water communications with London, Bath, and Bristol. The articles exported are, flour, of which 20,000 sacks are sent annually to the metropolis, timber, bark, straight hoops, linen, wool, cheese, beer, and a variety of minor articles: in exchange are received groceries of every kind, iron, spirits, fir timber, deals, staves, Portland stone, bricks, hemp, flax, hides, leather, coals, Bath free-stone, Birmingham goods, &c. For the convenience of trade, several wharfs are formed at Reading, and many improvements have been lately made in the internal navigation of the district at large.

This town, from time immemorial, has been noted for its markets, which are held weekly, on Wednesday and Saturday. The Wednesday's market is chiefly for fruit; but that of Saturday embraces corn and every article of provision. The spot on which the corn market is held, is a spacious piece of ground, of a triangular form, environed by commodious shops for the accommodation of people attending the market, who may be supplied here with colonial or manufactured goods cheaper than in any other town in the county. This market-place is kept in repair by the corporation, for which they are entitled to take one pint out of each sack of corn sold in the market, amounting to about 54,600 quarters annually. The provision market buildings adjoin to the corn market-place, and form a long square, consisting, one-half of two ranges of butchers' shops, and the other half of apartments for the market-women, who bring butter, eggs, poultry, &c. for sale. At the southern end of this building is a square open area for fishmongers' and hucksters' stalls, and next to this, and fronting a street called Fisher-street, is a large square gate-way, over which is the house occupied by the clerk of the market. Besides these market-places, there is another for the sale of store pigs, conveniently situated between Friar-street and Broad-street. This is private property, but the corporation receive the toll. At Reading are four annual fairs, one on the 2d of February, another on the 1st of May, a third on the 25th of July, and a fourth on the 21st of September. The three first are chiefly for the sale of horses and cows; but the last is also a statute fair for the hiring of servants, and is further remarkable for the quantity of cheese brought hither from the counties of Gloucester and Wilts. Hops are also plentiful at this fair.

The houses of Reading are mostly constructed of brick, and are generally disposed in regular streets, some of them very narrow, which have been paved under the authority of an act of parliament, passed in the year 1785.

The principal public buildings and institutions in the town are the three churches of St. Lawrence, St. Mary, and St. Giles, and several dissenting meeting-houses, the town-hall and free-school, the blue-coat school, the green school, the foundation school, the school of industry, the Lancastrian school, the school for national education, the theatre, and the county gaol.

READING.

The church of St. Lawrence was chiefly erected towards the close of the 16th century, and is partly constructed of materials taken from the buildings of the abbey. Among the parts of it, so pilfered from the monastery, is a large doorway, which is composed of a circular arch, ornamented with rich mouldings, from which were suspended on each side the arms of the abbey; but these are now nearly obliterated. This door-way is likewise ornamented with niches, in which statues formerly stood. The advowson of the church belongs to St. John's college, Oxford. St. Mary's church is somewhat more ancient than that of St. Lawrence, having been constructed about the year 1547, in the stead of a previous one, which had gone to decay. Some portions of this building have evidently belonged to an older edifice, particularly a window over the west door, which is in the early pointed style of architecture. St. Giles's church was probably constructed at the commencement of the 12th century. The tower only is modern, the ancient one having been demolished during the civil war. The livings of both the churches last mentioned are in the gift of the lord chancellor. The principal meeting-houses for dissenters are the Calvinistic or Independent meeting-house in Broad-street, a Baptist meeting-house and a Quaker's meeting-house in Church-street, a Methodist chapel in Castle-street, and another in Minster-street, a Cudworthian and an Unitarian meeting-house in London-street, and a Catholic chapel in Vastern-lane. Another meeting-house for Baptists has also been lately erected in Sievier-street.

The town-hall and free-school form one building; the free-school occupying the ground story, and the hall, court-room, and offices, the floor above. The free-school was established in the reign of Henry VII., by John Thorne, abbot of Reading, with the funds of a suppressed almshouse. This school has two scholarships in St. John's college, Oxford, the gift of sir Thomas White, in 1557. Julius Palmer, one of the masters of this school, fell a martyr to his Protestant tenets in 1556. The blue-coat school, which is so named from the dress of the scholars, was founded in 1656, by Mr. Richard Aldworth, who bequeathed 4000*l.* for the support of a master, lecturer, and twenty boys. The present school-house is of late erection, and consists of a centre and two wings. Several donations and bequests having been made to this establishment by various persons, it now usually supports about 48 boys. The green school is situated in Broad-street, and is appropriated for the education of the daughters of decayed tradesmen, residents in the town, and of orphans, who have been left unprovided for by their parents. The inhabitants of Reading are indebted for the institution of this school to the Rev. Charles Sturges, the Rev. Dr. Nicholls, and the Hon. and Rev. W. B. Cadogan, former vicars of the three parish churches belonging to the town. It is supported by annual subscription, and the proceeds of different donations and bequests. In the foundation school, founded in 1766, eight male and eighteen female children are taught to read. It was instituted with a legacy left for that purpose by Mr. Joseph Neale. The school of industry originated under the patronage of Mrs. Cadogan, for female children, and is supported by the voluntary contributions of ladies in the town. The Lancastrian school, established in 1810, is situated in Southampton-street, and is attended by about 320 boys, who are nominated by the subscribers individually. The school for national education was opened in September, 1813. It is founded on the plan of instruction recommended by Dr. Bell, and is chiefly supported by the clergy of the town and county. Both these institutions are calculated to be highly beneficial to the rising generation. Besides these seminaries of

education, there are in Reading several Sunday schools, all the children attending which receive a suit of clothes annually, from a fund provided by the bequest of Mr. Edward Simeon, who clothed them in the same manner during his life-time. The theatre of Reading is a neat and convenient building, lately erected, under the act for regulating provincial theatres. The gaol was built in 1793, on the site of some of the abbey ruins. It is a large edifice, and contains commodious apartments for the keeper, a neat chapel, an infirmary, and a room for the reception of the magistrates, in the centre; and two wings, one for male, and the other for female prisoners, with yards, cells for refractory individuals, &c.

Besides the above public buildings and establishments, there is a public library lately established at Reading, under the name of the "Reading Institution;" also a dispensary, which is attended by some of the medical gentlemen of the town. The house is the property of the corporation, and the general expences are defrayed by subscription. The Oracle may likewise be reckoned among the public buildings of Reading. This structure was erected by the mayor and burgeses, in conformity to the will of John Kendrick, who left 7500*l.* "to build a strong house of brick, fit and commodious to set the poor to work therein." The funds of this charity having been at different periods greatly abused and misapplied, the subject has been several times before the supreme courts of justice. The testator's object, in bequeathing his large legacy, was the improvement of the woollen trade; but instead of this, it was perhaps the first occasion of the decay of that manufacture, by enabling such as could obtain its advantages to undersell those who were not so fortunate. The same complaints are made against it, with respect to the manufactures now carried on in it, and, as we suspect, not without some show of reason.

Monastic Establishments.—As already mentioned, the earliest religious institution at Reading was a monastery for nuns, founded by Elfrida, the mother-in-law of Edward the Martyr. This nunnery was founded in 979, and was destroyed, in 1009, by the Danes. The precise site on which it stood is uncertain, but there can be no doubt of its existence. It appears from the Domeaday-book, and also from Tanner's Notitia, that another nunnery was established here at a later period, but nothing of its history is known. The abbey, the ruins of which are still sufficient to attest its extent and importance, was founded by Henry I. in 1121. It occupied a spot of ground, equal, if not superior, to any in Berkshire for fertility of soil and beauty of situation. This spot comprehended about thirty acres, and was environed on three sides by a massive and lofty wall, and on the fourth by the river Kennet. Exterior to this wall was a piece of ground, about fifty yards wide, (like the pomærium that surrounded the Roman cities,) which it was not allowable either to cultivate or build upon. It had four entrances to it, defended by arched gateways, and having battlements on their tops similar to those on the walls. Within these was the outer court, whence another gate-way led into the inner court. Part of this building remains, and is composed of bricks, chalk, and stone; and, from the dissimilarity of styles which it exhibits, has evidently undergone many alterations and repairs. Some of it is probably as late as the reign of Henry VII., though other portions of it are, undoubtedly, of much higher antiquity. The inner court conducted to the principal entrance to the abbey, the situation of which, owing to the ground having been since built upon, and the confusion occasioned by throwing up the ramparts in the civil war, cannot now be accurately determined. The only entrance on this side at present is through an arched passage, opening into the south-east corner of the cloisters, which is

READING.

certainly too mean to be supposed to have been the grand entrance to this superb monastery. On the right-hand of the passage is a door-way, leading to a range of apartments, and within is a circular staircase, which conducts to the upper part of the building. This division of the abbey is conjectured to have been appropriated as offices for servants and others, as, underneath it, is a series of arched cellars, and at its southern extremity was the kitchen. The great hall, or confistory, was entered from the cloisters by three large entrance doors. It measured 80 feet in length, 40 in width, and the same in height, to the centre of the ceiling, which was constructed of stone, and supported by arches springing from four pilasters, 20 feet high, placed against each of the side walls. These walls, and probably also the outer ones in every part of the building, measure twelve feet thick from the foundation to the set-off, and six feet thick from thence to the top, and are composed of flints and rubbish of various kinds, bedded in mortar, and indurated in the highest degree. The abbey-church appears to have extended 260 feet in length, and to have been built in the form of a cross, with a tower and spire in the centre. The nave was 40 feet wide, and was divided from the side-aisles by alternate piers and arches. From the massive character of this structure, in general, and from the circular form of the windows in the dormitory, it is conjectured that its windows also had circular arches. In the ground to the east of the church, many skeletons have been discovered, a circumstance which points it out as the probable burial-place of the monks. The above-mentioned buildings constituted the body of the abbey, but there were likewise many others, both connected with and detached from them. Among these were the infirmary, the stables, and the mill. This last is yet standing, and appropriated to its original purpose. It is a substantial edifice, built of flint and stone, and is probably coeval with the abbey-church.

Reading monastery was indubitably among the most distinguished in England. The monks were of the Benedictine order, and were endowed with many privileges and immunities, not only by the founder, but by several of his successors, and by some of the popes. They had the right of coining granted to them by king Edward III., also the right of holding three annual fairs, and a market every Sunday at Thatcham. The abbot was among those entitled mitred, and took precedence in the house of peers, next after the abbots of Glastonbury and St. Alban's. He was lord of the manor of Reading, and possessed otherwise much influence in the government of the borough. Many of the monks were distinguished for their talents and their acquirements in the learning of their respective ages. Robert of Reading, one of the first monks, was particularly famous, as being, with Adelard of Bath, the only Englishmen of their time who were masters of the Arabic language. The abbey-church was the place of sepulture of many royal and noble persons, among whom were Henry I., and his second queen, Adeliza, and probably also his first queen, Matilda; the empress Maud, and William, eldest son of Henry II.; Constance, grand-daughter to Edward III.; Ann, countess of Warwick; Richard, earl of Cornwall, and king of the Romans; and Richard de Curtenea, natural son of Henry II. At the dissolution, the revenues of this monastery were estimated at 211*l.* 3*s.* 9*d.* annually, above 20,000*l.* according to the present value of money. The lands, of course, were seized upon by king Henry, who parcelled them off, either in gifts or in lease, to different individuals; but the monastery itself was converted into a royal palace, and continued to be occasionally occupied by our kings till its destruction during the grand rebellion, in the reigns of Charles I. and II.

The other monastic institutions in Reading, besides those already noticed, were two convents for Franciscan or Grey friars, St. Edmond's chapel, and Colney chantry. One of the convents was founded about the middle of the thirteenth century, soon after the first appearance of the Franciscan order in this country. Its original situation was on a marshy ground adjoining the Caversham road, and still called the Friery Mead; but in 1285 the friars removed to their subsequent residence, at the western extremity of Frier-street. After the dissolution this house was appropriated as a work-house for the poor; and part of the church now forms the borough prison. This building is in the early pointed style, and has at its western end a very beautiful lancet window. The other convent stood in Castle-street, probably on the spot now occupied by the Methodist chapel. This institution seems to have been on a very small scale, though it is mentioned by Leland as "a fayre house of Grey freres." St. Edmond's chapel stood on the rising ground, called Chapel Hill, near the borough prison. It was founded, in 1284, by Lawrence Burgets, then bailiff of the town. In the civil war it was converted into a fort; and afterwards, about the year 1750, was demolished, and another chapel erected in its stead on Battle-Farm. Colney chantry was instituted by one of that family in the reign of Richard II., for the souls of king Edward III., of Thomas Colney, John Colney, and William Catour. It had distinct incumbents of its own, and was under the patronage of the corporation.

Reading has given birth to several persons of eminence. Sir Thomas White, founder of St. John's college, Oxford, is said to have been born here; but Fuller affirms that he was a native of Rickmansworth. Archbishop Laud was born in this town in 1573, having been the son of William Laud, then a clothier in Broad-street, who, as the archbishop himself told lord Say, had borne all offices in the corporation, save the mayoralty. John Blagrove, the mathematician, is also commonly reputed to have been a native of Reading; as was Joseph Blagrove, a celebrated astrological writer, who does not seem to have been related to the mathematician. The other distinguished natives of Reading were, sir Thomas Holt; sir John Barnard, a noted alderman of London; James Merrick, the translator of the Psalms; William Baker, a learned printer; sir Constantine Phipps, lord chancellor of Ireland; and Dr. Phaniel Bacon, author of several dramas, &c.

The vicinity of Reading presents several objects worthy of notice. At a short distance to the southward, close to a place called Catgrove-lane, may be seen a remarkable stratum of oyster-shells, imbedded in a vein of sea-sand, at least twenty fathoms beneath the surface of a hill. This stratum is from one to two feet in thickness, and extends through a circumference of five or six acres of ground. Mixed with the shells is a considerable quantity of small teeth, apparently of fish. Caversham, formerly a seat of the Craven family, and afterwards of the Cadogans, is situated nearly opposite the town, on the north bank of the river Thames. The house was built by the earl of Cadogan, in the reign of George I., but has since undergone material alterations. In the old mansion, Anne of Denmark, queen to James I., was splendidly entertained by lord Knowles, when on her journey to Bath, in 1613. At the time Charles I. was a prisoner at Windsor, the parliament, through the mediation of general Fairfax, permitted him to visit Caversham Lodge, where all his children who were in England then resided, in the custody of the earl of Northumberland. In the hamlet of Woodley is a very pleasing seat, belonging to lord Sidmouth; and two miles to the westward

westward is another, the property of the Blagrave family. The park is very extensive, and is noted for fine venison. South-east, about the same distance, is White-Knights, the seat of the marquis of Blandford. Sunning, celebrated in history as having been for some time the seat of the see of Wilshire, and subsequently the seat of one of the palaces of the bishops of Salisbury, is a village three miles to the eastward, on the road to Maidenhead. Leland mentions the bishop's palace as standing in his time. It was given by bishop Gheast, along with the manor, to queen Elizabeth, in exchange for estates in Dorsetshire. The antiquity of this place is strongly marked by the sepulchral monuments in the church. Close to Sunning is an elegant mansion, the seat of Charles Fyfe Palmer, esq. Lysons's *Magna Britannia*, 4to. Berkshire. *Beauties of England and Wales*, vol. i. by John Britton and E. W. Brayley, 1801. *The History and Antiquities of Reading*, by John Mann, 4to. 1814. From the latter work, the chief and most essential parts of this account have been obtained: and those who wish to possess the most copious and authentic history of Reading will procure this volume.

READING, a township of America, in Fairfield county, Connecticut, S. of Danbury adjoining. It contains 1717 inhabitants.—Also, a large township of Middlesex county, in the state of Massachusetts, incorporated in 1644, and containing 2278 inhabitants, many of whom are employed in the manufacture of shoes, from 2 to 300,000 pair being annually exported; 12 miles N. of Boston.—Also, a township of Vermont, in Windfor county, W. of Windfor, adjoining. It contains 1565 inhabitants.—Also, a beautiful post-town, and the capital of Berks county, Pennsylvania, situated on the N.E. side of Schuylkill river; 54 miles N.W. of Philadelphia. This town is regularly laid out, and flourishes: its inhabitants are chiefly German: the borough and township contain 3462. The public buildings are, a stone gaol, a court-house, an elegant church for German Lutherans, erected in 1793, a church for Calvinists, one for Roman Catholics, a meeting-house for Friends, and a large edifice for the public offices. In the neighbourhood are 10 fulling mills, and several iron-works: and at the distance of 10 miles, on the road to Harrisburgh, is a spring, about 15 feet deep and 30 feet wide, from which issues a copious stream, containing some fine trout. In 1795 the sum of 12,000*l.* was voted by the county for building a stone arched bridge over the Schuylkill, at this town, on the high road to Harrisburgh. N. lat. 40° 21'. W. long. 75° 55'.—Also, a township of Adams' county, in Pennsylvania, containing 732 inhabitants.

READING. See LECTIO.

READING of a Deed. See DEED.

READINGS, in *Criticism*. Various readings, *varie lectiones*, are the different manners of reading the text of authors in ancient manuscripts; where a diversity has arisen from the corruption of time, or the ignorance of copyists.

A great part of the business of the critics lies in settling the readings, by confronting the various readings of the several manuscripts, and considering the agreement of the words and sense. The various readings in the bible, (see *Hebrew Bibles*;) and in the classic authors, are almost innumerable.

READINGS are also used for a sort of commentary or gloss on a law, text, passage, or the like; to shew the sense an author takes it in, and the application he conceives to be made of it.

READINGTON, or RIDDENTON, in *Geography*, a town of New Jersey, in Hunterdon county; 17 miles

N.W. by W. of New Brunswick. It contains 1797 inhabitants.

READ'S BAY, a road for ships on the W. coast of the island of Barbadoes, between Hometown and Speightstown; half a mile broad. Ships may anchor here in safety, in six to twelve fathoms water, the ground being soft ooze, defended from all winds, except the west, which blows right into the bay. N. lat. 13° 7'. W. long. 59° 47'.

READSBOROUGH, or REEDSBOROUGH, a post-town of America, in Bennington county and state of Vermont; 435 miles from Washington. It contains 410 inhabitants.

RE-AFFORESTED, is where a forest, having been disafforested, is again made a forest. As the forest of Dean was, by an act of parliament in the 20th of king Charles II. See FOREST.

RE-AGGRAVATION, in the Romish *Ecclesiastical Law*, the last monitory, published after three admonitions, and before the last excommunication.

Before they proceed to fulminate the last excommunication, they publish an aggravation, and a re-aggravation. Fevret observes, that in France the minister is not allowed to come to re-aggravation, without the permission of the bishop or official, as well as that of the lay judge. See EXCOMMUNICATION.

REAL, in *Geography*, a town of Syria, in the pachalic of Aleppo, situated in a country that abounds with olives, of which considerable quantities are prepared, and sent to Persia and other parts. This is the residence of an Aga; 36 miles S.S.W. of Aleppo.

REAL, REALE, is applied to a being that actually exists; in which sense it coincides with *actual*.

REAL, in *Law*, is opposed to *personal*.

REAL *Action*, that by which the plaintiff lays title to land, &c. See ACTION.

Customs are said to be real; that is, they determine all inheritances within their extent; and none may dispose of them, but according to the conditions allowed by the customs where they are situated.

REAL *altitude, assets, character, chattels, covenant, distinction, distress, estate, horizon, optic place, patronage, privilege, qualities, root, services, suit, and writs*. See the several substantives.

REAL, in *Commerce*, a Spanish money of account, of which there are four different sorts. The real vellon is that which is most general; it consists of 8½ quartos, 17 ochavos, or 34 Maravedis vellon. Madrid, and the whole of Castile, with most of the adjacent provinces, and so Bilbao, Malaga, and Galicia, keep accounts in reals and Maravedis vellon. The real of *new plate* (real de plata nuevo, or provincial) is double the real vellon: it is worth 17 quartos, or 34 ochavos: and it is also reckoned at 34 Maravedis of new plate. This real is represented by an effective coin of base silver, but books are not kept in any part of Spain in this money.

The real of *old plate* (real de plata antigua), mostly called the real of plate, is chiefly used in foreign commerce and exchanges: it is worth 16 quartos, or 32 ochavos: and it is also reckoned at 34 Maravedis of old plate. Cadiz and Seville keep accounts in reals and Maravedis of old plate.

The real of *Mexican plate* (real de plata Mexicano) is used in transactions with Spanish America, where accounts are mostly kept in hard dollars, reals, and quarters, and sometimes in sixteenths: 8 Mexican reals make 1 hard dollar (pefo duro): this coin is worth 10 reals of new plate, 10½ reals of old plate, or 20 reals vellon. Thus, 1 real of new plate = 2 reals vellon: and 4 reals Mexi-

can = 5 reals of new plate: 64 Mexican reals = 85 reals of old plate: 2 Mexican reals = 5 reals vellon: 16 reals of new plate = 17 reals of old plate: 17 reals of old plate = 32 reals vellon. The pistole of exchange (dobloon de plata) is worth 32 reals of old plate, or 60 reals 8 Maravedis vellon. The dollar of exchange (pefo de plata) is worth 8 reals of old plate, or 15 reals 2 Maravedis vellon. The ducat of exchange (ducado de plata) is worth 11 reals 1 Maravedi of old plate, or 20 reals 25 $\frac{1}{2}$ Maravedis vellon. But, in commercial transactions within the country, the doblon is reckoned only at 60, the pefo at 15, and the ducat at 11 reals vellon.

The coins now current in Spain are as follow:

	Reals Vellon.	Maravedis Vellon.
In gold.—The doblon of 8 escudos, or quadruple pistole, passing for	320	
The doblon of 4 escudos, or double pistole		
The doblon de Oro, or pistole	80	
The escudo	40	
The coronilla, or vein-ten de Oro	20	
In silver.—The dollar, or pefo duro	20	
The half dollar, or escudo vellon	10	
The peceta Mexicana	5	
The real of Mexican plate	2	17
In base silver.—The peceta provincial	4	
The real of provincial plate	2	
The real vellon	1	
In copper.—The piece of two quartos		8
The quarto		4
The ochavo		2

From 1730 to 1772, the gold was 22 carats, and the silver 11 dineros fine (the dinero = 24 grains): but in 1772 the gold was reduced to 21 $\frac{1}{2}$ carats, and the silver to 10 $\frac{3}{4}$ dineros fine, the pecetas and reals being reduced to

9 $\frac{3}{4}$ dineros fine. In 1786 the standard of the gold was again reduced to 21 carats for the different dobloons and their divisions; and to 20 $\frac{3}{4}$ carats for the coronilla or vein-ten de Oro. For the value of the pitole, see PISTOLE.

The dollar (coined since 1772) contains 374 $\frac{1}{2}$ troy grains of fine silver, or 405 $\frac{3}{4}$ grains of English standard silver: its value therefore in English silver coin is 4s. 4 $\frac{1}{2}$ d.; and the half dollar in proportion. The value of the pefo of plate, or dollar of exchange, in English silver coin, is 39 $\frac{1}{2}$ d.; of the doblon of plate, or pistole of exchange, 13s. 2d.: and of the ducat of plate, 4s. 6 $\frac{1}{2}$ d. The real of old plate is worth about 5d.; and the real vellon 2 $\frac{1}{2}$ d. nearly; or more accurately, 1l. sterling = 48 reals, 20 $\frac{3}{4}$ Maravedis of old plate, or 91 reals 17 Maravedis vellon.

By the reports of average assays lately made on the quadruple and dollar at the London mint by order of the bank of England, the quadruple weighs 17 dwt. 8 gr.; its fineness 4 $\frac{1}{2}$ gr. worse than English standard: hence its value in English gold coin is 3l. 4s. 0 $\frac{1}{2}$ d. The dollar weighs 17 dwt. 8 gr.; its fineness 8 dwt. worse than English standard: hence its value in English silver coin is 4s. 3 $\frac{3}{4}$ d. See PISTOLE.

The value of reals of Spain, and monies of account, expressed in pence and decimals of pence, according to the mint price both of gold and silver in England, *i.e.* 3l. 17s. 10 $\frac{1}{2}$ d. per ounce for gold, and 5s. 2d. per ounce for silver, is as follows:

	Value in Silver.	Value in Gold.
	d.	d.
Real of old plate	4.93	4.57
Real of new plate	5.24	4.86
Real of Mexican plate	6.55	6.07
Real vellon	2.62	2.43
The dollar of old plate, or of exchange	39.45	36.59

The assay, weight, &c. of Spanish silver coins compared with the English standard of 11 oz. 2 dwt., and according to the mint price of silver in England, *i.e.* 5s. 2d. per ounce standard, are as follow, W. denoting worse than English standard.

	Affay.		Weight.		Contents in Pure Silver.	Value in Sterling.	
	oz.	dwt.	oz.	dwt. gr.		s.	d.
Dollar, old Mexican square (1747)	W.	0 4 $\frac{1}{2}$	0 17	7	376.1	4	4 $\frac{1}{2}$
Half ditto	W.	0 4 $\frac{1}{2}$	0 8	15 $\frac{1}{2}$	188.	2	2 $\frac{1}{4}$
Dollar, old, called Sevillan (1731)	W.	0 4 $\frac{1}{2}$	0 17	7	376.1	4	4 $\frac{1}{2}$
Old Mexican peceta, of two Mexican reals (1734)	W.	0 4 $\frac{1}{2}$	0 4	7 $\frac{1}{4}$	93.6	1	1
Real of Mexican plate (1746)	W.	0 4 $\frac{1}{2}$	0 2	3 $\frac{1}{2}$	46.8	0	6 $\frac{1}{2}$
Dollar, Mexican, with globes and pillars (1765)	W.	0 4 $\frac{1}{2}$	0 17	8 $\frac{1}{4}$	377.	4	4 $\frac{3}{4}$
Peceta, of two reals of plate (1721)	W.	1 7	0 3	16 $\frac{1}{2}$	71.9	0	10
Real of plate (1721)	W.	1 7	0 1	20 $\frac{1}{4}$	35.9	0	5
Dollar, of late coinage, universally circulated under the name of the Spanish dollar	W.	0 8	0 17	8	370.9	4	3 $\frac{3}{4}$
Half dollar, ditto	W.	0 8	0 8	16	185.2	2	1 $\frac{3}{4}$
Mexican peceta (1774)	W.	0 8	0 4	7 $\frac{1}{2}$	92.3	1	0 $\frac{3}{4}$
Real of Mexican plate (1775)	W.	0 8	0 2	3 $\frac{3}{4}$	46.1	0	6 $\frac{1}{4}$
Peceta provincial, of two reals of new plate (1775)	W.	1 9 $\frac{1}{2}$	0 3	18	72.2	0	10
Real of new plate (1795)	W.	1 9 $\frac{1}{2}$	0 1	21	36.1	0	5

For the assay, weight, value, &c. of gold coins, see PISTOLE.

REAL, or *Reali*, is also a money of account at Leghorn. At Zante, and also Cefalonia and Corfu, accounts are kept in reali, of 10 lire, or 100 soldi, also called aspri.

REAL is the name of a kind of boat in some places.

REAL *el Novita*, in *Geography*. See NOVITA.

REAL *Nuevo*, a town of Mexico, in the province of New Biscay; 120 miles N.W. of Parral. N. lat. 29° 10'. W. long. 107° 2'.

REAL del Rosario, a town of Mexico, in the province of Chiametlan, on the Spiritu Santo; 24 miles N. of Chiametlan.

REAL de Frayles, a town of New Mexico, in the province of Mayo; 60 miles from Santa Cruz. N. lat. $27^{\circ} 44'$. W. long. $110^{\circ} 22'$.

REAL de Minas, a town of New Navarre; 180 miles S.S.E. of Casa Grande.

REAL de St. Juan, a town of New Navarre; 195 miles S.S.E. of Casa Grande.

REAL de la Jura, El, a town of Spain, in the province of Seville; 25 miles N.W. of Carmona.

REALE, *Knights of the*, or *Knights of the Lionses*, owed their institution to the following event. Ladislaus, son of Charles Duras, having been proclaimed and crowned king of Naples at Gaeta, the Neapolitans set up Lewis II. duke of Anjou, and laid the foundation of the bloody wars that followed. These troubles divided the Neapolitan nobles into two factions; and of those who declared for the house of Anjou, some wore on their left arm a golden *reale* embroidered or on a red ground, by way of contempt to queen Margaret, widow of Charles III. who wanted to hold the reins of government during the minority of Ladislaus, and called themselves "knights of the Reale;" whilst others wore on their breast the figure of a "lionses, with her feet tied," pendant to a ribbon which passed round their necks, indicating by it, that they looked upon queen Margaret as tied by the leg; and then styled themselves "knights of the Lionses."

REALEJO, in *Geography*, a town of Mexico, in the province of Nicaragua, situated on a bay of the Pacific ocean, at the mouth of a river, both of the same name. The river is so deep and capacious as to be capable of receiving 200 sail of ships. The town is defended by large intrenchments, and very fine docks for building and repairing ships; but the place suffered considerably from the Buccaneers. The town is large, has three churches, and an hospital; but the place is unhealthy, on account of the creeks and stinking swamps in its vicinity. Its chief trade consists in pitch, tar, and cordage. At the mouth of the harbour is an island, which intercepts the sea, and renders it safe and commodious: it forms two channels, but that on the N.W. side is much the best; 18 miles N.W. of Leon. N. lat. $12^{\circ} 45'$. W. long. $87^{\circ} 30'$.

REALGAR, in *Mineralogy*, sometimes called red orpiment, an ore of arsenic, consisting, according to Thenard, of

75 parts arsenic,
25 sulphur.

The colour of realgar is a bright deep red, passing into scarlet and orange: it occurs both massive, and crystallized in prisms, which have either 4, 6, 8, 10, or 12 sides, terminated by four-sided summits. The primitive form of the crystal is an octahedron, with scalene triangles. The lustre of realgar is between vitreous and waxy: it is semi-pellucid, soft, fragile, and easily fusible, burning in the air with a blue flame, and giving out arsenical and sulphureous vapours. By friction it becomes negatively electrical. Realgar is found in the vicinity of volcanos, and accompanying other metallic ores, both in primitive and secondary mountains. This substance is used as a pigment; and is formed by the Chinese into toys. See *Sulphurated Arsenic* under **ARSENIC**.

In the history of the French Academy, we have an account of a cup brought to Paris by the ambassadors of Siam, and presented there, as a remedy used by that people against all diseases.

Upon an examination, which had like to have cost M. Homberg dear, he found it to be a kind of realgar, or red arsenic, much more caustic than our's.

Its use among the Siamese, he takes to have been the same with that of regulus of antimony; *viz.* to give an emetic quality to the wine drank out of it.

As the dose of medicines is much stronger in the torrid zone than among us (the quantity of ipecacuanha, *e. gr.* ordinarily taken by the Indians, being twenty times as great as that among us), it is very possible a cup of realgar, though enough to poison an European, may prove a gentle medicine to a Siamese.

REALIJO, in *Geography*, a small island in the Pacific ocean, near the coast of Popayan. N. lat. $4^{\circ} 16'$.

REALIZE, in *Commerce*, a term little known in trade before the year 1719, when those immense fortunes began to be made in France and England, by the business of actions or stock.

By *realizing* is meant the precaution many of those who had gained most, took, to convert their paper into real effects: as lands, houses, rich moveables, jewels, plate; but, above all, into current species. A precaution capable of ruining the state; but the French regency had the wisdom to frustrate it, by taking proper measures to have the money, thus ready to be hoarded up, returned to the public.

REALISTS, **REALISTÆ**, a sect of school-philosophers who followed the doctrine of Aristotle with respect to universal ideas, formed in opposition to the **NOMINALISTS**, (see that article,) who embraced the hypothesis of Zeno and the Stoics upon that perplexed and intricate subject.

Aristotle held, against Plato, that, previous to, and independent on, matter, there were no universal ideas or essences, and that the ideas or exemplars which the latter supposed to have existed in the divine Mind, and to have been the models of all created things, had been eternally impressed upon matter, and were coeval with, and inherent in, their objects. Zeno and his followers, departing both from the Platonic and Aristotelian systems, maintained, that these pretended universals had neither form nor essence, and were no more than mere terms and nominal representations of their particular objects.

Under the Realists are included the Scotists, Thomists, and all excepting the followers of Occam.

Their distinguishing tenet is, that universals are realities, and have an actual existence, out of an idea and an imagination; or, as they express it in the school-language, *a parte rei*; whereas the Nominalists contend, that they exist only in the mind, and are only ideas, or manners of conceiving things.

Doctor Odo, or Oúard, a native of Orleans, afterwards abbot of St. Martin de Tournay, was the chief of the sect of the Realists. He wrote three books of dialectics; where, on the principles of Boethius and the ancients, he maintained that the object of that art is things, not words; whence the sect took its rise and name.

REALITY, **REALITAS**, in the *Schools*, a diminutive of *res*, *thing*, first used by the Scotists to denote a thing which may exist of itself, or which has a full and absolute being of itself, and is not considered as a part of any other.

Yet a reality is conceived as something less than *res*; and accordingly every *res* is supposed to contain a number of realities, which they otherwise call *formalities*.

Thus, *e. gr.* in a man, according to the doctrine of the Scotists, are a number of realities; *viz.* a substance, life, animal, and reason.

Some distinguish reality into subjective and objective.

REALM, REGNUM, *Kingdom*, a country which gives its head or governor the denomination of king.

The word is formed of the French *royaume*, which denotes the same.

REALMONT, in *Geography*, a town of France, in the department of the Tarn, and chief place of a canton, in the district of Alby; 9 miles S. of Alby. The place contains 2247, and the canton 8949 inhabitants, on a territory of 247½ kilometres, in 19 communes.

REALVILLE, a town of France, in the department of the Lot; 8 miles N.E. of Montauban. N. lat. 44° 6'. E. long. 1° 34'.

REAMLA, a town of the Arabian Irak; 10 miles W. of Bassora.

REAMO, a town of Naples, in Abruzzo Ultra; 6 miles W.N.W. of Teramo.

REAMUR, a town of France, in the department of the Vendée; 18 miles N. of Fontenay le Comte.

REANG, a town of Bengal; 45 miles S. of Silhet.

REAPER, a person whose business it is to reap or cut grain.

REAPING, the operation of cutting crops by means of the sickle. It is a very laborious sort of field-work, and one which requires considerable attention and care to perform it in a neat and exact manner. Reaping is performed with some other sorts of crops, besides those of the grain kinds; as occasionally for peas, beans, flax, and others of a similar nature. Work of this nature is executed in many different ways, according to the differences in the customs of different districts; as by sets of men hired by the month, for this particular purpose, called harvest-men; by persons taking it by the piece, or by the acre, and by the sheaf or stook of eight sheaves.

In some methods, by the piece or the quantity is unquestionably the best, in most cases, on account of the very high prices which are exacted at this very busy season, and the very small extent of labour which is performed in working by the day, which cannot be controlled by the farmer at such hurrying times. Besides, the work is, for the most part, the best and most expeditiously performed in these ways; which are objects of very great importance, and deserving of much consideration in this sort of business. The eye of the farmer is, however, constantly necessary to see that all goes on in a right manner.

In the northern parts of Lancashire, this sort of labour is mostly performed by the day, or the hattock of ten sheaves, of the stook of twelve sheaves; three-pence being often paid for the former, and four-pence or five-pence for the latter, in these places.

In some districts, the reaping of the crops commences before they are quite ripe; but in others, not until this has fully taken place.

REAPING of *Corn*, the practice of cutting it with the sickle, or otherwise, by persons employed for the purpose. It may be observed, that the business of reaping or cutting grain crops differs much in the manner of performing the work, in different districts of the kingdom, and kinds of crops. In the more southern parts of the island, the crops of this sort are mostly cut by means of short stiff scythes, made for the purpose, having bows formed of bent sticks, or what in some places are termed *cradles*, fixed upon the lower parts of the handles, for the more readily depositing the ears or heads of the corn in one uniform direction, as much as possible, in order that it may be afterwards bound up into sheaves. But in other cases, the naked scythe is

made use of; the corn being seldom bound up, being simply raked together into small heaps, in a similar manner to hay.

In the more northern parts of England, and in Scotland, the reaping of grain crops is, however, in general performed by the sickle, or reaping hook; the different handfuls, as soon as cut, being deposited upon bands, formed by twirling together a few stalks of the corn at the ends next the ears, and afterwards bound up into sheaves, in order to their being set up into *shocks* or *hattocks*. This method is, in most instances, adopted with the wheat and rye crops, in every part of the island; as in cutting them with the scythe, it is difficult to be performed without much loss being sustained by the shedding of the grain. And, in addition, it is of great advantage to have these sorts of crops bound up regularly into sheaves, the straw being much better.

Besides these, there is another mode sometimes practised, which is by means of a hook with a sharp edge, without any teeth; the labourer, in executing the work, hooking up the corn towards him. It is mostly made use of in the southern districts, where it is known by the name of *bagging*, the grain in this way being cut very low.

In this way the reaper collects enough for one sheaf at a time, binds it, and sets it up in tens, called a shock in Middlesex. This bagging (or fagging) practice is, to all intents and purposes, mowing with one hand against the standing corn. The toothless hook, employed in doing it, is of nearly twice the weight of the common sickle. It is sharpened occasionally, when necessary, in the manner of the scythe; and the operation of cutting the crop down is by a succession of blows made upon the straw of the standing grain, very nearly in the direction down towards the surface of the ground. Reaping in Middlesex is mostly all done in this way, as the proper use of the scythe is but little known.

This method has the advantage of being done closer, and with equal or more expedition than the hand-reaping mode, besides the saving in straw, which is here supposed worth 7s. the acre.

In Essex wheat crops are generally reaped or cut with the sickle, though in the vicinity of the metropolis it is not uncommon to have it mown with the scythe, as close to the ground as other sorts of grain crops, in the view of increasing the quantity of straw, which is there very valuable. It is thrown, in these cases, with great skill and dexterity into swaths. When perfectly ripe, it is soon bound up into sheaves of six or eight inches diameter, with bands of wheat-straw of single or double lengths; but when not in this ripe or dry state, it is allowed to remain in the swaths two or three days, as necessary. However, in more than three quarters of the county, it is reaped or cut with the sickle; and indeed in almost all places, when beaten down by the wind and rain.

In regard to the time of reaping the grain, there is considerable difference in different districts; some not reaping it until it is quite ripe, while others cut it when something short of this state. This, however, should probably be regulated by the nature of the season, and the kind state or quality of the crop, as well as the uses to which the grain is to be put.

In respect to the manner of reaping grain crops, whether the sickle or scythe be employed for the purpose, there is much difference in the height at which the crops are cut in different places. In some it is the practice to have the business performed in as close a manner as possible; while in others a stubble of eight, ten, and fifteen inches, or more,

is left. These different practices have their advocates; one party supposing that the work proceeds more slowly, where it is executed in so close a manner; while the other contend that the contrary is the case. But as the stubble which is left is not only useless to the land, but in many cases very troublesome in its succeeding culture, being frequently under the necessity of being removed, it would seem to be the best as well as cheapest practice, to have the business constantly executed in a close manner. It has been observed by a late practical writer, that by this means the agricultor will not only have more litter at command, for the bedding of his yards, stalls, and other places, and consequently an increase of manure, but have the business more expeditiously performed, with much less waste of grain, and at the same time be freed from the trouble and expence of removing the stubble. It has indeed been fully shewn, by a careful trial, made with the view of ascertaining the difference between high and low reaping, that the advantage is considerably in favour of the close method.

And the result of the trial is thus stated by the writer of the Agricultural Survey of the West Riding of Yorkshire, who observes that the experiment was made upon part of a field of wheat, two ridges of which were cut close by the ground, and the other two considerably higher, though not so high as the general run of the Yorkshire stubbles. Each of the divisions was apparently of equal quality, and measured a trifle more than a quarter of a Scotch acre, which is about one-fifth larger than the English statute acre. The crop was stacked separately, and the time taken to the part cut low was one hour and twenty-four minutes, of eight shearers; while the high cutting was performed by the same number of hands in forty-eight minutes. The wages paid that week were 18*d.* per day, and the supposed expence of maintenance 6*d.* or 2*s.* per day altogether. When threshed, the grain and straw were carefully measured and weighed, and the result of the experiment was as follows:

	£	s.	d.
Result—8 shearers, 1 hour 24 minutes, at 2 <i>s.</i> } per day, or 22½ <i>d.</i> per hour - - - - - }	0	2	4
The same hands in 48 minutes - - - - - }	0	1	4
Difference of expence	0	1	0

In favour of high cutting one shilling, or four shilling² per acre.

	£	s.	d.
1¼ peck of wheat more upon the low cut } ridges than those cut high, at 1 <i>s.</i> 4 <i>d.</i> per } peck - - - - - }	0	1	8
¼ stones (22 avoirdupois pounds) of more } straw, at 2 <i>d.</i> per stone - - - - - }	0	2	4
	0	4	0

Or sixteen shillings per Scotch acre. From which deduct the increased expence of cutting, there remains a benefit of twelve shillings per acre in favour of low cutting.

It is noticed farther, that the above trial, according to the best of the reporter's judgment, was fairly made; and the reason which urged him to make it, was to silence the objections of some neighbours, who alleged low shearing was not profitable. It is also proper to observe, that the field of wheat, on which the trial was made, was not broke down nor straggled, so was in a favourable condition for high cutting. We have seen wheat-fields, where three times

the quantity might have been left, unless great pains were used.

But the methods of reaping grain crops, both with the sickle and the scythe, have each their advantages and disadvantages. In the first manner, the crops are deposited with more regularity and exactness, and consequently bound into sheaves with greater facility and dispatch. Besides, in many cases less loss is incurred by shedding, in the time the work is in performing; but the labour is executed with greater difficulty and trouble. The latter possesses the superiority of being more expeditious, and of being performed to any degree of closeness that may be required; while it has the evident disadvantage of leaving the cut grain in a more irregular and uneven situation, by which it is rendered less fit for being bound up into sheaves, which in many cases is an inconvenience of great consequence. When the grain has attained a high degree of ripeness, there may likewise be great loss sustained, by its being shed during the operation, in this way of reaping and cutting the crop. Where this method is practised, it is, however, not unfrequently the case to have it bound into sheaves; though the most common custom is to let it remain in the rows or swaths, till fit for being put into the stack. When bound, it is generally the practice to cut it inwards against the crop on which it rests: in the other case, it is cut in the manner of grass for hay. It is obvious, therefore, that when labourers are procured with difficulty, this mode of reaping is the most adviseable; while, under the contrary circumstances, the former may be had recourse to with more advantage, as the work may be executed in a neater and more exact way. See HARVESTING and SICKLE.

It may be remarked, that this is a sort of work that is often let by the acre to persons that go about for harvest work; and it may, in many cases, be the best performed in this manner. But great attention should be paid by the farmer, to see that the grain is cut and bound up in a proper method, and that the work be not performed in improper weather. The prices vary according to the nature of the crops, the season, and other circumstances, sometimes rising as high as eleven or twelve shillings the acre, and sometimes much higher.

REAPING Fork, a tool of the fork kind, invented for the purpose of raising and collecting the mown grain into sheaves, so that it may be bound up. It is constructed with two, rather long, prongs below, slightly curving upward, somewhat in the manner of the common large hay fork, to which are attached, at the upper part, near the insertion into the handle, two other upright prongs, which bend a little forward towards their tops or ends; by means of which, with the under prongs running along the ground, the tool being pushed forward by the labourer, the grain in the straw is raised up, brought together, held in a firm manner, and removed from the swathe so as to be bound into sheaves. In this way, the lower prongs perform the work of picking the strawy material from the land, while the higher upright ones prevent it from falling backwards, and determine the quantity which is necessary for a sheaf. In this manner, by this simple contrivance, the mown grain can be brought together and bound up with much greater regularity, and in a much more expeditious method than is possible to be done by mere hand labour.

REAPING Hook, an implement of the sickle kind, with which the business of reaping is performed in some districts.

These hooks are sometimes formed with teeth, or in a toothed manner, and sometimes with a cutting edge. In Devonshire, and some other counties, those with smooth edges are generally preferred to sickles with sawed ones; these

these sorts of hooks are used occasionally with either hand, the operator shifting hands, chopping the straw low down, and gathering about half a sheaf at a time, which, when put together, is bound with reed, combed from former wheat-straw, or with a double length of the wheat which is reaping. See *SICKLE*.

REAPING Machine, a contrivance for the purpose of reaping grain by means of animal labour. With this view, and to facilitate an operation of such importance to the farmer, different attempts have been made to construct machines, so as to dispatch the work in a rapid manner by the assistance of horse labour, but the success with which they have been attended, has hitherto been far from complete. An implement of this sort has lately been made by Mr. Plunknett; it is upon a somewhat new principle, the horse drawing the machine instead of pushing it forward, as was the old mode of applying the power.

In this machine, the horse tracks from the front side of it, which is seen at once by the appearance of the implement, so as to be clear of the crop, and the two large wheels, by means of the axle, drive another wheel, which communicates with the two other wheels, the latter of which is found in the axis of the cutter: a man at the handles regulates the direction, &c. This machine may be seen fully represented in the second volume of the *Farmer's Dictionary*; and a reaping machine for clover may be seen in the same work in the same plate.

Other machines of this kind have still more lately been invented by other persons, but without answering the purpose in that full and complete manner which is necessary in this sort of work.

What appears to be chiefly wanting in these sorts of machines, to render them complete and effective, as tools for the purpose of reaping, is that of their having more power or velocity in the cutting parts, so that the work may be performed in a perfectly clean neat manner, without the straw being drove or forced down in an improper manner before the instruments which are to cut it; their cutting it out fully in the whole of its breadth; their being capable of being regulated to cut at different heights, and to different breadths; their being made capable of directing the cut straw grain all in one even regular direction, so that it may be bound up with facility; the horses, or other animals, being so attached to them as to permit of their walking along on the side of the standing grain, where the former cut was made, or where they push the implements before them, the having them so conveniently fixed in them as to admit of no sort of interruption to the labour in any way; their being made light and of ready application, as well as at a cheap rate; and their keeping the scythes or cutting parts in a perfectly sharp state, without their being taken out, and undergoing the operation of whetting. There are, besides these, some other points, which should be attended to, but these are, probably, the most material.

REAPS, small parcels of corn, laid along on the stubble, in reaping, to be afterwards gathered into sheaves by the binder. This is most commonly the case, when the weather is moist, as in dry times the reaps of corn are usually laid in the bands, and tied up, as soon as they are in sufficient quantity, into sheaves.

REAR, a term frequently used in composition, to denote something behind or backward in respect of another; in opposition to *van*, or *avant*, *before*.

It is formed by corruption of the French *arriere*, signifying the same.

REAR, in a *Military Sense*, is used for the hind-part of an army, &c. in opposition to the *front*, or face of it.

REAR, in *Naval Language*, is a name given to the last division of a squadron, or the last squadron of a fleet, and which is accordingly commanded by a rear-admiral, or the third officer of the said fleet or squadron.

REAR-admiral. See *ADMIRAL*.

REAR-guard. See *GUARD*.

REAR-half-files, are the three hindmost ranks of a battalion, when it is drawn up six deep. See *FILE-leaders*.

REAR-line of an army encamped, is always twelve hundred feet at least from the centre line, both of which run parallel to the front line, and also to the reserve.

REAR-rank, is the last rank of a battalion, or squadron, when drawn up, and generally sixteen or eighteen feet from the centre line, when drawn up in open order.

REAR-up, in the *Manege*, called in French *cabrer*, is the action of a horse, when he raises himself upon his houghs or hinder legs, as if he would fall quite over in a backward direction, to the great danger of his rider. This is often caused by his having too much of the curb.

REAR, in *Rural Economy*, to raise the roof part of any sort of shed or other building for containing some kind of live-stock.

REARED, or *Wale-REARED*. See *WALE-reared*.

REARING ANIMALS, in *Agriculture* and *Rural Economy*, the business of breeding and bringing them up to the most suitable states for the purposes of the farmer. The principles of this art depend upon a variety of different circumstances and kinds of knowledge, as has been already explained. See *BREEDING*, and *LIVE-Stock*.

Animals of the horse kind should invariably be brought up in the best manner, without any sort of stinting in their food, according to the uses they are designed to serve, in order that they may have their full growth and power. In the labouring cattle kinds of animals, attention should, in some degree, be paid to hardiness, both in their food and their exposure, by having recourse to the more coarse sorts of feeding in the less sheltered situations, but nothing of stinting should ever be allowed, as by these means they become large, and capable of sustaining a greater degree of exertion. There is, likewise, much utility in good training, in rearing all sorts of animals in this intention; and it requires careful, steady, mild persons to be employed in it, as they, for the most part, acquire the habits and dispositions of those about them, in some measure; and the more early they are obtained the better. This point deserves much more attention from farmers and others than it has hitherto met with, as most of the bad habits of working animals arise from the neglect of it. Besides, good training and mild dispositions are highly favourable to fattening animals. See *HORSE*.

In rearing poultry, pigeons, rabbits, and fish, much care, management, and circumspection, are constantly necessary, in order to their perfect success. Too little attention is for the most part bestowed on the nature of the birds, in some sorts of the more wild poultry kinds, as those which are of the game description, for instance, the galena, the pheasant, the swan, and some others. These cannot be so readily reared, or with so much facility, under hens of the domestic kind, as other sorts are, such as the turkey, peacock, &c. This circumstance should therefore be always kept in mind in rearing such birds. See *POULTRY*, *PIGEONS*, *RABBIT*, &c.

A very nice attention and management is also requisite in the rearing and perfecting of fish. See *FISH*, *POND-Fisheries*, and *Salmon FISHERY*.

In rearing birds of the game kind, such as the above, in the way of ornament about a residence, Mr. Loudon has remarked, much depends upon encouraging them, when allowed

lowed to go wild, by giving them proper and abundant cover, and sowing among it such herbs and plants as they are particularly fond of, as those of the crests, chervil, parsley, thyme, and some other kinds. They have likewise a tendency to encourage and domesticate hares. Abundance of fearless game about a residence, he thinks, give a peculiar nobleness, and appearance of freedom, which few things else can communicate or afford.

REASON, RATIO, a faculty or power of the soul, by which it distinguishes good from evil, and truth from falsehood. Or, reason is that principle, by which, comparing several ideas together, we draw consequences from the relations they are found to have.

Some of the later school-philosophers define reason to be the comprehension of many principles which the mind successively can conceive and from which conclusions may be drawn.

Others conceive reason as no other than the understanding itself, considered as it discourses.

Reason, Mr. Locke observes, comprehends two distinct faculties of the mind; *viz. sagacity*, by which it finds intermediate ideas; and *illation*, by which it so orders and disposes of them, as to discover what connection there is in each link of the chain, by which the extremes are held together; and by them, as it were, draws into view the truth sought for.

Illation, or inference, consists in nothing but the perception of the connection there is between the ideas in each step of the deduction, by which the mind comes to see either the certain agreement or disagreement of any two ideas; as in demonstration, in which it arrives at knowledge; or their probable connection, on which it gives or withholds its assent; as in opinion.

Sense and intuition reach but a little way; the greatest part of our knowledge depends upon deductions, and intermediate ideas. In those cases, where we must take propositions for true, without being certain of their being so, we have need to find out, examine, and compare, the grounds of their probability; in both cases, the faculty which finds out the means, and rightly applies them to discover certainty in the one, and probability in the other, is that which we call *reason*.

In reason, therefore, we may consider four degrees; first, the discovering and finding out of proofs. See INVENTION.

Secondly, the regular and methodical disposition of them, and laying them in such order, as that their connection may be plainly perceived. See METHOD.

Thirdly, the perceiving of their connection (see JUDGMENT.) And,

Fourthly, the making a right conclusion.

Reason fails us in several instances; as, first, where our ideas fail.

Secondly, it is often at a loss, because of the obscurity, confusion, or imperfection, of the ideas it is employed about. Thus, having no perfect idea of the least extension of matter, nor of infinity, we are at a loss about the divisibility of matter.

Thirdly, our reason is often at a stand, because it perceives not those ideas which would serve to shew the certain or probable agreement or disagreement of any two other ideas.

Fourthly, our reason is often engaged in absurdities and difficulties, by proceeding upon false principles, which, being followed, lead men into contradictions to themselves, and inconsistency in their own thoughts.

Fifthly, dubious words, and uncertain signs, often puzzle men's reason, and bring them to a nonplus.

Though the deducing one proposition from another be a great part of the office of reason, and that about which it is usually employed; yet the principal act of ratiocination is the finding the agreement or disagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by juxtaposition. Words have their consequences as the signs of such ideas and things agree or disagree with what they really are; but we observe it only by our ideas.

Hence we may be able to form an idea of that ordinary distinction of things, into such as are *according to*, those that are *above*, and those *contrary to reason*.

Those *according to reason* are such propositions, whose truth we can discover by examining and tracing those ideas we have from sensation and reflection, and by natural deduction find to be true or probable.

Those *above reason* are such propositions, whose truth or probability we cannot by reason derive from those principles.

Those *contrary to reason* are such propositions as are inconsistent with, or irreconcilable to, our clear and distinct ideas.

Thus the existence of one God, is according to reason; the existence of more than one God, is contrary to reason; and the resurrection of the body after death, above reason.

Above reason may be also taken in a double sense; *viz.* above probability or above certainty.

They who dispute most against the power and privileges of human reason, do it because their own reason persuades them to that belief; and so, whether the victory be on their or our side, they are equally defeated.

They seek to terrify us with the example of many great wits, who, by following this *ignis fatuus* (so they call the only pole-star God has given us to direct our course by), have fallen into wild and ridiculous opinions, and increased the catalogue of heresies to so great a number; but these men either followed not their reason, but made it follow their will; or else they first hoodwinked it by interest and prejudice, and then bade it shew them the way; or were wanting in those necessary diligences required for so doubtful a passage: or if, without any of these, the weakness of their understanding had deceived them, the error is neither hurtful to themselves, nor would be to others, if this doctrine of governing ourselves by our own reason, and not by authority and example, were generally established. *Dis. Concern. Hum. Reas.*

It is not the use of such liberty, but the appropriating it to ourselves, that is the cause of all the disorders charged upon it; for those who lay a restraint on other men's reason, have first made use of their own to settle them, and to make use of it in this very restraining of others. *Ibid.*

REASON, in *Matters of Religion*, is used in opposition to *faith*.

This use of the word, Mr. Locke takes to be in itself very improper; for faith is nothing but a firm assent of the mind; which, if it be regulated, as it is our duty, cannot be afforded to any thing but upon good reason, and so cannot be opposite to it.

He that believes without having any reason for believing, may be in love with his own fancies; but he neither seeks truth as he ought, nor pays the proper obedience due to his Maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error.

But since reason and faith are by some men opposed to one another, it may be necessary to consider them together.

Reason, as contradistinguished to faith, is the discovery of the certainty or probability of such propositions, or truths, which it has got by the use of its natural faculties; viz. by sensation, or reflection.

Faith, on the other hand, is the assent to any proposition upon the credit of the proposer, as coming immediately from God; which we call *revelation*, which see.

REASON, in *Logic* and *Rhetoric*, denotes a necessary or probable argument; or an answer to the question, *cur est? why is it?*

As if it be inquired, why do the subject and predicate agree? and it is answered, because they are spoken of the same thing: this last enunciation is a reason. Hence, say the schoolmen, because *quia* is the sign or character of a reason, as *non*, *no*, of a negation, and *est*, *is*, of an affirmation.

They make three kinds of reasons, *rationes*; viz. *ratio ut*, *that*; *ne*, *lest*; and *quia*, *because*. For, answering to a question, *cur*, *why*, we begin with *because*, *quia*; as, why do you study? that I may become learned; which is the *ratio ut*. Again, why do you study? lest I should be ignorant; which is the *ratio ne*. Lastly, why is a body tangible? because matter is impenetrable; which is the *ratio quia*.

The *reason ut* properly denotes the end, or final cause; and *reason ne* the beginning: accordingly the one is called the beginning, the other end; so that the *reason quia* is left the only reason, properly so called.

REASON, among *Metaphysicians*, is used in the same sense with essence; or that by which any thing is what it is.

This is sometimes also called formal reason, as representing the thing under that form or nature under which it is conceived.

REASON, in *Mathematics*. See RATIO.

REASON of State, *Ratio Status*, in *Matters of Policy*, denotes a rule or maxim, whether it be good or evil, which may be of service to the state.

The phrase is borrowed from the Italians, who first used *ragione di stato* in this sense.

Reason of state is properly understood of something that is necessary and expedient for the interest of the government, but contrary to moral honesty, or justice.

Politicians have a long time disputed about the *ratio status*; whether states and governments are tied down to the same laws of morality with individual persons; or whether things, otherwise immoral and unlawful, may not be practised on urgent occasions, by way of reason of state?

The question is, whether any thing be unlawful, or prohibited a state, that is necessary to the preservation of that state, or whether it be allowed to preserve itself on any terms?

REASON. *Challenge upon*. See CHALLENGE.

REASON: *sufficient of Leibnitz*. See LEIBNITZIAN Philosophy.

REASONABLE AID, a duty which the lord of the fee anciently claimed of his tenants, holding in knight's service, or on socage, towards the marrying his daughter, or the making his eldest son knight.

This is taken away by stat. 2 Car. II. See AID.

REASONING, RATIOCINATION, the exercise of that faculty of the mind called *reason*: or, it is reason deduced into *discourse*; which see.

The agreement or disagreement of two ideas does not appear from the bare consideration of the ideas themselves, unless some third be called in, and compared, either sepa-

ately, or conjointly with it: the act, then, by which, from ideas thus disposed and compared, we judge this or that to be so, or not so, is called *reasoning*. Or, it is that operation of the mind, by which we infer one thing, *i. e.* one proposition from two or more propositions premised. Or, again, it is the drawing of a conclusion, which before was either unknown, or dark, or doubtful, from some propositions which are more known and evident. It is the narrowness of the human mind which introduces the necessity of reasoning; for if the mere perception and comparison of two ideas would always shew us whether they agree or disagree, then all rational propositions would be matters of intelligence, or first principles, and there would be no use of reasoning, or drawing any consequences. But when we are unable to judge of the truth or falsehood of a proposition in an immediate manner, by the mere contemplation of its subject and predicate, we are then constrained to use a medium, and to compare each of them with some third idea, that by seeing how far they agree or disagree with it, we may be able to judge how far they agree or disagree among themselves. Watt's *Logic*, part iii. chap. 1.

Rohault defines reasoning to be a judgment depending on some antecedent judgment: thus, having judged that no even number can be composed of five uneven numbers, and that ten is an even number; to conclude, that ten cannot be divided into five uneven parts, is a ratiocination, or reasoning.

This agrees with father Malebranche's doctrine, one of the great points of which is, that reasoning, on the part of the understanding, is only a mere perceiving.

That ingenious author endeavours to shew, that, as to the understanding, there is no difference between a simple perception, a judgment, and a reasoning, except in this, that the understanding perceives a simple thing without any relation to any thing else, by a simple perception; that it perceives the relations between two or more things in a judgment; and, lastly, that it perceives the relations that are between the relations of things, in a reasoning. So that all the operations of the understanding are no more than mere perceptions.

Thus, *e. gr.* when we conclude, that 4 being less than 6, twice 2 being equal to 4, are of consequence less than 6, we do no more than perceive the relation of the inequality between the relation of twice 2 and 4, and the relation of 4 and 6.

The manner of proceeding justly in reasoning; so as to arrive with the greater safety at the knowledge of truth, makes what we call *method*.

For the real benefit of logic to reasoning, see LOGIC and SYLLOGISM.

RE-ATTACHMENT, in *Law*, a second attachment of him who was formerly attached, and dismissed the court without day, by not coming of the justices, or the like casualty.

Brook makes re-attachment either *general* or *special*. *General* is where a man is re-attached for his appearance on all writs of assize lying against him: *special*, for one or more certain writs.

REAU, in *Geography*, a town of Germany, in the principality of Culmbach; 9 miles S.E. of Hof.

REAVE, in *Rural Economy*, a provincial term, used to signify the unroofing or disturbing the thatch or other covering of a building by winds, &c.

REAUMUR, RENÉ-ANTOINE FERCHAULT, *Sieur de*, in *Biography*, was born in 1683 at Rochelle. He was brought up to the study of the law, which he quitted for

that

that of the mathematics, natural history, and natural philosophy. In 1703 he went to Paris, and so distinguished himself in a few years, that in 1708 he was admitted into the Academy of Sciences. From that time he entirely gave himself up to the pursuits of natural history in all its branches, and few men have passed a life more actively and usefully employed. Utility was the constant aim in all his enquiries, even into the most minute parts of nature; and experiment and observation were his perpetual guides. No one surpassed him in the patient industry with which he observed natural phenomena, or followed the processes of art. The Memoirs of the Academy of Sciences, from 1709 to 1756, are enriched with his communications. The improvement of manufactures was a great object of his attention. In 1722 he published a work, entitled "L'Art de convertir le Fer forgé en Acier, et l'Art d'adoucir le Fer fondu," which contained a minute and scientific account of the processes employed in that branch of manufacture, with hints for their improvement. He introduced into France the manufacture of tinned iron, which article had before been imported from abroad; and he made a great many experiments in the manufacture of porcelain, which contributed to its perfection in France. He also performed numerous experiments relative to the art of hatching chickens by artificial heat, as practised in Egypt, an account of which he published in two vols. 1752. M. Reaumur rendered his name celebrated by his peculiar method of graduation on the thermometer, which is still the only one used in France and many parts of the continent. In this thermometer the freezing point is marked zero, and the boiling point at 80°. (See THERMOMETER.) Some of the most valuable of Reaumur's physiological experiments were those relating to the concoctive powers of the stomach in granivorous and carnivorous birds, in which he clearly establishes the different modes of action in these two classes, viz. by trituration, and by solution. In natural history, he acquired the greatest fame as an entomologist. Besides a number of curious papers on this subject in the Memoirs of the Academy, he published a very elaborate work, entitled "Memoires pour servir à l'Histoire Naturelle des Insectes," in six vols. 4to. 1734—1742. This work was the labour of many years, and the result of innumerable observations made in his garden, in which he kept insects of all kinds, that he might examine their generation, changes, and mode of life. Reaumur was a man of much private worth, of mild and amiable manners, and correct morals. He died in 1757, at the age of 75. He bequeathed his manuscripts, and cabinet of natural philosophy, to the Academy of Sciences.

REAUMURIA, in Botany, so called in honour of the great French naturalist, René Antoine Ferchault de Reaumur, principally known, as a botanist, by his examination of the fructification of *Fucus*, but chiefly celebrated as a philosophical inquirer into the history of insects, and their transformations, to which the specific name of the original species, *vermiculata*, evidently alludes. Linnæus mentions Hasselquist as the author of the name *Reaumuria*; of which we can find no traces in his book, though the specimen of the plant in the Linnæan herbarium, has some appearance of having been gathered by this distinguished Oriental traveller. Is it possible, that the *Anonyma dubia*, n. 15, of his *Iter Palestinum*, 465, which his editor Linnæus could not make out, can be the *Reaumuria*? The description is not inapplicable, except what concerns the stamens and style. Yet this does not make him the author of the name, though it may possibly account for Linnæus's mention of him in conjunction therewith. The latter appears, by his manuscripts, to have once destined *Vermicularis* for

the generic appellation.—Linn. Gen. 276. Schreb. 371. Willd. Sp. Pl. v. 2. 1249. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 327. Juss. 316. Lamarck Illustr. t. 489. Dict. v. 6. 84.—Class and order, *Polyandria Pentagynia*. Nat. Ord. *Succulenta*, Linn. *Ficoidea*, Juss.

Gen. Ch. Cal. Perianth inferior, of five prominent, ovate, pointed, permanent leaves. Cor. Petals five, oblong, equal, sessile, rather longer than the calyx, oblique, or lobed, at the extremity. Nectary of five double, fringed scales, at the meeting of the petals, attached to their lower part. Stam. Filaments numerous, capillary, the length of the calyx, inserted into the receptacle; *Desfont.*; anthers roundish, incumbent. Pist. Germen superior, roundish; styles five, thread-shaped, erect, approaching each other, on a level with the stamens; stigmas simple. Peric. Capsule ovate, of five cells, with five flat, at length reflexed, valves; the partitions membranous, unconnected, deciduous. Seeds several, erect, oblong, entirely clothed with numerous, silky, simple hairs, twice their own length.

Ess. Ch. Calyx of five leaves. Petals five, with ten fringed scales at their base. Capsule of five cells, with five valves, and five deciduous partitions. Seeds several, oblong, hairy.

Obi. Specimens in seed, from professor Desfontaines, have enabled us to reconcile his account, and that of Linnæus, with the observation of Forskall, that "the capsule has only one cell," the partitions being deciduous, and concealed among the hairy seeds. Not having examined the nectariferous scales, we have, in adverting to Labillardiere's and Hooker's plates of the second species, made the description so general as to accord with both.

1. *R. vermiculata*. Saltwort-leaved Reaumuria. Linn. Sp. Pl. 754. Willd. n. 1. Forsk. Ægypt. Arab. 101. Desfont. Atlant. v. 1. 431. Lamarck Illustr. t. 489. f. 1. (*Sedum ficulum maritimum vermiculatum*, flore Saxifragæ albæ, femine villosa; Bocc. Sic. 6. t. 4. f. C. G. S. minimum arborescens vermiculatum; Lob. Ic. 380. Kali vermiculatum albo et amplo fedi rosei flore; Barrel. Ic. t. 888. Vermicularis frutex minor; Ger. Em. 523; at least the figure, which is that of Lobel. The description accords rather with *Salsola fruticosa*, as cited by Hudson.)—Leaves linear-awlshaped, convex beneath. Calyx entire.—Native of barren sandy ground towards the sea, in Sicily, Barbary, Egypt, and Syria, flowering in summer. The habit of the plant is like a *Tamarix*, or *Salsola*. Stem shrubby, bushy, much branched, round, smooth, whitish, leafy. Leaves numerous, scattered, sessile, from a quarter to three quarters of an inch long, spreading, linear-awlshaped, acute, fleshy, smooth, glaucous; convex beneath; flat above; dotted on both sides with minute depressions. Desfontaines compares the leaves to those of *Sedum reflexum*. Flowers terminal, solitary, white, not unlike those of *Saxifrage Cotyledon*, each encompassed with a number of imbricated floral leaves, like those of the stem or branch, but longer. Calyx-leaves ovate, with a narrow, entire, membranous edge, and awlshaped leaf-like point. Petals terminating in three slight lobes, well represented by Barrelier. Capsule brown, very smooth, and somewhat shining; its valves rigid, reflexed after the seeds are discharged, and permanent. Seeds clothed with long, tawny, shining hairs. Forskall says this plant is used at Alexandria as a cure for the itch, being applied bruised externally, and taken internally in the form of a decoction. It is an elegant little shrub, well worthy of a place in our gardens, or green-houses, to which it is as yet a stranger.

2. *R. hypericoides*. Elliptic-leaved Reaumuria. Willd. n. 2. Ait. n. 1. Lamarck f. 2. (*R. linifolia*; Salis. Parad.

Parad. t. 18. *Hypericum alternifolium*; Labillard. Syr. fasc. 2. 17. t. 10.)—Leaves elliptic-lanceolate, flat. Calyx minutely crenate.—Gathered in barren dry ground, near the desert of Syria, by M. Labillardiere, to whom we are obliged for a wild specimen. The plant is said to have been introduced into England, by the late Mr. John Bell, about 1800, and is marked by Mr. Aiton as a hardy perennial. Its true genus is well ascertained by Lamarck, Poirer, and Salisbury. The stem is herbaceous, about a foot high, simple, or branched, smooth, pale or reddish. Leaves alternate, glaucous, from half an inch to an inch in length, elliptic-oblong, or somewhat lanceolate, varying greatly in breadth, dotted all over. Flowers terminal, solitary, pale rose-coloured, with oblique petals. Calyx-leaves broader than in the former, their membranous edges finely crenate, their points very small. We know nothing of the capsule or seeds.

REAY, in *Geography*, a town of Scotland, in the county of Caithness; 6 miles W. of Thurfo.

REBACH, a river of France, which runs into the Rhine, nearly opposite to Manheim.

REBAIS, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Coulommiers; six miles E.N.E. of it. The place contains 1256, and the canton 11,284 inhabitants, on a territory of 190 kilometres, in 18 communes.

RE-BAPTISANTS, a religious sect, who maintain, that persons irregularly baptized are to be baptized afresh.

The Anabaptists are re-baptisants, inasmuch as they baptize those at maturity, who had been before baptized in childhood.

St. Cyprian and pope Stephen had mighty differences about the re-baptization of converted heretics.

Donatus was condemned at Rome in a council, for having re-baptized some persons, who had fallen into idolatry after their first baptism.

REBAT, in *Geography*. See RABAT.

REBATE, in *Architecture*. See JOINERY and PLANE.

REBATE, or *Rabat*, *Rebatement*, in *Commerce*, a term much used at Amsterdam for a discount or abatement in the price of certain commodities, when the buyer advances the sum in hand, for which he might have taken time. See DISCOUNT.

Rebate (among us usually called *prompt payment*) is estimated by months, and is only allowed for certain kinds of merchandizes, which, according to the custom of Amsterdam, are

15 months, or 10 per cent. on German, Prussian, and Polish wools.

18 months, or 12 per cent. on brown Muscovado sugar, pot-ashes, soda, Italian Armoifines, fatin, damask, and silk stuffs.

21 months, or 14 per cent. on Spanish wool and lamb's wool.

33 months, or 22 per cent. on Italian silk and raw silk from the Levant, which silks are sold by the Antwerp weight, about 5 per 100 lighter than that of Amsterdam.

Dutch cloths, camlets, &c. are sold with 4 per cent. rabat, for ready money, or without any rabat at 9 months' credit.

Dutch silk stuffs are sold with 2 per cent. rabat at 6 months' credit: with 4 per cent. at 3 months; or with 6 per cent. for ready money.

In all sales of goods, except those last mentioned, a further abatement is made of 1 or 2 per cent. for prompt payment.

At Hamburg, some sorts of merchandise, when sold in

large quantities, have an allowance made of 7, 13, or 19 months rabat, reckoned at 8 per cent. per annum; which the buyer, when he pays ready money, or pays within four weeks of the day of sale, deducts from the nominal price.

Refined sugars, English and Dutch cloths, English baize, shalloons, flannels, kerseymeres, ratteens, and ferges, are sold with 7 months' rabat, or 4 per cent.; that is, 4 per cent. are deducted from 104 per cent., or 7 from 157.

Cotton, cinnamon, cochineal, indigo, ginger, nutmegs, cloves, mace, rice, raw sugars, capers, currants, cumine, gall-nuts, Russian leather, linen, crape, Italian silks, table-linen, Silesia cloth, Marseilles soap, almonds, fumac, molasses, Turkish yarn, Italian tartar, are sold with 13 months' rabat, or 8 per cent.; that is, 13 is deducted from 163. Silks from the Levant, as Ardassette, Barutine, and Cerbaffi, are sold with 16 months' rabat, or 10 per cent.; that is, 8 is deducted from 83. Kelly's Un. Camb. vol. i.

This interest, called *rebate*, or *rabat*, is usually regulated on the footing of 8 per cent. per annum.

The reason of this expedient is, that the merchants having not always wherewithal to pay for their goods in hand, by means of the rebatement, such as have, will find their account in it; and such as have not will be engaged to discharge themselves as soon as possible, for the sake of the discount.

REBATEMENT, in *Heraldry*, a diminution or abatement of the dignity of the figures or bearing in a coat of arms. See ABATEMENT.

REBEBE, in *Commerce*, a measure of corn in Egypt, particularly at Alexandria, equal to about 4½ bushels; as *kisloz*, another measure, is equal to 4 per cent. English measure: 17.94 rebebes are equal to 10 English quarters, and each of them contains 9587 cubic inches; and 16.51 kilos are equal to 10 English quarters, and each contains 10418 cubic inches.

REBEC, a musical instrument resembling a fiddle, with a neck, finger-board, three strings tuned 5ths, and played with a bow.

Etymologists have tortured themselves to find a derivation for the name of a vulgar instrument, no longer in use. Some trace it from the Arabic, some from the Celtic, the Welsh, the Spanish, Italian, and old French. Indeed, so numerous, discordant, and unsatisfactory are their opinions, as neither to be worth writing, nor perusal, if we could give them a place.

Rebec and ribible seem to be the same instrument, and are often indiscriminately used by Gower, Chaucer, and the still more ancient bards of Normandy, and our own country.

As the head, or scroll-work, of old viols and violins used to be curiously carved, so seems to have been that of the rebec. Chaucer compares the face of an old woman, an old trot, to the head of a rebec. Rabelais does the same.

—“ A tel minefrier tel rebec
Tenant toujours le verre au bec
Car elle avoit visage de rebec.”

REBECCO, in *Geography*, a town of Italy, in the department of the Panaro; 29 miles S.W. of Modena.

REBEL, JEAN-FERRY, sen. in *Biography*, one of the 24 violins of the king of France's band, and chamber composer to his majesty. He beat time for many years at the opera, and, in his day, passed for a great composer. His music for dances is still heard with pleasure. His capriccios, freaks, and dancing characters, have enjoyed great reputation. In 1703 he set the opera of Ulysses, written by Guichard

Rebel left two children: Francis, who died in 1775, and Anne, the wife of the celebrated Lalande, master of the king's band.

REBEL, FRANÇOIS, knight of St. Michael, master, like his father, of the king's band, and director of the opera, born 1702, and died in 1775. He was the son of Jean-Ferry Rebel, director of the orchestra at the opera, and one of the twenty-four violins of the king's band. His son had obtained the reversion, in 1717, of chamber musician to the king, and in 1703, that of composer; having given proofs of his abilities by many different works, but, above all, by his "Pyramus and Thisbe," composed in partnership with Francœur.

He was successively appointed to all the musical posts of honour and profit under the royal patronage and that of the public. The close and uninterrupted friendship between this musician and Francœur, does honour to the memory of both; having composed jointly, for 50 years, successful pieces, without discovering to which of them the greatest honour was due. Laborde. See FRANCOEUR.

REBELLION originally signified a second resistance or rising of such as had been formerly overcome in battle by the Romans, and had yielded themselves to their subjection.

It is now generally used for a traitorous taking up of arms against the king, either by his own natural subjects, or by those formerly subdued; whether their view be to deprive him of the supreme authority, or whether they intend to resist his commands in some particular affairs, in order to impose conditions on him. Popular commotion is a concourse of people, tumultuously assembled, and resisting the voice of their superiors, whether their designs be against those superiors themselves, or only some private persons. Such violent commotions are common when the people think themselves aggrieved, and are occasioned by no order of men so frequently as the tax-gatherers. (See the next article.) If the rage of the malcontents be particularly levelled at the magistrates, or others vested with the public authority, and they proceed to a formal disobedience or violent proceedings, it is called a "sedition." When the evil spreads, infecting great numbers in the city or provinces, and subsists in such a manner, that the sovereign is no longer obeyed, such a disorder custom has more especially distinguished by the name of "insurrection." All these violences disturb the public order, and are crimes of state, even when arising from just causes of complaint. For violent measures are interdicted in civil society; the injured party should have recourse to the magistrates, to whom they may apply for redress; and if justice be not obtained from them, their complaints may then be laid at the foot of the throne. Every citizen should even patiently suffer supportable evils, rather than disturb the public peace. Nothing less than a denial of justice from the sovereign, or affected delays, can excuse the furious commotions of a provoked people; they in some measure justify themselves, if the evils be intolerable, and the oppressions great and manifest. But, it may be asked, what conduct shall the sovereign observe towards the insurgents? The reply in general is, that which shall at the same time be most consonant to justice, and most salutary to the state. If he is to repress those who unnecessarily disturb the public peace; he is, by the same reasoning, to shew clemency towards unfortunate persons, to whom just cause of complaint has been given, and who are guilty only in having undertaken to do themselves justice; so that they have been wanting in patience rather than fidelity. The sovereign should consider that his rights are derived from those of civil society, from the trust reposed in him, from the obligation devolved upon him of watching over the

welfare of the nation, of procuring its greatest happiness, and of maintaining in it order, justice, and peace. He will also duly distinguish the nature and degree of the different disorders which may disturb the state, oblige him to take arms, or substitute the means of force instead of those of authority. By considerations of this kind he will regulate his behaviour towards revolted subjects. It cannot be questioned, that subjects rising against their prince without cause deserve severe punishments; yet in this case the number of delinquents calls for the sovereign's clemency; shall he depopulate a city, or desolate a province, in punishing their rebellion? Such a chastisement, however just in itself, becomes a cruelty when extended to so great a number of persons. Had the insurrection of the Netherlands against Spain been totally unwarrantable, every man of virtue would still execrate the memory of the duke of Alva, who made it his boast that he had caused above 20,000 heads to be struck off by the hands of the common executioner. Let not his sanguinary imitators (says the excellent Vattel) expect to justify their enormities by necessity. Who was ever more undeservedly insulted by his subjects than Henry the Great of France? His conquests were ever accompanied by an uniform clemency, and at length that excellent prince obtained the success he deserved: he thereby gained over faithful subjects; whereas the duke of Alva lost his master the United Provinces. Tyrants alone will treat, as seditious, those brave and resolute citizens, who exhort the people to preserve themselves from oppression in the vindication of their rights and privileges; a good prince will commend such virtuous patriots, provided their zeal be tempered with moderation and prudence. If he has justice and his duty at heart; if he aspires to that immortal and unfulfilled glory of being the father of his people; let him mistrust the selfish suggestions of a minister, who represents to him as rebels all those citizens who do not hold out their hands to chains, who refuse tamely to suffer the strokes of arbitrary power.

The safest, and the most just way thoroughly to appease sedition, is to give the people satisfaction; and if the insurrection has been without cause, which perhaps has never been the case, still an amnesty is to be granted where the offenders are numerous. When this amnesty is once published and accepted, whatever has past must be buried in oblivion. A prince who makes any conscience of his word, is faithfully to keep what he has promised to rebels themselves; *i. e.* to those subjects who have revolted without reason or necessity. If his promises are not inviolable, what security have the rebels in treating with him? When they have once drawn the sword, they have nothing to do but, as one of the ancients expresses it, to throw away the scabbard. The prince will then want the mild and salutary means of appeasing a revolt: to exterminate the rebels will be the only expedient remaining. These will become formidable through despair: compassion will bestow succours on them; their party will increase, and the state will be in danger. Vattel's Law of Nations, b. iii. See CIVIL WAR.

Rebel is sometimes also used, in our ancient statutes, for a person who wilfully breaks a law; and sometimes for a villain disobeying his lord.

REBELLION, *Commission of*. See COMMISSION.

REBELLIOUS ASSEMBLY, a gathering of twelve persons, or more, intending, going about, or practising, unlawfully, and of their own authority, to change any laws of the realm, or to destroy the inclosure of any park or ground inclosed, banks of fish-ponds, pools, conduits, &c. to the intent the same shall remain void, or that they shall have way in any of the said grounds; or to destroy the deer in any park, fish in ponds, coney in any warren, dove-houses,

houses, &c. or to burn stacks of corn, or to abate rents, or prices of victuals. See RIOT, ROUT, and UNLAWFUL Assembly.

REBENSOE, in *Geography*, a small island in the North sea, near the coast of Norway. N. lat. 70°.

REBHIANG, one of the Hebrew accents, answering to our comma, and enumerated among their kings and pauses. It is marked by a dot over the middle of a letter. See ATH-NACH, SYLLUK, &c. See also ACCENTS.

REBINARE, was to give a second stirring or ploughing to arable land that lay fallow, to prepare it for sowing wheat, &c. or to plough the ground a third time for that purpose. "Tempus rebinandi erit post festum Nativitatis sancti Johannis Baptiste cum terra pullulaverit post carucani." Fleta, lib. ii. cap. 73.

REBNITZ, in *Geography*. See RIBNITZ.

REBORDAOS, a town of Portugal, in the province of Tras los Montes; two miles S. of Bragança.

REBOUND. See RECOIL.

REBOUX, in *Geography*, a town of France, in the department of Mont Blanc; 9 miles N.W. of Chambéry.

REBTORF, a town of Bavaria, in the principality of Aichstatt; 3 miles W. of Aichstatt.

REBUS, a name-device, as Camden englishes it; or an enigmatical representation of some name, &c. by using figures or pictures, instead of words, or parts of words. Such is that of the gallant mentioned by Camden, who expressed his love to Rose Hill, by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; which, in the rebus style, is read, *Rose Hill I love well*.

The Picards have the honour of the invention of this notable kind of wit; whence the French, to this day, call it *rebus de Picardie*. Camden adds, that the English first learnt it of them in the reign of our Henry III. by means of the garrisons we then had in Calais, Guienne, and other places bordering on Picardy.

Its origin is by Menage, &c. ascribed to the priests of Picardy, who, it seems, anciently, in carnival time, used every year to make certain libels, entitled *de rebus que geruntur*, being railleries on the intrigues and transactions that had passed about the city; in which they made great use of such sort of equivoques and allusions, breaking and joining words, and supplying them with paintings.

Camden tells us, the rebus was in wonderful esteem among our forefathers; and that he was nobody who could not hammer out of his name an invention by this wit-craft, and picture it accordingly.

The Sieur des Accords has made an ample collection of the most famous rebuses de Picardie. And Mr. Camden has done something of the same kind in his Remains.

Abel Druggers device in Ben Johnson's Alchemist, and Jack of Newbury, in the Spectator, are known to every body. But the rebus, being once raised to sign-posts, grew out of fashion at court.

Yet has rebus antiquity on its side, as having been in use in the pure Augustan age: Cicero, in a dedication to the gods, inscribed Marcus Tullius, with a little pea, called by the Latins *cicer*, by us a *chick pea*. And Julius Cæsar, in some of his coins, used an elephant, called *Cæsar* in the Mauritanian tongue. Add to these, that the two mint-masters in that age, L. Aquilius Florus, and Voconius Vitulus, used, the first a flower, the second a calf, on the reverse of their coins.

REBUS, in *Heraldry*, a coat of arms which bears an allusion to the name of the person: as three castles, for Castleton; three cups, for Butler; three conies, for Conisby; a kind of bearings which are of great antiquity.

Rebus is also used by the chemical writers, sometimes to signify four milk, and sometimes for what they call the ultimate matter of which all bodies are composed.

REBUTTER, from *re*, and the French *bouter*, to *repeal*, or *bar*, in *Law*, the answer of the defendant in a cause to the plaintiff's sur-rejoinder.

The plaintiff's answer to the defendant's rebutter, is called a *sur-rebutter*.

REBUTTER is also when a man warrants any land or hereditament to another, and the person making the warranty, or his heir, sues him to whom the warranty is made, or his heir or assignee, for the same thing: if he, who is so sued, plead the deed or fine with warranty, and pray judgment, if the plaintiff shall be received to demand the thing which he ought to warrant to the party, against the warranty in the deed, &c. this is called a rebutter.

Again, if I grant to the tenant to hold *sine impetitione vassii*, and afterwards implead him for waste, he may debar me of the action, by shewing my grant; which is likewise a rebutter.

REC, in *Geography*, a river of France, which runs into the Sarre, at Sarre Alb.

RECANATI, a town of the marquise of Ancona; near which towards Macerata are seen the ruins of Helvia Ricina; a town built by the emperor Sept. Severus, and destroyed by the Goths; 8 miles N.N.E. of Macerata. N. lat. 43° 25'. E. long. 13° 39'.

RECANGED, in *Rural Economy*, a term provincially used to signify lited or discoloured in stripes.

RECANTATION. See PALINODY, or RETRACTATION.

RECAPITULATION, in *Oratory*, &c. a part of the peroration, or conclusion; called also *anacephalæsis*.

Recapitulation is a summary of the preceding discourse; or a concise, transient enumeration of the principal things insisted on at large in it; by which the memory of the hearer is refreshed, and the force of the whole collected into one view.

An instance of this may be given in the peroration of Cicero's Manilian: "Quare, cum bellum ita necessarium sit, ut negligi non possit: ita magnum, ut accuratissime sit administrandum; & cum ei imperatorem præficere possitis, in quo sit eximia belli scientia, singularis virtus, clarissima auctoritas, egregia fortuna; dubitabitis, Quirites, quin, &c."

In order to constitute a good repetition or recapitulation, it must be short and concise: it is also convenient to recite things in the same order in which they were at first laid down; but sometimes a repetition is made, by running a comparison between the speaker's own argument, and those of the adverse party, and placing them in opposition to each other; and this method Cicero takes in the conclusion of his third oration upon the Agrarian law. In some cases, when the discourse is very long, and the arguments insisted on have been many, the orator only mentions such things which he thinks of least consequence, by saying that he omits or passes over them, till he comes to what is of greater moment, which he represents more fully. Ward's Orat. vol. i. sect. 13. See PRETERITION.

RECAPTION, RECAPTIO, or *Reprisal*, in *Law*, is a remedy given to the party himself for an injury to his personal property. This happens, when any one hath deprived another of his property in goods or chattels personal, or wrongfully detains one's wife, child, or servant; in which case the owner of the goods, and the husband, parent, or master, may lawfully claim and retake them, wherever he happens to find them, so it be not in a riotous manner,

or attended with a breach of the peace. Thus, *e. gr.* if my horse is taken away, and I find him in a common, a fair, or a public inn, I may lawfully seize him to my own use; but I cannot justify breaking open a private stable, or entering on the grounds of a third person to take him, except he be feloniously stolen, but must have recourse to an action at law. Recaption is unlawful, if it be done with intention to smother or compound a larciny. See RESTITUTION of *Stolen Goods*.

RECAPTION also is the taking a second distress of one formerly distrained for the same cause, and also during the plea grounded on the former distress.

Recaption is also the name of a writ lying for the party thus distrained to recover damages. See REPLEVIN.

RECAPTURE, in *Naval Insurance*, denotes the recovery of a ship, or its cargo wholly or in part, after having been taken by an enemy. For every loss occasioned by capture, whether lawful, *i. e.* when made by a declared enemy, according to the laws of war, or unlawful, *i. e.* when it is against the rules established by the law of nations, whether by friends or enemies, the insurer is liable, agreeably to the comprehensive and express words of the policy: and in every case of capture the insurer is answerable, to the extent of the sum insured, for the loss actually sustained. This may be either *total*, as where the ship and goods insured are not recovered; or *partial*, as where the ship is recaptured or restored before abandonment; in which case the insurer is bound to pay the salvage, and any other necessary expence the insured may have incurred by the recovery of his property. The insurer is liable for a loss by capture, whether the property in the thing insured be changed by the capture or not. As to the length of possession by an enemy, which is deemed sufficient to divest the property out of the original owner, or the effect of a recapture in revesting it; these are matters which can never now come directly in question between the insurer and insured, in any case of insurance upon real interest. In gaming insurances, or insurances without interest, indeed, when there was a recapture, the claim, as for a total loss, seems formerly to have involved the question, whether the property in the thing insured had, by the capture, or any proceeding founded on it, been divested out of the original owner, or not, before the recapture. Nevertheless, when a ship is insured "interest or no interest," it has been repeatedly determined, that if the ship be taken, it is a total loss, however illegal the capture may be, and though the ship may be retaken and restored to the owner. But though no question can now arise between the insured and the insurer, as to the effect of a capture or recapture, in divesting or revesting the property; it may not be deemed unimportant to inquire when a capture shall be deemed to transfer the property to an enemy, and what shall be the effect of a recapture in revesting it in the original owner. The general opinion seems to be, that by the law of nations, the property of things captured in war is changed when all reasonable hope of recovering them is gone; and, with respect to things moveable, all reasonable hope of recovering them is presumed to be gone when they are brought within the protection of the enemy's fortrefs. Grotius says, that ships or goods, taken at sea, become the property of the captors, when they are brought into the enemy's harbours, or to the place where his whole fleet is stationed; for then all hopes of recovering them may be said to vanish. But, he adds, that by the law of nations, as introduced among European states in more modern times, things are considered as captured, when they have been 24 hours in the power of the enemy. Others deny this rule of the law of nations, and insist on the rule of the Roman law, that the prize must be carried

"infra præfidia" before it can become the property of the captors; and by "præfidia" Bynkershoeck understands the camps, the ports, the towns, and the fleets, of the enemy. In our courts of admiralty, however, it has always been holden, by the marine law of England, independent of the statute which commands restitution, and fixes the rate of salvage, the property is not changed in favour of a vendee or recaptor, so as to bar the original owner, till there has been a regular sentence of condemnation: and in the reign of king Charles II., a solemn judgment was given upon this point; and restitution of a ship taken by a privateer was decreed, after she had been fourteen weeks in the enemy's possession, *because she had not been condemned*. The same doctrine has, in several instances, prevailed in our courts of common law. In one case it was holden that nine days' possession by the captor, and in another, that four years' possession, and several voyages performed, will not change the property, without a sentence of condemnation.

In general, whenever a ship is taken by the enemy, the insured may abandon, and demand as for a total loss; and he is not bound to make any claim or appeal in the enemy's courts of admiralty, or to litigate there the validity of the capture.

But the insured is in no case bound to abandon; and, as the law now stands, no capture by the enemy can be so total a loss as to leave no possibility of recovery, for the *jus possidendi* continues for ever, except in the case of a captured ship converted into a ship of war. (Stat. 33 G. III. c. 66. § 42.) If the owner himself should retake his ship or goods, he will be fully intitled to them; and if they be retaken at any time, whether before or after condemnation, he will be intitled to restitution, upon payment of a settled salvage. Stat. 29 G. II. c. 34. § 24; and 33 G. III. c. 66. § 42.

The chance of the owner's recovering his property, does not, however, suspend the demand of the insured, as for a total loss: but in the case of a recapture, justice is done to the insurer by putting him in the place of the insured. In questions upon policies of insurance, the nature of the contract as an *indemnity*, and nothing else, is always liberally considered.

When there has been a capture, whether legal or not, and the ship has been recaptured or restored, the insurer is bound to defray all necessary expences which the insured has been put to for the recovery of his property. He is therefore liable for a sum of money paid by the insured to the captors, as a *compromise made bonâ fide*, to prevent the ship being condemned as prize. See RANSOM.

It often happens that a recaptured ship is in a state to prosecute her original voyage; and, in that case, it is the interest of the recaptors, as well as of the other parties concerned, that she should be permitted to do so. The last prize act (stat. 33 Geo. III. c. 66. § 44.) has therefore very properly provided, "That if a ship be retaken before she has been carried into an enemy's port, it shall be lawful for her, if the recaptors consent thereto, to prosecute her voyage; and it shall not be necessary for the recaptors to proceed to adjudication till six months after the recapture, or till the return of the ship to the port from whence she failed; and the master, owners, or agents, with the consent of the recaptor, may dispose of their cargoes before adjudication: and in case the vessel shall not return to the port from whence she failed, or the recaptors shall have had no opportunity of proceeding regularly to adjudication within the six months, on account of the absence of the said vessel, the court of admiralty shall, at the instance of the recaptors, decree restitution to the former owners, they paying salvage, upon such evidence as to the court shall, under all the cir-

RECAPTURE.

circumstances of the case, appear reasonable; the expence of such proceeding not to exceed *fourteen pounds.*"

We shall here observe, that there is an obvious difference between capture and arrest of princes; the object of the one is prize, that of the other detention, with a design to restore the ship or goods detained, or to pay the value to the owner. When a ship is detained in a port after a declaration of war, or the issuing of letters of reprisal, this more resembles a capture than a detention, and gives the injured an immediate right to abandon, as for a loss by capture, even though no condemnation be pronounced, and though the ship be afterwards restored. The most frequent cause of detention is an embargo, which is a proclamation or order of state, usually issued in time of war or threatened hostilities, prohibiting the departure of ships or goods from some or all of the ports of such state until further order. An embargo laid on ships and merchandize in the ports of this kingdom by virtue of the king's proclamation, is strictly legal, when the proclamation does not contravene the ancient laws, or tend to establish new ones; but only to enforce the execution of such laws as are already in being, in such manner as the king shall judge necessary. But whether an embargo be legally or illegally laid, the injury to the owner, by the detention of his ship or goods, is the same; and the insurer is equally liable for the loss occasioned by it. If a ship be seized after a cessation of arms and preliminary articles of peace are signed, this shall not be deemed a capture, but only an arrest of princes. For the regulation of salvage upon a recapture, we refer to the article SALVAGE.

Capture by an enemy or a pirate, or an arrest of princes, or even an embargo, is *prima facie* a total loss; and immediately upon the capture, or upon a mere arrest, or at any time while the ship continues under detention, the insured may elect to abandon, and give notice to the insurer of his intention so to do; and thus entitle himself to claim as for a total loss from the insurer. For, from the moment of the capture, the owners lose their power over the ship and cargo, and are deprived of the free disposal of them; and, in the opinion of the merchant, his right of disposal being suspended or rendered uncertain, is equivalent to a total deprivation. It would therefore be unreasonable to oblige the insured to wait the event of capture, detention, or embargo.

There is this difference between a policy *upon interest*, and a *wager policy*, that in the one case the insured may, if he thinks proper, abandon the moment he has notice of a capture or detention, and this will bind the underwriters, whatever may be the ultimate fate of the ship; but in the case of a wager policy there can be no abandonment, because the insured has nothing to abandon.

But a capture or arrest does not necessarily, and at all events, terminate in a total loss, so as to entitle the insured to abandon; for as he cannot abandon till he has received advice of the loss; if, at the time he receives such advice, or before he has elected to abandon, he receive advice that the ship or goods insured are recovered, or are in safety, he cannot then abandon; because he can only abandon *while* it is a total loss, and he knows it to be so; not after he knows of the recovery. Therefore, if a captured ship be retaken and permitted to proceed on her voyage, so that she suffers but a small temporary inconvenience; this would only be a partial, and not a total, loss.

On the other hand, a title to restitution upon a recapture does not necessarily, and at all events, deprive the insured of the right to abandon; for if, in consequence of the capture, the voyage be lost, or not worth pursuing; if the salvage be very high; if farther expence be necessary, and

the insurer will not undertake at all events to pay it, he may abandon. The rule is, that, if the thing insured be recovered before any loss is paid, the insured is entitled to claim as for a total, or a partial loss, according to the final event; that is, according to the state of the case at the time he makes his claim. There is no vested right to a total loss, till the insured, having a right to abandon, elects to do so; for he is only entitled to an indemnity for his loss as it stands at the time of the action brought, or offer to abandon.

But if, after a total loss has been actually paid, the thing insured be recovered, the insurer cannot oblige the insured to refund the money he has received; but he shall stand in the place of the insured, and so no injustice is done.

Cases are mentioned by Mr. Serjeant Marshall, which serve as examples to shew, that though a captured ship be recaptured, yet if the voyage be lost, the loss will be total, and the insured will have a right to abandon.

By the marine law, the property was not changed by the capture, till after condemnation: and since the 29 Geo. II. c. 34, the "*jus postliminii*" continues for ever. A recapture does not in all cases prevent the loss being total. If the voyage be absolutely lost, or be not worth pursuing; if the salvage be very high; if further expence be necessary; if the insurer will not engage, at all events, to bear that expence, though it should exceed the value, or fail of success: under these, and many other similar circumstances, the insured may disentangle himself and abandon, notwithstanding there was a recapture. Upon a recapture the property returns to the original owner, pledged to the recaptors for the amount of the salvage: upon the payment of which he is intitled to restitution. If upon a recapture the captain, finding that the voyage cannot be pursued, and, acting fairly for the benefit of all concerned, sell the ship and cargo to pay the salvage, and thereby put an end to the voyage, the insured may abandon and recover as for a total loss. However, a capture does not necessarily amount to a total loss, nor does a recapture prevent its being total. If the captain purchase the ship from the captors for account of his owners, the money paid, being in the nature of salvage, is only partial loss.

To this article we shall subjoin two or three remarks on the subject of abandonment, which do not elsewhere occur. A time should be fixed when the degree of the insurer's responsibility should be ascertained. In several maritime states on the continent, positive regulations have been established, limiting the time, after a loss has happened, within which the insured may abandon. In England we have no such positive regulation, nor any time limited by law for abandoning. But the courts have laid down a rule, better adapted to the purpose; and the rule is, that as soon as the insured receives advice of a total loss, he must make his election whether he will abandon or not. If he determines to abandon, he must give the underwriters notice of this within a reasonable time after the intelligence arrives; and any unnecessary delay in giving this notice will amount to a waiver of his right to abandon; for unless the owner does some act, signifying his intention to abandon, it will be only a partial loss, whatever may be the nature of the loss, or the extent of the damage. If the insurers in any manner prevent the abandonment, they shall pay the whole loss, to the amount of the sum insured. If no intelligence be received of a ship within a reasonable time, it shall be presumed that she foundered at sea: when the time has elapsed which affords that presumption, the insured may abandon, and claim as for a total loss. Marshall on Insurance, vol. ii.

RECARDAINS, in *Geography*, a town of Portugal, in the province of Beira; 6 miles E. of Bragança Nova.

RECCAN. See ARRACAN.

RECCO, a town of the Ligurian republic, near the sea-coast; 11 miles S.E. of Genoa.

RECEIF, a fort and harbour on the coast of Brazil. S. lat. 8° 10'.

RECEIPT, or RECEIT, in *Commerce*, an acquittance or discharge; or a written acknowledgment of having received a sum of money.

Where the receipt is on the back of a bill, &c. it is usually called an *endorsement*.

Among tradesmen the receipt usually makes the second of the three articles of an account; the receipt contains the monies received; the two others the expence, and the return or balance.

By the 44 Geo. III. c. 98, the former stamp duties were repealed, and others imposed; by the 48 Geo. III. c. 149, these last were repealed, and the following were imposed; *viz.*

Receipt or discharge given for or upon the payment of money		Duty.

And where any sum of money whatever shall be therein expressed, or acknowledged to be received in full of all demands

And any note, memorandum, or writing whatsoever, given to any person for or upon the payment of money whereby any sum of money, debt, or demand, or any part of any debt or demand therein specified, and amounting to 2*l.* or upwards, shall be expressed or acknowledged to have been paid, settled, balanced, or otherwise discharged or satisfied, or which shall import or signify any such acknowledgment, and whether the same shall or shall not be signed with the name of any person, shall be deemed and taken to be a receipt for a sum of money of equal amount with the sum, debt, or demand so expressed or acknowledged to have been paid, settled, balanced, or otherwise discharged, or satisfied, within the intent and meaning of this schedule, and of the foregoing act, and shall be charged with a duty accordingly.

And any receipt or discharge, note, memorandum, or writing whatever, given to any person for or upon the payment of money, which shall contain, import, or signify any general acknowledgment of any debt, account, claim, or demand, debts, accounts, claims, or demands, whereof the amount shall not be therein specified, having been paid, settled, balanced, or otherwise discharged or satisfied, or whereby any sum of money therein mentioned shall be acknowledged to be received in full, or in discharge or satisfaction of such debt, account, claim, or demand, debts, accounts, claims, or demands, and whether the same shall or shall not be signed with the name of any person, shall be deemed and taken to be a receipt for the sum of 500*l.* or upwards, within the intent and meaning of this schedule, and of the foregoing act, and shall be charged with the duty of 5*s.* accordingly.

By 43 Geo. III. c. 126, such receipt shall not be available in law or equity as such acknowledgment, or be given in evidence, unless duly stamped as aforesaid.

And all receipts, discharges, and acknowledgments of the description aforesaid, which shall be given for or upon payments made by or with any bills of exchange, drafts, promissory notes, or other securities for money, shall be deemed and taken to be receipts given upon the payment of money within the intent and meaning of this schedule and of the foregoing act.

Exemptions from the preceding Duties on Receipts.

Receipts exempted from stamp duty by any act or acts of the present session, relating to the assessed taxes.

Receipts or discharges given by the treasurer of the navy for any money imprested to or received by him for the service of the navy.

Receipts or discharges given by any agent for money imprested to him on account of the pay of the army or ordnance.

Receipts or discharges given by any officer, seaman, marine or soldier, or their representatives respectively, for or on account of any wages, pay, or pension due from the navy-office, army pay-office, or ordnance-office.

Receipts or discharges given for the consideration money, for the purchase of any share in any of the government or parliamentary stocks or funds, or in the stocks and funds of the governor and company of the bank of England, or of the East India company, or South Sea company, and for any dividend paid on any share of the said stocks or funds respectively.

Receipts given for money deposited in the bank of England, or in the bank of Scotland, or royal bank of Scotland, or in the bank of the British linen company in Scotland, or in the hands of any banker or bankers, to be accounted for on demand, provided the same be not expressed to be received of or by the hands of any other than the person or persons to whom the same is to be accounted for; but if with interest, see *PROMISSORY Notes*.

Receipts or discharges written upon promissory notes, bills of exchange, drafts or orders for the payment of money duly stamped according to the laws in force at the date thereof, or upon bills of exchange drawn out of, but payable in Great Britain.

Receipts or discharges given upon bills or notes of the governor and company of the bank of England; letters by the general post acknowledging the safe arrival of any bills of exchange, promissory notes, or other securities for money.

Receipts or discharges indorsed or otherwise written upon, or contained in any bond, mortgage, or other security, in any conveyance, deed, or instrument whatever, duly stamped according to the laws in force at the date thereof, acknowledging the receipt of the consideration money therein expressed, or the receipt of any principal money, interest, or annuity thereby secured.

Releases or discharges for money by deeds duly stamped according to the laws in force at the date thereof.

Receipts or discharges given for drawbacks or bounties upon the exportation of any goods or merchandise from Great Britain.

Receipts or discharges for the return of any duties of customs upon certificates of over entry.

Receipts or acknowledgments of payments indorsed upon any bills, orders, remittance bills, or remittance certificates, drawn by commissioned officers, masters, and surgeons in the navy, or by any commissioner or commissioners of the navy, under the authority of the act passed in the 35th year of his majesty's reign, for the more expeditious payment of the wages and pay of certain officers belonging to the navy.

RECEIPT.

Receipts or acknowledgments of payments indorsed upon any bills drawn pursuant to any former act or acts of parliament, by the commissioners of the navy, or by the commissioners for victualling the navy, or by the commissioners for managing the transport service, and taking care of sick and wounded seamen, upon and payable by the treasurer of the navy.

If any person shall write or sign any receipt liable to any stamp duty, without being first duly stamped as aforesaid; or with a stamp of a lower value than is herein directed: he shall forfeit 10*l.* if the sum paid or expressed therein shall not amount to 100*l.*; and 20*l.* if the sum amount to 100*l.* or upwards. 31 Geo. III. c. 27. f. 17. 35 Geo. III. c. 55. f. 8.

Every person who shall give any receipt or writing acknowledging the payment of money, in which a less sum shall be expressed than the sum actually paid or received, or who shall separate or divide the sum actually paid or received into divers sums, or shall write off any part of any debt, or demand, or be guilty of or concerned in any contrivance with intent to defraud his majesty, shall forfeit 50*l.* 35 Geo. III. c. 55. f. 9.

And the persons, or their agent, from whom any sum shall be due or payable, and who shall have paid such sum, may provide a stamp with the proper duty, or of some higher rate of duty than required, and demand of the person entitled to such sum, or any agent to whom the same shall have been paid, a receipt for such sum, and also the amount of the duty thereon as aforesaid; and if such person refuse to give such receipt upon demand thereof, or to pay the amount thereof, every such person shall forfeit for each offence 10*l.* 43 Geo. III. c. 126. f. 5.

Stamps denoting the duties under former acts may be used, provided they be applied to receipts of the like amount as required by this act. f. 8.

And all vellum, parchment, and paper liable to any stamp duty as aforesaid, shall be stamped before the same be written or printed upon; or may be brought to the said commissioners or their officers to be stamped within 14 days after such receipts shall be given or bear date, and shall be stamped on payment of 5*l.* over and above the duty; and if brought after 14 days within one calendar month, on payment of 10*l.* over and above the duty. 31 Geo. III. c. 25. f. 19, 20. 35 Geo. III. c. 55. f. 10, 11.

All penalties by this act incurred may be sued for in the courts at Westminster; or any neighbouring justice may hear and determine any offence which subjects the offender to any pecuniary penalty; who may, on complaint made within three calendar months, summon the party accused, and the witnesses, and examine into the matter of fact; and on confession, or the oath of one witness, may give judgment therein, and levy such penalty by distress on the goods of the offender, which, if not redeemed within six days, may be sold; and such penalty shall be distributed half to the king, and half to the informer; and for want of sufficient distress, the offender shall be committed to prison for three calendar months, unless such penalty shall be sooner paid. 31 Geo. III. c. 25. f. 24, 25. 35 Geo. III. c. 55. f. 12, 13.

If any person shall find himself aggrieved by the judgment of such justice, he may, upon giving security to the amount of such penalty and costs, appeal to the next sessions, which shall happen 14 days next after such conviction, on giving reasonable notice; and in case such judgment be affirmed, they may award the person appealing such costs as to them shall seem meet. *Id.*

Provided, nevertheless, that such justice may, where he

shall see cause, mitigate any such penalty, so as not to reduce the same to less than one moiety thereof over and above the costs. 31 Geo. III. c. 25. f. 26. 35 Geo. III. c. 55. f. 14.

Witnesses not appearing, having been duly summoned, without reasonable cause to be allowed by such justice, or refusing to give evidence, shall forfeit 40*s.* to be recovered in like manner. 31 Geo. III. c. 25. f. 27. 35 Geo. III. c. 55. f. 15.

Persons counterfeiting or forging any stamp hereby directed to be made use of shall be guilty of felony without benefit of clergy. 31 Geo. III. c. 25. f. 29. 35 Geo. III. c. 55. f. 17. 43 Geo. III. c. 126. f. 11.

All powers given by any former act relating to the stamp duties shall extend to this act. 31 Geo. III. c. 25. f. 30. 35 Geo. III. c. 55. f. 18. 43 Geo. III. c. 126. f. 12.

Persons sued or prosecuted on account of any thing done in pursuance of this act may plead the general issue and give the special matter in evidence; and if a verdict be for the defendant, or the plaintiff be nonsuited, treble damages shall be awarded against such plaintiff. f. 15.

By the 44 Geo. III. c. 98, the former duties on legacies under the care of the commissioners for stamp duties were repealed, and new duties were imposed. By the 45 Geo. III. c. 28, additional duties were imposed, and by the 48 Geo. III. c. 149, the following were imposed (being by f. 3. of this last act placed under the provisions of former acts relating to such duties,) and those imposed by former acts were repealed.

Schedule, Part III.

Legacies and succession to personal or moveable estate upon intestacy.

I. *Where the testator, testatrix, or intestate, died before or upon the 5th of April 1805.*

For every legacy, specific or pecuniary, or of any other description, of the amount or value of 20*l.* or upwards, given by any will or testamentary instrument of any person who died before or upon the 5th day of April 1805, out of his or her personal or moveable estate, and which shall be paid, delivered, retained, satisfied, or discharged, after the 10th of October 1808.

Also for the clear residue (when devolving to one person), and for every share of the clear residue (when devolving to two or more persons), of the personal or moveable estate of any person who died before or upon the 5th of April 1805 (after deducting debts, funeral expences, legacies, and other charges first payable thereout), whether the title to such residue, or any share thereof, shall accrue by virtue of any testamentary disposition, or upon a partial or total intestacy; where such residue, or share of such residue, shall be of the amount or value of 20*l.* or upwards, and where the same shall be paid, delivered, retained, satisfied, or discharged, after the 10th of October 1808.

Where any such legacy, or residue, or share of such residue, shall have been given, or devolved, to or for the benefit of a brother or sister of the deceased, or any descendant of a brother or sister of the deceased; a duty at and after the rate of 2*l.* 10*s.* per cent. on the amount of the value thereof - - - - - 2 10 0

Where to or for the benefit of a brother or sister of the father or mother of the deceased; or any descendant of a brother or sister of the father or mother of the deceased; a duty at and after the rate of 4*l.* per cent. on the amount or value thereof - - - - - 4 0 0

Where

RECEIPT.

Where to or for the benefit of a brother or sister of a grandfather or grandmother of the deceased, or any descendant of a brother or sister of a grandfather or grandmother of the deceased; a duty at and after the rate of *5l. per cent.* on the amount or value thereof - - - - - 5 0 0

Where to or for the benefit of any person in any other degree of collateral consanguinity to the deceased, than is above described, or to or for the benefit of any stranger in blood to the deceased; a duty at and after the rate of *8l. per cent.* on the amount or value thereof - - - - - 8 0 0

II. Where the testator, testatrix, or intestate, shall have died after the 5th of April 1805.

For every legacy, specific or pecuniary, or of any other description, of the amount or value of *20l.* or upwards, given by any will or testamentary instrument, of any person who shall have died after the 5th of April 1805; either out of his or her personal or moveable estate, or out of or charged upon his or her real or heritable estate, or out of any monies to arise by the sale, mortgage, or other disposition of his or her real or heritable estate, or any part thereof, and which shall be paid, delivered, retained, satisfied, or discharged after the 10th of October 1808.

Also, for the clear residue, (when devolving to one person), and for every share of the clear residue (when devolving to two or more persons), of the personal or moveable estate of any person who shall have died after the 5th of April 1805, (after deducting debts, funeral expences, legacies, and other charges first payable thereout), whether the title to such residue, or any share thereof, shall accrue by virtue of any testamentary disposition thereof, or upon a partial or total intestacy, where such residue, or share of residue, shall be of the amount or value of *20l.* or upwards, and where the same shall be paid, delivered, retained, satisfied, or discharged after the 10th of October 1808.

And also for the clear residue (when given to one person), and for every share of the clear residue (when given to two or more persons), of the monies to arise from the sale, mortgage, or other disposition of any real or heritable estate, directed to be sold, mortgaged, or otherwise disposed of, by any will or testamentary instrument of any person who shall have died after the 5th of April 1805, (after deducting debts, funeral expences, legacies, and other charges, first made payable thereout, if any), where such residue, or share of residue, shall amount to *20l.* or upwards, and where the same shall be paid, retained, or discharged, after the 10th of October 1808.

Where any such legacy or residue, or any share of such residue, shall have been given, or have devolved, to or for the benefit of a child of the deceased, or any descendant of a child of the deceased; a duty at and after the rate of *1l. per cent.* on the amount or value thereof - - - - - 1 0 0

Where to or for the benefit of a brother or sister of the deceased, or any descendant of a brother or sister of the deceased; a duty at and after the rate of *2l. 10s. per cent.* on the amount or value thereof - - - - - 2 10 0

Where to or for the benefit of a brother or sister of the father or mother of the deceased, or any descendant of a brother or sister of the father or mother of the deceased; a duty at and after the rate of *4l. per cent.* on the amount or value thereof - - - - - 4 0 0

Where to or for the benefit of a brother or sister of a grandfather or grandmother of the deceased, or any descendant of a brother or sister of a grandfather or grandmother of the deceased; a duty at and after the rate of *5l. per cent.* on the amount or value thereof - - - - - 5 0 0

Where to or for the benefit of any person in any other degree of collateral consanguinity to the deceased, than as above described, or to or for the benefit of any stranger in blood to the deceased; a duty at and after the rate of *10l. per cent.* on the amount or value thereof - - - - - 10 0 0

And all gifts of annuities, or by way of annuity, or of any other partial benefit, or interest, out of any such estate or effects as aforesaid, shall be deemed legacies within the intent and meaning of this schedule.

Exemptions.

Legacies and residues, or shares of residue, of any such estate or effects as aforesaid, given or devolving to or for the benefit of the husband or wife of the deceased, or to or for the benefit of any of the royal family.

And all legacies which were exempted from duty by the 39 Geo. III. c. 73, for exempting certain specific legacies, given to bodies corporate or other public bodies, from the payment of duty.

By s. 43. of 48 Geo. III. c. 149, the commissioners are authorized to remit penalties incurred before passing this act by non-payment of the duty on legacies, if the duty in arrear shall be paid on or before the 31st Jan. 1809.

By s. 44, in all cases not provided for by s. 43, where any receipt for any of the above matters shall be brought to the head office to be stamped after the expiration of three calendar months from the date thereof, it may be stamped on payment of the duty, together with the penalty incurred for not stamping the same in due time: and if the receipt have been signed out of Great Britain, and be brought to be stamped within 21 days after being received in Great Britain, and no penalty to be incurred.

The said duties to be under the management of the commissioners of the stamp duties. 35 Geo. III. c. 52. s. 3.

And in case of specific legacies, where the residue of any personal estate shall consist of property not reduced into money, the person taking administration of such effects, or by whom the duty ought to be paid, may set a value thereon, and offer the duty accordingly; and may, at his own expence, require the stamp commissioners to appoint a person to set such value, and such commissioners may accept the duty set by such person with an appraisement, but if they shall not be satisfied with the value so set, they may appoint a person to appraise such effects, and to set the value thereon, and require the duty to be paid accordingly; but if the person who ought to pay such duty shall not be satisfied with such valuation, he may cause the same to be reviewed by the commissioners of the land-tax of the district where such effects shall be, at their next meeting, if fourteen days have elapsed before such meeting, and if not, at the next succeeding meeting, of which appeal six days notice shall be given to the stamp commissioners; and the said commissioners of the land-tax may appoint a person to appraise such effects, and to set a value thereon, and may hear and determine such appeal in like manner as appeals to them in other cases, and their judgment shall be final; and if the valuation made under the authority of such stamp commissioners shall not be appealed from within the time aforesaid, or shall be affirmed upon appeal, the duty shall be paid accordingly; and if any variation shall be made on such

appeal, the duty shall be paid according to such variation ; and if the duty assessed in manner aforesaid shall exceed the duty offered to and refused by such stamp officers, the expences shall be borne by the person liable to pay such duty. If any dispute shall arise between persons entitled to any such legacy, or residue, or taking administration as aforesaid, respecting the value thereof, or duty to be paid thereon, the duty shall be assessed by such stamp commissioners on reference to them by either party ; and if the value of such property shall be in dispute, such stamp commissioners shall cause an appraisement to be made thereof, at the expence of the person liable to pay the duty, in manner aforesaid ; and if such person shall be dissatisfied with such valuation, the same shall be reviewed and finally determined by the said commissioners of the land-tax, upon appeal to them within the time and in the manner aforesaid. And if the effects whereon such duty is payable shall be ten miles from London, such persons as shall be deputed by the said stamp commissioners shall act in their stead. f. 22. 36 Geo. III. c. 52.

And if it shall appear to the said stamp commissioners, upon oath, to be administered by a justice, or matter extraordinary in chancery, that less duty has been paid than ought to have been, by mistake, without intention of fraud, such mistake may be rectified by such commissioners, who may accept the duty really due within three calendar months, if no suit hath been instituted, and on payment of 10*l.* per cent. thereon by way of penalty. f. 30.

Every person paying or receiving money contrary to this act, who shall within twelve calendar months discover the other party offending, so as he be convicted thereof, shall be indemnified and discharged from all penalties against this act. f. 31.

And all powers of forming acts relating to the stamp duties, not hereby altered, shall be in force, in the execution of this act. f. 42.

Wherever any executor or administrator shall not have paid the said duties within time, the court of exchequer may, on application from the stamp office on satisfactory affidavit, grant a rule for such executor to shew cause why he should not deliver to the commissioners an account on oath of all legacies, or of the personal property paid or payable by him, and why the duties thereon have not been, or should not be forthwith paid, and may make such rule absolute where it appears proper. And registrars of ecclesiastical courts shall, within a month of requisition, deliver to the stamp office an account of wills and letters of administration in their custody, with particulars relating thereto, and extracts from any wills deemed necessary by the commissioners, on payment of fees agreed on or allowed by the ecclesiastical court, on pain of 5*l.* recoverable by information by the attorney-general. 42 Geo. III. c. 99. f. 2, 3.

And by the 5 W. c. 21, the probate of the will or letters of administration of any common soldier or seaman, slain or dying in the service, shall be exempt from the stamp duties. f. 6.

RECEIPT, or *Resceit*, in *Law*. See RESCEIT.

RECEIPT of *Homage*. See RESCEIT.

RECEIPT of the *Exchequer*. See COURT of *Exchequer*.

RECEIPT, in *Medicine*. See RECIPES.

RECEIPTS, *Auditor of*. See AUDITOR.

RECEIVER, or RECIPIENT, in *Chemistry*, a globe-shaped vessel, which is adapted to the neck or beak of an alembic, retort, or other distillatory vessel, in order to collect, receive, and contain the products of distillations.

Receivers should be made of glass, not only because this matter resists the action of the strongest and most corrosive

substances, but also because being transparent, it allows the operator to see through it, and to judge by the frequency of the drops, if the distillation be too quick or too slow, and also if the quantity and nature of the substances that come over be such as are required.

Almost all receivers are kinds of bottles of different sizes, of a spherical form, the necks of which are cut short, and each of which is pierced with a small hole in its lateral or upper part, to give vent to the air or vapours, which are too expansive. Receivers of this form are called *balloons* ; which see. Some receivers are matrasces with long necks. These are generally adapted to the beaks of glass alembics. The long neck serves to keep the belly of the receiver, where the liquor is collected, at a proper distance from the fire.

Receivers have different forms for particular operations. Such are those which have two or three beaks, either to be adapted to other receivers, or to admit at the same time the necks of several distillatory vessels, when the intention of the operator is, that the vapours of different substances should meet in the same receiver. Such also are receivers for essential oils, obtained from aromatic plants distilled with water, which are so made, that they are never full, but that the water runs out, and leaves the oil behind. These are a kind of glass cucurbits, which contract as they rise higher ; so that their neck or upper opening is but nearly of a convenient size to receive the beak of the worm. These receivers have another opening about the middle of the swelling or belly ; and to this opening is joined a glass tube, which bends and rises vertically along the outer part of the receiver, so as to be within two inches and a half as high as the upper opening. At this height the tube bends again towards the side opposite to the body of the receiver, to pour into another vessel the liquor which arises there. It forms the figure of an S.

When this receiver is to be used, it is to be placed vertically under the beak of the worm. During the distillation, the liquor rises to an equal height in the body of the receiver, and in the crooked tube : when, therefore, the height of the liquor in the receiver becomes greater than the height of the tube, it must begin to flow from the mouth of this tube into another vessel placed on purpose to receive it ; but as essential oils are either lighter or heavier than water, and as they are, therefore, always collected either above or under the water, and as the liquor which discharges itself through the tube is taken from the middle part of the receiver, nothing but water can be evacuated at the mouth of the pipe, while the oil always remains in the receiver. With such a receiver distillation may be performed without the trouble of changing the vessels. Macquer's Chem. Dict. See DISTILLATION and LABORATORY.

RECEIVER of an *Air-Pump*, is part of its apparatus ; being a glass vessel placed on the top of the plate, out of which the air is to be exhausted. To an air-pump belong various receivers, of various forms and sizes, and serving for various purposes. See AIR-PUMP.

RECEIVER, *Exhausted*, in *Pneumatics*. See EXHAUSTED. And for the method of repairing those that are cracked, see CEMENT.

RECEIVER, *Receptor*, or *Receptator*, in *Law*, is used commonly in the bad sense, for such as knowingly receive stolen goods from thieves, and conceal them.

This offence is only a misdemeanor at common law : however, by the statutes 3 & 4 W. & M. c. 9. and 5 Ann. c. 31. the offender is made accessory to the theft and felony. But because the accessory cannot in general be tried, unless with the principal, or after the principal is convicted, the receivers

receivers by that means frequently eluded justice; to remedy which it is enacted by statute 1 Ann. c. 9. and 5 Ann. c. 31. that such receivers may be still prosecuted for a misdemeanor, and punished by fine and imprisonment, though the principal felon be not before taken, so as to be prosecuted and convicted. And in case of receiving stolen lead, iron, and certain other metals, such offence is, by statute 29 Geo. II. c. 30. punishable by transportation for fourteen years. So that now the prosecutor has two methods in his choice: either to punish the receivers for the misdemeanor immediately, before the thief is taken (Folter. 373.); or to wait till the felon is convicted, and then punish them as accessories to the felony. But it is provided by the same statutes, that he shall only make use of one, and not of both these methods of punishment.

By the same statute also (29 Geo. II. c. 30.) persons having lead, iron, or other metals in their custody, and not giving a satisfactory account how they came by the same, are guilty of a misdemeanor, and punishable by fine and imprisonment. And by statute 10 Geo. III. c. 48. all knowing receivers of stolen plate or jewels, taken by robbery on the highway, or when a burglary accompanies the stealing, may be tried as well before as after the conviction of the principal, and whether he be in or out of custody; and, if convicted, shall be adjudged guilty of felony, and transported for fourteen years. By stat. 21 Geo. III. c. 68. the receiving of any stolen copper, brass, bell-metal, or utensil fixed to any building, or any iron-rails or fencing set up in any court or other place, is made transportation for seven years, or three years' imprisonment to be kept to hard labour. By stat. 21 Geo. III. c. 69. the receiving of stolen pewter of any kind is subjected to the like penalty, although the principal has not been convicted. By stat. 22 Geo. III. c. 58. the receiving of any stolen goods, (except lead, iron, copper, brass, bell-metal, and solder,) is made a misdemeanor, punishable by fine and imprisonment, or whipping, as the court shall appoint; which shall exempt the offender from being punished as accessory, although the principal be afterwards convicted, and the offence shall appear to be grand larceny, or some greater offence. (See LARCENY.) For the punishment of receivers of goods stolen by bum-boats, &c. on the river Thames, see stat. 2 Geo. III. c. 28. § 12. Receivers of linen goods stolen from the bleaching-grounds are, by stat. 18 Geo. II. c. 27. declared felons without benefit of clergy. In France, receivers are punished with death; and the Gothic constitutions distinguished also three sorts of thieves: "unum qui consilium daret, alterum qui contrectaret, tertium qui receptaret et occultaret; pari poena singulos obnoxios."

RECEIVER also denotes an officer, of which there are various kinds, denominated from the particular matters they receive, the places where, or the persons for whom, &c.

As receiver of rents; receiver-general of the customs; receiver of the fines, upon original writs in chancery, &c.

RECEIVER-General of the duchy of Lancaster, is he who gathers all the revenues and fines of the lands of the said duchy, all forfeitures, assessments, &c.

RECEIVER-General of the public revenue is an officer appointed in every county, to receive the taxes granted by parliament, and remit the money to the treasury.

RECEIVER'S Office. See *Greenwich HOSPITAL*.

RECENT FRUITS. See *FRUIT*.

RECEPTACLE of *Stall Manure*, in *Agriculture*, the place where the various matters from the stalls, and other places where animals are kept, are deposited and laid up.

Some suppose that these places should be a little hollow or excavated; while others are of quite a different opinion, and think that they should be even, or a little raised. A very slight hollowing is, however, probably the best. An experienced writer on this subject suggests, that it is not to be inferred that, because they should be hollow, they should also be deep; as one principal use of them is to bring the rain waters, which fall within the yards or inclosed parts, into a stagnant state, and to let them off superficially, so as to prevent any thing of the ground current kind from carrying away the dung, either in a bodily manner, or in a thick fluid state: they may, in this way, suffer the more watery particles only to pass away into reservoirs, prepared to preserve and keep them for future use. It is believed that two feet on the lower side, or deepest parts, may be taken as a mean depth; but less may often be quite sufficient: and the bottoms of the waste-water channels being laid six or eight inches lower than the rim of the basons, the depth of water which they can contain is, it is concluded, not more than sixteen or eighteen inches, when empty of manure. But it is suggested, as necessary to good farm management, that, soon after the winter's manure has been removed and cleared away, floorings of marle, or some other earthy fertilizing material, mixed with lime, to the thickness of ten or twelve inches, should be spread out over the bottoms of the basons or hollowed parts; by which means a rich compost for grass lands may be formed at small expence, on which all the offal materials of manure which can be collected, free from seeds of weeds, during the summer and autumn, should be deposited. In this manner the receptacles should be filled to the brims, even though no stable manure were put into them during the above two seasons; so that the winter's stall manures may have firm platforms to rest upon, out of the way of water, the great evil which antiquated prejudice so much fears in these manure receptacles, as the prevention of the due maturation of their different contents.

With these receptacles of manure there should be connected drains from the cattle-houses, stalls, and farm-offices, for receiving and conveying the urine, and other liquid matters, from them to these basons or receptacles; and the mouths of their outlet channels should be well guarded, in order to prevent their being choaked up by the manure, when piled up to considerable height above them. The reservoirs, pits, or wells, which are made before them, are always to be kept free, for the superfluous water, or other liquid matters of the receptacles, to drain or filtrate into; and thence to pass away in moist weather; or to be pent up in them, in dry warm seasons, for the purpose of being thrown over the piled-up manures, for the promotion of their decay and maturation.

Where there are grass lands lying conveniently below these receptacles and reservoirs for receiving their overflowings, all the different parts of the places, where they are situated, may be made to shelve gently towards them; but where land cannot be commanded for favouring this intention, the receptacles or basons should receive no other waters than what are supplied to them by the atmosphere. This regulation may easily be accomplished, simply by raising their rims a few inches higher than the surrounding surfaces, which should be frequently cleared from the manure and litter dropped upon them, depositing all such substances within their rims. The rain-water which falls, in these cases, is to be conveyed to the catch-pools, or the most contiguous common drains. In all cases, that which falls upon the buildings should be conveyed away, without being suffered to pass through the receptacles or basons, unless

unless where liquid manure is more in demand than that of the bulky kind.

From the slow progress made by manures of this sort to maturation, in the winter season, in the open air, even when piled up in the driest situations, on account of its being constantly soaked or saturated with moisture, and exposed to the effects of the cold atmosphere, the plan of giving receptacles of this sort a long oval square form, and covering them with roofs, to free them wholly from rain, as well as to defend them from cold, has been hit upon, and recommended from authority. As by thus affording the articles of manure the means of passing into the state of fermentation, in the winter months, their putrefaction and decay would be beneficially promoted, for the use of the more early crops of the spring. But how far the advantage, gained in this way, may equal or be superior to the expence of building, and extra labour in the removals of the manure, is a point which is by no means yet fully decided. And the superior benefits, which have lately been derived from the use of manure in its more raw or fresh state, render all such schemes perhaps of less importance than would otherwise be the case.

As it is a matter of great consequence to prevent the excessive waste of this sort of manure, which at present frequently takes place in most parts of the country, it has been suggested by an experienced writer, who has attended much to the subject, and thought a great deal upon it, that piling it in shallow receptacles or basons, and conducting the liquor, when not wanted for moistening the piles of manure, which overflows from them, to reservoirs or catch-pools, in order to stop, deposit, and arrest the heavier and more gross particles that may be conveyed in it, and to provide a valuable collection of liquid manure in particular situations, and of rich muddy matters in others, are the most appropriate practical means of accomplishing the matter, in an easy and cheap way, that can be adopted or had recourse to. See DUNG, FARM-YARD, HOMESTAL, MANURE, RESERVOIR, and YARD Manure.

RECEPTACULUM, RECEPTACLE, in *Botany and Vegetable Physiology*, is the seventh, or last, part of fructification distinguished by Linnæus, being the common basis, or point of connection, of the others. (See FRUCTIFICATION.) It is evident that such a part must exist, under some shape or other; yet the receptacle is not always distinguished by any particular figure. In simple flowers it is often little more than a mere point; in compound ones it is very remarkable and important, serving, by its differences of structure, to afford very good generic distinctions. The receptacle of the Daisy, *Bellis*, is conical; that of *Chrysanthemum* convex. In *Sphæranthus* this part is very nearly globular, while in some species of *Centaurea* and *Carlina* it is either flat, or slightly concave. In *Sonchus* it is naked, destitute of hairs or scales between the florets or seeds; while in *Carduus* it is hairy, and in *Anthemis* variously scaly. This last genus differs, by the character in question alone, from *Chrysanthemum*, whose receptacle is naked; but the character is not quite so natural, in this case, as could be wished. Mr. Brown has observed to us, that it affords not even a certain artificial distinction, in the *Chrysanthemum indicum* of the gardens, Curt. Mag. t. 327; which Willdenow, like M. de Ranatuelle and professor Desfontaines, has referred to *Anthemis*, because they found the receptacle to be scaly. We are convinced they are in the right, and yet this appears to be the very same plant with *Chrysanthemum indicum*, the scales of the receptacle being variable, and sometimes almost, if not altogether, evanescent. Some genera of this class have a cellular, or honeycomb-

like receptacle, as *Onopordum*, and *Tolpis* (*Crepis barbata* of Linnæus). In that case the edges of the cells are variously jagged, toothed, or fringed, and they now and then are scarcely distinguishable from the reticulations or rugosities of some naked receptacles.

The *receptacle of the flower*, in Linnæan language, means the area or space between the stamens and styles, in certain genera whose germen is inferior; as the whole umbelliferous order, in which the part in question is more or less tumid, often coloured, and assumes a glandular aspect. The *receptacle of the seeds* is not unfrequently a distinct part from the capsule or its valves, serving to connect the seeds therewith. (See an example of it in REDUCTEA.) The *rachis*, or common stalk of a spike, or spikelet, in *Grasses*, is also termed a receptacle.

In some plants the receptacle undergoes great changes, acquiring a different texture in the fruit, from what it had in the flower. Thus, the whole fruit, as we call it, of the Fig, (see FIGUS,) is a common receptacle, at first coriaceous, and, like the rest of the plant, containing a milky, somewhat acid, juice. It forms a bag, lined with flowers or florets, and having a small aperture at the top. After the flowers are past, this bag becomes pulpy, coloured, and full of sweet aromatic juice. So the fruit of the Strawberry, (see FRAGARIA,) is but an originally small dry receptacle, subsequently enlarged, and become pulpy, whose outside is studded with naked seeds. In *Broussonetia*, described under our article PAPIRUS, the separate stalk of each germen becomes the enlarged and pulpy supporter of a naked seed. In POLLICIA, (see that article,) the common receptacle of the flowers, minutely scaly, and hardly discernible, in its earlier state, changes to a congeries of white, juicy, sweet, tooth-like scales, elevating the seeds in their appropriate withered perianths, and altogether constituting one of the most extraordinary pulpy fruits that we have ever met with. A similar change of substance is observable in the calyx of the Mulberry, as well as in *Commelina Zanonia*; a change common and natural in the germen of pulpy fruits, though rare in the particular parts of which we have been speaking.

RECEPTACULUM *Chyli*, in *Anatomy*, that portion of the trunk of the absorbing vessels, into which the lacteal absorbents pour the fluids which they have taken up in the alimentary canal: it is usually rather larger than the neighbouring portions of the vessel, and sometimes very considerably so. See ABSORBENTS.

RECEPTARII, a term of reproach used for such physicians as wrote pompous receipts for loads of medicines, more consulting the good of the apothecary than the patient; as also for such as gave receipts for general medicines, to be used at the discretion of people wholly unacquainted with the nature of diseases.

RECEPTION, RECEPTIO, in *Philosophy*, denotes the same with *passion*, considered as opposed to *action*.

RECEPTION is also properly used for the manner of treating or entertaining a person; and the solemnities and ceremonies practised on that occasion. See ENTRY.

The reception of ambassadors is usually performed with a great deal of pomp.

RECEPTION is sometimes also used for the act of approving, accepting, and admitting a thing. See ACCEPTANCE.

The canon law only binds where it is *received*: the civil law is received in some countries, and not in others.

The French would never *receive* the council of Trent, the Spanish inquisition, nor the dogmata of the ultramontane canonists.

RECEPTION, in *Astrology*, is a dignity befalling two planets when they exchange houses; *e. gr.* when the sun arrives in Cancer, the house of the moon; and the moon, in her return, arrives in the sun's house.

The same term is also used, when two planets exchange exaltation.

RECEPTITIOUS GOODS. See GOODS.

RECESSION of the *Equinoxes*. See PRECESSION of the *Equinoxes*.

RECESSUS, a word used by some medical writers to express an abscess, or aposthumation.

RECESSUS *Imperii*, *Recess of the Empire*, a phrase used in speaking of the affairs of Germany; signifying a collection of the votes or determinations of a diet.

At the end of each diet, before it breaks up, they gather together all their resolutions, and reduce them into writing; the act which contains them they call the *recessus imperii*, because made when on the point of retiring.

RECEY *sur Ouse*, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Chatillon; 15 miles S.E. of Chatillon. The place contains 880, and the canton 5913 inhabitants, on a territory of 260 kilometres, in 17 communes.

RECHABITES, a kind of religious order among the ancient Jews, instituted by Jonadab the son of Rechab; and comprehending his family and posterity.

Their founder prescribed them three things: first, Not to drink any wine. Secondly, Not to build any houses, but to dwell under tents. Thirdly, Not to sow any corn, or plant any vines.

The Rechabites observed these rules with great strictness, as appears from Jerem. xxxv. 6, &c. Whence St. Jerom, in his thirteenth epistle to Paulinus, calls them *monachi, monks*. Jonadab, their founder, lived under Jehoash, king of Judah, contemporary with Jehu, king of Israel; his father Rechab, from whom his posterity were denominated, descended from Raguel or Jethro, father-in-law to Moses, who was a Kenite, or of the race of Ken; whence Kenite and Rechabite are used as synonymous in scripture.

The Kenites entered the promised land with the Hebrews, and dwelt in the tribe of Judah, about the Dead sea. They were distinguished from the Israelites by their retired sort of life, and by their contempt of cities and houses. Serrurius distinguishes the ancient Rechabites descended from, and instituted by, Jethro, from the new Rechabites of Jonadab. The injunction of Jonadab laid no obligation on the other Kenites, nor on the other descendants of Jethro. This they continued to observe above 300 years. Jehu began to reign A.M. 3120, and Jehoia-kim, king of Judah, was put to death A.M. 3405, B.C. 599; but in the last year of Jehoiakim, king of Judah, Nebuchadnezzar coming to besiege Jerusalem, the Rechabites were forced to take refuge in the city, still, however, lodging in tents. During this siege, Jeremiah received orders from the Lord to converse with the disciples of Rechab, to invite them into the temple, and to offer them wine to drink. But the Rechabites would not accept the offer.

The Rechabites were, probably, led captive, after the taking of Jerusalem by the Chaldeans. (See Psalm lxx.) They returned from their captivity, and settled in the city of Jabez beyond Jordan. (See 1 Chron. ii. 55.) Some have suggested, that the Assidæans of the Maccabees, (1 Macc. ii. 42. vii. 13. and 2 Macc. xiv. 6.) were successors and followers of the Rechabites. Others have con-

founded them with the Essenes. But it is certain, that the manner of life of the Essenes was very different from that of the Rechabites, as appears from Josephus, *Antiq. lib. xviii. cap. 2.* who informs us, that the Essenes had fields, and inhabited houses, but had neither wives nor children; and did not perform their religious ceremonies with the other Jews at Jerusalem: all which was contrary to the practice of the Rechabites.

RECHACING, in *Hunting*, the driving back of the deer, or other beasts, into the forests, chaces, &c. which had straggled out into the copses or thickets, &c.

Anciently there were offices of rechacers of the deers bestowed by the king on gentlemen, or old hunters, with salaries for the keeping of running dogs to recharge the deer into the forests, and then to beat the dogs off, without pursuing any farther.

RECHANGE, in *Commerce*. See RE-EXCHANGE.

RECHANGE is also used at sea for such tackle as is kept in reserve aboard the ship, to serve in case of failure of that already in use. See TACKLE.

The Levantines use the word *respect* or *respit* in the same sense.

RECHARGE of a *Fire Arm*, is a second loading, or charge. The recharge should never be so deep as the first charge, lest the piece, being over heated, should burst.

RECHBERG, in *Geography*, a town of Austria; eight miles N.W. of Grein.

RECHE, a river of France, which runs into the Amblave, near Malmedy.—Also, a town of England, in the county of Cambridge, on the river Cam, formerly a place of great trade, and before the draining of the fens, a port for vessels of considerable burthen; five miles W. of Newmarket.

RECHEAT, in *Hunting*, a lesson which the huntsman winds on the horn, when the hounds have lost their game, to call them back from pursuing a counter-scent.

RECHENBURG, in *Geography*, a town of Saxony, in the circle of Erzgebirg; four miles S.E. of Frauenstein.

RECHIA, a town of Servia; 100 miles W. of Nissa. N. lat. 43° 12'. E. long. 19° 3'.

RECHICOURT, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Sarrebourg; five miles N. of Blamont. The place contains 992, and the canton 8516 inhabitants, on a territory of 217½ kilometres, in 18 communes.

RECHNITZ, a town of Hungary; six miles S.S.W. of Guntz.

RECHPERG, a town of Austria; two miles N. of Stain.

RECIMUS, among the Romans, a kind of square mantle, or veil, worn by women on the head. Salmasius will have it to have been a sort of gown used by the Roman ladies, and tucked up before with a square pin, of a purple colour.

RECINA, in *Geography*, a town of the marquisate of Ancona; three miles N.W. of Macerata.

RECIPE, in *Medicine*, a prescription, or formula, of a remedy, appointed to be administered to a patient. See PRESCRIPTION.

It is thus called, because always beginning with the word *recipe, take*; ordinarily expressed by the abbreviation R.

RECIPIANGLE, or RECIPIENT-ANGLE, a mathematical instrument, serving to take the quantity of angles; used especially in the drawing plans of fortifications.

The recipiangle was formerly a popular instrument among the French, but little known among us; it is usually very

simple, in form of a square, or rather a *bevel* (which see); consisting of two arms, or branches, rivetted together, and yet moveable, like a sector, on the centre or rivet.

To take an angle with it, they lay the centre of a protractor to the joint, and the degrees cut by the edge shew the quantity of the angle: otherwise the angle made by the two rulers is drawn on paper, and then measured with a protractor.

Sometimes there is a circle divided into degrees added over the centre or rivet, with an index to shew the degrees without a protractor. At other times the under branch is divided.

To measure a saliant angle with any of the recipiangles, apply the insides to the lines that form the angle; for a re-entering angle, apply the outsidings, &c.

RECIPIENDO EXCOMMUNICATO. See EXCOMMUNICATO.

RECIPIENDO *et faciendo attornato*. See ATTORNATO.

RECIPIENT, in *Chemistry*. See RECEIVER.

RECIPIENT, *Italian*, a vessel like a tea-pot, intended for the separation of essential oils from the watery liquor on which they float.

RECIPIENT of an *Air-pump*. See RECEIVER.

RECIPROCAL, RECIPROCUS, something that is mutual, or which is returned equally on both sides, or affects both parties alike.

The end of human society is to afford each other reciprocal aid; there are reciprocal duties between the prince and his subjects, the husband and wife, &c. There is a reciprocal action between the agent and patient.

The *lex talionis* establishes a kind of reciprocation of justice.

If two similar triangles be cut by parallel lines, the sections of the sides will be proportional; and reciprocally, if the sides be cut proportionably, the triangles are similar.

RECIPROCAL, in *Logic*, is applied to terms which have the same signification, or are convertible; as, *reasonable animal* and *man*.

Schoolmen define *reciprocation* a conversion of the several terms in an enunciation. And terms are said to be converted in an enunciation, when the predicate is put in the place of the subject, and, *reciprocally*, the subject in that of the predicate.

Thus, rationality and risibility are said to reciprocate; for we say equally, *a rational is risible*, and *a risible is rational*.

RECIPROCAL, in *Grammar*, is applied to certain verbs and pronouns in some of the modern languages; in regard of their turning or reflecting the noun, or person, upon himself.

Thus the pronoun relative, *himself*, refers Cato to Cato's self.

The abbé de Dangeau defines reciprocal verbs to be those whose nominative is plural, and denotes persons acting mutually on one another: as, *Ces quatre hommes s'entrebattoient, these four men fought together*; *Pierre et toi vous vous louez, Peter and you praise one another*, &c.

Reciprocal verbs are a species of those which that author calls *pronominals*, and which he distinguishes into reciprocal and identical.

RECIPROCAL, in *Poetry*, is applied to verses which run the same both backwards and forwards; called also *recurrents*. See RETROGRADE.

RECIPROCAL, in *Arithmetic* and *Algebra*, is the quotient arising from the division of unity by any number or quan-

tity. Thus, the reciprocal of $a = \frac{1}{a}$, the reciprocal of $\frac{x}{y} =$

$\frac{y}{x}$, and so on.

RECIPROCAL *Equations*, in *Algebra*, are those equations which contain several pairs of roots which are the reciprocals of each other. Thus, an equation whose roots are $a, \frac{1}{a}$;

$b, \frac{1}{b}$; &c. is called a reciprocal equation. Some authors

define reciprocal equations, to be those equations whose coefficients proceed in the same order from both extremes, and respectively equal to each other: thus, $x^3 + ax^2 + bx + 1 = 0$, is a reciprocal equation; but this form ought rather to be considered as a necessary property of these equations, by which they may be readily distinguished, than to be employed in the definition of them; it being doubtless the reciprocity of the roots from which they have received their peculiar appellation.

The solution of these equations may always be made to depend upon others of half the original degree, when the equation is of even dimensions; or upon half the dimension minus 1, when it is odd.

Thus far, in fact, this property is not exclusively due to reciprocal equations, as the same may be done in all cases where any similar relation is known to have place between the roots of an equation, whether by multiplication, division, addition, or subtraction; but in these cases there is nothing in the form of the equation by which such relations may be known to have place, whereas in reciprocal equations their reciprocity becomes immediately obvious by the peculiar order of their co-efficient, these being the same from both extremes, both with regard to sign and magnitude. Hence any equation of the form

$$x^n + ax^{n-1} + bx^{n-2} + \dots + bx^2 + ax + 1 = 0$$

is immediately known to be reciprocal, and we may proceed in its solution as follows.

First, if the equation be of odd dimensions, as

$$x^{2n+1} + ax^{2n} + bx^{2n-1} + \dots + bx^2 + ax + 1 = 0,$$

then it is obvious that either +1, or -1, is one of its roots, for either +1, or -1, substituted for x , according as the signs of the co-efficients may require, will obviously render the whole expression equal to zero, and is therefore a root of the equation. The equation may, therefore, be immediately reduced to another of lower dimensions by division, according to the known theory of equations; thus, let the proposed equation be

$$x^5 - 5x^4 + 7x^3 + 7x^2 - 5x + 1 = 0.$$

Here $x = -1$ is obviously one of the roots, as this substituted for x renders the whole equal to zero; and consequently the whole equation is divisible by $x + 1$, according to the known theory of equation, which division being made, we have, for our reduced equation,

$$x^4 - 6x^3 + 13x^2 - 6x + 1 = 0,$$

which is now of even dimension one degree less than the original equation, and still reciprocal. We need, therefore, only consider equations of the latter form; viz. those of which the index of the highest power is an even number.

Let $x^{2n} + px^{2n-1} + qx^{2n-2} + \dots + px + 1 = 0$ be any reciprocal equation, whose roots are $a, \frac{1}{a}$; $b, \frac{1}{b}$;

RECIPROCAL EQUATIONS.

$c, \frac{1}{c}$, &c. Then from the theory of equations we may consider this to be made up of the factors $(x - a) (x - \frac{1}{a}) (x - b) (x - \frac{1}{b}) (x - c) (x - \frac{1}{c})$, &c.

Or, putting $a + \frac{1}{a} = m, b + \frac{1}{b} = n, c + \frac{1}{c} = r$, &c. these become

$$(x^2 + mx + 1)(x^2 + nx + 1)(x^2 + rx + 1), \text{ \&c.}$$

If, therefore, we really perform this multiplication and equate the co-efficients, it is obvious, since the multiplication is reduced to half the number of factors, the equation by which the values of m, n, r , &c. are obtained, will be of only half the dimension of the original equation; and having found these, since

$$\begin{aligned} x^2 + mx + 1 &= 0 \\ x^2 + nx + 1 &= 0 \\ x^2 + rx + 1 &= 0 \end{aligned}$$

we shall have $x = -\frac{m}{2} \pm \sqrt{\left(\frac{m^2}{4} - 1\right)}$

$$x = -\frac{n}{2} \pm \sqrt{\left(\frac{n^2}{4} - 1\right)}$$

$$x = -\frac{r}{2} \pm \sqrt{\left(\frac{r^2}{4} - 1\right)}, \text{ \&c.}$$

Thus, for example, let there be proposed the equation

$$x^4 + 5x^3 + 7x^2 + 5x + 1 = 0.$$

Multiply together $x^2 + mx + 1$
and $x^2 + nx + 1$

$$\begin{aligned} &x^2 + m \left\{ \begin{array}{l} x^3 + m n \\ + n \end{array} \right\} x^2 + m \left\{ \begin{array}{l} x^2 + m \\ + n \end{array} \right\} x + 1 \end{aligned}$$

Comparing the co-efficients, we have $m + n = 5$, and $m n + 2 = 7$.

Hence, $m = \frac{5 + \sqrt{5}}{2}$, and $n = \frac{5 - \sqrt{5}}{2}$

therefore, $x = \frac{5 + \sqrt{5}}{4} \pm \sqrt{\left(\frac{30 + 10\sqrt{5}}{16} - 1\right)}$

and $x = \frac{5 - \sqrt{5}}{4} \pm \sqrt{\left(\frac{30 - 10\sqrt{5}}{16} - 1\right)}$

which are the four roots of the proposed equation.

From the preceding principles are readily deduced the solution of all reciprocal equations under the 10th power.

3d degree. $x^3 + px^2 + px + 1 = 0.$

Find z in the simple equation $z + p - 1 = 0$, and call it r ; then

$$x = -1, x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}$$

4th degree. $x^4 + px^3 + qx^2 + px + 1 = 0.$

Find the two values of z in the equation $z^2 + pz + q - z = 0$, and call them r, r' ; then

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

5th deg. $x^5 + px^4 + qx^3 + qx^2 + px + 1 = 0.$

Find the two values of z in the equation $z^2 + (p - 1)z + q - p - 1 = 0$, and call them r, r' ; then $x = -1$

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

6th deg. $x^6 + px^5 + qx^4 + rx^3 + qx^2 + px + 1 = 0.$

Find the three values of z in the cubic equation $z^3 + pz^2 + (q - 3)z + r - 2p = 0$, and call them r, r', r'' ; then

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

$$x = \frac{1}{2}r'' \pm \sqrt{\left(\frac{1}{4}r''^2 - 1\right)}$$

7th deg. $x^7 + px^6 + qx^5 + rx^4 + rx^3 + qx^2 + px + 1 = 0$

Find the three values of z in the cubic equation $z^3 + (p - 1)z^2 + (q - p - 2)z + r - p - q + 1 = 0$, and call them r, r', r'' ; then $x = -1$

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

$$x = \frac{1}{2}r'' \pm \sqrt{\left(\frac{1}{4}r''^2 - 1\right)}$$

8th deg. $x^8 + px^7 + qx^6 + \dots + qx^2 + px + 1 = 0.$

Find the four values of z in the equation $z^4 + pz^3 + (q - 4)z^2 + (r - 3p)z + s - 2(q - 1) = 0$, and call them r, r', r'', r''' ; then

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

$$x = \frac{1}{2}r'' \pm \sqrt{\left(\frac{1}{4}r''^2 - 1\right)}, x = \frac{1}{2}r''' \pm \sqrt{\left(\frac{1}{4}r'''^2 - 1\right)}$$

9th deg. $x^9 + px^8 + qx^7 + \dots + qx^2 + px + 1 = 0.$

Find the four values of z in the equation $z^4 + (p - 1)z^3 + (q - p - 3)z^2 + (r - q - 2p + 2)z + s - r - q + p + 1 = 0$, and call them r, r', r'', r''' ; then $x = -1$

$$x = \frac{1}{2}r \pm \sqrt{\left(\frac{1}{4}r^2 - 1\right)}, x = \frac{1}{2}r' \pm \sqrt{\left(\frac{1}{4}r'^2 - 1\right)}$$

$$x = \frac{1}{2}r'' \pm \sqrt{\left(\frac{1}{4}r''^2 - 1\right)}, x = \frac{1}{2}r''' \pm \sqrt{\left(\frac{1}{4}r'''^2 - 1\right)}$$

A reciprocal equation of the 10th and higher powers, requires the general solution of equations of the 5th and higher powers, and therefore cannot be exhibited analytically. Bonnycastle's Algebra, vol. i.

Binomial equations are all reciprocal equations of a peculiar kind, which renders them all resolvable by means of certain trigonometrical formulæ.

Binomial equations are all reducible to the form $x^m \pm 1 = 0$; or $x^m = 1$; or $x^m = -1$. Where it is obvious, that if m is even, or $m = 2n$, then $x^{2n} = 1$ will have two real roots, viz. $+1$, and -1 ; and $x^{2n} = -1$ will have two of its imaginary roots $+\sqrt{-1}$, and $-\sqrt{-1}$; so that, in both cases, such an equation may be reduced two degrees lower, by dividing it by $x^2 - 1$, or $x^2 + 1$, and the resulting equation will be a reciprocal one, having each of its co-efficients equal to unity. If m be odd, then the equation will necessarily have one real root, and no more, which will be $+1$ in the first case, and -1 in the second; consequently, such an equation can be reduced but one degree, the same as those above stated. We may, therefore, find a direct solution for all binomial equations of odd dimensions as far as the 9th power, and of even dimensions as far as the 10th power, by the principles and formulæ already given, by merely making $p = 1, q = 1, r = 1$, &c. and it would, therefore, be useless to repeat them again in this place; we shall proceed immediately to the general solution of binomial equations, on the principles of analytical trigonometry.

All the imaginary roots of the equation

$$x^n - 1 = 0$$

'That is, as much longer as the side A, in the first rectangle, is than the side B of the second rectangle; so much deeper is the side C in the second rectangle, than the side D in the first; and, consequently, the length of one is compensated by the depth of the other.

Also, as the side A is $\frac{1}{3}$ longer than the side C, so the side B is $\frac{1}{3}$ longer than D: wherefore the rectangles must be equal.

This is the foundation of that Catholic theorem; that the rectangle of the extremes must always be equal to that of the means; and, consequently, the reason of the rule of three, or golden rule.

For, suppose there were given any three numbers, or quantities, geometrically proportional, as A, B, and C; and, that it were required to find a fourth, D, proportional to them: since $A : B :: C : D$, therefore $AD = BC$, and, consequently, $D = \frac{BC}{A}$; that is, the fourth term is equal to the quotient of the second, multiplied by the third term, divided by the first.

Or, thus in numbers: suppose given 12, 4, and 9, required a fourth proportional. Now as $12 : 4 :: 9 : Q$.

But $12 Q = 4 \times 9 = 36$. Therefore $Q = \frac{4 \times 9}{12} = 3$, by dividing both sides by 12.

And hence it follows, that if any two triangles, parallelograms, prisms, parallelepipeds, pyramids, cones, or cylinders, have their bases and altitudes reciprocally proportional, those two figures or solids are equal to one another; and, *vice versa*, if they are equal, their bases and altitudes are reciprocally proportional.

RECIPROCAL Proportion, is when in four numbers the fourth is less than the second by so much as the third is greater than the first; and *vice versa*. See PROPORTION.

This is the foundation of the inverse, or indirect rule of three. Thus, $4 : 10 :: 8 : 6$.

Great use is made of this reciprocal proportion, by Sir Isaac Newton, and others, in demonstrating the laws of motion.

RECIPROCAL Theorem. See THEOREM.

RECIPROCALLY, the property of being reciprocal; thus we say, that in bodies of the same weight, the density is reciprocally as the magnitude; *viz.* the greater the magnitude the less the density; and the less the magnitude the greater the density; so again, the space being the same, the velocity is reciprocally as the time, and the contrary.

RECIPROCITY. The law of reciprocity is a term used by Legendre, in his "Theorie des Nombres," to denote a reciprocal law, which has place between prime numbers of different forms; which is this; that m and n being prime odd numbers,

$$\text{the remainder of } m^{\frac{n-1}{2}} \div n =$$

$$\text{the remainder of } n^{\frac{m-1}{2}} \div m$$

provided m and n are not both of the form $4x - 1$, and if they are both of this form, then

$$\text{the remainder of } m^{\frac{n-1}{2}} \div n = -$$

$$\text{the remainder of } n^{\frac{m-1}{2}} \div m,$$

or they will have only contrary signs.

RECISSION, in Law. See ADEPTION.

RECIT, Fr, a general term in music, for what is sung by a single voice. It is likewise applicable to instruments; as, *recit de basse, recit de hautbois*, a solo part for the violoncello

or hautbois. Indeed *recit*, in French, seems synonymous with the word solo in Italian, to whatever vocal or instrumental part it is applied, in opposition to *tutti*, or chorus, in which the whole band is employed.

Recit in France is not only a technical term in music, but in the drama, where, at the opening of a tragedy, or subsequent to an event, it implies an account, a narration, the recital of an event. In the French and Italian tragedies, in imitation of the Greeks, battles and murders are always recited, but never transacted on the stage.

RECITAL, in Law, the rehearsal, or making mention, in a deed or writing, of something which has been done before.

A recital is not conclusive, because it is no direct affirmation; and by feigned recitals in a true deed, men might make what titles they pleased, since false recitals are not punishable. If a person, by deed of assignment, recite that he is possessed of an interest in certain lands, and assign it over by the deed, and become bound by bond to perform all the agreements in the deed; if he is not possessed of such interest, the condition is broken; and though a recital of itself is nothing, yet being joined and considered with the rest of the deed, it is material. And where it is but a recital, that before the indenture the parties were agreed to do such a thing, it is a covenant, and the deed itself confirms it. The recital of one lease in another, is not a sufficient proof that there was such a lease as is recited. But the recital of a lease in a deed of release, is good evidence of a lease against the releasor, and those who claim under him. A new reversionary lease shall commence from the delivery, where an old lease is recited, and there is none, &c. A. recites that he hath nothing in such lands, and in truth he has an estate there, and makes a lease to B. for years; the recital is void, and the lease good. In this case, if the recital were true, the lease would not bind.

RECITATION, the act of reciting, or delivering a discourse, either in the way of narration, rehearsal, declamation, or the like.

RECITATIVO, Ital., *Recitative*. The Crusca Dictionary gives no more early authority for the use of this word, as a musical term, than that of Batista Doni, de Præst. Mus. Veteris, published in 1647; who defines it, "a musical composition in an andante or plain style, different from air: it is used in narrative poetry, in imitation of reciting on the stage."

Rousseau's definition is more full and clear. He terms it "a discourse, or speech, in musical and harmonical tones. It is a melody nearly approaching to common speech; a musical declamation, in which the musician ought to imitate, as much as possible, the inflexions of voice in declaiming. This melody is called recitative, because it resembles a narration, a recital; and is used in the dialogue of musical dramas."

We have presented our readers, under the article OPERA, with extracts from the prefaces of the poets and composers by whom recitative was invented, as well as from contemporary writers, who thought its origin of sufficient importance to be recorded.

Giovanni Batista Doni, about the middle of the 17th century, (Op. Omn. tom. ii. in Firenze, 1763, folio,) a learned and elegant writer on music, though extremely warped in his judgment by a predilection for the music of the ancients, in a dissertation on the Origin of Stage-singing, during his own time, gives so curious and instructive an account of the first operas that were performed at Florence, that we shall translate a part of it.

"Some kind of *cantilena*, or melody, has been introduced in

in dramatic representations, at all times, either in the form of intermezzi (interludes), between the acts; or, occasionally, in the body and business of the piece. But it is still fresh in the memory of every one, when the whole drama was first set to music, and sung from the beginning to the end."

The revival of theatrical music was brought about by the invention of recitative, as we have already stated in our article OPERA.

"The beginning of this century (1600) was the era of musical recitation on the public stage at Florence, though it had been used there in several private exhibitions before. There resided in that city, during these times, signor Gio. Bardi de' Conti di Vernio, who was afterwards called to the service of pope Clement VIII., by whom he was tenderly beloved, and made his *maestro di camera*. This most accomplished nobleman was particularly attached to the study of antiquity, and to the theory and practice of music, to which he had applied himself for many years so closely, that he became, for the time in which he lived, a correct and good composer. His house was the constant rendezvous of all persons of genius, and a kind of flourishing academy, where the young nobility often assembled to pass their leisure hours in laudable exercises and learned discourse; but particularly on musical subjects, when it was the wish of all the company to recover that art of which the ancients related such wonders, as well as other noble inventions, which had been ruined by the irruptions of barbarians.

"During these discussions, it was universally allowed that as modern music was extremely deficient in grace, and the expression of words, it became necessary, in order to obviate these objections, that some other species of cantilena, or melody, should be tried, by which the words should not be rendered unintelligible, nor the verse destroyed."

Euridice was the first musical drama after the invention of recitative. It was written by Ottavio Rinuccini, set by Jacopo Peri, and performed at Florence in 1600, on occasion of the marriage of Mary of Medicis with Henry IV. of France. The poem and the music were published separately the same year. The poet, in his dedication to the queen of France, says, "It is generally imagined that the tragedies of the ancient Greeks and Romans were entirely sung; but this noble kind of singing had not till now been revived, or even attempted, to my knowledge, by any one; and I used to think, that the inferiority of our music to that of the ancient was the cause; till hearing the compositions of Jacopo Peri to the fable of Daphne, I wholly changed my opinion. This drama, written merely as an experiment, pleased so much, that I was encouraged to produce Euridice, which was honoured with still more applause, when sung to the music of the same composer Jacopo Peri, who with wonderful art, unknown before, had merited the favour and protection of the grand duke our sovereign, it was exhibited in a most magnificent manner at the nuptials of your majesty, in the presence of the cardinal legate, and innumerable princes and nobles of Italy and France."

Such is the abridged history of recitative. The only printed copy of the music to this primitive opera was in the library of the marchese Rinuccini, a descendant of the poet at Florence: in examining and making extracts from which, we observed that it was printed in score, and barred; two very uncommon circumstances at the time of its publication; that the recitative seemed to have been not only the model of subsequent composers of early Italian operas, but of the French operas composed by Lulli, a native of Florence; and that the time was as frequently changed as in the old French operas.

The confusion arising from all the parts singing different words at the same time, together with some other circumstances, mentioned under OPERA, account for the necessity of a recitative, or a *musica parlante*, a speaking music, and for solo singing in general on the stage: besides, poetry was injured, and rendered unintelligible in fugues, canons, and in choruses, full of imitations and contrivances, all unfit for narration and dialogue.

To describe the characteristic difference of recitative from air, and common speech: it is not air, as no time is kept; it is not speech, as every inflexion of voice is in tune with some one note of the instrument by which it is accompanied; and as to the length or shortness of the notes that are written, the accompanier watches for the accents or termination of phrases, or lines in the verse, to give the chord to which the note that is sung belongs.

It is sometimes accompanied by the orchestra with *ritornelli*, or interstitial symphonies; but then a regular time must be kept. This only happens in solemn scenes of dignity or distress, and in soliloquies.

No flats or sharps are placed at the clef in recitative: these are all regarded as accidental; nor is Italian recitative ever confined to any one key.

After recitative was found, it was long ere any thing like an air appeared in these musical dramas. (See OPERA, AIR, MOTIVO, and MEASURE.) Rousseau has treated the article recitative at large, with great intelligence and good taste.

RECITATIVE *Style*, is the way of writing accommodated to this sort of music.

RECIV, LA, in *Geography*, a well-fortified town of Brasil, in the jurisdiction of Fernambuco.

RECKENITZ, a river which separates the duchy of Mecklenburg from Pomerania, and runs into a lake, which communicates with the Baltic near Ribnitz.

RECKHEIM, or REKUM, a town of France, in the department of the Lower Meuse, which gives name to a county, situated on the W. side of the Meuse, and surrounded by the bishopric of Liege; 7 miles N. of Maeftricht.

RECKLING, in *Rural Economy*, a provincial word, signifying the last of the farrow or brood of pigs, poultry, or other sorts of domestic birds.

RECKLINGHAUSEN, in *Geography*, a town of Germany, fortified by a castle, and capital of a county of the same name, which is situated between the bishopric of Munster, the duchy of Cleves, and the county of Mark; 16 miles S.S.W. of Munster.

RECKON, in *Rural Economy*, a term sometimes applied to a pair of pot-hooks of a certain make, occasionally employed in dragging wells, ponds, &c.

RECKONING, in *Navigation*, the act of estimating the quantity of a ship's way; or of the distance run between one place and another.

Or, more generally, a ship's reckoning is that account, by which at any time it may be known where the ship is, and on what course or courses she is to steer to gain her port. See LOG-BOARD, LOG-BOOK, and JOURNAL.

This is usually performed by means of the log-line; the manner of applying which, see under its proper article, LOG-LINE.

Yet this is liable to great irregularities. Vitruvius advises an axis to be passed through the sides of the ship, with two large heads projecting out of the ship, in which are to be included wheels touching the water, by whose revolution the space passed over in any given time may be measured. The same has since been recommended by Snellius; but

but there are few who have written of navigation, that have not shewn the insufficiency of this method.

RECKONING, *Dead*. See *DEAD Reckoning*.

RECKSON, in *Geography*, a town of Bengal; 6 miles E. of Calcutta.

RECLAIMING, or RECLAMING, in our *Ancient Customs*, the action of a lord pursuing, prosecuting, and recalling his vassal, who had gone to live in another place, without his permission.

RECLAIMING is also used in a similar sense, for the demanding of a person or thing to be delivered up, or surrendered, to the prince or state it properly belongs to; when, by any irregular means, it has come into the possession of another.

RECLAIMING, in *Falconry*, is the calling of a hawk, or bird of prey, back to the fitt.

The sparrow-hawk, gos-hawk, &c. are reclaimed with the voice; the falcon only by shaking the lure. So that the term luring, with regard to the falcon, is more proper than reclaiming.

The partridge is also said to reclaim her young ones, when she calls them together upon their scattering too much from her.

RECLAIMING is also used for taming animals that are wild by nature.

RECLAIMING, in a monastic sense. See *RELIGIOUS*.

RECLAIMING *Lands*, in *Agriculture*, the business of restoring and bringing them into a state of cultivation and improvement. There are various kinds and states of land, which admit of this sort of amelioration and improvement; as among the wet sorts, all those of the bay or estuary description, which are washed and occasionally covered by the sea or other waters; different descriptions of fen lands, and those of the more firm marshy nature, and those in more interior situations, which are of a loose swampy or watery quality, as morasses and boggy grounds. And among those of the more dry, hard, waste, and wild descriptions; all the varieties of the rough stony sorts of unimproved lands; the many different kinds of rough woody grounds; and the numerous sorts of moory lands, as well as other varieties, which are now and then to be met with in particular circumstances and situations.

The first of the wet or watery sorts of land, noticed above, are far from being always ready, or in a ripe state for admitting improvement of this nature; yet in different situations and circumstances, they occasionally permit of its being accomplished, without any great difficulty or trouble. See *EMBANKMENT*, and *EMBANKING against the Sea*.

The fenny and marshy lands, where, in the former, they are wholly or only in a partial manner overgrown by usefess aquatic plants; and in the latter, are become so firm as to bear pasturing stock, and to afford nutritious herbage for their growth and support, but are notwithstanding still liable to be overflowed by high tides, or land floods; are, of course, capable of very great improvement in the above ways, as well as by many other means. See *FEN*, *FENNY Land*, *MARSH Land*, and *SALT Marsh*.

These sorts of watery lands are not incident to the flat bays and inlets of the sea-coasts, or the mouths of the large rivers, in a particular manner; but are met with in the more inland situations of the country, accompanying the larger rivers and waters in the more central parts of the kingdom: consequently such sorts of improvement must be very extensive in their nature, and of very great importance to the nation.

The other kinds of swampy watery lands, which are liable to be covered with that fluid during wet seasons; those on

the sides of lakes and ponds; the morasses which are choaked and grown up with aquatic vegetables, so as to have some sort of hardish crust formed upon them; and the soft boggy lands, formed in somewhat similar ways, are all capable of allowing great improvement, by suitable draining, and other methods of management. See *SPRING* and *SURFACE Draining*, *SWAMP*, *BOG*, and *MORASS*.

Lands of the above kinds are mostly met with on the lower slopes, or at the feet of hilly grounds; being caused by the stagnation of water in their internal parts, which has the effect of chilling and rendering them too moist for the production of a nutritious and useful herbage, as well as of promoting the growth of coarse plants of the aquatic nature, though their situations may occasionally have some degree of relative height.

There are many valuable tracts of land of these kinds, in many different parts of the island, which have been already reclaimed by these methods of proceeding; which should have the effect of stimulating the owners of such lands in other places, where they still remain unimproved, to exert themselves in getting them reclaimed.

Among the more dry kinds of unreclaimed lands, the first, or those of a rough, stony, waste quality, are all those in the vallies of hilly or mountainous tracts, on the skirts or lower parts of mountainous heights, and the rough stony lands, fit for cultivation, in other situations. They are the most readily reclaimed and improved, in the less hilly sorts of lands and situations. In some cases, where the surfaces of the ground were in a great measure covered by large rocks and stones of great sizes, very hard in their qualities, and of scarcely any value, the lands have been reclaimed, and brought into an arable state, and let for high rents: the stones which were removed paying, in a great degree, the expences of the labour; they being exported and sold as paving-stones, and for other uses to the metropolis. And though this cannot always be done, it shews what is capable of being performed by industry and perseverance; and that, where surface stones can be turned to useful purposes, the most rugged and barren lands may be reclaimed with advantage, under proper modes of management. In such instances, instead of leaving the surfaces of the grounds in worse states than they were before, by being taken up with pits, and heaps of usefess rubbish, which buried the better moulds, as is common in working superficial quarries, the pits and other hollows were levelled, and filled up to some height, with the coarse and rubbish materials produced in the course of the works, and the finer mould from other parts thrown back upon the above sub-soil materials, so as to form an even top-soil; the larger spaces of the ground being trenched over to a good depth, leaving the best soil on the surface. It is suggested, that by following similar easy methods of management, in carrying on other undertakings of the same kind, lands of a value in proportion to that of the materials which are removed, may commonly be created, without incurring any very great expence. Hence it is thought to behove those who have the direction and management of landed estates, that comprehend grounds of these sorts, to examine and consider well whether the stony materials which they contain, and encumber their surfaces, cannot be turned or converted to some profitable purpose, by the means of roads, iron railways, canals, or some other easy mode of conveyance for such heavy substances.

It must be noticed, however, that the method of levelling and trenching over the lands by the spade, in such circumstances, can only be practised in a very few cases, where labour is particularly cheap.

There is another description of stony lands, of a much
less

less formidable nature, which frequently stands in need of being reclaimed, and in which the surface is less encumbered than the interior parts of the soil. In these cases, the interrupting materials are rather large stones than rocks, though the latter may sometimes in part form them. The means which are best suited to the bringing of these into a profitable state of cultivation, are to be found in the more northern parts of the island, in the practice and exertions of particular spirited individuals. The plan of the improvement is perfectly simple, but it is expensive in its performance; the whole of the lands being trenched over, by means of the spade, to a proper depth, as from one to two feet. The stones which are not wanted for use are thrown into pits, and the hollow parts, to contribute to their being made level, and sometimes into the deep trenches formed in digging, being first covered over with the worst of the earthy materials, upon which the better moulds and turfy substance, which are stirred in the work, are spread out as a soil, by which the whole is rendered very suitable for agricultural purposes.

The cost of reclaiming lands in this way depends, in some measure, on the cast of surface in the lands, the nature of the interrupting matters, and the depth of the earthy substances to be removed, in raising a sufficiency of mould for forming the surface soil: but from five to twenty pounds the acre may be considered as the limits of the charges.

And this, it is supposed, leaves an ample profit in the sale of such lands, or otherwise, in these situations where tythes are not taken, and where the rates and taxes are so very few and trifling, and where labour and living is so cheap. It can now, however, be done in this manner in but few instances, as has been already noticed.

It is, notwithstanding, believed that there are very many lands, not only in these northern parts, but in England and Wales, that would more than repay the expences of this spirited mode of improvement. It may be remarked, that where the stones are very large, or where fragments of rocks are met with, in these undertakings, they may be got rid of either by blasting, or rending their upper parts, or by sinking them in the soil, so as to allow the plough to pass over them with safety.

The former method is more suited to the soft sorts of stones; the latter to those of the harder kinds.

Such rocky grounds as are common in hilly and mountainous situations, which, on account of their climate, and the compact nature of the rocky materials, as well as their quantity, are incapable of being cleared as corn-lands, or so as to admit the plough, may often be reclaimed and improved as pasture lands for sheep, &c. or sometimes as hay lands. The plan of proceeding, in these cases, is that of removing the stony matter from the surface, and allowing it entirely to the growth of grassy herbage; the means of accomplishing which are similar to those already noticed, but the cost considerably less: the main intention here being merely the smoothing of the surface ground, for the purposes of pasturing or mowing; but the more the stony substances are covered with good earthy mould, the better and greater will be the quantity of produce. See **TIL-
LAGE**.

There are many rough woody tracts of ground, of the shrubby or other kinds, which may be cleared and reclaimed with vast advantage to their proprietors, as well as the community in general, as corn-lands, or for other uses. The most usual method of accomplishing this sort of improvement has been to dig out the whole of the roots, whether of low woods or timber woods, at the time of removing the tops, so as to admit the plough immediately. r In perform-

ing this in this way, however, where the stools are of the timber kind, numerous and large, deep breaking of the ground is often necessary, which is laborious and expensive; and rotten wood, mould, leaves, and other surface matters, are apt to be left in mixture with the infertile or poisonous sub-strata. As lands, cleared and reclaimed in this manner, have been known to remain in a *raw* unprofitable condition, for several years, although limed, dunged, and raised in sharp ridges, in order to its amelioration.

This improper practice has consequently been highly disadvantageous, injurious, and ruinous, and thrown much difficulty and interruption in the way of clearing and reclaiming such waste lands for the growth of corn, however suitable they may be for the purpose in the nature of their soils and situations, thereby tending to propagate and support the notion, that such sorts of land will not repay the expences and trouble of being improved.

But from attending to what has naturally happened to the cleared parts of wood-lands, it will be seen that a depth of fertile mould, resting on less fertile substances, form a regular soil and sub-soil, which are free from the roots of trees, ready to receive the plough, and afford corn crops in due succession. This is supposed to take place somewhat in this way. The trees having been suffered to become decayed, or more properly cut down in due season, and the brush or underwood cut and cleared away from time to time by the occupiers, while such commons or other places were fully or too much stocked with cattle and sheep, the young shoots were of course browsed off and nibbled away quite to the stumps, consequently weakened, and at length finally destroyed. The roots and other parts soon followed this course, and passed into a state of vegetable mould, increasing and enriching the soil at the same time. Nay, this may, in the natural state, it is supposed, be, in some measure, effected alone by the grazing animals, as it is essential to their existence.

This natural process, however assisted in this way, is slow, requiring a length of time for its completion; yet by proper means of art, well applied, it may be accomplished in a few years; the larger roots being extracted from the ground, instead of waiting for their reduction by a slow decay, without any unnecessary disturbance of the sub-soil; and then tilling in the pits by the roughness of the natural surface: by which means the cleared ground will be smoothed, and made fit in due time for being cultivated. Where the surface is much incumbered with leaves and rotten woody matters, they are to be raked up, and put into heaps to decay; or they may be burnt, and the ashes spread out over the surface of the land. Proper draining and further levelling must likewise take place, where necessary; as well as harrowing or hacking the surface sward, so as to sow it with proper grass seeds; again raking off any rubbish that may arise, and then rolling the whole quite smooth for mowing. It should be stocked hard, especially with sheep, mowing off occasionally any woody shoots that may be permitted to arise; keeping the whole in the state of close pasturage, until the smaller roots, which were left, be so decayed as to become obedient to the plough-share. At this period, but not before, such pasture ground may be broken up for grain crops in proper succession.

The process might be hastened by the use of lime, or other calcareous matters in union with the vegetable substances which were removed, as they would be sooner dissolved or reduced, and the compost be more rich. And by spreading them out on the land a similar effect might be produced, and a finer sort of herbage be encouraged, which would cause a closer bite, and sooner bring the land into a

more thick fet state of sward, which is the prolific matrix for corn crops.

The really necessary expence of reclaiming and bringing these kinds of wooded lands into a state of cultivation, by these means, is inconsiderable, particularly where fuel is dear. Where the timber wood is properly cut down by the axe, and the underwood taken off rather below the surface, the larger roots, and the stubs which are left, will, in some instances, more than repay the cost of the clearing and levelling the surface. And the other expences will be repaid by the immediate production of a pasture ground, the value of which is constantly increasing without any further charge, until it may probably be worth two or three times what the lands were while they were in the woody condition.

In cases where fuel is cheap, and particularly when the timber wood is rapidly fallen, as in the barking season, they may be cut off by the saw level with the surface of the land; the stools and large superficial roots being after that carefully disbarbed to some inches within the ground, so as to prevent their throwing out shoots to injure the surface and keep the roots alive. In this way the stools will be so decayed in a few years as to be capable of being removed with little trouble or expence. See *TILLAGE*.

In clearing and reclaiming moory lands where they are too wet, the first step is that of properly draining them; they are afterwards brought into cultivation and to their full value by other means, such as in large undertakings, by suitable divisions of the lands into fields proper for the farm or farms to which they are to be laid, and so ditched as that the surface water may be effectually taken off, without having deep, open, expensive troublesome drains in other parts; the surface of each field being adjusted in such a manner as to shoot off the rain water into the intersecting ditches, in order to prevent injury from happening, in that way, so as to impede the cultivation for any length of time.

As the surfaces of these kinds of land are mostly rugged and uneven, as well as of a loose spongy texture, which unfits them for the tillage processes, without previous assistance from hand labour; where the moory earth, or vegetable mould, is deep, and rises to the surface uncovered by fossile matters, some length of time is requisite to bring it to that solidity and firmness of texture which is suited to the common arable purposes. Hence the general principle of improving deep moory lands, where there is no fossile covering, is supposed to be the same as that advised for bringing woodlands into cultivation; namely, that of converting them to a profitable state of herbage, before corn crops are attempted to be produced.

The process must be guided and regulated by the nature and situation of the tract to be improved. Where the surface is very irregular, full of inequalities, and of an abrupt nature, it must first be adjusted so as to admit the means of tillage when they can be properly had recourse to, and for carrying away the surface waters in the manner already noticed. Then to pare off the lesser hillocks and risings, as the tufts and hafts which were formed during its wet state, and more or less of its general surface, so as to remove the coarse plants and stale mould which occupy it, and thereby produce a freshness in the whole.

In dry seasons, when the surface has sufficient firmness to bear the tread of animals, the paring may be done by the plough for that purpose, but in other cases by the breast-plough or paring-spade. When the surface has been cut over in this manner, and any part has the appearance of being too wet, as may be judged of by the colour of the mould, in some degree, covered drains are to be formed in such places, which may commonly be made in a cheap and

durable manner by the firm fibrous tufts collected from the surface. The rest of the roots and mould which were pared off should be burnt, and their ashes spread evenly over the surface, being immediately raked or harrowed into the soil. At this period of the improvement almost any kind of fossile material can be thrown over the ashes at a little expence; and a full quantity of different grass seeds be covered in with it; leaving the surface to take on a sward without any further trouble or outlay of money.

Afterwards the grassy herbage is to be kept closely fed down when the weather will permit, first by sheep and then by heavier sorts of stock, until the surface becomes firm and the soil is well bound together by the fibrous roots of the herbage, so as to be capable of affording corn crops in proper succession.

It has been objected to this summary mode of bringing the land into the state of herbage, that there are no immediate gross returns for the money laid out in reclaiming and bringing it into the cultivable state. But although corn cannot be raised on such raw loose-textured sorts of land at first, potatoes are found to answer well, and rape with still more advantage in its culture, the labour attending it, and the profit which it affords. See *MOOR, MOORY-LAND, SPRING and SURFACE Draining, &c.* See also the *Livernefsshire Agricultural Report*.

The reclaiming and bringing lands of these several different descriptions into a state of cultivation and improvement is evidently a work of very great importance, particularly in a country where the population is getting too numerous for the produce, as by such means the extent of agricultural territory may be justly said to be increased. Extensive improvements of these kinds have lately taken place in Cornwall, and some other southern districts.

RECLAIMING Plantations and Timber Woods, in Rural Economy, the restoring of such as have grown into a wild, neglected, and improper state from some sort of mismanagement, or want of attention. The causes which have a tendency to produce this effect are very numerous, and have been the means of vast individual as well as national loss. One material and very frequent cause is the neglect of their boundary fences; another is the mistaken notion of its being the best practice to leave them entirely to nature after they are once properly planted; a third is the very absurd supposition, that nothing should be done to them for a length of time after planting, in the way of rendering the trees more thin among themselves, or in their branches; and lastly, an universal carelessness and disregard of them, frequently from the narrow conception of expence being incurred without the chance of any immediate return of profit. It is, on the whole, much too common to take great care in first forming the plantations, without ever thinking or taking any sort of interest in their after-management. But the business is by no means accomplished in the simple act or operation of planting out the trees. Good examples of this kind of management are indeed few, but they occasionally exist, and much has been written on the matter, so that information may be readily obtained. And there is every inducement to get it; as well prepared, inclosed, planted, cultivated and managed plantations, will far outgrow others that have existed for a much longer time, but have been otherwise treated, often affording more than woods of three times their length of standing.

In directing the proper management in all cases of this nature, some attention must be paid to the particular kinds of the plantation which they may be, in the first place; after which, the means of reducing them to their appropriate states, or to some other in the most easy and convenient

manner, may be taken into consideration. It may often happen that their proper originally intended states cannot be attempted, but that which has been gradually acquired must be promoted. With a view to the accomplishment of those intentions, plantations may be considered as consisting either of hard woods only, of evergreen or resinous trees only, or of both these sorts of trees in mixture.

In the first of these kinds, or those which are composed solely of the hard-wooded sorts of trees and plants, where they are to be brought to the state of woods, as timber trees and undergrowths, and the latter to be used only as fuel, the good trees of such kinds as are suitable to the soil, and the probable demand of the vicinity and other parts, should be fixed upon, and left as standard trees; the whole of the others being cut over by the surface of the ground, so that they may become stools for supplying the undergrowths. When this has been performed, the ground, where necessary, should be dug, hoed, or trenched over, as circumstances may direct; but where the trees and underwoods have been much crowded, these kinds of work will seldom be required. However, if, instead of the common underwood, oak be required, then after pitching upon the most proper and suitable standard trees for remaining, the whole of the rest are to be taken up by the roots, the land dug over, and acorns planted out upon it; which, when they are grown up, must be kept clean and free from weeds for some years, in order to promote their healthy growths and rising to the state of young trees.

Where the whole is to be reduced to the state of copse wood for fuel only, the best way is to cut over every part by the surface of the ground; and when for bark, to root out the whole, only reserving the oaks, and planting with acorns, as already noticed.

In case the grove forms are to be produced, the most suitable and appropriate trees are to be left at proper distances, and the whole of the remainder taken out by the roots; after which the ground should have the proper culture, until the trees are incapable of being injured by cattle stock; at which time the whole may be laid down with natural grass feeds.

In the second sorts of plantations, where they have remained, after planting, without being in any way thinned, for a great many years, they are often, in a great measure, incapable of being remedied, as they are, for the most part, so overpowered by each other, that their growth is suspended; wherever any thinning takes place, the trees all around are destroyed. In these cases it is the advice of some to have the whole grubbed up by the roots and replanted, after the ground has been properly prepared by fallowing and repeated corn crops. But as there may sometimes be much loss in this way, it may be proper to try the cautious thinning of them, which should be done during the latter summer months in a careful manner, as success has occasionally attended this method.

With natural plantations of this kind under twenty years' growth, and artificial ones under ten, much advantage has been gained by suitable cautious thinning and retrenching. In all these cases there is no necessity whatever for the cultivation of the ground, as the trees suffer few or no plants to rise below them, and besides, injury may be done to their superficial roots.

The management in the last or mixed kinds of plantations, where the evergreen trees are in such proportions as not to admit of either of the above modes, is to reduce them to the grove plan only, or to this in some parts and the wood kind in others; the modes of accomplishing both of which have been already laid down. However, in each of

these methods, it will frequently happen that the tree or trees which are the most advantageous and desirable in the parts where the plantations exist, are either very deficient, or wholly wanting. In all such instances it is probably the best and most beneficial practice to grub up nearly the whole of such trees, and replant the ground with the proper sort or sorts; care being taken to leave such a number of the old trees, either in a scattered manner, or in narrow stripes and screens, for sheltering and protecting the young trees, plants, and seeds, which have been put in, planted, or sown. See *PLANTATION and WOOD*.

It may be noticed that in reclaiming all kinds of wild and neglected plantations in lands which are inclined to the retention of moisture; the first thing which is necessary is invariably that of the removal of the stagnant wetness, as where this is not properly performed, the other operations will be of but little avail, however well they may be executed. In many extensive tracts of this nature, the injury which is sustained by this sort of neglect is scarcely to be calculated. There are many thousands of acres, in different situations in this country, which would by this means alone be brought to twenty times and more their present value. And as this sort of work in such cases can, for the most part, be accomplished by open cuts or gutters alone, at a very trifling expence in comparison of that for arable and some other sorts of land, it should never be neglected where good management is in the least degree attended to. See *SPRING and SURFACE Draining*.

It is a material point in reclaiming all these sorts of plantations and timber woods, to keep the surrounding ditches and fences well up and in a proper safe state, as large tracts are often completely ruined in a very short time by inattention in this respect, from the cropping, rubbing, and destruction in other ways produced by the entrance of cattle of different kinds into them. There is hardly any thing so injurious to the more young timber plantations as cattle being suffered to get into them. See *FENCE*.

The retrenching of old ill-managed plantations of these kinds should constantly be done in a very gradual manner, having due regard to their length of standing, the nature of the trees, the quality of the land, the situation and exposure, as well as some other points. Their outside parts are in general to be left more thick and close, than those which are more in the interior, and the parts of the soil which are of a bad thin quality, should be left less thick of trees and plants than where it is of greater depth and richness. And open exposures should be kept more thick and close than where they are more warm and sheltered.

In retrenching the branches of the different trees, the work should be performed according to the length of time the trees have been growing, their particular growths and sizes, the difference of kind, and the uses, purposes, and intentions for which their wood or other parts are designed. It is always proper to stop rather short, than to carry it to an extreme, as there is sometimes danger in the latter case. See *PRUNING*.

It is always necessary and essential to reclaim these old wild sorts of plantations as soon as possible, as the forming of new tracts of this kind chiefly benefit posterity, while the ameliorating and improving of the other, by these means, are an immediate and direct gain to the present proprietors, of very great national importance at the present time, and which would otherwise be complete loss to both.

No sorts of woods of the timber kind should indeed ever be suffered to remain any great length of time without being properly looked over and put into such states as that they may go on in the most beneficial and profitable manner, as

where

where they are in any way or by any means restricted or impeded in their growths, there is a constant and continual loss taking place, and the ultimate disadvantage is prodigiously great, as the timber never becomes either so good or in such quantity; of course it is of inferior value in both respects, which makes a difference of much consequence to the proprietors as well as to the nation at large. See **WOOD**.

RECLINATION of a *Plane*, in *Dialling*, the number of degrees which a dial-plane leans backwards, from an exactly upright or vertical plane, *i. e.* from the zenith.

The reclination is easily found, by means of a ruler, and a quadrant; for having drawn an horizontal line on the plane by a level or quadrant, and to it another line at right angles, apply a ruler, so that one end of it may hang over, or reach beyond the plane; then will a quadrant, applied to the under edge of the ruler, shew the degrees and minutes of the plane's reclination; counting from that side of the quadrant that is contiguous to the edge of the ruler.

RECLINATUM FOLIUM, in *Botany*, a leaf whose point is curved downwards, below the level of the base. See **LEAF**.

RECLINATUS CAULIS, a reclined stem, is bent towards the earth, as in many species of *Ficus*, *Salix*, *Rubus*, &c.

RECLINER, or **RECLINING Dial**, is a dial whose plane reclines from the perpendicular; *i. e.* leans from you when you stand before it.

When this reclination is equal to the height of the pole, the dial is said to be equinoctial. See **DIAL**.

RECLINER, *Declining*, or *Declining reclining dial*, is a dial which neither stands perpendicularly, nor opposite to one of the cardinal points. See **DIAL**.

RECLUSE, among *Religious*, a person close shut up in a very narrow cell of an hermitage, or other religious house; and cut off, not only from all conversation with the world, but even with the house.

The word is chiefly used for such as thus imprison themselves out of devotion, to do penance. It is sometimes also applied to incontinent wives, whom their husbands procure to be thus kept in a perpetual prison in some convent.

Recluses were anciently very numerous; they were then a kind of solitaries who shut themselves up in some little cell, with a vow never to stir out of it.

None were admitted to this oath until they had given sufficient proofs of their abstinence, and had leave from the bishop, or the abbot of the monastery where they were shut up; for the cells of the recluses were always to join to some monastery.

The prelate's permission being obtained, they were tried for a year in the monastery; out of which, during that time, they never stirred.

They were then admitted to their vow of stability in the church before the bishop; which being done, and the recluse having entered his little cell, the bishop set his seal on the door.

The cell was to be very small, and very exactly closed. The recluse was to have every thing within it necessary to life; and even, if he were a priest, an oratory consecrated by the bishop, with a window which looked into the church, through which he might make his offerings at the mass, hear the singing, sing himself with the community, and answer those who talked to him. But this window was to have curtains before it, both within and without; so that the recluse might neither see, nor be seen.

Indeed he was allowed a little garden in his reclusion, to plant a few herbs, and take fresh air; adjoining to his cell

was that of his disciples, which he was very rarely without; with a window, through which they served him with necessities, and received his instructions.

When it was judged proper to have two or three recluses together, their cells were made contiguous to each other with windows of communication; if any woman would consult them, or confess to them, it was to be in the church, and in the face of all the world.

Where there were two or three recluses together, they were never to hold any conference, but on spiritual matters, and to confess to each other; where there was but one, he was to confess and examine himself.

If the recluse fell sick, his door was opened for people to come in and assist him; but he was not allowed to stir out on any pretence whatever.

These articles are extracted from the rule, compiled for the recluses, by Grimlaic, a priest in the ninth century.

There were also women recluses, who led the same life, in proportion. St. Viborade lived a recluse at St. Gall, and was there martyred by the Hungarians in 825.

RECLUSION, the state of a recluse; or the cell and other appurtenances of it.

F. Helyot gives a particular account of the ceremonies practised in the reclusion of a woman, in that of mother de Cambray, institutrix of the order of the representation of Nôtre Dame. A cell being built for her in 1625, adjoining to the church of St. Andrew, in Tournay, the bishop waited for her early in the morning at the church-door. Upon her arrival, prostrating herself at the feet of that prelate, he gave her his benediction; conducted her to the grand altar; and there blessing a mantle, veil, and scapular, he put them on her, and gave her a new name.

Having here made her vow, and the bishop having harangued the people in praise of the new recluse, he conducted her processionally to her reclusion; the clergy all the way singing *Veni, sponsa Christi*, &c.

Here the bishop, blessing her afresh, consecrated the reclusion, and shut her up in perpetual confinement.

RECOGNISANCE. See **RECOGNIZANCE**.

RECOGNITION, **RECOGNITIO**, denotes an acknowledgment. The word is particularly used in our law-books, for the title of the first chapter of the stat. 1 Jac. I. by which the parliament acknowledged the crown of England, after the death of queen Elizabeth, to have rightfully descended to king James.

RECOGNITIONS of *Clement*, in *Ecclesiastical History*, a supposititious or apocryphal book, ascribed to St. Clement, but really composed by some learned and eloquent man in the second century. Rufinus, who translated the ten books of Recognitions out of Greek into Latin, in whose translation only we now have them, plainly supposes them to have been written by Clement of Rome; but that the copies, in his time, had been corrupted in some places. The first ecclesiastical writer who has mentioned this work is Origen, by whom it is cited twice; but he does not seem to have held it in high estimation. Eusebius, who is supposed to mention the Recognitions under the title of "The Acts of Peter," which made a part of them, rejects these, and owns no work for St. Clement, but his epistle to the Corinthians. Epiphanius mentions "The Travels of Peter" as written by Clement, but corrupted by the Ebionites, so that little was left that is genuine. St. Jerome's opinion of the works of Clement coincides with that of Eusebius. This book is, for a large part of it at least, says the learned Dr. Lardner, a fiction or romance, in which divers things concerning the Christian religion are represented in a philosophical manner, in order to render them more agreeable to the Greeks. It

is called the "Circuits," or "Travels and Acts of Peter," from its subject, as it contains an account of the apostle Peter's disputes with Simon Magus, and his discourses to other people, and his miracles. It is called the "Recognitions," from Clement's recognizing his father, and mother, and brethren, who had been long separated from each other.

Mr. Whiston, though he allows that this work was not written by Clement himself, supposes that it was the production of some of the hearers of Clement, and other companions of the apostles; but Dr. Lardner is of opinion, that it must be reckoned to be Clement's, or to be supposititious. With regard to the age of this work, Lardner farther adds, that the arguments here urged against Heathenism seem to imply, that the Christian was not yet the prevailing established religion. And the author often speaks of the power of Christians to heal diseases, and to expel dæmons, as if it was common in his time. That such gifts were enjoyed by many Christians in the second, and in the beginning of the third, century, we are assured by Irenæus, Tertullian, Origen, and others; after which time, or however after the end of the third century, they were not so common, if they did not quite cease. Mr. Whiston's opinion of this book is, that if it be not, in some sense or other, itself a sacred book, yet it ought certainly to be esteemed in the next degree to that of the really sacred books of the New Testament. But in the opinion of many other learned men, it is a worthless piece, of little or no use. It contains, however, as Dr. Lardner suggests, some excellent sentiments, and fine passages, intermixed with very great faults, for which no excuse can be made. This book contains passages of our four gospels, though it has been doubted whether he used the four, or some one gospel containing in it all these. Its author seems to own the first epistle of St. John, and the book of the Revelation. He was also well acquainted with the book of the Acts of the Apostles; but it is not certain how far he owned it. The passages from St. Paul's epistles are not sufficient to prove, that they were esteemed by this writer to be of authority. The author does not seem, indeed, to have any great kindness for the apostle Paul, and on this account he made little use of his epistles, and of the Acts of the Apostles. From his sly insinuations, and injurious reflections upon St. Paul, it may be suspected that he was a mere Ebionite; the ancients assuring us, that this sect of Christians rejected the authority of that apostle and his epistles. The author bears testimony to many principal facts of the New Testament. He gives an account of our Lord's temptation; he mentions the choice of the 12 apostles, and afterwards of other 72 disciples. In one place he speaks of the 12 apostles in such a manner as if he intended to exclude Paul from the honour of the apostleship, and even to deny him the character of a sufficient and faithful "preacher of Christ's word." We have also, in this book, relations of the miracles of our blessed Lord's ministry, and of his death and resurrection, and the extraordinary signs attending these events. Grabe's Preface to the Writings of St. Clement in his "Spicilegium." Coteler apud Patr. Apost. tom. i. p. 484. Lardner's Works, vol. ii. p. 342, &c. See CLEMENTINE HOMILIES.

RECOGNITION, in the Drama. See DISCOVERY.

RECOGNITIONE *adnullanda per vim et duritiam facta*, in Law, is a writ to the justices of the common bench for sending a record touching a recognizance, which the recognizer suggests to have been acknowledged by force and hard dealing; that, if it so appear, it may be annulled.

Transcriptio Recognitionis factæ coram iustitiariis iuramentibus. See TRANSCRIPTIO.

RECOGNITORS, RECOGNITORES. The jury impanelled upon an assize are called recognitors, because they acknowledge a disseisin by their verdict.

RECOGNIZANCE, or RECOGNISANCE, a bond or obligation of record acknowledged to the king; testifying the recognizer to owe to the recognizee a certain sum of money; with condition to do some particular act, as to appear at the assizes, to keep the peace, to pay a debt, or the like.

It is thus called, because recognized, or acknowledged in some court of record, or before some judge, master in chancery, or justice of the peace.

It is, in most respects, like another bond; the difference being chiefly this: that the bond is the creation of a fresh debt or obligation *de novo*, whereas the recognizance is an acknowledgment of a former debt upon record; the form of which is "A B. doth acknowledge to our lord the king, to the plaintiff, to C. D., or the like, the sum of ten pounds," with condition to be void on performance of the thing stipulated; in which case the king, the plaintiff, C. D., &c. is called the "cognizee," *is cui cognoscitur*, or recognizee, as he that enters into the recognizance is called the "cognitor," or recognizer, *is qui cognoscit*. This, being either certified to, or taken by the officer of some court, is witnessed only by the record of that court, and not by the party's seal; so that it is not in strict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of payment, and binding the lands of the cognitor, from the time of enrolment on record. Stat. 29 Car. II. c. 3.

There are also recognizances for *bail* (which see), others for appearing at the sessions to prosecute a felon, others for good behaviour, &c. See GOOD *Abearing*.

There are also other recognizances of a private kind, in nature of a STATUTE *Staple*, (which see,) by virtue of the statute 23 Hen. VIII. cap. 6. which are a charge upon real property. This recognizance is a security, acknowledged before either of the chief justices, or (out of term) before their substitutes, the mayor of the staple at Westminster, and the recorder of London: by which the benefit of their mercantile transactions is extended to all the king's subjects in general by the above cited statute 23 Hen. VIII. c. 6. amended by 8 Geo. I. c. 25, which direct such recognizances to be enrolled and certified into chancery. But these, by the statute of frauds, 29 Car. II. c. 3. are only binding upon the lands in the hands of *bonâ fide* purchasers, from the day of their enrolment, which is ordered to be marked upon the record.

RECOGNIZANCE is also used, in our *Ancient Statutes*, for the verdict of the twelve jurors impanelled upon an assize; hence called *recognitors*.

RECOGNIZÉE, or COGNIZÉE, is he to whom one is bound in a recognizance. He that is so bound is called *recognitor*.

RECOIL, or REBOUND, the resiliation of a body, chiefly a fire-arm; or the motion by which, upon explosion, it starts or flies backwards; the cause of which is the impelling force of the powder, which acts equally on the breech and on the ball; so that if the piece and ball were of equal weight, and other circumstances the same, the piece would recoil with the same velocity as that with which the ball is discharged; but the heavier any body is, the less will its velocity be, when the force impelling it continues the same. Therefore for many times as the cannon and carriages are heavier than the ball, just as many times will the velocity of the cannon be less than that of the ball; and the space through which the cannon recoils whilst the ball moves along

along the cylinder, is to the length of the cannon diminished by the space behind the ball, as the weight of the ball is to the weight of the cannon. Let a twenty-four pounder of ten feet be 6400 pounds weight, and when the ball quits the piece, the cannon will have recoiled $\frac{24}{6400} \times 10 = \frac{3}{200}$ of a foot, less than half an inch.

The greater the charge, *ceteris paribus*, the greater the rebound. By an experiment made before the Royal Society, and related in the Philosophical Transactions, it was found, that cannons, charged to a certain degree, throw the ball from right to left of their own direction; but that the cannons themselves recoil from left to right.

Some of the gentlemen of the French academy doubting the justness of the observation, M. Cassini, the younger, undertook to repeat the experiment; which he did by means of a machine, as like that used in England as he could: and that tried over and over again.

The result was, that the ball, when the gun had liberty to recoil, was always thrown to the right of the point to which it was thrown when the gun was fixed without a possibility of rebounding; but then the recoil was always made the same way, *viz.* to the right; and he never found that contrariety of directions between the ball and the rebound, observed in the English experiment. See Hist. Acad. R. Scienc. A. 1703. p. 120, &c.

The cause of the phenomenon seems very difficult to assign; for supposing the guns of a common make, with the touch-hole on the top, we cannot so much as guess what cause should constantly determine the ball from right to left; unless some very material circumstances be omitted in the recital they have given us in the experiment.

Guns whose vents are a little forward in the chase recoil most. To lessen the recoil of a gun, the platforms are generally made sloping towards the embrasures of the battery. See PROJECTILES.

RECOLATION, a method of fining the decoctions of vegetables, &c. by repeated percolation, or straining them several times successively through a linen or woollen-bag.

RECOLLECTION, a mode of thinking, by which those ideas, sought after by the mind, are with pain and endeavour found, and brought again to view. See MEMORY and IMAGINATION.

RECOLLETS, a congregation of reformed Franciscans, called also *friers minor of St. Francis, of the strict observance*. They were established about the year 1532, when some religious of the order of St. Francis being willing to keep his rule to the letter, Clement VII. gave them houses, whither they might retire, and receive such as were disposed to follow them. The same year he approved the reform; and in 1584 it was carried from Italy into France, where these religious had already been established, in the towns of Tullés in Limousin, and Murat in Auvergne. They had a convent at Paris in 1603; and since they have erected no less than a hundred and fifty in the whole kingdom, where they are divided into seven provinces.

RECOLOGNE, in *Geography*, a town of France, in the department of the Doubs; eight miles W. of Besançon.

RECOMMENDATI. See AFFIDAVIT.

RECOMMENDATION, in a *Military Sense*, denotes a certificate, stating an individual to be properly qualified for a situation in the army. This certificate must be signed by a field-officer in the regulars, addressed to the commanding officer of the regiment, by whom it is forwarded to the commander-in-chief, who lays the name of the person recommended before the king.

RECOMPOSITION, in *Chemistry*, the compounding of bodies from their separated parts, or principles, so as to compose the original whole again. This is extremely difficult to effect universally, but in some cases it may be done, and that so perfectly, that the recomposed body shall not be distinguishable by the senses from that which had never been separated by the fire. If the art of chemistry were perfect, we should thus be able, at least in some degree, to recompose all the bodies we divide; but this is far from being the case at present. We can by no means do this in vegetable and animal bodies, where there is a vascular structure, and therefore we are carefully to distinguish between the regeneration of organized, and that of unorganized bodies.

RECONCILIARI, in our *Law Books*, &c. A church is said *reconciliari*, to be reconciled, when it is consecrated afresh, after having been polluted or profaned; as by the possession of pagans, heretics, &c.

RECONCILIATION of *Penitents*, in *Church History*, See POENITENTES.

RECONNOITRE, in *War*, implies to view and examine the state of things, in order to make a report of them.

The word is French, signifying, literally, *to know, recollect*.

We say to reconnoitre the coasts, to reconnoitre a port, &c. A body of horse was sent to reconnoitre their camp, the ground, the condition of the roads, rivers, &c.

Parties ordered to reconnoitre, are to observe the country and the enemy; to remark the routes, conveniencies, and inconveniencies of the first; the position, march, or forces of the second. In either case, they should have an expert geographer, capable of taking plans readily; he should be the best mounted of the whole, that in case the enemy happen to scatter the escort, he may save his works and ideas.

All parties that go for reconnoitring only, should be but few in number: never more than twelve or twenty men. An officer, be his rank what it will, cannot decline going with so few under his command: the honour is amply made up by the importance of the expedition, frequently of the most interesting consequence, and the propriest to recommend the prudence, bravery, and address of any officer that has the fortune to succeed.

It is previously necessary that the officer ordered on this duty should be well acquainted with the country, the roads, and the distance of the enemy. His party must consist of men of approved fidelity, part of whom should be disguised. This detachment must march off in the night. The men must have strict orders neither to smoke tobacco, make a noise, nor speak. The officer must be provided with two guides, who are to be strictly interrogated, but are to remain ignorant of the route you intend to take. A detachment of this kind should be furnished with subsistence for two or three days. The horses are to be fed every two or three leagues, for it is absolutely necessary that they should be always fresh and fit for duty. The officer will take care never to halt, but at a distance from any road, and also take every precaution to prevent his being surpris'd, whilst his horses are feeding, &c.

RECONNOITRE is also used at sea. To reconnoitre a vessel, a fleet, &c. is to approach near enough to examine the rate and burden of a vessel, &c. the force it may have aboard, what nation it is of, &c.

To reconnoitre a land, or shore, is to observe its situation, in order to find what land it is.

RECORD, RECORDIUM, in *Law*, an authentic testimony of any thing in writing, contained in rolls of parchment, and preserved in a court of record. See COURT, and CUSTOM.

Records

Records are said to be *vetustatis & veritatis vestigia*. So early as the Conquest we find the "*prætorum memoria eventorum*" reckoned up as one of the chief qualifications of those who were held to be "*legibus patriæ optimè instituti*." For it is an established rule to abide by former precedents, where the same points come again in litigation; as well to keep the scale of justice even and steady, and not liable to waver with every new judge's opinion, as also because the law in that case being solemnly declared and determined, what before was uncertain, and perhaps indifferent, is now become a permanent rule, which it is not in the breast of any subsequent judge to alter or vary from, according to his private sentiments: he being sworn to determine not according to his own private judgment, but according to the known law and custom of the land; not delegated to pronounce a new law, but to maintain and expound the old one. Yet this rule admits of exception, where the former determination is most evidently contrary to reason; much more if it be clearly contrary to the divine law. But even in such cases the subsequent judges do not pretend to make a new law, but to vindicate the old one from misrepresentation. For if it be found that the former decision is manifestly absurd or unjust, it is declared, not that such a sentence was *bad law*, but that it was *not law*, that is, that it is not the established custom of the realm, as has been erroneously determined. An act committed to writing in any of the king's courts, during the term in which it is written, is alterable, being no record; but that term once ended, and the act inrolled, it is a record, and of such credit as admits no alteration, or proof to the contrary.

It is a settled rule and maxim that nothing shall be averred against a record (see COURT,) nor shall any plea, or even proof, be admitted to the contrary. (Co. Litt. 260.) And if the existence of a record be denied, it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. But if there appears any mistake of the clerk in making up such record, the court will direct him to amend it. Courts of record, or repositories for the public records of the kingdom, were first established by Edward I., our English Justinian, some of which are more ancient than the reign of his father, and those were by him collected.

Lawyers reckon three sorts of records; *viz.* a *judicial* record, as attainder, &c.; a *ministerial* record upon oath, as an office of inquisition found; and a record made by *conveyance* and consent, as a fine, or deed inrolled, and the like.

RECORD, *Affurances by matter of*, are such as do not entirely depend on the act or consent of the parties themselves; but the sanction of a court of record is called in, to substantiate, preserve, and be a perpetual testimony of the transfer of property from one man to another; or of its establishment, when already transferred: of this nature are private acts of parliament, the king's grants, fines, and common recoveries.

RECORD, *Court of*. See RECORD, *supra*, and COURT.

RECORD, *Debt of*, is a sum of money, which appears to be due by the evidence of a court of record. Thus, when a specific sum is adjudged to be due from the defendant to the plaintiff, on an action or suit at law, this is a contract of the highest nature, being established by the sentence of a court of judicature. Debts upon recognizances, together with statutes merchant, and statutes staple, &c. if forfeited by non-performance of the condition, are also debts of record; the contract, on which they are founded, being witnessed by the highest kind of evidence, *viz.* by matter of record.

RECORDS, *Imbezzling of*. See IMBEZZLE.

RECORD, *matter, mustler, oyer, prisoner upon matter of*, see MATTER, MUSTER, OYER, and PRISONER, &c.

RECORD, *Trial by*, is used only in one particular instance; where a matter of record is pleaded in any action, as a fine, a judgment, or the like; and the opposite party pleads "*null tiel record*," that is, there is no such matter of record existing: upon this, issue is tendered and joined in the following form, "and this he prays may be enquired of by *the record*, and the other doth the like;" and hereupon the party pleading the record has a day given him to bring it in, and proclamation is made in court for him "to bring forth his record, or he shall be condemned:" and, on his failure, his antagonist shall have judgment to recover. The trial of this issue is, therefore, merely by the record; for, as Sir Edward Coke observes (1 Inst. 117. 260.), a record or enrolment is a monument of so high a nature, and importeth in itself such absolute verity, that if it be pleaded there is no such record, it shall not receive any trial by witness, jury, or otherwise, but only by itself. Thus, titles of nobility shall be tried by the king's writ or patent only, which is matter of record. (6 Rep. 53.) Also in case of an alien, whether alien, friend, or enemy, shall be tried by the league or treaty between his sovereign and our's; for every league or treaty is of record. (9 Rep. 31.) And also whether a manor be held in ancient demesne or not, shall be tried by the record of Domesday in the king's exchequer. Blackst. Com. book iii.

RECORD, among *Fowlers*. A bird is said to record, when it begins to tune or sing within itself; or to form its notes and dispose its organs for singing.

The cock thrush is distinguished from the hen in recording; the first being more loud and frequent in it than the second.

Instances have been known of birds beginning to record when they were not a month old. This first essay does not seem to have the least rudiments of the future song; but as the bird grows older and stronger, one may perceive what the nestling is aiming at. A young bird commonly continues to record for ten or eleven months, when he is able to execute every part of his song, which afterwards continues fixed, and is scarcely ever altered. The term record is probably derived from a musical instrument, formerly used in England, called a *recorder*, which seems to have been a species of flute, and was probably used to teach young birds to pipe tunes. Lord Bacon describes this instrument (in his second Century of Experiments) to have been straight, to have had a lesser and greater bore, both above and below, to have required very little breath from the blower, and to have had what he calls a fipple or stopper.

RECORDARI *facias loquelam*, in *Law*, a writ directed to the sheriff to remove a cause depending in an inferior court, as hundred-court, county-court, court of ancient demesne, &c. to the king's bench, or common pleas, &c.

It is thus called, because it commands the sheriff to *make a record* of the proceedings either by himself, or others; and then to send up the cause.

RECORDE, ROBERT, in *Biography*, an early English physician, of Welsh origin, commenced his education at Oxford about the year 1525; and in 1531 was elected fellow of All-Souls' College. Directing his studies to physic, but where, or under what masters, we are not told, he was created doctor in that faculty at Cambridge in 1545. Both before and after this period he is said to have taught arithmetic at Oxford, and to have excelled all his predecessors

iors in rendering this branch of knowledge clear and familiar. He is likewise mentioned as remarkably skilled in rhetoric, astronomy, geometry, music, mineralogy, and every part of natural history. He was well acquainted with the Saxon language, and made large collections of historical and other ancient manuscripts. To these various studies he joined that of divinity, and was attached to the principles of the Reformers. But notwithstanding he was justly deemed a prodigy of learning and talents, it does not appear that he met with encouragement at all adequate to his merits; since all that we know further of him is, that he died in the king's bench prison, where he was confined for debt, in the year 1558.

He was author of several works, some of which were several times reprinted, on the following subjects.

"The Ground of Arts, teaching the Work and Practice of Arithmetic, both in whole Numbers and Fractions," 1540. This was dedicated to king Edward VI. "The Whetstone of Wit," a second part of the former. "The Path-way to Knowledge, containing the first Principles of Geometry." "The Castle of Knowledge, containing the Explanation of the Sphere." "The Urinal of Physick," 1547, which was reprinted in London in 1582, 1599, and 1665; and in the last mentioned year, the title of "The Judicial of Urines" was given to it. This book contains a description of urinary vessels with figures. It is a short, but very methodical treatise, full of divisions and subdivisions relative to the different kinds of urines, and the prognostics to be deduced from them. Nevertheless he candidly acknowledges at the beginning, that the judgment to be formed in diseases from the urine is not so certain as some have represented; and indeed the perplexity and variety of opinions concerning this subject are sufficiently apparent from his treatise. His other works were, "Of Anatomy;" "Of Auricular Confession;" "Of the Eucharist;" and "The Image of a true Commonwealth." Aikin's Biog. Memoirs of Medicine.

RECORDER, RECORDATOR, a person whom the mayor, or other chief magistrate of any city, or town corporate, having jurisdiction, and a court of record, within their precincts, does associate with him, for his better direction in matters of justice, and proceedings according to law. He is usually a counsellor, or other person, versed and experienced in the law. In some towns, which have their particular assizes within themselves, and no mayor, the recorder is the judge.

The recorder of London is one of the justices of oyer and terminer, and a justice of peace of the quorum, for putting the laws in execution for preserving the peace and government of the city; and being the mouth of the city, he delivers the sentences and judgments of the courts therein, and also certifies and records the city customs, &c. He is chosen by the lord mayor and aldermen, and attends the business of the city, on any warning by the lord mayor, &c.

RECORDER, in Music. See **RECORD**, supra.

RECORDO & *processu mittendis*, in Law, is a writ to call a record, together with the whole proceedings in the cause, out of an inferior court into the king's court.

RECOVERY, in a legal sense, an obtaining of any thing by judgment, or trial at law; answering to *evictio* among the civilians.

There is a *true* and a *feigned* recovery.

RECOVERY, True, is an actual or real recovery of any thing, or of the value of it, by judgment. As if a man sue for any land, or other thing, and have a verdict or judgment for him.

RECOVERY, Feigned or Common, is a sort of *fiat juris*, being a certain form or course prescribed by law to be observed for the better assuring of lands and tenements to us; the end and effect of which is, to discontinue and destroy estates-tail, remainders, and reversions, and to bar the entails of them.

These common recoveries were invented by the ecclesiastics to elude the statutes of mortmain; and afterwards encouraged by the finesse of the courts of law in 12 Edw. IV. in order to put an end to all fettered inheritances, and bar not only estates-tail, but also all remainders and reversions expectant thereon.

A common recovery is so far like a *fine* (which see), that it is a suit or action, either actual or fictitious; and in it the lands are *recovered* against the tenant of the freehold; which recovery, being a supposed adjudication of the right, binds all persons, and vests a free and absolute fee-simple in the recoveror.

This recovery is either with a *single* or *double voucher*; and sometimes a treble or farther voucher, as the exigency of the case may require.

As a recovery is in the nature of an action at law, not immediately compromised like a fine, but carried through every regular stage of proceeding, its form and method are not easily understood by those who are unacquainted with the course of judicial proceedings. Judge Blackstone has, therefore, stated its nature and progress as clearly and concisely as possible; avoiding, to the utmost of his power, all technical terms and phrases not before interpreted. Of his luminous statement we shall avail ourselves in the sequel of this article.

Let us (says he), in the first place, suppose David Edwards to be tenant of the freehold, and desirous to suffer a common recovery, in order to bar all entails, remainders, and reversions, and to convey the same in fee-simple to Francis Golding. To effect this, Golding is to bring an action against him for the lands; and he accordingly sues out a writ, called a *precipe quod reddat*, because those were its initial or most operative words, when the law proceedings were in Latin. In this writ the demandant, Golding, alleges, that the defendant, Edwards, (here called the tenant) has no legal title to the land; but that he came into possession of it after one Hugh Hunt had turned the demandant out of it. The subsequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are first recited; whereupon the tenant appears, and calls upon one Jacob Morland, who is supposed, at the original purchase, to have warranted the title to the tenant; and thereupon he prays, that the said Jacob Morland may be called in to defend the title, which he so warranted. This is called the *voucher, vocatio*, or calling of Jacob Morland to warranty; and Morland is called the *vouchee*. Upon this, Jacob Morland, the vouchee, appears, is impleaded, and defends the title. Whereupon Golding, the demandant, desires leave of the court to *imparl*, or confer with the vouchee in private; which is (as usual) allowed him. And soon afterwards the demandant, Golding, returns to court, but Morland the vouchee disappears, or makes the default. Whereupon judgment is given for the demandant, Golding, now called the recoveror, to recover the lands in question against the tenant, Edwards, who is now the recoveree: and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompense for the lands so warranted by him, and now lost by his default; which is agreeable to the doctrine of warranty. This is called the recompense, or *recovery in value*. But Jacob Morland having no lands of his own, being usually the cryer of the

RECOVERY.

court (who, from being frequently thus vouched, is called the *common vouchee*) it is plain that Edwards has only a nominal recompense for the lands so recovered against him by Golding; which lands are now absolutely vested in the said recoveror by judgment of law, and seisin thereof is delivered by the sheriff of the county. So that this collusive recovery operates merely in the nature of a conveyance in fee-simple, from Edwards the tenant in tail, to Golding the purchaser.

The recovery, here described, is with a single voucher only; but sometimes it is with *double, treble*, or farther voucher, as the exigency of the case may require. And indeed it is now usual always to have a recovery with double voucher at the least: by first conveying an estate of freehold to any indifferent person, against whom the *præcipe* is brought; and then he vouches the tenant in tail, who vouches over the common vouchee. For, if a recovery be had immediately against tenant in tail, it bars only such estate in the premises of which he is then actually seised; whereas if the recovery be had against another person, and the tenant in tail be vouched, it bars every latent right and interest which he may have in the lands recovered. If Edwards therefore be tenant of the freehold in possession, and John Barker be tenant in tail in remainder, here Edwards doth first vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the last person vouched, and always makes default: whereby the demandant, Golding, recovers the land against the tenant Edwards, and Edwards recovers a recompense of equal value against Barker the first vouchee; who recovers the like against Morland the common vouchee, against whom such ideal recovery in value is always ultimately awarded.

This supposed recompense in value is the reason why the issue in tail is held to be barred by a common recovery. For if the recoveree should obtain a recompense in lands from the common vouchee (which there is a possibility in contemplation of law, though a very improbable one, of his doing) these lands would supply the place of those so recovered from him by collusion, and would descend to the issue in tail. This reason will also hold with equal force, as to *most* remainder-men and reversioners; to whom the possibility will remain and revert, as a full recompense for the reality, which they were otherwise entitled to: but it will not *always* hold; and therefore, as Pigott says, the judges have been even *astute*, in inventing other reasons to maintain the authority of recoveries. And, in particular, it hath been said, that, though the estate-tail is gone from the recoveree, yet it is not *destroyed*, but only *transferred*; and still subsists, and will ever continue to subsist (by construction of law) in the recoveror, his heirs, and assigns: and, as the estate-tail so continues to subsist for ever, the remainders or reversions expectant on the determination of such estate-tail can never take place.

To such awkward shifts, such subtle refinements, and such strange reasoning, were our ancestors obliged to have recourse, in order to get the better of that stubborn statute *de donis*. The design, for which these contrivances were set on foot, was certainly laudable; the unrivetting the fetters of estates-tail, which were attended with a legion of mischiefs to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of justice have indeed adopted a more manly way of treating the subject; by considering common recoveries in no other light, than as the formal mode of conveyance, by which tenant in tail is enabled to aliene his lands. But, since the ill consequences of fettered inheritances are now generally seen and allowed, and of course the utility and expedience

of setting them at liberty are apparent; it hath often been wished, that the process of this conveyance was shortened, and rendered less subject to niceties, by either totally repealing the statute *de donis*; which perhaps, by reviving the old doctrine of conditional fees, might give birth to many litigations: or by vesting in every tenant in tail of full age the same absolute fee-simple at once, which now he may obtain whenever he pleases, by the collusive fiction of a common recovery; though this might possibly bear hard upon those in remainder or reversion, by abridging the chances they would otherwise frequently have, as no recovery can be suffered in the intervals between term and term, which sometimes continue for near five months together: or, lastly, by empowering the tenant in tail to bar the estate-tail by a solemn deed, to be made in term time and enrolled in some court of record; which is liable to neither of the other objections, and is warranted not only by the usage of our American colonies, and the decisions of our own courts of justice, which allow a tenant in tail (without fine or recovery) to appoint his estate to any charitable use, but also by the precedent of the statute 21 Jac. I. c. 19. which, in case of a bankrupt tenant in tail, empowers his commissioners to sell the estate at any time, by deed indented and enrolled. And if, in so national a concern, the emoluments of the officers, concerned in passing recoveries, are thought to be worthy attention, those might be provided for in the fees to be paid upon each enrolment.

The *force* and *effect* of common recoveries may appear, from what has been said, to be an absolute bar not only of all estates-tail, but of remainders and reversions expectant on the determination of such estates. So that a tenant in tail may, by this method of assurance, convey the lands held in tail to the recoveror, his heirs and assigns, absolutely free and discharged of all conditions and limitations in tail, and of all remainders and reversions. But, by statute 34 and 35 Hen. VIII. c. 20. no recovery had against tenant in tail, of the king's gift, whereof the remainder or reversion is in the king, shall bar such estate-tail, or the remainder or reversion of the crown. And by the statute 11 Hen. VII. c. 20. no woman, after her husband's death, shall suffer a recovery of lands settled on her by her husband, or settled on her husband and her by any of his ancestors. And by statute 14 Eliz. c. 8. no tenant for life, of any sort, can suffer a recovery, so as to bind them in remainder or reversion. For which reason, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is desirous to suffer a valid recovery; either he, or the tenant to the *præcipe* by him made, must *vouch* the remainder-man in tail, otherwise the recovery is void: but if he does vouch such remainder-man, and he appears and vouches the common vouchee, it is then good; for if a man be vouched and appears, and suffers the recovery to be had against the tenant to the *præcipe*, it is as effectual to bar the estate-tail as if he himself were the recoveree. Salk. 571.

In all recoveries it is necessary that the recoveree, or tenant to the *præcipe*, as he is usually called, be actually seised of the freehold, else the recovery is void. (Pigott, 28.) For all actions to recover the seisin of lands, must be brought against the actual tenant of the freehold, else the suit will lose its effect; since the freehold cannot be recovered of him who has it not. And, though these recoveries are in themselves fabulous and fictitious, yet it is necessary that there be *actores fabulae*, properly qualified. But the nicety thought by some modern practitioners to be requisite in conveying the legal freehold, in order to

to make a good tenant to the *præcipe*, is removed by the provisions of the statute 14 Geo. II. c. 20. which enacts, with a retrospect and conformity to the ancient rule of law, that, though the legal freehold be vested in lessees, yet those who are entitled to the next freehold estate in remainder or reversion may make a good tenant to the *præcipe*;—that, though the deed or fine which creates such tenant be subsequent to the judgment of recovery, yet, if it be in the same term, the recovery shall be valid in law;—and that, though the recovery itself do not appear to be entered, or be not regularly entered, on record, yet the deed to make a tenant to the *præcipe*, and declare the uses of the recovery, shall after a possession of twenty years be sufficient evidence, on behalf of a purchaser for valuable consideration, that such recovery was duly suffered. And this may suffice to give the student a general idea of common recoveries, the last species of assurances by matter of record.

For an account of deeds to lead, or declare, the *uses* of fines, and recoveries; see *USES*.

In some manors, by special custom, recoveries may be suffered of copyhold (Moor, 637.); but as these differ in nothing material from recoveries of free land, excepting only that they are not suffered in the king's courts, but in the court baron of the manor, we shall refer this subject to the article *SURRENDER*. In this place we shall observe, however, that a fine or recovery had of copyhold lands in the king's court may, if not duly reversed, alter the tenure of the lands, and convert them into frank-fee, which is defined in the old book of tenures to be "land pleadable at the common law:" but upon an action on the case, in the nature of a writ of "deceit," brought by the lord in the king's court, such fine or recovery will be reversed, the lord will recover his jurisdiction, and the lands will be restored to their former state of copyhold. Blackst. Com. b. ii.

Clerk of Inrolments of Recoveries and Fines. See *CLERK*.

RECOVERY, Fort, in *Geography*, a fort of America, in the Indiana territory, situated on a branch of the Wabash river, about 23 miles from Greenville. It consists of two block-houses, and barracks with curtains, sufficient for 60 men.

RECOUPE, French; formed of *re*, and *couper*, to cut again, in *Law*, to rebate, or discount.

Thus, if a man have ten pounds issuing out of certain lands, and he disseises the tenant of the land; in an assise brought by the disseisee, if he recover the land and damages, the disseisor shall recoupe the rent due in the damages.

RECOUPE also denotes a quick, sharp reply, to a peremptory demand. See *REPARTEE*.

RECREANT, in our old *Law-Books*, implies cowardly, faint-hearted.

Hence *recreantise*. See *CRAVEN* and *CHAMPION*.

Recreant was so reproachful a word, that Glanville would not describe it. *Recreantes equi* is used by Fleta, lib. ii. cap. 2. for dull, jaded horses.

RECREATION ISLAND, in *Geography*, a fertile island in the Southern Pacific ocean, discovered by Roggewin in the year 1722. Some of the ship's company obtained a quantity of antiscorbutic herbs; but upon venturing into the country, they were assaulted by the natives, who, by casting stones at them, killed some, and wounded almost all. Many of the islanders were killed by the fire-arms in return. The soil produces sugar-canes, cocoa-nuts, pomegranates, Indian figs, &c. The inhabitants were well made, robust, and very lively: their bodies were painted, and they were armed. S. lat. 16°. W. long. 148°.

RECREMENT, RECREMENTUM, in *Medicine*, some

superfluous matter separated from some other that is useful.

In which sense, it amounts to much the same with *feces*, or excrement.

Recrements of vegetables are useful as manure.

RECREMENT is sometimes also used to denote such secreted juices in the body, as are afterwards of use in the economy; as the lymphæ, gall, &c. which are thus called, in contradistinction to excrements, which are expelled out of the body, as of no farther use.

RECRIMINATION, a posterior accusation brought by the accused against his accuser, upon the same fact.

When two parties have made their mutual complaint at the same time; the business is, first, to determine who shall be the accuser, and who the accused, *i. e.* on whom shall fall the recrimination.

By the French laws, recrimination is of no force till the criminal hath been purged legally.

RECRUESCENCE, RECRUESCENTIA, in *Medicine*, is a relapse, when a disease that has gone off returns again.

RECRUITS, in the *Military Art*, new men raised to supply the places of such as have lost their lives in the service, or are rendered unserviceable by age or wounds. See *LISTING*.

RECRUIT-Horses, are the horses brought up for completing the regiments of horse or dragoons every year.

RECTANGLE, in *Geometry*, called also *oblong*, and *long square*, a quadrilateral rectangular figure *MLIK*, (*Plate XII. Geometry, fig. 3.*) whose opposite sides, *ML* and *IK*, as well as *MI* and *LK*, are equal.

Or, a rectangle is a parallelogram, whose sides are unequal, but its angles right.

To find the area of a rectangle, see *PARALLELOGRAM*.

If from the same point *A*, (*fig. 4.*) be drawn two lines, one of which, *AD*, is a tangent to a circle, the other a secant *AB*; the square of the tangent *AD* will be equal to the rectangle under the secant *AB*, and that part of it without the circle *AC*. If two or more secants, *Aa*, *AB*, &c. be drawn from the same point *A*; the rectangles, under their wholes, and their parts without the circle, will be equal. If two chords intersect each other, the rectangles under their segments will be equal. The rectangles under equal lines are equal. The sum of all the rectangles contained under a given line, and all the parts of another any how divided, is equal to the rectangle contained under the two whole lines. If from any point, within a rectangle, to the angles of a rectangle, four lines be drawn, the sums of the squares of those drawn to the opposite angles will be equal. The rectangles contained under the corresponding sides of equiangular triangles, taken alternately, are equal. The rectangle under the two sides of any triangle is equal to the rectangle under the perpendicular to its base, and the diameter of the circumscribing circle. The square of a line bisecting any angle of a triangle, and terminating in the opposite side, together with the rectangle under the two segments of that side, is equal to the rectangle of the two sides, including the proposed angle. The rectangle of the two diagonals of any quadrilateral inscribed in a circle, is equal to the sum of the two rectangles contained under the opposite sides.

RECTANGLES, Similar. See *SIMILAR*.

RECTANGLE, in *Arithmetic*, is the same with product or factum.

RECTANGLED, RIGHT-ANGLED, Triangle, is a triangle, one of whose angles is right, or equal to 90°. See *TRIANGLE*.

There can be but one right angle in a plain triangle; therefore a rectangled triangle cannot be equilateral.

RECTANGULAR, in *Geometry*, is applied to figures and solids which have one or more angles right.

Such are squares, rectangles, and rectangled triangles, among plain figures; cubes, parallelepipeds, &c. among solids.

Solids are also said to be rectangular with respect to their situation: thus, if a cone, cylinder, &c. be perpendicular to the plane of the horizon, it is called a rectangular or right cone, cylinder, &c.

The ancients used the phrase *rectangular section of a cone*, to denote a parabola; that conic section, before Apollonius, being only considered in a cone, whose section by the axis would be a triangle, right-angled at the vertex. See **CONIC SECTIONS**.

Hence it was that Archimedes entitled his book of the quadrature of the parabola, by the name of "*Rectanguli Coni Sectio*."

RECTANGULAR Barometer. See **BAROMETER**.

RECTANGULAR Windmills. See **WINDMILLS**.

RECTIFICATION, compounded of *rectus*, right, *directa*, and *facto*, I became, the act of *rectifying*, i. e. of correcting, remedying, or redressing, some defect or error, in respect either of nature, art, or morality.

RECTIFICATION, in *Chemistry*, is the repeating of a distillation or sublimation several times, and generally with a less degree of heat than at first, in order to render the substance purer, finer, and freer from aqueous and earthy parts.

Rectification is a reiterated depuration of a distilled matter, e. g. brandy, spirits, or oils, by distilling them over again, to render them more subtle, and exalt their virtues.

That the rectification of spirits may, in all cases, proceed with the greatest exactness, a due regard to it must be had even from the first fermenting the substance from which they are to be made, and continued through all the stages of distillation, the low wines, proof spirit, and alcohol. The management of the fermented liquor, to this purpose, is principally the letting it stand to subside after the fermentation is over, and the drawing it off clear and thin, not too rich for the still. The still is not to be overfilled with this. Great care must be taken to prevent its burning, and the fumes that run last must be kept separate, not mixed with the rest of the liquor distilled, which is now called the low wines. In the rectifying of these into proof spirit, great caution must be used that the fire be kept regular, not raised by sudden spirits, which always throw up the oil in large quantities, which is to be left behind. In the succeeding rectification of the proof spirit into alcohol, the same cautious management of the fire is necessary; and, in both this and the last, the fumes are not to be suffered to run in among the spirit, but to be saved separate. They may be all mixed together at last, and reduced to a spirit fit for burning in lamps; but the keeping out of the rectified liquor will keep away the coarsest and most stinking part of the oil of the ingredients.

By these easy means, without any additional trouble or charge, we might be furnished with a spirit greatly exceeding what we commonly meet with. And in general, the art and mystery of our sellers of the several sorts of English brandies, seem to consist in this prudent management, and in the adding a little of the *oleum vini*, or oil of wine-lees, to the spirits thus procured pure: this gives the flavour of foreign brandies, and is so extensive in its use, that half an ounce of it is sufficient for a hoghead of pure spirit.

Malt spirit is that which principally requires all this care in the rectification, because its oil is more nauseous and

offensive than that of any other spirit; but all others will be greatly the better for being treated in the same manner, and it is indeed necessary that they should for some particular uses.

It is remarkable, that no one method of combinatory rectification, that is, of the rectification performed by means of salt, and other additions, is suited to all the several kinds of spirits; scarcely indeed will any one way serve for any two spirits; but this method, by simple and careful distillation, is equally suited to all. Molasses-spirit, cyder-spirit, wine-spirit, or brandy, rum, and arrack, are all improved by it; and all of them are then known to be perfectly rectified, when, in the state of alcohol, they not only prove totally inflammable in a little vessel floating upon cold waters, but when poured into the purest spring water they have not the least power of making any change in it, nor leave any marks of oiliness, or that unctuousity which, on the mixture of the less pure spirits, floats on the top, and in certain lights gives the rainbow colours. Shaw's Essay on Distillery. See **ALCOHOL** and **DISTILLATION**.

Fixed salts are rectified by calcination, dissolution, or filtration.

Metals are rectified, i. e. refined, by the coppel; and reguluses by repeated fusions, &c.

In a word, all rectifications are founded upon the same principle; and consist in separating substances more volatile from substances less volatile; and the general method of effecting this is to apply only the degree of heat which is necessary to cause this separation.

RECTIFICATION of vitriolic Acid. See **CONCENTRATION**.

RECTIFICATION, in *Geometry*, is the finding of a right line equal to a proposed curve, or simply finding the length of a curve line; a problem which, even in the present advanced state of analysis, is attended in many cases with considerable difficulty; and was, in all, totally beyond the reach of the ancient geometers, who were not able to assign the length of any curve line whatever; though they could, in a few instances, determine the area of a curvilinear space. See **QUADRATURE**.

The first rectification of a curve line was effected by Mr. H. Neal, as we are informed by Dr. Wallis, at the conclusion of his Treatise on the Ciloid. This curve was the semicubical parabola, and Neal's rectification of it was published in July or August, 1657; and two years after, viz. in 1659, the same was done by Van Haureat in Holland. See Schooten's Commentary on Descartes' Geometry.

It is, however, to the doctrine of fluxions that we owe the complete rectification of curve lines, in finite terms, when they admit of it; and in others by means of infinite series, circular arcs, logarithms, &c.; of which method we shall give a general view in the present article.

Let **A M O** (*Plate XIII. Analysis, fig. 10.*) be a curve of any kind, whose ordinates are parallel to one another, and perpendicular to the axis **A H**; and let the fluxion of the absciss **A P** be denoted by Pp or MR , and Rm be taken to represent the corresponding fluxion of the ordinate **PM**, then will the tangent **Mm** be the line which the generating point of the curve would describe, if its motion were to become uniform at **M**; consequently this line will truly express the fluxion of the space **AM**. Hence putting $AP = x$, $PM = y$, and $AM = z$, we have $z = Mm = \sqrt{(MR^2 + Rm^2)} = \sqrt{(x^2 + y^2)}$; from which, and the equation of the curve, the value of z may be determined. But if all the ordinates of the proposed curve **A R M** (*fig. 11.*) be referred to a centre **C**; then, putting the tangent **R P**, intercepted by the perpendicular **C P**, = t , the arc **B N**, of a circle described about the centre **C**, = x , the radius

RECTIFICATION.

radius CN (or CB) = a , &c. (see QUADRATURE of Curves, Case 2.) we shall have $\dot{z} : \dot{y} :: y (\dot{C}R) : t (\dot{R}P)$; and consequently, $\dot{z} = \frac{y\dot{y}}{t}$; whence the value of z will be found, if the relation of y and t is given.

I. To find the length of the semi-cubical parabola, of which the equation is $ax^2 = y^3$, or $x = \frac{y^{\frac{3}{2}}}{a^{\frac{1}{2}}}$.

Here $\dot{x} = \frac{3y^{\frac{1}{2}}\dot{y}}{2a^{\frac{1}{2}}}$, or $\dot{x}^2 = \frac{9y\dot{y}^2}{4a}$; substituting, therefore,

this value of \dot{x}^2 in the general expression

$$\dot{z} = \sqrt{(\dot{x}^2 + \dot{y}^2)}, \text{ we have}$$

$$\dot{z} = \sqrt{\left(\frac{9y\dot{y}^2}{4a} + \dot{y}^2\right)} = \frac{\dot{y}}{2a^{\frac{1}{2}}} \sqrt{(9y + 4a)}$$

the fluent of which is

$$z = \frac{1}{27a^{\frac{1}{2}}} \times (9y + 4a)^{\frac{3}{2}} + C, \text{ correction.}$$

Now when the arc = 0, then $y = 0$; therefore

$$\frac{4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}} + C = 0, \text{ or } C = -\frac{4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}};$$

whence the complete fluent is

$$z = \frac{(9y + 4a)^{\frac{3}{2}} - 4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}},$$

which is the length of the curve, answering to any length of the ordinate y .

II. To rectify the common parabola; or to find the length of any parabolic arc AM (fig. 11.) Let the parameter = a , the absciss = AP = x , &c. as above. From the well known property of this curve, $ax = y^2$; and $a\dot{x} = 2y\dot{y}$; consequently $\dot{x} = \frac{2y\dot{y}}{a}$, and $\dot{x}^2 = \frac{4y^2\dot{y}^2}{a^2}$, which substituted for \dot{x}^2 in the general expression for the length of the curve, makes $\dot{z} = \left(\frac{4y^2\dot{y}^2}{a^2} + \dot{y}^2\right)^{\frac{1}{2}} = \frac{\dot{y}}{a} \times (a^2 + 4y^2)^{\frac{1}{2}}$;

which, thrown into an infinite series, becomes $= \frac{\dot{y}}{a} \times \left(a + \frac{2y^2}{a} - \frac{2y^4}{a^3} + \frac{4y^6}{a^5}, \&c.\right)$ i. e. $\dot{z} = \dot{y} + \frac{2y^2\dot{y}}{a^2} - \frac{2y^4\dot{y}}{a^3} + \frac{4y^6\dot{y}}{a^5}, \&c.$

The fluent of this series is $z = y + \frac{2y^3}{3a^2} - \frac{2y^5}{5a^4} + \frac{4y^7}{7a^6} - \dots$, &c. = the length of the curve AM required.

Otherwise: the above $\dot{z} = \frac{\dot{y}}{a} \times (a^2 + 4y^2)^{\frac{1}{2}}$ is $= \frac{\dot{y}}{a} \times \frac{a^2 + 4y^2}{(a^2 + 4y^2)^{\frac{1}{2}}} = \frac{a^2y\dot{y} + 4y^3\dot{y}}{a \times (a^2y^2 + 4y^4)^{\frac{1}{2}}} = \frac{\frac{1}{2}a^2y\dot{y} + 4y^3\dot{y}}{a \times (a^2y^2 + 4y^4)^{\frac{1}{2}}} + \frac{\frac{1}{2}a^2\dot{y}}{a \times (a^2 + 4y^2)^{\frac{1}{2}}} = \frac{1}{a} \times (a^2y^2 + 4y^4)^{-\frac{1}{2}} \times (\frac{1}{2}a^2y\dot{y} + 4y^3\dot{y}) + \frac{1}{4}a \times \frac{\dot{y}}{(\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}}$. But the fluent of the first of these

two terms is $= \frac{1}{2a} \times (a^2y^2 + 4y^4)^{\frac{1}{2}} = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$; and the fluent of the last of the two terms is $= \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$; therefore $z = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$. But when z and y vanish, or become equal 0, as they do at the vertex, this fluent becomes $= \frac{1}{4}a \times \text{hyp. log. of } \frac{1}{2}a$; and, therefore, the said fluent being corrected, gives the true value of z , or the length of the curve AM $= \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} - \frac{1}{4}a \times \text{hyp. log. of } \frac{1}{2}a = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } \frac{y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}}{\frac{1}{2}a}$.

and the fluent of the last of the two terms is $= \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$; therefore $z = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$. But when z and y vanish, or become equal 0, as they do at the vertex, this

fluent becomes $= \frac{1}{4}a \times \text{hyp. log. of } \frac{1}{2}a$; and, therefore, the said fluent being corrected, gives the true value of z , or the length of the curve AM $= \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} - \frac{1}{4}a \times \text{hyp. log. of } \frac{1}{2}a = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times \text{hyp. log. of } \frac{y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}}{\frac{1}{2}a}$.

Hence, if AC and DC (fig. 12.) be the conjugate semi-axes of an equilateral hyperbola; and AC = a , MP = $2y$, QM = x , then will AP = $x - a$; and $x^2 - a^2 = 4y^2$; therefore $x^2 = 4y^2 + a^2$; consequently $x = \sqrt{4y^2 + a^2}$. If then qm be supposed infinitely near QM, we shall have Qq = y , and therefore the element of the area CQMA = $y \times \sqrt{a^2 + 4y^2}$. Whence it appears, that the rectification of the parabola depends on the quadrature of the hyperbolic space CQMA.

III. To determine the length of an arc of the common hyperbola. Let the semitransverse axis be represented by b , and the femiconjugate by c , and we shall have $\frac{b^2y^2}{c^2} = 2bx + x^2$, from the nature of the curve (see HYPERBOLA); and therefore $x = \frac{b\sqrt{c^2 + y^2}}{c} - b$; hence $\dot{x} = \frac{by\dot{y}}{c\sqrt{c^2 + y^2}}$, and $\dot{z} = \sqrt{y^2 + \dot{x}^2} = \sqrt{y^2 + \frac{b^2y^2\dot{y}^2}{c^2 \times (c^2 + y^2)}} = y\sqrt{1 + \frac{b^2y^2}{c^4 + c^2y^2}}$; which, by converting $\frac{b^2y^2}{c^4 + c^2y^2}$ into an infinite series, becomes $y\sqrt{1 + \frac{b^2y^2}{c^4} - \frac{b^2y^4}{c^6} + \frac{b^2y^6}{c^8} - \frac{b^2y^8}{c^{10}}, \&c.}$ But still we have the square root to extract: in order to which, let it be assumed $= 1 + Ay^2 + By^4 + Dy^6, \&c.$ Then, by squaring, and transposing, there arises

$$\left. \begin{aligned} 1 + 2Ay^2 + 2By^4 + 2Cy^6 + 2Dy^8, \&c. \\ + A^2y^4 + 2ABy^6 + 2ACy^8, \&c. \\ + B^2y^8, \&c. \end{aligned} \right\} = 0. \\ - 1 - \frac{b^2}{c^4} \times y^2 + \frac{b^2}{c^6} \times y^4 - \frac{b^2}{c^8} \times y^6 + \frac{b^2}{c^{10}} \times y^8, \&c.$$

Hence $A = \frac{b^2}{2c^4}$; $B = -\frac{b^2}{2c^6} - \frac{1}{2}A^2 = -\frac{b^2}{2c^6} - \frac{b^4}{8c^8}$; $C = \frac{b^2}{2c^8} - AB = \frac{b^2}{2c^8} + \frac{b^4}{4c^{10}} + \frac{b^6}{16c^{12}}, \&c. \&c.$ Therefore $\dot{z} = y\sqrt{1 + \frac{b^2y^2}{c^4}, \&c.} = y \times (1 + Ay^2 + By^4, \&c.) = y + \frac{b^2}{2c^4} \times y^3 - \left(\frac{b^2}{2c^6} + \frac{b^4}{8c^8}\right) \times y^5 + \left(\frac{b^2}{2c^8} + \frac{b^4}{4c^{10}} + \frac{b^6}{16c^{12}}\right) \times y^7 + \dots$

RECTIFICATION.

Having thus laid down his plan of operation, by a few trials he fell upon a number well suited to his purpose, *viz.*

knowing the tangent of $\frac{1}{4}$ of 45° , or $11^\circ 15'$, to be very

nearly $\frac{1}{5}$, radius being 1, he assumed for his first arc that

whose tangent is $\frac{1}{5}$; then since $\tan. 2a = \frac{2 \tan. a}{1 - \tan.^2 a}$,

he had $\frac{5}{12}$ for the tangent of his double arc, and $\frac{120}{119}$ for

the double of this, or of four times the first, which being

a little greater than 45° , was well adapted to his views; for

by a known trigonometrical property, $\tan. (a - 45) =$

$\frac{\tan. a - 1}{\tan. a + 1}$; that is, the tangent of the small arc, which is

equal to the excess of his multiple above 45° , was $\frac{\frac{120}{119} - 1}{\frac{120}{119} + 1}$

$= \frac{1}{239}$. He had, therefore, two arcs to compute, the one

having for its tangent $\frac{1}{5}$, and the other $\frac{1}{239}$; and then four

times the first of these arcs minus the latter, would evidently

give the exact arc of 45° , and both these numbers being such

as to converge very well in the general series, the difficulty

attending the usual approximation was avoided. Other approximations,

however, have since been discovered, which, if not more rapid,

their investigation is, at least, more simple, of which, perhaps,

that of Euler's is the most deserving of notice. This celebrated

geometer observes, that every arc whose tangent is commensurable

with the radius, as, for instance, 45° , may be divided into two

arcs, of which the tangents, though much smaller, are still

commensurable with the radius; for since

$$\tan. (a + b) = \frac{\tan. a + \tan. b}{1 - \tan. a \tan. b},$$

we have also

$$\tan. a = \frac{\tan. (a + b) - \tan. b}{\tan. (a + b) \tan. b + 1};$$

where it is obvious that if $\tan. (a + b)$ and b be rational,

$\tan. a$ will also be rational; thus, if $\tan. (a + b) = \tan. 45^\circ$

$= 1$, and $\tan. b = \frac{1}{2}$, we have $\tan. a = \frac{1}{3}$, and we shall

evidently have a similar result, whatever rational fraction we

assume for $\tan. b$.

We shall find, therefore, by the series which gives the arc

in terms of the tangent, each of these arcs, the sum of which

will evidently be the measure of the whole arc sought; whether

the arcs themselves, which belong to these tangents, be rational

or irrational, with respect to the whole arc of which they

form the parts. These tangents, substituted in

the general series above, give arc to $\tan. \left(\frac{1}{2}\right) =$

$$\frac{1}{2} - \frac{1}{3 \cdot 2^3} + \frac{1}{5 \cdot 2^5} - \frac{1}{7 \cdot 2^7} + \frac{1}{9 \cdot 2^9} - \&c.$$

and arc to $\tan. \left(\frac{1}{3}\right) =$

$$\frac{1}{3} - \frac{1}{3 \cdot 3^3} + \frac{1}{5 \cdot 3^5} - \frac{1}{7 \cdot 3^7} + \frac{1}{9 \cdot 3^9} - \&c.$$

In both which series, the terms diminish much more rapidly than in the original series, and may therefore be computed with tolerable ease.

But it is evident that we may proceed farther in this approximation,

by dividing each of these into other two arcs, by which means

the convergency will obviously be much more rapid; and though,

generally speaking, for every subdivision we double the number

of our series, yet the degree of convergency is so much the greater

as amply to compensate for the additional number of series. Besides,

we may always subdivide our greater arc, so that one of its subdivisions

shall be the same as the smaller arc, in which case we do not

increase the number of series. Thus; arc to $\tan. \frac{1}{2} =$ arc

to $\tan. \frac{1}{3} +$ arc to $\tan. \frac{1}{7}$; therefore arc to $\tan. 1 = 2$

arc to $\tan. \frac{1}{3} +$ arc to $\tan. \frac{1}{7}$. Again; arc to $\tan. \frac{1}{3}$

$=$ arc to $\tan. \frac{1}{7} +$ arc to $\tan. \frac{2}{11}$; therefore arc to $\tan.$

$1 = 3$ arc to $\tan. \frac{1}{7} + 2$ arc to $\tan. \frac{2}{11}$, and so on to

any extent required, which might in course be pursued so far

as to render the operation as simple and as little laborious as

can be expected in such kind of computations. Even with these

already mentioned, the circumference of the circle might

undoubtedly be computed to 200 places of decimals, with less

labour than it cost Vieta to carry them to 10 places, or Romanus

to 15.

The reader will observe, that this approximation differs from

Machin's in nothing except the simplicity and generality of the

investigation; for if we make the successive subdivision of the

greater arc, we shall find in our results the identical formula of

Machin.

Let us repeat our former expression

$$\tan. a = \frac{\tan. (a + b) - \tan. b}{1 - \tan. a \tan. b}.$$

Let $\tan. (a + b) = \frac{R}{T}$, $\tan. a = \frac{R'}{T'}$, $\tan. b = \frac{r}{t}$, and

we shall have generally $\frac{R'}{T'} = \frac{Rt - Tr}{Rr + Tt}$.

Let now $\tan. (a + b) = 1$, answering to arc 45° , so that

$R = 1$, and $T = 1$; assume also $r = 1$, then, by constantly

substituting, in the general expression, the values found for

$R', R'', R''', \&c.$ and $T', T'', T''', \&c.$ for R and T respectively,

we shall have

$$\frac{R'}{T'} = \frac{t - 1}{t + 1}$$

$$\frac{R''}{T''} = \frac{t^2 - 2t - 1}{t^2 + 2t - 1}$$

$$\frac{R'''}{T'''} = \frac{t^3 - 3t^2 - 3t + 1}{t^3 + 3t^2 - 3t - 1}$$

$$\frac{R^{iv}}{T^{iv}} = \frac{t^4 - 4t^3 - 6t^2 + 4t + 1}{t^4 + 4t^3 - 6t^2 - 4t + 1}$$

$$\frac{R^v}{T^v} = \frac{t^5 - 5t^4 - 10t^3 + 10t^2 + 5t - 1}{t^5 + 5t^4 - 10t^3 - 10t^2 + 5t + 1}$$

$$\frac{R^{(n)}}{T^{(n)}} = \frac{t^n - n t^{n-1} - \frac{n(n-1)}{1 \cdot 2} t^{n-2} + \&c.}{t^n + n t^{n-1} - \frac{n(n-1)}{1 \cdot 2} t^{n-2} - \&c.}$$

So that, generally, arc to tan. 1 = $n \times$ arc to tan. $\frac{1}{t} +$ arc to tan. $\frac{R^{(n)}}{T^{(n)}}$. If we take $n = 1$, and $t = 3$, we have arc tan. 1 = arc tan. $\frac{1}{3} +$ arc tan. $\frac{1}{2}$. If $n = 2$, and $t = 3$, we have arc tan. 1 = $2 \times$ arc tan. $\frac{1}{3} +$ arc tan. $\frac{1}{7}$. If $n = 4$, and $t = 5$, we have arc tan. 1 = $4 \times$ arc tan. $\frac{1}{5} -$ arc tan. $\frac{1}{239}$; which is the formula of Machin; and by

giving other values to n and t , a variety of other formulae might be found, though it would, probably, be difficult to find one more convergent than the last. The reader will find more on this subject in vol. i. of Dr. Hutton's Tracts.

We shall conclude this article by giving the circumference of the circle to 155 places, as given by Zach, from a manuscript which he saw in the Ratcliff library at Oxford, distinguishing the periods of the several approximations of different authors mentioned in the preceding part of this article, and the article QUADRATURE.

The diameter of a circle being 1, the circumference will be

* This figure is a 7 in Lagny's approximation, but Vega, in the revision of the computation, asserts that it ought to be an 8, as we have given it.

RECTIFIED SPIRITS, &c. are such as have undergone the operation of rectification, or have been distilled over and over, to separate from them any heterogeneous matter, which might have arisen with them in the former distillations.

Hence we say, spirit of wine twice rectified, thrice rectified, &c.

It is the rectification that makes the difference between brandy and rectified spirits of wine. See SPIRITS.

RECTIFIER, in Navigation, is an instrument used for determining the variation of the compass, in order to rectify the ship's course, &c.

It consists of two circles, either laid upon, or let into one another, and so fastened together in their centres, that they represent two compasses, the one fixed, the other moveable: each is divided into thirty-two points of the compass, and three hundred and sixty degrees, and numbered both ways, from the north and the south, ending at the east and west in ninety degrees.

The fixed compass represents the horizon, in which the north, and all the other points, are liable to variation.

In the centre of the moveable compass is fastened a silk thread, long enough to reach the outside of the fixed compass: but if the instrument be made of wood, an index is used instead of the thread.

RECTIFIER, in the *Distillery*, the person whose employment is to take the coarse malt-spirit of the malt-stiller, and re-distil it to a finer and better liquor. The art of the rectifier might be entirely set aside, if the malt-stiller could make his spirit perfect at a second operation; which seems very practicable, if the malt-stillers could be induced to forsake their old practice. The great things to be recommended for the improvement of their art, would be, first, the brewing in perfection; and secondly, the keeping of their wash after the manner of stale beer, till it has entirely lost its malt flavour, and acquired a pungent acid vinosity; and then, thirdly, leaving out the lees, to distil with a well-regulated fire. It is scarcely to be thought how pure a spirit is to be obtained from malt this way; but the great art would be, the finding of a method to make malt liquors artificially stale, bright, and flavourless, though otherwise vinous. Shaw's Lectures, p. 223.

RECTIFYING of Curves. See RECTIFICATION.

RECTIFYING of the Globe or Sphere, is a previous adjusting of the globe or sphere, to prepare it for the solution of problems. For the method of doing it, see *Use of the Celestial GLOBE*.

RECTILINEAR, RIGHT-LINED, in Geometry, is applied to figures whose perimeter consists of right lines.

RECTILINEAR Angle, Maps, and Superficies. See the substantives.

RECTITUDE, RECTITUDO, *Rectum*, in matters of philosophy, refers either to the act of judging, or of willing; and therefore, whatever comes under the denomination of rectitude is either what is true, or what is good: these being the objects about which the mind exercises its two faculties of judging and willing.

Rectitude of the mind, considered as it judges, *i. e.* rectitude of the faculty of judgment, consists in its agreement and conformity to the nature and reason of things, and in its determining and deciding about them according to what their constitutions, properties, uses, &c. really are.

Rectitude of the mind, considered as it wills, called also moral rectitude, or uprightness, consists in the choosing and pursuing of those things which the mind, upon due enquiry and attention, clearly perceives to be good; and avoiding those that are evil.

RECTITUDINES, in Law, rights, or legal dues, belonging either to God, or man. See RIGHT.

RECTO, a writ usually called a *writ of right*; of so high a nature, that whereas other writs in real action are only to recover the possession of the lands, &c. in question, lost by the plaintiff, or his ancestor; this aims to recover both the seisin thus lost, and the property of the thing: so that both rights are here blended together; that of *property*, and that of *possession*.

If a man lose his cause upon this writ, he is without all remedy.

There are two kinds of this writ: *breve magnum de rebo*,

or *breve de recto patens*, a writ of right patent; and *recto clausum*, a writ of right close.

The first is so called, because sent open. It lies only for him that hath fee-simple in the lands sued for, against the tenant of the freehold at least.

Indeed, the writ of right patent is extended, in practice, beyond its original intention; for a writ of right of dower, which lies for the tenant in dower, is patent; and so in several other cases. Fitzherb.

The writ of right close, called also *breve parvum de recto*, is directed to the lord of ancient demesne, or the bailiff of the king's manors; and lies for those who hold lands and tenements by charter, in fee-simple, or in fee-tail, or for term of life, or in dower, if they be ejected out of such lands, or disseised. In such case a man, or his heirs, may sue out the writ of right close, directed to the lord of ancient demesne, commanding him to do him right in his court. This is called a writ *secundum consuetudinem manerii*. See POSSESSION, PROPERTY, TITLE, and WRIT.

RECTO de advocacione ecclesie, a writ of right, lying where a man has right of advowson in fee to him, and his heirs; and, the incumbent dying, a stranger presents his clerk to the church; and he, not having brought his action of *quare impedit*, nor *darrein presentment*, within six months, has suffered the stranger to usurp upon him. See *Disturbance of PATRONAGE, QUARE IMPEDIT*, and *ASSISA darrein presentment*.

RECTO de custodia terre & heredis, a writ which lies for him whose tenant dying in his nonage, a stranger enters, and takes the body of the heir.

This writ as to lands holden in *capite*, or by knight's service, is become useless by the stat. 12 Car. II. but not where there is a guardian in socage, or appointed by the last will of the ancestor. See GUARDIAN.

RECTO de dote, a writ of right of dower, which lies for a woman that has received part of her dower, and proceeds to demand the remnant in the same town against the heir, or his guardian. This extends either to part or the whole, and is a more general remedy than that mentioned in the next article.

RECTO de dote unde nihil habet, is a writ of right which lies in case where the husband, having divers lands and tenements, has assured no dower to his wife; and she is thereby driven to sue for her thirds against the heir, or his guardian. See DOWER, and *Writ of ENTRY*.

RECTO quando or quia dominus remisit, a writ of right, which lies in case where lands or tenements in the signory of any lord, are in demand by a writ of right.

If the lord hold no court, or, at the prayer of the demandant or tenant, send his writ to the king's court, to put the cause thither for that time; this writ issues for the other party, and has its name from the words comprised, which is the true occasion of it.

RECTO de rationabili parte, a writ that lies between priors of blood, as brothers in gavel-kind, or sisters, or other coparceners, as nephews and nieces, and for land in fee-simple.

If a man lease his land for life, and afterwards die, leaving issue two daughters, and, after, the tenant for life likewise dies; the one sister entering on all the land, and so deforming the other, the sister so deformed shall have this writ to recover her part.

RECTO sur disclaimer, a writ which lies where the lord, in the court of common pleas, does avow upon his tenant, and the tenant disclaims to hold of him; upon which disclaimer the lord shall have this writ. This takes place when the tenant upon a writ of assize for rent, or on a re-

plevin, disowns or disclaims his tenure: whereby the lord loses his verdict; in which case the lord may have this writ, grounded on this denial of tenure, and shall, upon proof of the tenure, recover back the land itself so holden, as a punishment to the tenant for such his false disclaimer. This piece of retaliating justice, whereby the tenant who endeavours to defraud his lord is himself deprived of the estate, as it evidently proceeds upon feodal principles, so it is expressly to be met with in the feodal constitutions: "vassalus, qui abnegavit feudum ejusve conditionem, expoliabitur."

RECTO folio. See FOLIO.

RECTOR of a parish, the parson, or he who has the charge or cure of a parish church. See PARSON.

If the predial tythes of the parish be impropriated, or appropriated, *i. e.* either in lay hands, or in those of some ecclesiastical community, then, instead of *rector*, the parson is called *vicar*, (which see). In England are reckoned 3485 rectories.

The name *rector* denotes him governor or ruler, *quia tantum jus in ecclesia parochiali habet, quantum praelatus in ecclesia collegiata*.

RECTOR also denotes the chief elective officer in several foreign universities, particularly in that of Paris.

RECTOR is also used in several convents for the superior, or officer who governs the house.

The Jesuits used it for the superiors in such of their houses as were either seminaries, or colleges.

RECTORY, or *RECTORATE*, *Rectoria*, a parish church, parsonage, or spiritual living, with all its rights, glebes, and tythes.

RETRICES, in *Ornithology*, denote the strong feathers of the tails of birds.

RECTUM INTESTINUM, in *Anatomy*; or in English, simply the *rectum*; is the last portion of the large intestine, and of the whole alimentary canal. It begins at the left sacro-iliac symphysis, below the sigmoid flexure of the colon, and ends at the anus. See *INTESTINE*.

RECTUM, Abscesses in the Neighbourhood of. See *FISTULA in Ano*.

RECTUM, Concretions and extraneous Substances lodged in. The concretions formed in the larger intestines, and especially in the rectum, by the accumulation and protracted lodgment of the feces, may become the cause of obstinate constipation, which can only be removed by their extraction. Sometimes these masses of indurated matter include no extraneous substance; in other instances, their nucleus is a biliary calculus; in a vast number of cases, they are merely composed of the feces in a dry hardened state. It is remarked that women, and persons of advanced age, are most subject to the constipation arising from the obstruction thus occasioned in the large intestines. Children and adults in the vigour of life are not, however, entirely exempt from the disorder, though they seldom have it, except when the formation of such concretions in the bowels has been brought on by swallowing a large quantity of hard indigestible bodies, like cherry and plum-stones. Lastly, excessively hardened masses of fecal matter have been noticed in patients who have for a long while been confined to bed in the recumbent posture by severe diseases.

Whatever may be the cause of the disorder, whether the defect itself consists in a mere accumulation of indurated feces, with which the rectum is distended, and behind which the excrement is detained; or whether the constipation is not complete, the concretion allowing the liquid part of the feces to pass out between it and the inside of the intestine; the existence of the hardened mass may be known

by

RECTUM.

by the constipation which it produces; by the sense of weight which the patient feels about the fundament; and also by the possibility of actually touching the indurated obstructing body, when a finger is introduced up the rectum.

Oily emollient clysters, and carminative draughts, will serve for expelling such concretions as are not of too firm a consistence; but the extraction of them is absolutely necessary when they are particularly hard. The operation is to be done with a spoon, or suitable forceps, properly oiled; and, after the concretion has been removed, an emollient clyster is to be administered, in order to allay any irritation which may have been caused by the introduction of the requisite instruments. When the sphincter ani contracts so forcibly, that the operation is attended with extreme pain and difficulty, we are advised by surgical writers to make a dilatation of the anus, by practising an incision at its posterior angle. A wound made in this direction cannot do injury to any part of consequence, whilst there would be a risk of wounding the urethra in the male, or the vagina in the female subject, if the cut were made at the anterior angle. An incision, carried laterally, would be apt to injure the pudic vessels. A division of the fibres of the sphincter ani does not produce any material permanent weakness of its action, and a paralysis of this muscle, according to Richerand, can never proceed from such a cause. *Nosographie Chirurgicale*, tom. iii. p. 414. edit. 2.

The hard concretions which lodge in the rectum cannot be reached with the finger when they are situated high, and, in this circumstance, the surgeon must use a probe, or sound, in order to assure himself positively of their presence, their moveableness, and their size.

With regard to foreign bodies lodged in this intestine, some have been swallowed, and have passed through the whole extent of the alimentary canal; while others have been pushed up the anus to a greater or lesser height. The extraction of these last is generally attended with a great deal of difficulty, and even demands on the part of the operator more than ordinary sagacity, in consequence of the various shapes, the hardness, and the fragility of these different bodies. Glass phials, instrument cases, shuttles, &c. have been introduced into the rectum by maniacs. One person of this description put into his rectum a flint-stone, which did not admit either of being extracted, or broken, owing to its hardness, and slippery surface, and which in the end caused the patient to die in the greatest agony, with swelling and gangrenous mischief in the abdomen. Marchetti has recorded an instance, in which a pig's tail, hardened by cold, was forcibly thrust up the rectum of a girl of the town. This extraneous body could not be withdrawn, as the short bristles, which all inclined outward, immediately came into contact with and pierced the inner part of the bowel. It remained in the part six days, and occasioned a train of alarming symptoms, such as fever, vomiting, swelling of the abdomen, and obstinate constipation. Marchetti fastened a ligature to the end of the foreign body, which protruded at the anus, and then passed the ligature through a long piece of reed, which he introduced up the rectum, in order that the foreign body might be drawn through this tube without the intestine being lacerated. The experiment was completely successful. *Obs. Med. Chir.* p. 126.

In another example a piece of wood, three inches long, and two in width, was introduced into the rectum. Colic, tension of the abdomen, fever, constipation, and difficulty of making water, came on, and lasted six days. The impossibility of removing the extraneous substance with a

pair of forceps, led to the idea of using a borer, which, having been passed up the rectum under the guidance of the finger, was inserted deeply enough into the piece of wood to draw it out. The extraction, however, could not be effected without a great deal of pain. See *Mélanges de Chirurgie*, par M. Saucerotte, p. 484. *Mémoires de l'Académie de Chirurgie*, tom. v. p. 605. *Lasus, Pathologie Chirurgicale*, tom. ii. p. 569, edit. 2.

RECTUM, Congenital and Syphilitic Contractions of its inferior Portion. A contraction of the lower end of the rectum is sometimes an original malformation; but more frequently it arises from what has been considered by various surgical authors to be a venereal thickening of the parietes of this intestine. If this be really a syphilitic disorder, a circumstance which is to be doubted, it is certainly as grievous as any of the more common effects of the venereal disease. Excrescences grow from the mucous membrane at the rectum, and discharge a purulent matter, which is continually oozing from the anus. When a finger is passed within this aperture, the irregularities occasioned by the tumour may be plainly felt. Such writers as believe in the syphilitic nature of this complaint inform us, that the truth of this may be known by the antecedent and co-existent symptoms of the venereal disease. They admit, however, that the disorder almost always lasts after the cure of every other mark of syphilis, and they caution us not to persist rashly in administering mercury any longer for a disease which cannot be further benefited by it. These circumstances are quite sufficient to prove that there is not much reason for the doctrine, that this sort of contraction of the lower end of the rectum is venereal.

Such writers as consider the complaint to be connected with syphilis, of course recommend the exhibition of mercury, and they further advise the frequent injection into the rectum of a weak solution of the oxymuriate of the same mineral. Tents, smeared with mercurial ointment, are also recommended to be passed into the bowel. The latter applications are stated to have the advantage; 1st, of opposing, by mechanical pressure, the further increase of the excrescences; 2dly, of dilating the contracted part; and, 3dly, of acting on the disease by their medicinal quality.

For our own part, we much doubt the reality of the venereal nature of the foregoing complaint. The language of the advocates for such a doctrine must raise suspicions, that they are influenced in their judgment more by prejudice than reason. "The venereal affection of the coats of the rectum (says one of these writers) almost always lasts after the total extinction of the syphilitic virus. Then, we ought to be content with the employment of dilating mechanical means, without persisting in the use of medicines, which would serve only to ruin the patient's constitution. An elastic gum cannula is to be preferred, and it should be of a conical shape, in order that it may be gradually introduced further and further, in proportion as the dilatation of the bowel is effected." *Richerand, Nosographie Chirurg.* tom. iii. p. 418, edit. 2.

In cases of congenital contraction of the rectum, the only plan which can be adopted, is that of making an incision through the posterior part of the intestine.

RECTUM, Polypi of. Sometimes, though not often, polypi grow from the mucous membrane of the rectum, and by their size obstruct the passage of the feces. Their existence is at first manifested by an uneasy sense of heaviness, and afterwards they are protruded outwardly in the efforts which the patient makes at stool. The anus contracting after their expulsion, their roots become strangulated, so that they cannot return, and excessive agony is produced.

In this circumstance, the surgeon should take the opportunity of removing them with a knife, after having tied their root, or even without this precaution. The lining of the rectum, freed from the weight of the tumour, immediately retracts, and if the polypus should have received a supply of blood from a large vessel, hemorrhage may ensue. Such accident may be remedied by completely distending the wounded part of the rectum with a large piece of sponge, or with a compress of lint; but as it is easier to prevent the hemorrhage altogether, than to stop it after it has occurred, we would advise surgeons, whenever the excrescence is of any size, always to tie its root before removing the rest of it with a cutting instrument.

RECTUM, *Prolapsus of*. See PROLAPSUS Ani.

RECTUM, *Scirrhus-contracted*. Scirrhus of the rectum is not uncommon at an advanced period of life. Sometimes it extends over a considerable length of the gut, but generally it is more circumscribed. The coats of the bowel become much thicker and harder than in the natural state. The muscular coat is subdivided by membranous septa, and the internal coat is sometimes formed into hard irregular folds. The surface of the inner membrane is occasionally ulcerated, so as to form a cancerous disease. Every vestige of the natural structure is occasionally lost, and the gut is changed into a gristly substance. The cavity of the bowel is always rendered narrow at the scirrhus part, and is sometimes almost obliterated. When the passage through the gut is much obstructed, the bowel is always a good deal enlarged just above the stoppage, or stricture, from the accumulation of the feces there. As the disease advances, adhesions form between the rectum and adjacent parts, and ulcerations produce communications between them.

The disease is usually not much noticed till somewhat advanced, not being at first very painful. The patient only thinks that he is colicky, and that he voids his stools with a little difficulty. In time, a good deal of pain is felt in the part affected, especially at stool, after which some relief is experienced. Pus and blood may sometimes be noticed with the excrement, particularly when the disease has advanced to the ulcerated state. The patient at length becomes fallow, the constitution suffers, and dissolution follows. Severe tenesmus attends the whole course of the disease.

Default has often seen the disease form a communication between the rectum and vagina, and the feces have passed through the latter part. In the latter stage of the affliction, the rectum, bladder, vagina, uterus, and adjacent parts, are all involved in one common ulceration.

When the disease has attained the ulcerated state, it is probably always incurable. Palliatives can now only be resorted to, such as anodyne and emollient glysters, the warm-bath, &c. with the exhibition of medicines like opium, cicuta, uva ursi, &c. Claudius applied his remedies to the inside of the bowel by means of tents, and did not employ the latter as a mode of curing the disease, when less advanced. Valsalva used to introduce a cannula pierced with numerous holes, when his patient got into the bath, so as to let the fluid enter the intestine. Numerous practitioners, among them Morgagni, made mercurials the base of their treatment, from a supposition that the complaint was of venereal origin.

When the disease is not attended with ulceration, the contraction and thickening of the gut may be diminished by introducing bougies, keeping them for a certain time, every day, so introduced, and increasing their size gradually. The pressure of these instruments seems to lessen the disease, and stop its progress; a proof that its nature differs from

VOL. XXIX.

that of what is usually understood by scirrhus. Default used to employ long tents, made of lint, smeared with cerate, and passed into the bowel by means of a probe, with a forked end. This surgeon gradually increased the size of the tents, so as to continue the compression, to which he conceived all the good was owing. Their length was also augmented by degrees. Fresh ones were, at first, introduced twice every day. When any hardnesses were situated on the outside of the anus, Default cured them on the same principle, viz. by making pressure on them with compresses and a bandage. This eminent surgeon effected a cure of a scirrhus-contracted rectum by this method. The woman was taught to pass occasionally the tents herself, so as to prevent a relapse. The disease is said to afflict women more frequently than men: from a comparative table kept at the Hôtel-Dieu, this has been the case there in the proportion of ten to one. See Œuvres Chirurgicales de Default, tom. ii. p. 422.

RECTUM, *Hemorrhoidal Swellings of*. See HEMORRHOIDS.

RECTUM, in *Law*. See RECTO.

RECTUM, in our old *Law Writers*, is also used for a trial or accusation.

RECTUM, *Commune*, denotes a trial at law, or in the common course of law. *Stare ad rectum*, denotes to stand a trial. *Rectum rogare*, to petition the judge to do right.

RECTUS, in *Anatomy*, a name applied to several muscles, generally, but not invariably, distinguished by the straightness of their fibres, or of their general direction.

RECTUS abdominis. See OBLIQUUS.

RECTUS abducens, or externus,

RECTUS adducens, or internus,

RECTUS attollens, or superior,

RECTUS deprimens, or inferior,

RECTUS anterior cruris, or femoris,

RECTUS extensor cruris, or femoris,

RECTUS capitis anticus major et minor.

See RECTUS internus.

RECTUS capitis internus major, rectus anticus major, trachelo-sous-occipitien; a muscle of the head, flattened, broader and thicker above than below, occupying the anterior and lateral part of the neck, and reaching from the transverse process of the sixth cervical vertebra, to the inferior surface of the basilar process of the occiput. Its anterior surface is covered by the carotid artery, the internal jugular vein, the nerve of the eighth pair, the great sympathetic, and the pharynx. The longus colli, the rectus capitis internus minor, the articulations of the occiput and atlas, and of the latter bone, and the second vertebra, are covered by its posterior surface. The inner edge lies on the longus colli, and is connected to it by cellular substance: the outer is fixed to the front of the transverse processes of the sixth, fifth, fourth, and third cervical vertebrae, and is unattached above the latter. The lower end, very thin and pointed, is fixed to the transverse process of the sixth cervical vertebra: it ascends with a little obliquity from without inwards, increasing in breadth and thickness: it approaches the muscle of the opposite side, and is attached by its upper end to the basilar process of the occipital bone, in front of the foramen magnum. At the upper part of this muscle is a broad and thin aponeurosis, which descends on the anterior and inner surface: the attachments to the transverse processes are by small tendons terminating in muscular portions. The muscular fibres run obliquely between the last mentioned tendons and the aponeurosis.

This muscle bends the head forwards on the neck; and restores it after it has been carried backwards. The muscle

of one side, acting singly, inclines the head towards its own side.

RECTUS capitis internus minor, or *rectus anticus minor*, trachelio-fous-occipitien; a small muscle of the head, lying under the last, short, narrow, and flattened, and extending from the atlas to the occiput. It is covered in front by the *rectus internus major*, the internal carotid artery, and the great sympathetic nerve: behind it covers the capsule of the articulation between the atlas and occiput. The outer and inner edges present nothing remarkable. Its lower extremity is fixed to the anterior surface of the lateral portion of the atlas, and to the neighbouring part of its transverse process. Thence it ascends, increasing somewhat in size, and inclined a little inwards, and is fixed to the under surface of the basilar process of the occiput, behind and a little on the outside of the *rectus internus major*, and to the cartilaginous mass filling the space between the occipital and temporal bones. It has aponeuroses at its extremities, and very short muscular fibres between these.

Its action on the head is exactly the same with that of the *rectus internus major*.

RECTUS capitis lateralis, le premier transverseur antérieur Winslow, atloïdo-maltoïdien, petit droit latéral; a small muscle of the head, situated at the upper and lateral part of the neck, flattened and quadrilateral, reaching from the transverse process of the atlas to the occiput. It is covered in front by the internal jugular vein; and it covers behind the vertebral artery. The two edges present nothing remarkable. Below it is fixed to the front of the upper surface of the transverse process of the atlas: thence it ascends a little outwards, and is attached above to the rough impression behind the jugular fossa. It is muscular, except just at the attachments, which are tendinous. Its action, like that of the two last muscles, is to restore the head, when it has been bent backwards; to bend it forwards; and, when one muscle acts singly, to incline it laterally.

RECTUS capitis posticus major, axoïdo-occipitien; a muscle of the head, of a triangular flattened figure, placed at the upper and back part of the neck, and extending from the spinous process of the second cervical vertebra to the occiput. Its posterior surface is covered by the complexus, and above by the *obliquus superior capitis*; the anterior surface covers the posterior arch of the atlas, the *rectus posticus minor*, and the occiput. The inferior extremity, narrow, and almost pointed, is attached to the spinous process of the second cervical vertebra, thence it ascends, directed outwards, and a little backwards, and gradually increasing in breadth, to be inserted in the inferior surface of the occiput, at about an equal distance from the great external transverse ridge, and the foramen magnum, between the complexus, the *obliquus superior*, and the *rectus posticus minor*. The extremities alone are tendinous; the rest being muscular. It restores the head, when it has been bent forwards; and carries it back on the vertebral column. When one muscle acts singly, it will have the power, from the oblique direction of its fibres, of rotating the head, so as to turn the face towards its own side.

RECTUS capitis posticus minor, atloïdo-occipitien; a small flattened muscle with radiated fibres, and consequently a triangular figure, placed at the upper and back part of the neck, extending from the atlas to the occiput, and lying with its fellow in the interval between the two *recti majores*. Its posterior surface is inclined downwards and covered by the complexus; the anterior surface corresponds to the occiput, and to the interval between it and the atlas. The lower extremity is the narrowest part, and is fixed to the rough impression in the middle of the pos-

terior surface of the posterior arch of the atlas: it ascends parallel to the opposite muscle and directed backwards, and is fixed to the external surface of the occipital bone at a short distance from the foramen magnum. It raises the head when bent forwards; and extends it or carries it back on the neck.

RECTUS cruris, *rectus extensor* or *anterior cruris*, droit ou grêle antérieur, ileo-rotulien; a muscle of the thigh, long and flat, broad in the middle, and narrow towards its extremities, occupying the middle and front part of the limb, and reaching from the anterior and inferior spine of the ilium to the patella. It is covered in front by the *iliacus internus*, the *sartorius*, and the *fascia lata*; behind it covers the orbicular ligament of the hip, the great extensors of the knee, and the external or anterior circumflex vessels. The outer and inner margins of the muscle are unattached in their upper three-fourths; they are confounded, in their lower fourth, with the extensors of the knee.

The superior extremity of the *rectus cruris* presents two tendons, one of which is straight, the other curved. The former is fixed to the anterior and inferior spine of the *os innominatum*: the latter, curved from before backwards, and from above downwards, is fixed to the outer surface of the *os innominatum* for about an inch, immediately above the edge of the acetabulum. From this upper attachment the muscle descends vertically in front of the thigh, growing broader to the middle of the limb; it then becomes narrow towards the lower part, and is fixed to the basis of the patella.

The *rectus* is tendinous at its extremities, and fleshy in the middle. The upper tendon has been already described as divided into two portions; the anterior of these, attached to the anterior and inferior spine of the *os innominatum*, is the thickest and shortest, and has the same direction as the muscle; the other is longer and curved, and detaches some fibres to strengthen the orbicular ligament of the hip. The two portions soon unite in a common tendon; this spreads out into a broad aponeurosis, which descends about four inches on the front of the muscle, and then dips into its substance. The inferior tendon is broad and flat, and rises from the basis of the patella; its posterior surface is united to the great extensors of the knee, and the edges are strongly connected to the *vastus externus* and *internus*. It is broad at the patella, grows a little narrower as it rises, then spreads out again, and forms a broad aponeurosis, covering the back of the muscle above its middle. The superficial fibres of this tendon descend over the front of the patella, to which they are strongly united, and are lost below in the tendon which unites this bone to the tibia. The muscular fibres are placed very obliquely between the superior and inferior tendons: they cover the back of the first up to the part where its two portions separate; and they descend on the front of the second to within two inches of the patella.

It extends the knee-joint, either by bringing the leg forwards upon the thigh, or the thigh upon the leg, according as the one or the other part is rendered a fixed point. If the knee be extended, or firmly retained in the bent position by its flexor muscles, the *rectus* may bend the thigh upon the pelvis: when the leg and thigh are fixed, it can bend the pelvis forwards upon the latter, as in the attitude of stooping to pick up any object from the ground. In the erect attitude it prevents the pelvis from inclining backwards; and restores it when it has been carried in that direction.

RECTUS in curia, in *Larv*, one who stands at the bar, and no man objects any thing against him.

When a man hath reverfed the outlawry, and can partici- pate of the benefit of the law, he is faid to be *reftus in curia*.

RECULVER, in *Geography*, a village and parifh in the upper half-hundred of Blean-Gate, lathe of St. Auguftine, and county of Kent, England, is fituated at the diftance of 10 miles N.E. by N. from Canterbury. It is noted in hiftory as the feite of the Roman *Regulbium*, the ftation or caftle which defended the northern entrance to the celebrated *Portus Rutupenfis*. It is remarkable, that while the ocean has receded from the fouthern entrance, leaving Rich- borough (Rutupium) confiderably inland, it has gradually advanced upon Reculver. This is proved on the authority of feveral ancient writers, particularly Leland, who ftates, that in his time it ftood about half a mile from the fhore, whereas, at prefent, the tide wafhes the walls of many of the village houfes, and threatens to overwhelm the whole at no diftant period. Regulbium was a ftation of much import- ance, as it not only commanded an extenfive view of the open fea, but likewife of the mouths of the Thames and the Medway. It was therefore ufed as a watch-poft to dif- cover the approaches of an enemy; and alfo as a light- houfe to guide failors. In its perfect ftate the ftation was of a fquare form, with the angles rounded off, and was en- vironed by a ditch exterior to the walls, of which a con- fiderable portion ftill remains. The extent of the inclofed area from eaft to weft is about 190 yards, and from fouth to north about 198 yards. The ancient town was without the ftation, and is fuppofed to have ftood towards the north, on that part of the coaft long fince fwallowed up by the waves: "and from the prefent fhore, as far as a place called Black Rock, feen at low water mark, where, accord- ing to tradition, a church once ftood, there have been found great quantities of tiles, bricks, fragments of walls, teffellated pavements, and other marks of a ruined town; and remains of the houfehold furniture, drefs and equipment of the houfes belonging to its inhabitants, are continually met with among the fands; for after the fall of the cliffs, the earthen parts of them being wafhed away, thefe metal- line fubftances remain behind." When a part of the cliff here fell down about the conclufion of the feventeenth cen- tury, a number of fmall vaults, arched over, and feveral cifterns, were difcovered. The latter were all of the fame figure, namely, fquare, and meafured from ten to twelve feet in length each fide, and the fame in depth. They were conftituted of pofts, driven deep into the ground, with planks two inches thick fixed to them. Their ufe was evidently the reception and prefervation of rain water, which the Romans thought more wholefome than fpring water. Vaft quantities of Roman coins have been dif- covered both in the fields and along the fhore here; and Du Frefne has produced many, which, from the markings upon them, appear to have been struck at a mint in this place. Britifh and Gaulifh coins are likewife occasionally found here; alfo feals, keys, fpoons, gold rings, bracelets, figulæ, bullæ, belts, bridles, harnefs, beams of fcales or ftiliards, and many other articles of which the ufe has not yet been determined.

When Kent was fubdued by the Saxons, Regulbium became a principal feat of the monarchs of that dynasty. It was then called *Raculf* and *Raculf-cefter*; and hither king Ethelred retired with his court, after his converfion to Chriftianity by St. Auguftine. In the next century it obtained the name of *Raculf-minfter*, from a Benedictine abbey founded here by Baffa, a prieft and nobleman, to whom lands were granted for that purpofe by king Egbert, as an atonement for the murder of his two nephews. This abbey was diffolved previous to the Conqueit, having probably

been destroyed by the Danes. The town, however, con- tinued in a flourifhing condition for many years after that event, and had the privilege of a weekly market granted to it in 1513; but this right has been long difcontinued. The church here is an ancient and fpacious edifice, confift- ing of a nave, with two aifles, a chancel, and two lofty towers, furmounted by fpires at the angles of the weft front. The nave is feparated from the aifles by five pointed arches, rifing from fhort oblong piers; and from the chancel by three fmall femi-circular arches, fpringing from tall round columns, with very fingular capitals. In this church kings Ethelbert I. and II. are faid to have been buried; and a monument erected to the memory of the firft is defcribed by Weever in his "Funeral Monuments," though it has now difappeared. On the floor of the chancel are feveral braffes of great antiquity. (See RICHBOROUGH.) Beauties of England and Wales, vol. vii. by E. W. Brayley. Hiftory and Antiquities of Reculver and Herne, by W. Battely, D. D. 8vo.

RECUMPADO, in *Geography*, a town of Hindooftan, in the circar of Rajamundry; 23 miles N.W. of Rajamundry.

RECUPERATOIRES, among the Romans, were com- miffioners appointed to take cognizance of private matters in difpute, between the fubjects of the ftate and foreigners, and to take care that the former had juftice done them.

It came at laft to be ufed for commiffioners, to whom the prator referred the determination of any affair between one fubject and another.

RECURRENS, in *Anatomy*, a name under which the inferior laryngeal branch of the par vagum is often defcribed, from the circumftance of its arifing in the cheft below the point of its diftribution to the larynx, and then going back into the neck in a retrograde courfe. See NERVE.

RECURRING SERIES, is a feries fo conftituted, that each fucceeding term is connected with a certain number of the terms immediately preceding it, by a certain and invari- able law; as the fums or differences of fome multiples of thofe terms. Thus the feries

$$\begin{matrix} \alpha & \beta & \gamma & \delta & \epsilon & \theta & \&c. \\ 1, & 3x, & 5x^2, & 7x^3, & 9x^4, & 11x^5, & \&c. \end{matrix}$$

is a recurring feries; for thefe terms being refpectively repre- fented by $\alpha, \beta, \gamma, \delta, \&c.$ we have

$$\begin{aligned} \gamma &= 2x\beta - x^2\alpha \\ \delta &= 2x\gamma - x^2\beta \\ \epsilon &= 2x\delta - x^2\gamma \\ \theta &= \&c. \quad \&c. \end{aligned}$$

that is, each term is equal to $2x$ times that which precedes it, minus x^2 times the one preceding the laft.

Or, generally, let

$$\begin{matrix} \alpha & \beta & \gamma & \delta & \epsilon & \theta & \&c. \\ a, & bx, & cx^2, & dx^3, & ex^4, & fx^5, & \&c. \end{matrix}$$

be any feries whofe terms are denoted as above, by $\alpha, \beta, \gamma, \delta, \&c.$ Alfo, let $\mu, \nu, \xi, \&c.$ represent the fucceffive multi- pliers by which the terms are connected, fo that

$$\begin{aligned} \alpha &= \alpha \\ \beta &= \beta \\ \gamma &= \mu x\beta + \nu x^2\alpha + \&c. \\ \delta &= \mu x\gamma + \nu x^2\beta + \&c. \\ \epsilon &= \mu x\delta + \nu x^2\gamma + \&c. \\ \theta &= \&c. \quad \&c. \end{aligned}$$

then this feries is called a recurring feries; and $\mu + \nu + \&c.$ De Moivre calls the *feale of relation*, which is faid to be of *one, two, three, &c.* terms; according to the number of multipliers

RECURRING SERIES.

multipliers by which it is connected. In the above we have used only two, μ and ν , whence $\mu + \nu$ is called the scale of relation, which is here of two terms; and 1 minus the scale of relation, as $1 - \mu - \nu$, is called by the same author the *differential scale*, which is always equal to the denominator of the fraction from which the series is produced.

If, in the above series, the terms had the relation

$$\begin{aligned} \alpha &= \alpha \\ \beta &= \beta \\ \gamma &= \gamma \\ \delta &= \mu x \cdot \gamma + \nu x^2 \cdot \beta + \xi x^3 \alpha \\ \epsilon &= \mu x \cdot \delta + \nu x^2 \cdot \gamma + \xi x^3 \beta \\ \theta &= \mu x \cdot \epsilon + \nu x^2 \cdot \delta + \xi x^3 \gamma \\ \&c. & \quad \&c. \quad \&c. \end{aligned}$$

then the scale of relation would be $\mu + \nu + \xi$, which is of three terms; and the differential scale, or the denominator of the fraction, is $1 - \mu - \nu - \xi$.

The following problems are naturally connected with the doctrine of recurring series; viz.

1. Any recurring series being proposed, to find the scale of relation, or the law of the series, which is not always obvious on inspection.

2. To find the sum of an infinite recurring series, or the sum of any number of its terms (n).

3. To find a general expression for any indefinite term of such a series, as, for example, the n th term.

We shall consider each of these problems under their separate heads.

I. To find the scale of relation in any proposed recurring series.

Let $\alpha, \beta, \gamma, \delta, \epsilon, \theta, \&c.$ be a recurring series, of which it is required to find the scale of relation

$$\begin{aligned} \text{Assume} \quad \delta &= \mu' \gamma + \nu' \beta + \xi \&c. \\ \epsilon &= \mu' \delta + \nu' \gamma + \xi \&c. \\ \theta &= \xi \&c. \quad \&c. \end{aligned}$$

Where $\beta, \gamma, \delta, \&c.$ are known, and $\mu, \nu, \&c.$ unknown quantities, whose numeral values are required, and which are readily found by the usual method of elimination. Thus in the above, using only μ and ν , we have

$$\mu' = \frac{\delta \gamma - \epsilon \beta}{\gamma \gamma - \epsilon \beta}, \text{ and } \nu' = \frac{\delta \delta - \gamma \epsilon}{\beta \delta - \gamma^2}.$$

These values of μ' , and ν' , will obviously contain in them the powers of the indeterminate quantity x , which being taken out, we shall have the required numeral values of μ and ν .

Let it be required to ascertain the scale of relation in the series

$$\begin{array}{cccccc} \alpha & \beta & \gamma & \delta & \epsilon & \theta \ \&c. \\ 1, & 3x, & 5x^2, & 7x^3, & 9x^4, & 11x^5, \ \&c. \end{array}$$

Here, by substituting the proper values of $\beta, \gamma, \delta, \&c.$ in the above equation, we have

$$\begin{aligned} \mu' &= \frac{35x^5 - 27x^5}{26x^4 - 21x^4} = \frac{8x^5}{4x^4} = 2x \\ \nu' &= \frac{49x^6 - 45x^6}{21x^5 - 25x^5} = \frac{4x^6}{-4x^4} = -1x^2 \end{aligned}$$

when $\mu = 2$, and $\nu = -1$.

The same method may obviously be employed in any other case; but in order to know whether or not we have assumed a scale of relation of a sufficient number of terms, we must repeat the same operation upon three other terms, of which one at least was not before employed; and if both give the same values, we may be assured of the truth of our results: or we may otherwise, instead of repeating the operation, examine the several terms, and see whether they agree with the

law we have determined, and if not, we must increase the terms in our scale of relation; for it may be observed, that we can never fail of determining them in consequence of having assumed too many terms, as we shall, in that case, have one of our results zero.

Lagrange has formed a different rule for ascertaining whether a given series be recurring or not, which Mr. Bonycastle has given at p. 323 of his Algebra; but as it does not seem adapted for detecting the law of formation, we shall not insert it.

II. To find the sum of any recurring series, of which the scale of relation is known.

$$\text{Let } \begin{cases} \alpha & \beta & \gamma & \delta & \epsilon & \theta \ \&c. \\ a, & bx, & cx^2, & dx^3, & ex^4, & fx^5, \ \&c. \end{cases}$$

be a recurring series, of which the scale of relation is $\mu + \nu$, so that

$$\begin{aligned} \alpha &= \alpha \\ \beta &= \beta \\ \gamma &= \mu x \cdot \beta + \nu x^2 \alpha \\ \delta &= \mu x \cdot \gamma + \nu x^2 \beta \\ \epsilon &= \mu x \cdot \delta + \nu x^2 \gamma \\ \&c. & \quad \&c. \quad \&c. \end{aligned}$$

Here it is obvious, that the whole sum

$$\begin{aligned} S &= \alpha + \beta + \gamma + \delta + \epsilon + \ \&c. \\ S &= \alpha + \beta + \mu x (\beta + \gamma + \delta + \ \&c.) + \nu x^2 (\alpha + \beta + \gamma + \ \&c.) \\ S &= \alpha + \beta + \mu x (S - \alpha) + \nu x^2 \cdot S \end{aligned}$$

$$\text{whence } S = \frac{\alpha + \beta - \mu \alpha x}{1 - \mu x - \nu x^2}$$

which is a general expression when the scale of relation is of two terms.

When the scale of relation is of three terms, so that

$$\begin{aligned} \alpha &= \alpha \\ \beta &= \beta \\ \gamma &= \gamma \\ \delta &= \mu x \cdot \gamma + \nu x^2 \cdot \beta + \xi x^3 \alpha \\ \epsilon &= \mu x \cdot \delta + \nu x^2 \cdot \gamma + \xi x^3 \beta \\ \theta &= \mu x \cdot \epsilon + \nu x^2 \cdot \delta + \xi x^3 \gamma \\ \&c. & \quad \&c. \quad \&c. \end{aligned}$$

it is equally obvious that

$$S = \alpha + \beta + \gamma + \delta + \epsilon + \theta + \ \&c. \text{ or}$$

$$S = \begin{cases} \alpha + \beta + \gamma + \\ \mu x (\gamma + \delta + \epsilon + \ \&c.) + \\ \nu x^2 (\beta + \gamma + \delta + \ \&c.) + \\ \xi x^3 (\alpha + \beta + \gamma + \ \&c.) \end{cases}, \text{ or}$$

$$S = \alpha + \beta + \gamma + \mu x (S - \alpha - \beta) + \nu x^2 (S - \alpha) \xi x^3 + S$$

whence we have

$$S = \frac{\alpha + \beta + \gamma - \mu x (\alpha + \beta) - \nu x^2 \cdot \alpha}{1 - \mu x - \nu x^2 - \xi x^3}$$

which is the general expression for the sum, when the scale of relation is of three terms.

In the same manner we have

$$S = \frac{\alpha + \beta + \gamma + \delta - \mu x (\alpha + \beta + \gamma) - \nu x^2 (\alpha + \beta) - \xi x^3 \cdot \alpha}{1 - \mu x - \nu x^2 - \xi x^3 - \sigma x^4}$$

for a scale of relation of four terms; and so on.

But as the terms $\alpha, \beta, \gamma, \delta, \&c.$ contain in them certain powers of x , we may reduce the above expressions to simpler forms

RECURRING SERIES.

forms by substituting a for α , $b x$ for β , $c x^2$ for γ , &c. in which case the above become

$$S = \frac{a + (b - a\mu)x}{1 - \mu x - \nu x^2}$$

$$S = \frac{a + (b - a\mu)x + (c - b\mu - a\nu)x^2}{1 - \mu x - \nu x^2 - \rho x^3}$$

$$S = \frac{a + (b - a\mu)x + (c - b\mu - a\nu)x^2 - (d - c\mu - b\nu - a\rho)x^3}{1 - \mu x - \nu x^2 - \rho x^3 - \sigma x^4}$$

which are the several expressions for the scales of relation of two, three, or four terms, and the law of formation is sufficiently obvious for any other scale.

The same law might have been otherwise obtained as follows. It is evident, from what is done above, that the scale of relation subtracted from unity is always equal to the denominator of the generating series, and the same may also be demonstrated on other principles. In order, therefore, to find the numerator, we might assume the proposed series

$$a + b x + c x^2 + d x^3 + \&c.$$

$$= \frac{a' + b' x + c' x^2 + d' x^3 + \&c.}{1 - \mu x - \nu x^2 - \rho x^3 - \sigma x^4}$$

then multiplying this denominator by the proposed series, and equating the co-efficients of the products with those of the like powers of x in the numerator, we should find

$$a' = a$$

$$b' = b - a\mu$$

$$c' = c - b\mu - a\nu$$

$$d' = \&c. \quad \&c.$$

as in the preceding formulæ.

It is only necessary to observe, farther, that if the indices of x do not follow the law we have supposed, we must make the necessary correction in the general expression, and if the proposed series have no power of x in it, as commonly happens, we must, in the conclusion, make $x = + 1$.

The above formulæ, it will be observed, give the sum of the infinite series. When only a certain number of terms are to be summed, different formulæ are required, which we shall investigate, after having shewn how to obtain a general expression for the n th term of such recurring series. We propose, however, in the first place, to illustrate the above rules by one or two examples.

Exam. 1.—Required the sum of the infinite recurring series $1 + 6x + 12x^2 + 48x^3 + \&c.$ the scale of relation being $1 + 6$.

Here $a = 1$, $b = 6$, $\mu = 1$, and $\nu = 6$, whence

$$\frac{a + (b - a\mu)x}{1 - \mu x - \nu x^2} = \frac{1 + 5x}{1 - x - 6x^2}$$

the sum required.

Exam. 2.—Required the sum of the infinite recurring series

$$1 + 4x + 6x^2 + 11x^3 + 28x^4 + 63x^5, \&c.$$

the scale of relation being $2, -1, +3$.

Here $a = 1$, $b = 4$, $c = 6$; $\mu = 2$, $\nu = -1$, and $\rho = 3$; whence

$$S = \frac{a + (b - a\mu)x + (c - b\mu - a\nu)x^2}{1 - \mu x - \nu x^2 - \rho x^3} = \frac{1 + (4 - 2)x + (6 - 8 + 1)x^2}{1 - 2x + x^2 - 3x^3} = \frac{(1 + x)^2 - 2x^2}{(1 - x)^2 - 3x^3}$$

as required

III.—To find the general term of any proposed recurring series.

From the preceding part of this article it appears, that every recurring series may be considered as arising from the development or expansion of some rational fraction of the form

$$\frac{a + bx + cx^2 + dx^3 + \&c.}{1 - \alpha x - \beta x^2 - \gamma x^3 - \delta x^4 - \&c.}$$

Let us, therefore, suppose this fraction to be converted into the infinite recurring series $A + Bx + Cx^2 + Dx^3 + Ex^4 + \&c.$ of which we already know how to determine the co-efficients, and the law of their formation.

Now if this rational fraction be decomposed into its simple fractions by the method explained under the article *RATIONAL Fractions*, and each of these simple fractions be then converted into a recurring series, it is evident that the sum of all these series ought to be equal to the original series

$$A + Bx + Cx^2 + Dx^3 + Ex^4 + \&c.$$

Now each of these partial fractions being of the form $\frac{A'}{1 - rx}$, the series thence arising will have the form

$$A' + A'r x + A'r^2 x^2 + A'r^3 x^3 \dots A'r^n x^n$$

of which $A'r^n x^n$ is the general term. Hence, the several series arising from the partial fractions may be supposed to be

$$A' + A'r x + A'r^2 x^2 + A'r^3 x^3 \dots A'r^n x^n$$

$$A'' + A''r' x + A''r'^2 x^2 + A''r'^3 x^3 \dots A''r'^n x^n$$

$$A''' + A'''r'' x + A'''r''^2 x^2 + A'''r''^3 x^3 \dots A'''r''^n x^n$$

$$A^{iv} + A^{iv}r''' x + A^{iv}r'''^2 x^2 + A^{iv}r'''^3 x^3 \dots A^{iv}r'''^n x^n$$

and since the sum of these series is equal to the original one proposed, we know that the co-efficients of the like powers of x are also equal, whence we have

$$A = A' + A'' + A''' + A^{iv} + \&c.$$

$$B = A'r + A''r' + A'''r'' + A^{iv}r''' + \&c.$$

whence it appears that the co-efficient of any term x^n of the recurring series is equal to the sum of the co-efficients of the same power of x , which arise from expanding the several simple fractions into which the given fraction is decomposed; and this co-efficient is always equal to the sum of each of the numerators of the several simple fractions, multiplied into the n th power of the corresponding value of r in the denominator of the same fraction, at least while the denominator contains no equal factor. But if, among the partial fractions,

there is any one of the form $\frac{A'}{(1 - rx)^2}$, the general term of

this will be $(n + 1) A r^n x^n$; of $\frac{A}{(1 - rx)^3}$, the general

term is $\frac{(n + 1)(n + 2)}{1 \cdot 2} A r^n x^n$; and universally $\frac{A}{(1 - rx)^k}$,

the general term is

$$\frac{(n + 1)(n + 2)(n + 3) \dots (n + k - 1)}{1 \cdot 2 \cdot 3 \dots (k - 1)}$$

we may, therefore, in all cases wherein the generating fraction of the original series admits of a rational decomposition, arrive very readily at the general term upon the principles above explained.

Thus,

RECURRING SERIES.

Thus, as an example, let there be proposed the recurring series

$$1 + 4x + 14x^2 + 46x^3 + 146x^4 + \&c.$$

to find the general term, or the co-efficient of x^n .

The sum of this series is found by the preceding part of this article to be $\frac{1-x}{1-5x+6x^2}$.

This rational fraction is equal to $\frac{-1}{1-2x} + \frac{2}{1-3x}$. Now

the general term of $\frac{1}{1-2x}$ is $-2^n x^n$; and of $\frac{2}{1-3x}$ is $2 \cdot 3^n x^n$, as shewn above, therefore the general term of the proposed series will be $(2 \cdot 3^n - 2^n) x^n$.

It may be observed, however, that this method is in some cases very laborious, and not always practicable; it will, therefore, frequently be better to make use of the *multinomial theorem*, which may be done by putting the generating fraction under the form

$$(a + bx + cx^2 + \&c.) (1 - \alpha x - \beta x^2 - \gamma x^3 - \&c.)^{-1}$$

See *Multinomial Theorem*.

IV.—To find the sum of any number (n) terms of a recurring series.

For this purpose it is only necessary to find the co-efficient of the $n + 1$ th term of the series. Then, from the sum of the entire series subtract the sum of the series beyond the n th term, and the difference will obviously be the sum of the first n terms sought.

Let there be proposed as an example to find the sum of n terms of the series

$$1 + 2x + 3x^2 + 4x^3 + \dots + nx^{n-1}.$$

The infinite sum of this series is readily found = $\frac{1}{(1-x)^2}$

In the second case, *viz.* of the terms beyond nx^{n-1} , the series is

$$(n+1)x^n + (n+2)x^{n+1} + (n+3)x^{n+2}, \&c.;$$

and in the formula $s = \frac{\alpha + \beta - \alpha\mu x}{1 - \mu x - \nu x^2}$ we have only to substitute

$\alpha = (n+1)x^n$, and $\beta = (n+2)x^{n+1}$, instead of $\alpha = 1$ and $\beta = 2x$, as in the former. Hence we have

$$s' = \frac{(n+1)x^n + (n+2)x^{n+1} - 2(n+1)x^{n+1}}{1 - 2x + x^2}, \text{ or}$$

$$s' = \frac{(n+1)x^n - nx^{n+1}}{(1-x)^2};$$

and, therefore, $s - s'$, or the sum of the first n terms is equal to

$$\frac{1 - (n+1)x^n + nx^{n+1}}{(1-x)^2}.$$

2. Required the sum of n terms in the series

$$1 + 3x + 5x^2 + 7x^3 + \dots + (2n-1)x^{n-1}.$$

Here, by trial, we find the scale of relation to be $\mu = +2$, and $\nu = -1$, as before, therefore the infinite sum is

$$s = \frac{\alpha + \beta - \alpha\mu x}{1 - \mu x - \nu x^2} = \frac{1 + 3x - 2x}{1 - 2x + x^2} = \frac{1+x}{(1-x)^2}.$$

After n terms, the series becomes

$$(2n+1)x^n + (2n+3)x^{n+1} + (2n+5)x^{n+2} + \&c.$$

which therefore arises from the fraction

$$\frac{(2n+1)x^n + (2n+3)x^{n+1} - 2(2n+1)x^{n+1}}{1 - 2x + x^2} =$$

$$\frac{(2n+1)x^n - (2n-1)x^{n+1}}{(1-x)^2}$$

whence the sum of n terms is

$$\frac{1+x - (2n+1)x^n + (2n-1)x^{n+1}}{(1-x)^2}$$

3. Required the sum of n terms of the series

$$(n-1)x + (n-2)x^2 + (n-3)x^3 + \&c.$$

Here again the scale of relation is $+2 - 1$, therefore the infinite sum is

$$\frac{(n-1)x + (n-2)x^2 - 2(n-1)x^3}{(1-x)^2} =$$

$$\frac{(n-1)x - nx^2}{(1-x)^2}$$

After n terms, it becomes $-x^{n+1} - 2x^{n+2} - \&c.$ the sum of which is found in the same manner to be $\frac{-x^{n+1}}{(1-x)^2}$; therefore n terms of the proposed series is

$$\frac{(n-1)x - nx^2 + x^{n+1}}{(1-x)^2}$$

Hence, also, n terms of the series

$$\frac{(n-1)x}{n} + \frac{(n-2)x^2}{n} + \frac{(n-3)x^3}{n} + \&c. \text{ is}$$

$$\frac{(n-1)x - nx^2 + x^{n+1}}{n(1-x)^2}$$

In a similar manner the sum of n terms of the series

$$1^2 + 2^2x + 3^2x^2 + 4^2x^3 + \&c.$$

is found to be

$$\frac{1+x - (n+1)^2x^n + (2n^2+2n-1)x^{n+1} - n^2x^{n+2}}{(1-x)^3}$$

the scale of relation being $3 - 3, 1$.

In all the preceding examples we have determined the infinite sum of the series, as beginning at the first term, and at the $(n+1)$ th term, a more easy method is as follows, which is due to Simpson. *Essays*, p. 96.

Let $A + B + C + D + \dots + K + L + M + N$ be any finite recurring series, of which each term depends upon the three which precede it, the scale of relation being p, q, r , so that

$$\begin{aligned} pA + qB + rC &= D \\ pB + qC + rD &= E \\ \&c. \quad \quad \quad \&c. \quad \quad \quad \&c. \end{aligned}$$

or, which is the same,

$$\begin{aligned} pA + qB + rC - D &= 0 \\ pB + qC + rD - E &= 0 \\ pC + qD + rE - F &= 0 \\ \vdots \quad \quad \quad \vdots \quad \quad \quad \vdots \quad \quad \quad \vdots \\ pK + qL + rM - N &= 0 \end{aligned}$$

whence,

whence, by addition

$$p(A + B + C + \dots K) + q(B + C + D + L) + r(C + B + D + \dots M) - (D + E + F + N) \} = 0$$

Or, representing the whole sum by S,

$$p(S - L - M - N) + q(S - A - M - N) + r(S - A - B - N) - (S - A - B - C) \} = 0$$

which, by addition and division, gives

$$S = \frac{p(L + M + N) + q(A + M + N) + r(A + B + N) - (A + B + C)}{p + q + r - 1}$$

where the sum depends merely upon the three first and the three last terms of the series; and a similar expression, it is obvious, may be obtained for any other scale of relation.

It may not be amiss to observe, that when the proposed series is wholly numeral, (the sum of which, as we have before observed, is to be found by making $x = 1$); both this formula and the preceding one fail, in the case in which the denominator of the fraction becomes zero, and we must, therefore, in such cases, have recourse to other methods of summation, as given under the article SERIES.

On this subject the reader should consult De Moivre's Misc. Analyt. and his Doctrine of Chances, and Euler's Analysis Infinitorum, where he will find an explanation of its application to the approximation to the roots of equations. Colson's Comment on Newton's Fluxions. Stirling's Methodus Differ. Cramer's Analysis des Lignes Courbes. Bernoulli de Serieb. Inf. &c. See also a chapter on this subject, in vol. ii. of Bonnycastle's Algebra.

RECURVIROSTRA, the *Avocet*, in *Ornithology*, a genus of birds of the order Grallæ, of which the generic character is; bill depressed, subulate, recurved, pointed, flexible at the tip; the feet are palmate, four-toed, the hind toe not connected, very short, and placed high up; the nostrils are narrow, pervious; the tongue is short. There are only three

Species.

* *AVOCETTA*; Scooping Avocet; called also in different parts of this country, butter-slip, scooper, yelper, crooked-bill, &c. This bird is variegated with white and black; the bill is three inches and a half long; irides hazel; crown black; a white spot behind and beneath the eyes; rest of the head, neck, back, exterior part of the wings, lesser quill-feathers, tail, and under part of the body, white; inner scapulars and greater quill-feathers without and at the tips black; legs blueish, and very long; membrane connecting the toes indented. It resides in the temperate parts of Europe, weighing thirteen ounces; and measuring, from the tip of the bill to the end of the tail, eighteen inches. It breeds in the fens of Lincolnshire, and on Romney Marsh, in Kent. The female lays two white eggs, tinged with green, and marked with large black spots. In winter these birds assemble in small flocks of six or seven, and frequent the shores, particularly the mouths of large rivers, in search of worms and marine insects, which they scoop out of the mud or sand. They seem to be particularly fond of the cancer, pulex, or locusta. By means of their long legs, they run over shores that are covered five or six inches with water. In their movements they are lively, alert, volatile, and difficult to catch. When the female is frightened off her nest she counterfeits lameness; and when a flock is disturbed, they fly with their necks stretched out, and their legs extended behind, over the head of the spectator, mak-

ing a shrill noise, and uttering a yelping cry of twit, twit, all the time.

AMERICANA; American Avocet. The head and neck are reddish; back black, beneath it is white. It inhabits North America and New Holland; is fourteen inches long. Bill black; front dusky-white; neck above white; primary and tertial wing-coverts black, the middle ones, and some of the secondary quill-feathers, white.

ALBA; White Avocet. This species is white; the lower wing-coverts brownish; bill orange; legs brown. Inhabits Hudson's Bay; fourteen inches and a quarter long. Bill tipped with black; edge of the wings, greater quill-feathers, and tail, tinged with yellowish.

RECUSANTS, in a general sense, persons, whether Papists or others, who refuse to go to church and to worship God after the manner of the church of England. Popish recusants are Papists, who so refuse; and a popish recusant convict is a Papist legally convicted of such offence. See **PAPIST**, **PÆMUNIRE**, and **TOLERATION**.

RECUSATION, **RECUSATIO**, an act by which a judge is desired to refrain from judging some certain cause, on account of his relation to one of the parties; or of some capital enmity, or the like.

By the French laws, kinship within the fourth degree is deemed a legal cause of recusation; as also the judge's being godfather, &c. of one of the parties.

By the laws of England also, in the times of Bracton and Fleta, a judge might be refused for good cause; but now the law is otherwise, and it is held that judges or justices cannot be challenged. Co. Litt. 254. See **CHALLENGE**.

RED, in *Physics*, one of the simple or primary colours of natural bodies, or rather of the rays of light.

The red rays are those which are of all rays the least refrangible: hence, as sir Isaac Newton supposes the different degrees of refrangibility to arise from the different magnitudes of the luminous particles of which the rays consist, the red rays, or red light, is concluded to be that which consists of the largest particles. See **COLOUR**, **LIGHT**, and **RAY**.

Authors distinguish three general kinds of red; one bordering on the blue, as colombine, or dove-colour, purple, and crimson; another bordering on yellow, as flame-colour and orange; and between these extremes is a medium, partaking neither of the one nor the other, which is what we properly call *red*.

Acids generally turn black blue, and violet into red; and red into yellow, and yellow into a very pale yellow.

Alkalies change red into violet, or purple; and yellow into feuilemort, or dead leaf-colour.

Terrestrial and sulphureous matters become red by extreme heat; and some, at length, black, as we see in brick, red bole, red chalk, slate, &c. All these, when vitrified by a burning-glass, become black.

Lobsters become red by a moderate fire; and by a violent one, black. Mercury and sulphur mixed and heated over a moderate fire make a beautiful red, called *artificial cinnabar*.

An acid spirit, as lemon juice, being poured on a blue solution of turafole, turns it into a beautiful red. Alkali restores it again to its original blue. Filtrating of some reddish wines takes from them all their red colour.

M. De la Hire observes, that a very luminous body viewed through a black one, always appears red; as when the sun is seen shining through a black cloud. He adds, that some people who see all the other colours perfectly well, yet have no idea of red, and only see it as black.

RED, in *Cosmetics*, a fucus or paint with which the ladies enliven their cheeks and lips.

There

There are two kinds of reds; the one in leaves, called Spanish red; the other a liquor, which is an extract of a scarlet dye.

RED, in *Dyeing*, is one of the five simple or mother colours of the dyers.

Some reckon seven kinds, or casts of red: *viz.* scarlet-red, crimfon-red, madder-red, half-grain-red, half-crimfon-red, lively orange-red, and scarlet of cochineal. But they may be all reduced to three, according to the three principal drugs which give the colours; which are kermes, cochineal, and madder.

The fine scarlet, called *scarlet of the Gobelins*, is given with agaric, bran-water, woad, and scarlet grain, or kermes. Some dyers add cochineal, and others fenugreek; brightening it with bran-water, agaric, tartar, and turmeric. See KERMES and SCARLET.

Crimfon-red is dyed with bran-water, tartar, and melleique cochineal. See CRIMSON.

Madder-red is dyed with madder; to which some add realgar, or red arsenic: others, common salt, or other salts, with wheat-flour; or agaric with spirit of wine, with galls or turmeric. See MADDER.

The half-grain is made with agaric and bran-water, half scarlet grain, half madder, and sometimes turmeric.

The half-crimfon is made of half madder, half cochineal. As to the lively orange-red, the stuff must be first put in yellow, then in a liquor made of goat's hair, (which has been boiled several times with madder,) dissolved over the fire with certain saline liquors, as urine, tartar, &c.

The scarlet of cochineal, or Dutch scarlet, as the French call it, is made with starch, tartar, and cochineal; after first boiling it with alum, tartar, sal gemma, and aqua fortis in which pewter has been dissolved.

Besides these seven reds, which are good and allowed colours, there is also a Brasil red; which is discouraged, as fading easily.

Of the seven good reds, only four have particular casts, or shades; the madder-red, crimfon-red, lively orange-red, and scarlet of cochineal.

The casts or shades of crimfon are flesh colour, peach colour, carnation rose colour, and apple-tree flower colour. Those of madder are flesh colour, onion-peel colour, and flame colour. Those of orange are the same with those of crimfon. Scarlet, besides the shades of all the rest, has some peculiar to itself, as cherry colour, fire colour, &c. See DYEING.

RED, in the *Manufacture of Glafs*. See Red GLASS.

To make a deep red in glafs, the following method is that most practised by the glafs-men. Take crystal frit twenty pounds, broken pieces of white glafs one pound, calcined tin two pounds; mix these well together, and put them into a pot to melt and purify. When these are melted, take steel calcined, scales of iron from the smith's anvil, both powdered very fine, of each an equal quantity; put leisurely an ounce of this mixed powder to the before mentioned metal; mix all well together, and let them stand six or eight hours in fusion to incorporate; take out a proof after this, and if there be too little of the powder, it will appear of a dusky yellow; then more of the powder must be added, and then add three quarters of an ounce of calcined brass, ground to a fine powder; mix them thoroughly together, and the mass will be of a blood red; continue stirring the whole together, and frequently taking out proofs of the colour, when it is right, work it immediately, otherwise it will lose its colour and become black. The mouth of the pot must in this process be left open, else the colour will be lost. Neri's Art. of Glafs, p. 100.

RED, in *Heraldry*. See GULES.

RED, in *Painting*. For painting in oil colours they use a red called *cinnabar*, or vermilion; and another called *lacca*. See each in its place.

In limning and fresco, for a violet red, instead of lacca they use reddle, a natural earth found in England; for a brown red, they use burnt ochre, which is a native yellow earth, made red by calcination. It is chiefly brought from Oxfordshire; and burnt by those who prepare it in large ovens. The marks of its goodness are brightness of colour, and a friable chalky texture, without manifesting any gritty roughness when rubbed betwixt the fingers.

The common Indian red, which is of a hue verging to the scarlet, is much used, on account of its standing and warm though not bright colour, in finer as well as coarser paintings in oil. It may be prepared by taking of the caput mortuum or ochre left in the iron pots after the distillation of aqua fortis from nitre and vitriol, two parts; and of the caput mortuum or colcothar left in the long necks after the distillation of oil of vitriol, one part; breaking the lumps found among them, and putting them into tubs with a good quantity of water: and having left them to stand for a day or two, frequently stirring them, then lading off as much water as can be obtained clear from them, and adding a fresh quantity; repeating the same treatment till all the salts be washed out, and the water comes off nearly insipid. The red powder which remains must then be washed over, and being freed from the water, laid out to dry. When this is designed for nicer purposes, it should again be washed over in basons.

The true Indian red is a native ochreous earth of a purple colour, brought from the island of Ormus, in the Persian gulf; and called, among the authors on these subjects, *terra Persica*. At present it is very rarely to be found; but it is certainly very valuable (there being no other uncompounded purple colour in use with oil) as well for the force of its effect, as for the certainty of its standing. In its genuine state, it needs no other preparation than grinding or washing over. It may be easily distinguished from any fictitious kind, by its being more bright than any other ochre which can be made so purple; and if it be rendered artificially purple by any addition, the fire will soon betray it; into which the genuine may be put without any hazard of change.

Venetian red is a native red ochre (see VENETA *bolus*), not much different from the common Indian red, but fouler; and may be easily prepared, by mixing common red ochre with the colcothar or caput mortuum taken out of the aqua fortis pots, and washed over. As it is generally used by the house painters in imitation of mahogany, it requires no other preparation than to be well ground with the oil with which it is used; but when it is used in miniature painting, it should be carefully washed over.

RED, *Blown*, in the *Porcelain Manufacture*, a name given to a peculiarly coloured china ware, of a spangled red, or to the colour alone that spangles it. It is an ornament easily introduced into use in our own manufactories of porcelain ware, and is done in the following manner. The colour is to be prepared of common copperas, calcined to a red colour in a charcoal fire, in a crucible, with another luted on the top of it inverted, and with a hole in its bottom. The signal of the calcination being finished, is, when the black clouds cease to come up through the hole, and a fine white thin vapour rises in their place. The vessels are to be then suffered to cool, and the red matter in them is to be reduced to a fine powder, while the vessels to be coloured with this

are yet wet. The operator is to provide a glass pipe, and covering one end of it with a piece of fine gauze, he is to dip this into the powder, and taking it carefully out, with what little is sticking to it, he is to blow against the vessel at some distance from it: thus the finest part of the powder only will reach the vessel, and will be laid on in form of glittering spangles, very small, but all distinct. This is sort of colouring much esteemed by the Chinese themselves, and they have a way of using the common blue in the same manner; but few of the vessels thus painted come over to us.

RED Clover, in *Agriculture*, an useful artificial grass for arable lands. It has this name in contradistinction to the white and some other sorts. There were at first many and very great prejudices against and objections made to the introduction of this plant into cultivation by farmers, which were not surmounted without difficulty, and it prevailed for some length of time in particular districts, as Staffordshire and Worcestershire, before it was known in some other counties, where it is now very predominant and beneficial, as Cheshire, Lancashire, and many more.

In some arable counties red clover is found to fail as a crop when long cultivated, dying away in the winter and spring, which the farmers designate by saying that the land is sick of it. This is a severe inconvenience to them in many cases; and renders such variations in the courses of cropping necessary, as may prevent the recurrence of it so frequently as has hitherto been the case. It is very liable to fail in every part of the county of Essex, but of the cause of which there are different opinions, some thinking that the land becomes sick of the plant, while others do not ascribe it to any satiety of this nature, but alter their modes of cropping that it may not take place so often. About the Belcamps and Bosely this is very much the case, some venturing it only once in seven years, and in that case it succeeds well. In all the Tendring hundred it is found to decline little on the strong rich lands, but is felt on the lighter sorts; on both the cropping is varied in regard to it. In the neighbourhood of Thorndon the lands are sick of it. And at Audley End the land is tired of it, but more in many cases from want of sufficient seed than any thing else. In the vicinity of Hallingbury it is very liable to fail, if sown oftener than once in seven or nine years, though the system thereabouts is crop and fallow.

In the county of Oxford some sow red clover twice in ten years, the land being new to it; of course it never fails. On the gravelly loamy soils about Henly it dies from repetition, so that it is alternately omitted in cropping, others being substituted, as white clover, trefoil, and peas. Nothing of this sort was known forty years ago, but now they sow it only once in two rounds. The loams and stone-brash lands around Wood Raton are not in general tired of this plant; some however find it to fail on the latter sort of soil. About Great Tew, where the lands have been inclosed forty years, they are not yet tired of red clover. At Atterbury, where the lands have been inclosed more years, it does not now succeed quite so well as it did fifteen or twenty years ago. In these failures other crops are put in, as tares and early peas drilled.

Some suspect sheep's dung to be destructive to the red-clover plant, but there are no proofs of the fact.

The most proper management of red clover as a preparation for wheat is a matter of great importance. Some think feeding it off wholly the best practice; others mowing and feeding; and a few mowing altogether. The method of feeding off the crops altogether, when done in a close even manner, is probably the most advantageous in this

intention, though there may be some immediate loss and inconvenience; after which that of mowing the first crop and feeding the second in a useful manner; the third mode, or that of mowing twice, is most to be feared, but upon some sorts of land it may be done and answer well for wheat. These methods are all practised and have their advocates in different parts of Essex; and some think that they get as good wheat after white as red clover, as well as that feeding the latter does no injury in this respect.

The farmers in Oxfordshire follow nearly the same practices, and hold much the same opinions in regard to the management of this crop as a preparation for wheat. And the custom of mowing and feeding off the first year, is thought the best practice in some other counties.

But in the county of Lancaster, and some others adjoining it, they know nothing of the land being ever *sick* or *tired* of this sort of crop, though they grow it in more frequent succession and in a more full manner than perhaps any where else in the kingdom. Ask the farmers about this, from one end of the above county to the other, they are all of the same opinion, and appear much surprised at the question, not ever having any conception of such a circumstance. What can be the reason that red clover has been as long and as frequently cultivated in these districts, as in those where it is so liable to fail? Does it depend upon the difference in the nature or quality of the soils, or the management in regard to the quantity of seed and other matters? The circumstance is worthy of further and more close attention and investigation, in consequence of its great importance to the farmer.

There is one particular feature of management in the cultivation of red clover in the county of Oxford, which is that of hand-sowing over it from fourteen to fifteen bushels of Newbury peat-ashes, that are brought into the Thames, by the Reading canal, on the acre, about the end of February or the beginning of the following month; which has an immediate effect upon it, seldom failing to produce a crop, except where it naturally declines. The expence is estimated at about ten shillings the acre. These ashes do not, however, seem to be employed in this way to the red clover crop in the district where they are found and prepared.

Seeded red clover undergoes two successive threshings, the first, which only beats off the heads and chaffs containing the seed from the stalks, is called *cobbing* in some places; the parts thus separated being denominated the red-clover *cobb*. The work is performed on a thick wooden plank frame for the purpose, and requires much labour to separate the seed, which, when done, is cleaned and passed through different sieves, being ultimately divided into two sorts, the primary and secondary. The cost of these operations is very great, amounting to from four to six shillings the bushel, and sometimes much more. It has been concluded by Mr. Middleton, that this plant grows a full crop in all the arable lands of this country, from the sands of Norfolk to the clays of Cleveland and Sussex. And that various soils that have been exhausted by corn, and not much accustomed to red clover, have been so much restored by it, as to produce a good crop of wheat; but that to do this every means should be used to secure a full crop, as that is an excellent preparation for corn, and seldom fails of ensuring a considerable produce, arising from shade, smother, and putrefaction, the natural and constant attendants of full-grown red clover. It is supposed advisable, in some cases of poor land, to feed both crops off on the land by sheep and other animals, in some way or other. And sometimes to mow the first and feed the second, or the contrary. In every point of view this is an interesting plant to the farmer. See CLOVER.

RED Gum, an insect disease on wheat, by which the ears of the grain are deprived of their nutrition, and thereby prevented from perfecting themselves. It is described by Mr. Middleton to be a collection of insects, which are visible to the unassisted eye, and which, in the early part of their growth, are of a reddish colour, but become brown with age: the black spots on the straw, blades, and ears of the wheat, are supposed to be the excrement of the insects. The blighted ears are probably rendered so, by the insects piercing the necks of the straw immediately below them, and sucking the saccharine juice, otherwise destined for filling the corn. In those ears which have both perfect and imperfect grains, the insect has perhaps inserted its probe at the connection between the corn and the straw, and by drinking up the food of the grains severally, has starved many of them in such a manner as to cause their destruction and decay. The exact nature of the disease is not, however, yet well ascertained.

RED Hay, a term used to signify such as is mow-burnt, in opposition to such as is green from a moderate heat, and *winy* hay, or such as is mouldy.

RED Land, a term used by husbandmen to express a sandy soil of a reddish hue, interspersed for the most part with pieces of sand-stone of the same colour, or somewhat deeper.

It may be noticed that there are several varieties of this soil: one of which is almost entirely made up of sand; another with an admixture of loam with the sand, the whole making a loose loamy earth; and a third full of fragments of a poor sandy iron ore, and often containing shining specular of selenite. See SOIL.

In some of the more northern parts of the county of Oxford, there is a rich red sandy loam, upon a red grit-stone rock. In some places this land is of a more sandy quality than in others; and, in particular instances, a deep red loam, or red clay. The lands are mostly of an excellent quality, both for arable purposes and those of grass; but the sandy sorts are better than those of the clayey kinds, especially for the former use. The red soiled tracts in this district are considered as the boast and glory of the county, as they are deep, sound, friable, and yet capable of tenacity; being well suited to almost every sort of plant which can be trusted to them, in the way of cultivation. Soils of this nature prevail more or less in a vast number of counties throughout the kingdom, even from the more southern ones to those far advanced towards the north.

RED Roan, a term signifying the red tinge in ripening barley, and sometimes other sorts of grain.

RED Row, a provincial term, applied to the grains of barley, when in a ripening state, or streaked with red. The crop is then said to be in the red row.

RED Antimony, in *Mineralogy*, an ore of that mineral, of a cherry-red colour, containing, according to Klaproth,

67.5 antimony,
10.8 oxygen,
19.7 sulphur.

It occurs most frequently in minute diverging capillary crystals. It melts and evaporates before the blowpipe, yielding a sulphurous odour. See ANTIMONY.

RED Arsenic. See ARSENIC.

RED Chalk. See REDDLE, and *Ores of IRON*.

RED Cobalt, called *cobalt crust*, and *cobalt bloom* or *ocbre*, an ore of cobalt, of a peach blossom red colour. See COBALT.

RED Copper, *Ruby copper*, an ore of copper, of a cochineal red colour, inclining to a lead-grey. It consists, according

to Klaproth, of 91 parts copper and 9 of oxygen. See COPPER.

RED Hamatite, *Fer oligiste concretienne* of Haüy, an ore of iron, found in kidney-shaped and globular balls. The structure is fibrous, and divergingly radiated, but arranged in concentric curves; the colour is a blueish-grey, intermixed with red. By friction, it acquires a high metallic lustre. It yields from 60 to 70 per cent. of pure iron. (See IRON.) An excellent ore of this kind is procured near Ulverstone, in the north of Lancashire, much valued, as producing an iron of a peculiarly ductile quality, suited for the purposes of the wire-drawers.

RED Lead. See MINIMUM and LEAD.

RED Scaly Iron Ore, *Fer oligiste luisant* of Haüy. It consists of scaly particles slightly cohering; it has an unctuous feel, and stains the fingers. It passes into micaceous iron ore.

RED Schorl. See *Ores of TITANIUM*.

RED, or *Ruby Silver Ore*, *Argent antimonie sulphuré* of Haüy. Werner divides this into two sub-species, dark red silver ore, and light red silver ore, distinguished from each other by their colour, and the situations in which they occur. The dark red ore is commonly accompanied by galena, antimonial sulphuret of silver, quartz, calcareous spar, and pyrites. The colour is between cochineal red and lead-grey. It occurs massive, disseminated, and crystallized in equiangular six-sided prisms, frequently variously truncated. The form of the primitive crystal is an obtuse rhomboid, whose plain angles are 104° 28' and 75° 32'; the inclination of the faces 109° 28' and 70° 32'. The external lustre is splendid, and in some specimens metallic; internally it is shining, and sometimes semi-metallic and metallic. The fracture is uneven, and in the crystallized varieties imperfectly small conchoidal. See *Ores of SILVER*.

The massive varieties are opaque; the crystallized, semi-pellucid and pellucid. The colour of the streak is a cochineal red. This variety yields easily to the knife: before the blowpipe or charcoal it decrepitates, and melts with a slight effervescence, emitting a dense smoke, which colours the charcoal yellow, and leaves a globule of silver. The specific gravity is 5.563 to 5.608.

The light red silver ore is usually accompanied by native arsenic, white cobalt ore, orpiment, and sulphate of barytes. The colour passes from a carmine red to a medium between cochineal red and lead-grey. In most of its characters it agrees nearly with the dark red silver ore; but when fused, it yields an arsenical vapour. Hence some chemists have conjectured that this ore differs from the dark red ore, by the former containing antimony, and the latter arsenic. According to Klaproth, red silver ore contains nearly

	60 of silver,
	10.5 sulphur,
Combined with 29.4	} 20.3 antimony, 3.2 oxygen, 5.9 sulphur.
of antimonial kimes,	
or - - - - -	

A variety of red silver ore, probably the light red ore of Werner, analysed by Proust, gave

74	fulphuret of silver,
25	fulphuret of arsenic.
.6	oxyd of iron.

Red silver ore may be distinguished from cinnabar and red copper ore, by its specific gravity, which is considerably less than the former, and greater than the latter; the specific gravity of red silver ore being 5.6 to 5.8.

of cinnabar	7 to 7.5.
red copper	3.9

RED Vitriol, a salt found at Neulohl, in Hungary, in the form

form of transparent crystals of a pale rose-red colour, and more or less transparent. It was discovered by Klaproth to be a sulphate of cobalt. Its solution affords a pale blue precipitate, with carbonate of potash, which tinges borax a pure blue colour.

RED *Charr*, in *Ichthyology*. See CHARR.

RED *Eye*, *Erythrophthalmus*, the *cyprinus erythrophthalmus* of Linnæus, called by some *rothauge*, or *rootang*, which, in the German language, signifies the fame. It very much resembles the common river bream in shape, but that it is somewhat thicker. The fins are all red, and the whole body of the fish is stained with a very elegant red, but no part of it so much as the iris of the eyes. When the scales are off, the body is of a greenish hue; and it has a yellow spot under the tongue. It much resembles the river mullet in some particulars, but it is of a more beautiful colour, and its eyes are more red. Its largest size seems a foot in length. It is a well-tasted fish; and spawns in April, under cover of the roots of trees. Ray.

This fish is called *rudd* by some English authors; it is also called *rutulus latior*, *rubellio fluviatilis*, and *finfcale*. It is very common in many of the rivers of Germany and England, and is in season all the year, except in spawning time, when the male is subject to a great number of white spots on its head, and is more rough than at any other season. Willughby. See *CYPRINUS Erythrophthalmus*.

RED-*Breast*, in *Ornithology*, a well-known bird, for the characters of which, see *MOTACILLA Rubecula*.

The song of this bird is remarkably fine and soft, and continues through the greatest part of the winter, spring, and summer. Many of the autumnal songsters seem to be the young cock red-breasts of that year. Pennant.

Thompson, in his *Seasons*, Winter, line 246, has admirably described the annual visits of this guest: and the ancient ballad of "The Babes in the Wood," recording the affection of this bird for mankind, is universally known.

RED *Chatterer* of Latham, *Red-bird* from Surinam of Edwards, and *Ampelis carnifex* of Gmelin, a bird of red colours, with an ocular band, and the wing and tail-feathers black at their tips. It is found in New Spain, Guiana, and Surinam.

RED *Game*, an English name of a bird, common in the mountainous parts of Yorkshire, and some other of our northern counties. See *GOR-cock*, *GROUSE*, and *TETRAO Lagopus*.

RED-*Pole*, or *Linnet*. See *FRINGILLA* and *LINNET*.

RED-*Pole*, *Yellow*, or *Red-headed Warbler*. See *MOTACILLA Petechia*.

RED-*Shank*, the name of a water bird, called by authors *gallinula erythropus*, and *callidrys*; the *scolopax calidris* of Linnæus. It is about the size of the common plover. The back is of a greyish or brownish-green, usually spotted with black; its neck grey, and its throat variegated with black and white; the breast is white, with a few loose streaks of black; the wing-feathers are variegated with black, brown, and white; the bill is two fingers breadth long, slender, and shaped like the beak of the woodcock; reddish at the base, and blackish lower down; its legs are of a fine beautiful red, and the hinder toe is very short and small. It breeds in the fens and marshes; is found on most of our shores; conceals itself in winter in the gutters; and is generally found single, or at most in pairs. When disturbed it flies round its nest, making a noise like a lapwing. It lays four eggs, of a whitish colour tinged with olive, and marked with irregular spots of black, chiefly on the thicker end. Ray and Pennant. See *SCOLOPAX*.

RED-*Start*, the English name of the *ruticilla*, or *motacilla*

phœnicurus of Linnæus, a very beautiful bird. The bill and legs of the male are black; the forehead white; the crown of the head, hind part of the neck, and the back, are of a deep blue-grey; the cheeks and throat black; the breast, rump, and sides, are red; the two middle feathers of the tail brown, the others red; the wings brown. In the female, the top of the head and back are of a deep ash colour; the rump and tail of a duller red than those of the male; the chin white; the lower side of the neck cinereous; and the breast of a paler red.

This bird appears among us only in the spring and summer, and is observed to come over nearly at the same time with the nightingale. It is so shy, that it will forsake its nest, formed with moss on the outside, and hair and feathers within, in hollow trees and the holes of buildings, if the eggs are only touched. It has a very fine soft note; and is remarkable for shaking its tail, and moving it horizontally, as a dog does when fawning. Pennant.

RED-*Start*, *Greater*. See *LANIUS Infansus*. See also *TURDUS Saxatilis*.

RED-*Start*, *Indian or Bengal*. See *LANIUS Emeria*.

RED-*Start*, *Small American*. See *MUSCICAPA Ruticilla*.

RED-*Start*, *Grey*. See *MOTACILLA Gibraltariensis* and *Eritbacus*.

RED-*Stone Poll*. See *LINNET*.

RED-*Tail*. See *MOTACILLA Eritbacus* and *Guianensis*.

RED *Tanager*, and *Summer Red-bird*. See *TANAGRA*.

RED-*Wing*, the name of a bird of the turdus, or thrush kind, called also in some places the *wind thrush*, or *swine pipe*; and by Linnæus and others the *turdus iliacus*, or *ilias*.

It is a little smaller than the common thrush, and is less spotted. Its back, neck, and head, are of the same colour with those of the common thrush; but its sides under the wings, and the feathers which line the wings, are of an orange colour, or dusky red; its belly and breast are whitish, and its throat yellowish, with brown spots: the wings are of a sort of chestnut colour, a little variegated. It feeds on insects, as worms, and the like; and is a bird of passage, coming to us in large flocks about the same time with the fieldfare, and leaving us also when that bird does. When the red-wing appears on the coast in autumn, it is certain the woodcocks are near. It is not well known where they breed, though some have guessed it to be in the mountains of Germany and Bohemia. They have a bitterish taste, and are less valued than the fieldfare. With us they have a disagreeable piping note; but in Sweden, during the spring, they sing very finely, perching on the top of some tree among the forests of maples. They nest in hedges, and lay six blueish-green eggs spotted with black. Ray and Pennant.

RED *Water*, a disease in sheep. It has been supposed by farmers to be caused by taking too much watery food, such as turnips, clover, rape, eddish, &c., but it is not peculiar to sheep feeding on turnips or rape, as has been believed by some. Its removal has been attempted by the use of common salt, a tea-spoonful of elixir of vitriol, and the frequent driving the animal about; and it is asserted, that the disease may be wholly prevented by having recourse to the use of dry food, in the night time, while the sheep are feeding upon these juicy kinds of food. See *SHEEP*.

In Suffex the sheep are sometimes affected with this complaint on their being first turned into turnips, which is supposed to be caused by their eating too large a portion of them in wet seasons. The disease is also believed to originate in the sheep being let out of the fold, when the ground

is covered with hoar frost; and often from feeding in the oat-erfhes about the beginning of the autumn, when the young oats are strong. It is thought here to be readily obviated by allowing a small quantity of hay so as to counteract the great wateriness of the turnip; the quantity of half a pound or even less in the course of the day is believed to be quite enough for each sheep in this intention. It is likewise suspected, that clover, stubble, and folded land, are productive of it in wet weather or moist seasons.

RED Weed, in *Botany*, a name given to a plant common in the Bermudas, and some other places; and called by our first travellers to that part of the world, the *Summer Island red weed*. Its berry is of a fine red colour, and affords a tincture little inferior to that of cochineal, and possessing all its virtues in medicine: the only misfortune of this, and some other very fine vegetable colours, is, that they fade soon. The juice of the fruit of the opuntia, or prickly pear, is as fine a dye as can be procured from the cochineal, but it will not stand; the insect feeding on this, however, we find affords a colour of the same nature that will stand. The fruit of the red weed is in the same manner liable to be eaten by insects as that of the prickly pear; and it is worthy a trial, whether the colour obtained at second hand from those insects, will not stand as well as the cochineal does, and whether the insects may not be propagated in a sufficient abundance to serve the markets in the same manner. Phil. Trans. N^o 40.

RED Weed is also a provincial term, signifying the round smooth-headed poppy, a pernicious weed in corn-fields. See **WEEDS**.

RED Worm, in *Natural History*, the name of an insect very destructive to young corn crops. The following description of this worm has been given by Mr. W. Baker: after observing, that he has often heard of the havoc which red worms make in young wheat, barley, and oats; and in some few writers upon husbandry has read of them, but never saw them till May 1764; when, to his great mortification, in a few days they destroyed almost totally nine acres of his wheat, for he did not reap above half a barrel *per acre*; and that the ingenious M. de Chateauvieux speaks of an insect, which is certainly of the same kind, if it be not the very insect which he has now under consideration; and in noticing the loss sustained in wheat crops, says, they found in it many little white worms, which afterwards became of a chestnut colour. They pass themselves between the blades, and eat the stems. They are usually found between the first joint and the roots; every stalk which they attacked grew no more, but became yellow and withered. And the same misfortune happened to them in the year 1732. The insects appeared about the middle of May, and made such havoc, that the crops were almost destroyed; Stillingfleet, also, in the second edition of his *Miscellaneous Tracts*, speaks of an insect, which is probably the same as in Suffolk and in some parts of Norfolk, where the farmers find it their interest to encourage the breed of rooks, as the only means to free their grounds from the grub, from which the tree or blind-beetle comes, and which in its grub state destroys the roots of corn and grass to such a degree, that he has seen a piece of pasture land where you might turn up the turf with your feet: he adds, that Mr. Matthews, a very observing and excellent farmer of War-grove, in Berkshire, told him, that the rooks one year, whilst his men were hoeing a turnip field, sat down in a part of it, where they were not at work, and that the crop was very fine in that part, whereas in the other part there were no turnips that year; though M. de Chateauvieux describes this worm as being first white, and afterwards be-

coming of a chestnut colour, he has carefully fought them at different periods during the past year, but always found them of the same chestnut colour, never varying in any particular except that of size, which he finds to be the case at all seasons in which he has seen them; and he observes, that the insect spoken of by Stillingfleet as a grub, which, he says, destroys corn and grass, induces him to believe that it is the same insect (though the report which he relates from Mr. Matthews seems to contradict it), because he has observed that the red or chestnut worm never appears voluntarily upon the surface; but when the earth is turned up, either with plough or spade, the rooks or crows are very bold in their approach to pick them up, a circumstance which, he owns, has in some degree abated his enmity to these birds; he therefore never destroys or frightens them off his land whilst he is ploughing it; but when he sows, when the corn rises, and when it is ripe, he destroys or banishes them as well as he can, because the mischief which they do at these times is intolerable; he has also observed his lucern to decay in its tops soon after it has been up; and upon examining the roots he has found the red worm which had eat them off; and that, in fact, this insect seems to be every where in Ireland called the red worm, but by some of the English writers, who have spoken of an insect which destroys the corn in the manner already mentioned, which he thinks undoubtedly the same, it is called a grub, by others the large maggot, and the rook worm, because the rooks eat it.

These worms are about half an inch long, and about one-tenth of an inch in diameter; they are jointed in their skins, and are of a very firm texture: they have many short legs, two small black specks, which appear to be their eyes; and two small points springing from their heads, with which, he believes, they eat the corn, and which in that work, he apprehends, act like forceps: and all that he has seen of this species are of a bright chestnut colour. For this reason, he should conceive it would be more descriptive to call them the chestnut-worms. When they are exposed to the air, by turning up earth which is infested with them, they will very soon cover themselves again in the soil, which they are very capable of doing by the strength which their make gives them, although they appear to be a sluggish insect, and have not the advantage of a sliminess upon their skins, which the common large creeping worm has, which enables that inoffensive worm to penetrate the earth, and get under timber and stones with ease. The red worm, immediately endeavouring to cover itself from the air, is certainly, he thinks, from natural instinct, as it will soon die when exposed to the air, as will appear by the experiment, N^o 10, mentioned below.

It is further stated, that these worms destroy wheat, barley, oats, and lucern, while in an infant state, in the months of March, April, and May. Late sown barley and oats they will destroy as late as June. He has not yet experienced that they destroy any other crops. The mischief done by them is in dry weather. Rain sufficient to penetrate the ground makes them desist from destroying the corn; and he supposes every thing else which they at any time injure. They eat wheat off just above the crown of the roots; barley and oats in the same place, and also higher up, upon any part of the stem which is below the surface of the earth. And these worms seem to abound more in ground which is lightly tilled, than in such as hath been well tilled; but in lay ground they seem to be more numerous than any where else: and the fields upon his farm in which he has found them, are wetter than other fields where they are not; whether that circumstance contributes to their increase, he cannot say; but the following

lowing experiments prove that they will live longer in water than they can when exposed to the open air.

Experiments.

N^o 1. He put ten red worms into a wine glass with common salt in it. They were all dead in four hours.

N^o 2. Into a glass with brine in it he put ten red worms. They were all dead in six hours.

N^o 3. Into a glass with lime in it, which had been slaked for a long time, and exposed to the weather, he put the like number. They were all dead in forty-four hours.

N^o 4. Into a glass with the above lime, and some water in it, he put the like number. They were dead in twenty hours.

N^o 5. Into a glass with lime newly slaked, and when cold, he put the like number. They were dead in fourteen hours.

N^o 6. Into lime water, made with cold water, he put the like number. They were dead in ten hours.

N^o 7. Into a glass with foot in it, he put the like number. They were dead in four hours.

N^o 8. Into foot and water he put the like number. They were dead in four hours.

N^o 9. Into pure water he put the like number. They were dead in fifty-two hours.

N^o 10. Into a glass, without any thing in it, he put the like number. They were dead in thirty-two hours.

It is stated that by these experiments it is seen that all the articles used will kill this insect in a short time, particularly the salt and foot. He thought it necessary to consider different articles, the better to suit different parts of the kingdom.

Where lime can be conveniently had, and that it is used as a manure, he is apt to believe, from the experiments, that no injury can be sustained from these worms; but he is afraid a small quantity will not effectually destroy them; besides, he should fear, if it were not put on before the sowing of the corn, that it might sting the blades of the corn; for, from these experiments, it appears that lime newly slaked is more suddenly destructive to them than old lime, and therefore it is to be preferred.

Where lime is used for no other purpose than to destroy this worm, he should conceive, that about eight barrels, regularly sown by hand on an acre of ground, might be sufficient: it must be first slaked and cold before a man can possibly cast it upon the ground with his hand, lime being a very strong caustic; and even when it is cold the man should have a thick glove upon his hand.

Where salt may be used to destroy this worm, it must always be sown upon the ground before the intended crop; for although corn will vegetate, and receive benefit from salt as a manure, when it is used antecedent to the sowing of the corn, yet if it be added after the corn is growing it will certainly destroy it: therefore it should never be used for this purpose, but before the corn is sown, or at least before it vegetates.

He conceives that where salt is used for this purpose only, about four hundred and a half to an acre will answer the purpose, which is a little more than one ounce to every square yard.

It is seen by the experiments, that foot kills this worm as soon as salt; and as in most places it is to be had at a much less price than salt, he thinks there can be no doubt about preferring it; besides which, it may be safely used after the corn is up.

He had some small parcels of barley under experiments, which these worms began to destroy; and in order to con-

vey the foot as soon as possible to the roots of the plants, he mixed a little of it in water, and poured it on the plants with a garden watering-pot: the consequence was that he did not lose one plant afterwards.

It will hardly be imagined that he means that the same method is to be pursued upon a whole farm: no; the method he would recommend to the practice of the farmer is this; to spread, or cast by hand, as he sows his corn, about six or eight barrels of foot on an acre, and let him be careful to choose a calm day for the work, otherwise the wind will carry away a great part of it: and as what remains cannot be regularly disposed, let him be careful to do it early enough in the spring, that the rain may wash in the foot and convey it to the roots of the plants before the worm begins the mischief; if he does this, he is persuaded his crop will be preserved.

It is found by the experiments, that these worms will live longer in water, by twenty hours, than when exposed to the open air; but at length, that is in fifty-two hours, they died in the water; perhaps this might be from the effect of drowning; but if so, he might have expected they would have been totally destroyed in his two fields in the winter of 1763 and 1764, by the immoderate rains which fell at that season for a long continuance, which often flooded the lands. But they survived that winter, as appeared by the great loss he afterwards sustained by their destroying his wheat; and therefore, whether water be an enemy to them or not, it seems not easy to determine: but if those which died in the glass of water were really drowned, he thinks we may conclude that water is necessary to their existence in the earth, and probably aids them in getting their food from it: and what seems to confirm this notion is, that when the land is wet, they do not touch the corn, but as soon as ever the land is dry, they begin their mischief. However, this speculation he must submit to the consideration of persons more capable of discussing it than he is.

It is seen by experiment N^o 10, that they cannot live in the open air, which seems to prove, that, where they abound in land, the oftener it is ploughed, particularly in the summer, when they cannot penetrate the ground so easily as when it is moist, they must be, by such ploughing, greatly diminished: besides which, the frequent ploughing gives the crows more opportunities of picking them up, in which, as he has before said, they are very watchful.

Frequent ploughing has been recommended by some writers as the only means of destroying this worm; and they have recommended the ploughs being stuck with nails, urging, that by those nails the worms are cut to pieces; others have recommended walnut leaves being soaked in water, to sprinkle the land, and steeping feed corn in various liquors, as infallible remedies; but such methods as these are founded upon mistaken principles; they only mislead the farmer, and must disappoint him.

Worldidge recommends a strong ley made of fixed salts, but that would be impracticable. Mortimer recommends sea-water, which he believes would answer very well. He says, he used foot once with success, but that it did not succeed with him afterwards. Mr. Baker is persuaded he did not use the foot early enough to have it washed into the ground by rain, or perhaps he used too small a quantity. He concludes by observing, that he would not be thought to arrogate any merit to himself, on account of what he has here offered on this subject, since it appears that other persons have used the articles which he has recommended, against this common enemy; but many persons have been disappointed in their expectations from these remedies,

remedies, which must have arisen, he thinks, from their either having used too small a quantity, or not having observed the necessary precautions; if those which he has recommended shall be put in practice and found to answer, he shall think himself amply rewarded.

This worm undoubtedly does great injury to grain crops in many cases, in particular soils and sorts of land; but a great number of additional facts and experiments are wanting to fully prove its nature, and the ways in which its destructive effects on such crops are produced, as well as the best, most ready, convenient, and effectual ways in which it can be destroyed. See *WIRE-WORM*.

RED Deer, fish, star, storax, tartar. See the substantives.

RED Ink. See *INK* and *PRINTING*.

RED Notes, in old *Music*, before the invention of printing, were used for diminution. In the MS. at Paris of the Latin and French poems of Guillaume Machau set to music, chiefly motets for a single voice, some are written in black and red notes, with this instruction to the singers; "nigræ sunt perfectæ, et rubræ imperfectæ;" an admonition worth remembering by those who wish to decypher music of the fourteenth and fifteenth centuries, in which red notes frequently occur. It was an easy expedient of diminution till the invention of the press, when the use of different coloured inks on the same page occasioned the trouble and expence of double printing. See *MACHAU*.

In the Pèpyfian collection at Cambridge, there are examples of the use of red notes for diminution in fragments of music by Joseph Gwineth and Robert Davie, who flourished in the time of Edward IV. Morley has given some examples of the use of red notes in his annotations.

RED Bank, in *Geography*, a fort of the United States, on the S.E. side of Delaware river, in the town of Woodbury, Gloucester county, New Jersey; seven miles S. of Philadelphia.

RED Bay, a bay on the N. coast of Spitzbergen. N. lat. 79° 44'. E. long. 10° 42'.—Also, a bay on the S.E. coast of Labrador. N. lat. 51° 50'. W. long. 56° 10'.—Also, a bay on the N. part of Buffalo's bay, on the S. coast of Massachusetts, in America.

RED Crab Island, a small island in the East Indian sea, near the coast of Arracan. N. lat. 21° 30'. E. long. 91° 50'.

RED Deer Lake, a lake of North America. N. lat. 55° 10'. W. long. 112°.

RED Flaggy Bay, a bay on the N. coast of the island of St. Christopher, E. of Ragged Point.

RED Haven, a bay of Scotland, on the N. coast of the county of Banff; three miles E. of Cullen. N. lat. 57° 39'. W. long. 2° 38'.

RED Head, a cape of Scotland, on the E. coast of the county of Angus; six miles S. of Montrose. N. lat. 56° 33'. W. long. 2° 26'.—Also, the N. point of the island of Eda. N. lat. 59° 6'. W. long. 2° 40'.

RED Hills, rocks in the German sea, near the coast of Northumberland. N. lat. 55° 26'. W. long. 1° 17'.

RED Hook, a town of America, in the township of Rhynebeck, and Dutchess county, New York, on the E. bank of Hudson's river; 21 miles S. of Hudson.

RED Horse, Vale of, a district of England, in the county of Warwick, which owes its name to a horse cut in a hill, the soil of which is reddish.

RED Island, an island near the E. coast of Labrador. N. lat. 43° 55'. W. long. 55° 50'.—Also, an island near the W. coast of Newfoundland. N. lat. 48° 35'. W. long. 59° 10'.

RED Lake, a comparatively small lake of North Ame-

rica, at the head of a branch of the Bourbon river, sometimes called "Red river;" its form is nearly round, and its extent is about 60 miles in circumference. It has on one side an island, close by which a river enters. It lies almost S.E. both from lake Winnepeck, and from the lake of the Woods. N. lat. 51° 5'. W. long. 94° 10'.—Also, a lake of North America, in N. lat. 47° 40'. W. long. 95° 15'.

RED Lick, a salt spring of the state of Kentucky; 32 miles E. of Stamford.

RED Point, a cape on the E. coast of New Holland. N. lat. 34° 29'. W. long. 208° 45'.

RED River, a river of Louisiana, which rises in about N. lat. 35°, and W. long. 96°, and runs into the Mississippi, N. lat. 37° 15'. W. long. 91° 48'.—Also, a river of Upper Canada, which runs into lake Superior. N. lat. 47° 51'. W. long. 85° 48'.—Also, a river of Tennessee, which runs into Cumberland river, about two miles N.W. of Clarksville. N. lat. 36° 18'. W. long. 87° 46'.—Also, a river of Kentucky, which runs into Kentucky river, about nine miles above Boonsborough, N. lat. 37° 45'. W. long. 84° 18'. It is 60 yards wide at the mouth.—Also, a river of North America, which rises from Red lake, in N. lat. 47° 40', and runs into Winnipeg lake.—Also, a river of Canada, which runs into the Utwas; 60 miles W. of Montreal. See also *NATCHITOCHE*.

RED Sea, called by the ancients the "Arabian gulph," forms the grand natural division between Asia and Africa, and extends about 21° or 1470 British miles from the straits of Babelmandeb to Suez; it terminates in two branches, the western being extensive, and the eastern ascending a little beyond the parallel of mount Sinai.

This sea is called, in the Old Testament, the sea of Suph or Zuph, the sea of weeds, on account of the great quantity of algæ and fuci, and perhaps the madrepores and coralline substances, anciently supposed to be of vegetable origin, found at its bottom, and near the shores. In scripture language it is also denominated "the tongue of the Egyptian sea;" in the Greek and Latin geography, it was called the gulph of Heroopolis; and by the Arabian geographers, the western arm of the sea of Kolzum, (al Kolzum, with the article,) which seems to have some affinity with "Clyfma," another name by which this gulph was formerly known; Kolzum in Arabic, and Clyfina in Greek, signifying destruction, in reference, as it is supposed, to the destruction of Pharaoh's host. Don John de Castro, viceroy of the Indies for the king of Portugal, conjectures that it was called the Red sea from the great quantity of coral that is found in it. Pliny says that it obtained this name, in Greek "Erythrea," from a king called Erythros, who reigned in Arabia, and whose tomb was seen in the island Tyrine or Agyris. Several learned men believe, that this king Erythros is no other than Esau, or Edom; Edom, in Hebrew, signifying red or ruddy, as Erythros does in Greek. But Calmet is of opinion, that Edom never dwelt, either on the shore of the Red sea, or the Persian gulph, which has been sometimes also called the Red sea. His habitation was east of the land of Canaan, towards Bozra; and he inclines to believe, that the name of the Red sea was not given to this gulph till after the Idumeans, descended from Edom, had spread themselves from east to west as far as the Red sea. At that time it might receive the name of the sea of Edom, which the Greeks rendered by the Red sea, or "thalassa erythrea."

The famous miracle of the passage of the Red sea by 600,000 Israelites, besides old men, women, and children, recorded in the sacred writings, is well known. Those who have been desirous of explaining this passage, with-

RED SEA.

out admitting the miraculous part of the history, have had recourse to a variety of conjectures; both as to the place and the manner in which this passage was effected. As to the place of the passage, there has been a difference of opinion even among those who have not hesitated to acknowledge that it was miraculous. Till of late years it has been generally believed, that the passage of the Israelites was at Baideah, or Bedea, which, according to Niebuhr, is about six German miles from Suez, and where the sea, says Bruce, is something less than four leagues broad, by 50 feet deep. In support of this hypothesis, Dr. Shaw has traced the march of the Israelites to their third encampment before Pihahhiroth. Whilst they were removing from the edge of the wilderness of Etham towards this station, they had left the open country and were marching through a narrow pass, betwixt the mountains of Gewoubee and Attackah. In these circumstances the Egyptians might well imagine, that they could have no possible way of escape, as the mountains of Gewoubee would obstruct their progress towards the south, and those of Attackah would impede their advancing towards the land of the Philistines: the Red sea lay before them to the east; whilst Pharaoh closed up the valley behind them, with his chariots and horsemen. This valley terminates at the sea, in a small bay, made by the eastern extremities of the mountains above-mentioned; and is called "Tiah Beni Israel," *i. e.* the road of the Israelites, from a tradition still existing among the Arabs of their having passed through it; and it is also called "Baideah," from the *new* and unheard-of miracle that was wrought near it, by dividing the Red sea, and destroying in it, Pharaoh, his chariots and his horsemen. The encampment of the Israelites, according to Dr. Shaw, was at this bay, before Pihahhiroth, betwixt Migdol and the sea, over-against Baal-tzepon, Exod. xiv. 2. Baal-tzepon, as this learned geographer suggests, might have relation to the northern situation of the place itself, or to some watch-tower, or idol-temple that was erected upon it; or it may be taken for the extremity of the mountains of Suez, or Attackah, the most conspicuous of these deserts, as it overlooks a great part of the Lower Thebais, as well as the wilderness that reaches towards, or rather which makes part of, the land of the Philistines. Migdol might lie to the south, as Baal-tzepon did to the north of Pihahhiroth. The marches of the Israelites, from the edge of the wilderness, being towards the sea, *i. e.* towards the S.E., their encampment betwixt Migdol and the sea, or before Migdol, could not well have any other situation. Pihahhiroth, or the mouth of Hhiroth, or a narrow gullet or defile, may denote the mouth, or the most advanced part of this valley towards the E., or towards the Red sea. But as the Israelites were delivered at this place from their captivity and fear of the Egyptians (Exod. xiv. 13.) we may suppose that Hhiroth denotes the place where they gained their liberty, *horar* and *hhiroth* being words of the like import in the Chaldee. It may be further urged in favour of this explication, and also of the tradition still preserved, of the Israelites having passed through this valley, that the eastern extremity of the mountain, supposed to be Baal-tzepon, is called, even to this day, by the inhabitants of these deserts, "Jibbel Attakah," or the mountain of deliverance; which appellation, together with those of Baideah and Tiah Beni Israel, could never have been given or imposed upon these inhabitants at first, or preserved by them afterwards, without some faithful tradition, that such places had been once the actual scene of these remarkable transactions. The sea likewise of Kolzum, *i. e.* destruction, as the correspondent part of the Red sea is called in the Arabian geography, is a further confirmation of this tradition. Moreover, the

Ichthyophagi, who lived in this very neighbourhood, are reported by Diodorus Siculus (l. iii.) to have preserved the like traditionary account from their forefathers, of this miraculous division of the Red sea. There are likewise other circumstances that tend to prove, that the Israelites took their departure from this valley, in their passage through the Red sea; for an account of which we refer to Shaw's Travels, ch. v.

This hypothesis, however, says Geddes, (Crit. Remarks on Exod. xiv.) has been fairly given up by our best modern critics; and the "Sinus Heroopolitanus," or gulph of Suez, pitched upon as the scene of action. The idea was first suggested by Le Clerc, and since adopted and defended by Michaelis, Niebuhr, and almost all the German commentators. But Mr. Bryant still contends for Bedea (Baideah), and calls the arguments of Niebuhr "prejudice and misconception." Dr. Geddes, whose sentiments concerning Moses and his whole history are singular, denies that there was any thing miraculous in the event; and strenuously maintains, that Suez or its vicinity was the place of passage; for here, he says, at this day, are shallows fordable at low water, and which might, in former times, have been frequently dry. We all know what changes happen in the bed of seas as well as that of rivers, especially where that bed is sand, which is the case with that of the gulph of Suez. The occurrence is thus described by Dr. Geddes. When Moses saw that the Egyptians had found out that the Israelites meant not to return, and were about to pursue him with a force which he could not resist, he wisely took the only course that was most likely to afford him an escape. Acquainted, as he must have been, during his long stay in Midian, with the nature of the Red sea, and its ebbs and flows, he deemed it better to take his chance of passing over some shallow which he knew to be fordable at low water, than to expose himself to be overtaken in a desert, where no stratagem could save him. If he got the start of the Egyptians but for a single day, he would have time to watch the tide, and begin his march as soon as the passage was fordable; and in the space of a few hours might be safe on the other side. The width of the sea at Suez is at present, according to Niebuhr's measurement, 757 double paces, or 3450 feet. It is common for the Arabs to pass on foot over this passage, although not always without danger, as the sea sometimes flows back unexpectedly. At Suez, according to Niebuhr, it is low water, at the full of the moon, at half past six; but as the passage of the Israelites must have happened some days after the full of the moon, the ebb and flow must have been considerably later, and the former must have occurred in the night-time, during which the Israelites are said to have passed. Michaelis was of opinion, that, as a strong wind is said to have accompanied this event, it might have caused a double ebb, as it sometimes does on the coast of Holland and North Germany; but Niebuhr thinks that no such thing is likely to happen in the Red sea. Be this as it will, the wind might certainly have prolonged the ebb; and, if it happened at the time of the passage, might well be considered as a providential interference, and readily construed into a miracle. Josephus, in recording this transaction, puts a formal speech into the mouth of Moses to his terrified and discontented people, and a prayer to God before he strikes the sea with his rod; yet he tells us that all this he has related as he found it in the sacred books. But he seems not sure, whether to consider it as a miracle or a natural effect. "Let no one," says he, "wonder at this account of a way of safety being opened to those old-world innocent folks, even through the sea, whether by the will of God or naturally; since, of later days, the Pamphylian sea opened a way

RED SEA.

way for Alexander's army, when God through him had decreed to overturn the Persian empire." (Antiq. l. ii. c. 16. n. 5.) For this he appeals to all Alexander's historians; and, indeed, both Appian and Arrian, who relate the event, seemed to have considered it as a sort of divine interposition; but honest Strabo tells us, that Alexander only took the advantage of low water; and, trusting to his good fortune, passed through the freight with his army; but not on dry land; for the water came up to the navel. (Strab. l. xiv.) The same was the case with Scipio's soldiers, who surprised New Carthage by taking the advantage of an ebb; although they waded sometimes up to the knee, at other times up to the navel, in water. (Liv. l. xxvi.) Here, says Geddes, the same two natural causes, the tide and a strong wind, concurred to make a passage through the water, as concurred at the passage of the Red sea; and in both cases they were converted into a miracle. Josephus concludes his narrative with these words. "Of such things, let every one think as he pleases;" and the author now cited adopts his language. It has been said, and thus the priests of Memphis explained the history (see Euseb. Præp. l. iv. c. 17.), that Moses taking advantage of the time of the ebb, led the Hebrews over in safety; but the Egyptians, not knowing the nature of the sea, and easily entering it just before the return of the tide, were all swallowed up and drowned.

In opposition to all conjectures for explaining this history, without having recourse to miracle, we shall content ourselves with appealing to the history itself, Exod. xiv. 16, 17, &c. from which it appears that the Hebrews traversed the sea from shore to shore, on a large space of dry ground, which was left by the retiring waters; and that they were driven back to overwhelm the pursuing host of Pharaoh. See also Isaiah, lxiii. 11, &c. Habakkuk, iii. 15. Wisdom of Sol. xix. 7, 8. x. 17, 18.

It is thought, says Calmet, after Eusebius, that the place where the Hebrews passed the Red sea, is two or three leagues below its northern point, at the place called Kolfum, or Clyfma. Niebuhr informs us that, every where on the coast of Arabia, we meet with indications, that the waters are withdrawn; *e. gr.* Mufa, which ancient authors mention as a port of Arabia, is now at many leagues distance from the sea; near Loheia, and Gidda, we see great hills filled with the same kind of shells and corals, as are now found living in the sea; near Suez, are petrifications of all these things. From these and similar circumstances he infers, that some thousand years ago this Arabian gulf was much larger, and extended much farther north, especially that arm of it near Suez, for the shore of this extremity of the gulf is very low. The breadth of the arm of the sea at Suez, he adds, is about 3450 or 3500 feet (in its present state). Although it would much shorten the distance of their way, no caravan now crosses this arm, nor could the Israelites have crossed it, without a miracle. The attempt must have been much more difficult to the Israelites, some thousand years ago, the gulf being then probably larger, deeper, and longer toward the north, at the lowest time of the tide. Niebuhr crossed, when returning from mount Sinai, that arm of the sea, over to Kolfum, upon his camel; and the Arabs, who accompanied him, were only immerged to their thighs in water. The banks of the Red sea are pure sand from Suez to Girondel; but lower to the south are banks of coral. If the Israelites had crossed the sea upon such banks, they must have been greatly incommoded by them.

The Red sea, notwithstanding the difficulty and danger, and also the tediousness of its navigation, was, for many ages before the discovery of the passage by the Cape of Good

Hope, the channel of communication between Egypt and other countries, bordering on the Mediterranean, and India. Accordingly, Dr. Robertson observes, in his "Historical Dissertation concerning Ancient India," that navigation made its first efforts in the Mediterranean and the Arabian gulf, and that in them the first active operations of commerce were carried on. Nor are the accounts of the earliest historians in this respect at all improbable, if we consider the position and form of these two great inland seas. They lay open the continents of Europe, Asia, and Africa, and spreading to a great extent along the coasts of the most fertile and most early civilized countries in each, seem to have been destined by nature to facilitate their communication with one another. We find, accordingly, that the first voyages of the Egyptians and Phœnicians, the most ancient navigators mentioned in history, were made in the Mediterranean, and, moreover, by acquiring early possession of ports on the Arabian gulf, they extended the sphere of their commerce, and are represented as the first people of the west who opened a communication by sea with India. Sesostris, in the course of his reign (if we may give credit to some historians), was able to fit out a fleet of 400 ships in the Arabian gulf, which conquered all the countries stretching along the Erythrean sea to India. The Phœnicians, who, by their situation on the Mediterranean, and the imperfect state of navigation, could not attempt to open a direct communication with India by sea, were prompted by the enterprising spirit of commerce to wrest from the Idumeans some commodious harbours towards the bottom of the Arabian gulf. From these they held a regular intercourse with India on the one hand, and with the eastern and southern coasts of Africa on the other. The distance, however, from the Arabian gulf to Tyre was so considerable, that it became necessary for them to take possession of Rhinocolura, the nearest port in the Mediterranean to the Arabian gulf. Thither all the commodities brought from India were conveyed over land by a route much shorter, and more practicable, than that by which the productions of the East were carried at a subsequent period from the opposite shore of the Arabian gulf to the Nile. At Rhinocolura they were reshipped and transported by an easy navigation to Tyre, and distributed through the world. For an account of the trade which the Jews carried on by the Red sea, we refer to the articles OPIUM and TYRE. For the manner in which the Egyptians carried on their trade with India by means of this gulf, see ALEXANDRIA and BERENICE.

All the commercial transactions of the ancients with the East were confined to the ports on the Malabar coast, or at the farthest extended to the island of Ceylon. To these staples, the natives of all the different regions in the eastern parts of Asia brought the commodities which were the growth of their several countries, or the product of their ingenuity, in their own vessels, and with them the ships from Tyre and from Egypt completed their investments. While the operations of their Indian trade were carried on within a sphere so circumscribed, the conveyance of a cargo by the Arabian gulf, notwithstanding the expence of land-carriage, either from Elath to Rhinocolura, or across the desert to the Nile, was so safe and commodious, that the merchants of Tyre and Alexandria had little reason to be solicitous for the discovery of any other. During the period in which this mode of carrying on commerce subsisted, the price of goods imported from India into Europe was very much enhanced by the various operations to which the conveyance of them was subject. In Ceylon, or the ports on the Malabar coast to which they were brought from the various countries of Asia by the natives, they were put

put on board the ships which arrived from the Arabian gulf. At Berenice they were landed, and carried by camels 258 miles to the banks of the Nile. There they were again embarked, and conveyed down the river to Alexandria, whence they were dispatched to different markets. But, after the passage to India by the Cape of Good Hope was discovered by Vasco de Gama, at the close of the fifteenth century, its various commodities were purchased at first hand in the countries of which they were the growth or manufacture; and as the carriage of mercantile goods by water is much less expensive than by any other mode of conveyance, the Portuguese, as soon as they could import the productions of India in sufficient quantities to supply the demands of Europe, were able to afford them at such a reduced price, that the competition of the Genoese and the Venetians, who had been actively engaged in this commerce, ceased almost entirely; and the full stream of commerce took its natural direction towards the cheapest market. The consequence was, that early in the sixteenth century, the subjects of the Portuguese monarchs became possessed of a monopoly of the trade with India, founded upon the only equitable title, that of furnishing its productions in greater abundance, and at a more moderate price. From the era of the discovery now mentioned, the Arabian gulf or Red sea lost its importance as a channel of communication between the western and eastern parts of the globe; and from this time both its navigation, and the commerce connected with it, have been partial and restricted. An account of its principal ports will be found under their respective articles.

REDA, a town of Turkish Armenia, in the government of Erzerum; 36 miles N. of Ispira.

REDANS, or REDANT See REDENS.

REDARIDES, in *Geography*, a town of France, in the department of the Mouths of the Rhone; 16 miles S.S.E. of Orangi.

RED-BOOK of the *Exchequer* (*liber rubeus scaccarii*) is an ancient record, in which are registered the names of those that held lands *per baroniam* in king Henry II's time. It is a manuscript volume of several miscellaneous treatises, in the keeping of the king's remembrancer, in his office in the exchequer; and hath some things (as the number of the hides of land in many of our counties, &c.) relating to the times before the Conquest. There is likewise an exact collection of the escheques under king Henry I., Richard II., and king John; and the ceremonies used at the coronation of queen Eleanor, wife to king Henry III. &c.

REDDAT. *Precipe quod Reddat.* See PRECIPE.

REDDENDIS CHARTIS. See CHARTIS.

REDDENDUM, in *Law*, a clause in a lease, &c. by which a rent is reserved to the lessor; which anciently consisted of corn, flesh, fish, and other victuals. 2 Rep. 71.

REDDIDIT SE, is where a man procures bail for himself to an action in any court at law; if the party bailed at any time before the return of the second *seire facias* against the bail, renders himself in discharge of his bail, they are thereby discharged. 2 Lill. Abr. 430. See BAIL.

REDDITARIUM, an ancient law term for a tarrier, roll, or rental, in which the rents and services of a manor are set down.

REDDITION, REDDITIO, a surrendering or restoring. In *Law*, it also denotes a judicial acknowledgment that a thing in question belongs to the demandant, and not to the persons so surrendering.

REDDITUS ASSISUS, a set or standing rent. See ASSISUS.

REDDLE, *Red Ochre*, or *Red Chalk*, in *Mineralogy*, the red oxyd of iron intermixed with earthy matter. It is

used for crayons, either in its natural state, or pounded and washed, and afterwards mixed with gum, and cast into moulds. The colour of reddle varies from a blood-red to a brown-red; its fracture is earthy; it is soft, friable, and stains the fingers. See *Ores of IRON*.

This is the common English name for the substance called in Latin *rubrica*, and used in painting, and for marking sheep, &c. There are two kinds of it, a harder and a softer.

The first, or harder kind, is but little in use, except among the turners in wood, as it does not mark so easily, requiring to be first wetted, and then pressed hard upon the substance to be marked. This is dug in Lincolnshire, Hampshire, and Suffex; and is a hard and dry earth, of a somewhat pale red, like the common pale red bricks, and is of a very regular and close texture, and always composed of a number of thin laminæ, lying closely and evenly on one another. It is of a rough uneven surface, adheres firmly to the tongue, is not easily broken between the fingers, and stains the hands a little; it is of a very astringent taste, and melts pretty readily in the mouth. It is very readily diffusible in water, mouldering to powder, soon after being thrown into it; and makes no effervescence with acids.

The second, or softer kind, is very common, and put to a number of different uses. It makes simply a very good pale red for the painters, and is very serviceable to them in their mixed colours. It is in constant use in many parts of the kingdom for the marking of sheep; and when washed and separated from its sandy particles, is, by some of our modern druggists, sold under the name of bole armenic.

It is found in many parts of the world: the best in England is that from several parts of Derbyshire, from whence the colour-shops and druggists of London are supplied; many of the latter thinking this a shorter method than the common one of our bole armenic makers, of preparing it from a mixture of tobacco-pipe clay, and the red ochre called Spanish brown.

This soft, or common reddle, is a loose ponderous earth, of a lax texture, and very friable; and of a pale, but tolerably bright red, of a somewhat smooth and glossy surface, soft to the touch, adhering firmly to the tongue, easily broken between the fingers, and staining the hands. It is of a rough austere taste, very readily breaks, and falls to powder in water, and makes no effervescence with aqua fortis. Hill.

Some call reddle, *lapis hematites*; but the real hematites is another thing.

REDEEMABLES, in *Law*, are lands, funds, &c. sold with a reservation of the equity of redemption.

Crown lands are redeemable for ever; others only for a certain time.

RE-DELIVERY, an yielding or delivery back of a thing: if a person has committed a robbery, and stolen the goods of another, he cannot afterwards purge the offence by any re-delivery. Co. Litt. 69. H. P. C. 72.

RE-DEMISE. See DEMISE.

REDEMPTION, REDEMPTIO, a faculty or right of re-entering upon lands, &c. that have been sold, and assigned; upon reimbursing the purchase-money, with legal costs.

Bargains in which the *faculty*, or, as some call it, the *equity of redemption*, is reserved, are only a kind of pignorative contracts.

A certain time is limited, within which the faculty of redemption shall be exercised; and beyond which it shall not extend.

REDEMPTION, in *Theology*, denotes the recovery of man-

kind from sin and death, by the obedience and sacrifice of Christ, who on this account is called the *Redeemer* of the world. See COVENANT.

REDEMPTIONS, *Redemptions*, in our old *Law Writers*, denote grievous mulcts imposed by way of commutation for the head or life of the delinquent.

REDEMPTION of the *National Debt*. See FUND.

REDEN, or REDZYN, in *Geography*, a town of Prussia, in the territory of Culm; 20 miles N.E. of Culm.

REDENS, REDANS, or *Redant*, in *Fortification*, a kind of work indented in form of the teeth of a saw, with salient and re-entering angles; to the end that one part may flank or defend another.

It is also called *saw-work*, and *indented work*. The faces in this flank one another.

Redens are frequently used in the fortifying of walls, where it is not necessary to be at the expence of building battions; as when they stand on the side of a river, a marsh, the sea, &c. But the fault of such fortification is, that the besiegers from one battery may ruin both the sides of the tenaille or front of a place, and make an assault without fear of being enfiladed, since the defences are mined.

The parapet of the corridor also is frequently redented, or carried on by way of redens.

REDES, in *Geography*, a river of South America, which runs into the gulf of Darien, N. lat. $7^{\circ} 37'$. W. long. $76^{\circ} 40'$.

REDHIBITION, REDHIBITIO, in the *Civil Law*, an action allowed a buyer, by which to annul the sale of some moveable, and oblige the buyer to take it back again, upon the buyer's finding it damaged, or that there was some personal cheat, &c.

The redhibition, or redhibitory action, has a place in several cases, in the body of the civil law. If a horse was sold that had the glanders, were broken-winded, or foundered, it was a redhibitory case; and the seller might be obliged to take him again within nine days.

REDI, FRANCIS, in *Biography*, an Italian physician, was descended from a noble family, and born at Arezzo, in Tuscany, in the year 1626. He commenced his studies at Florence, and then removed to Pisa, for the prosecution of his philosophical and medical pursuits, where he received the degree of doctor in both these sciences. He had acquired great reputation both in science and literature, and was induced to settle at Florence, where he at length gained the favour of the court, and was appointed first physician to Ferdinand II. duke of Tuscany, and subsequently to Cosmo III. These appointments and his constant professional employment did not, however, prevent him from cultivating his favourite study of the belles lettres. He devoted much of his time to the language of his country, and contributed not a little to the perfection of the dictionary of the academy of La Crusca, of which, and of several other learned bodies, he was a member. Totally free from presumption, and attached to every cultivator of learning and science, he was always ready to give his assistance to them in every way he could, and was universally esteemed and beloved. He displayed both in his practice, and in the prosecution of his inquiries in natural history, a singular acuteness of observation, and a complete incredulity as to the marvellous, which was so prevalent in his time; and he cautioned his friends and pupils against the popular errors in this respect. Although he was afflicted with epileptic fits in his latter years, yet he appears neither to have abandoned his studies, nor his professional business, until his death, which took place in 1697, in his 71st year.

Redi was the author of several Italian poems, which are

held in much estimation. His other works were all written in Italian, and his style was deemed so pure and elegant, that the authors of the dictionary of La Crusca have often cited it as a standard. Most of his writings on natural history have been translated into Latin; especially his "*Experimenta circa Generationem Insectorum, cum Figuris Æncis*;" his "*Observationes de Viperis*;" his "*Experimenta circa diversas Res naturales, speciatim illas quæ ex Indiis adferuntur*;" and his "*Observationes de Animalibus viventibus, quæ intra Animalia viventia reperiuntur*." He also published a letter on the Use of Spectacles, and an Essay on Styptics. Eloy Dict. Hist. de la Med.

Redi, in the notes to his "*Bacco in Torcano*," a dithyrambic poem, published in 1685, has given many curious etymologies and explanations of the musical terms used by the Italians in early times.

REDIGOODÉM, in *Geography*, a town of Hindoostan, in the circar of Ellore; 25 miles W. of Ellore.

REDIMICULUM, among the Romans, a girdle, which going about the neck, divided on the breast, and passing down each side, went round, and kept the robe tight to the body.

REDINKA, in *Geography*, a town of Portugal, in the province of Beira; 14 miles S. of Coimbra.

REDINTEGRATED MEDALS. See MEDAL.

REDINTEGRATION, REDINTEGRATIO, in the *Civil Law*, the act of restoring a person to the enjoyment of a thing, of which he had been illegally dispossessed.

In France, where a person is despoiled of his property, he claims it again by redintegrand, or action of restitution. But the redintegrand must be demanded within a year and a day, otherwise it is precluded.

REDINTEGRATION, in *Chemistry*, the restoring of any mixed body, or matter, whose form has been destroyed by calcination, corrosion, sublimation, or the like, to its former nature and constitution.

The redintegration of mercury is properly called *revivification*. Mr. Boyle has an express treatise on the redintegration of saltpetre; where he shews, that after reducing it by fluxion into fixed nitre, which is next of kin to salt of tartar in all its properties, he could presently redintegrate it, by pouring a sufficient quantity of spirit of nitre on it; *i. e.* he could re-produce true crystals of the usual form and virtue of saltpetre.

It is a strong objection against the chemical principles, that we cannot redintegrate the body they were procured from, by re-mixing them.

This seems to argue, that the body did not properly consist of such elements, or that they were not originally contained in it, but were rather produced by the fire.

REDIPATAM, in *Geography*, a town of Hindoostan, in Marawar; 18 miles N. of Ramadnaporum.

REDIRE *ad Pacem*, in *Law*, is applied to a person, whose outlawry is reversed, and who is restored to the king's peace.

REDISSEISIN, a disseisin made by him who once before was found and adjudged to have disseised the same man of his lands or tenements; for which there lies a special writ, called a *writ of redisseisin*. See ASSISE of *Novel Disseisin*, DISSEISIN, and *Post-Disseisin*.

REDMANS, or RADMANS, in *Doomsday* and other ancient books, are probably the same with rod, or rad-knights; *viz.* men who, by the tenure or custom of their lands, were to ride with, or for, the lord of the manor, about his business.

REDNITZ, in *Geography*, a river of Germany, formed by the union of the Upper and Unter Restat, about 5 miles S. of Roth, in Franconia. After receiving in its course

several streams, it discharges itself into the Maine, a little below Bamberg.

REDOLESCO, a town of Italy, in the department of the Mincio; 14 miles W.S.W. of Mantua.

REDON, a town of France, and principal place of a district, in the department of the Ille and Vilaine; 32 miles S.S.W. of Rennes. The place contains 3783, and the canton 11,620 inhabitants, on a territory of 187½ kilometres, in 5 communes. N. lat. 47° 39'. W. long. 2°.

REDONDA, an island in the West Indies, about 10 miles in circumference, without ports, rivers, or towns. N. lat. 16° 55'. W. long. 62° 20'.

REDONDELA, or REDONDILLO, a town of Spain, in the province of Galicia, near the west coast, defended by a strong castle; 32 miles W.S.W. of Orensa.

REDONDO, a rock, about three miles in circumference, between the islands of Montserrat and Nevis, in the West Indies. N. lat. 17° 6'. W. long. 61° 35'.

REDONDO *Novo*, a town of Benguela. S. lat. 11° 22'. E. long. 13° 45'.

REDONDO, *O*, a town of Portugal, in Alentejo; 14 miles E.N.E. of Evora. N. lat. 38° 33'. W. long. 7° 22'.

REDONDOS, a town of Portugal, in the province of Beira; 17 miles S. of Coimbra.

REDOUBLE', Fr., in *Musiq.*, a doubled interval in the octave above a single interval. The octave of the octave, with us, is called the 15th. See INTERVAL.

REDOUBT, or REDOUTE, *Reductus*, in *Fortification*, a small square fort, without any defence but in front, used in trenches, lines of circumvallation, contravallation, and approach; as also for the lodging of corps de garde, and to defend passages. See FORT.

They are usually figures of three, four, five, or six sides, encompassed with a ditch, and a bank of earth, which consists of two parts, called rampart and parapet.

In marshy grounds, redoubts are often made of stone-work, for the security of the neighbourhood; their face consists of from ten to fifteen fathoms; the ditch round them from eight to nine feet broad and deep; and their parapets, which are cut into embrasures and merlons, have the same thickness. See REDUCT.

The inner sides of square redoubts are usually between the limits of twelve and thirty-two yards; and when they are to be defended by musketry, the number of men necessary to the defence may be thus determined: half the side squared gives the number of troops; and twice the square root of a given number of men, shews the length in yards of the side of a square redoubt proper to contain them.

To construct a square redoubt.—Mark out a square, whose side is adapted to the number of troops allotted for the defence, as AB (*Plate VII. Fortification, fig. 5.*) for the inside of the rampart. About this square, at the distance of ten or twelve feet, describe another square, whose side, CD, is the inner boundary of the parapet; make a parapet of about nine or ten feet thick, whose outline is the line EF; leave a berm about three or four feet broad, whose side is GH; and dig a ditch about sixteen feet wide, and about six or seven feet deep, which should be rounded before the angles of the redoubt. Make the rampart from four feet to nine or ten feet high; let the parapet be six or seven feet higher, and let the foot-bank be four feet and a half lower than the crown of the parapet. On that side most secure from the enemy, make a bridge across the ditch, and a passage through the rampart, about four or five feet broad when the defence is musketry, about nine or ten feet broad when cannon are to be used; and shut up the passage by a strong gate. If the redoubt is to be defended by can-

non, both the rampart and parapet should be at least five or six feet thicker. In order to make the fire pretty nearly equal on all sides, and sufficient for defending the angles of the work, M. Clairac has contrived to cut the inside of the parapet into notches, whose two sides, of a yard each, are at right angles to one another, and make half-right angles with the sides of the work; the manner of which, and its defence, are plainly shewn in the figure, where the lines with dots at the ends represent the fire three different ways from the same side.

For the method of constructing flanked redoubts, see FORT.

A *detached redoubt* is a kind of work resembling a ravelin, with flanks, placed beyond the glacis; such as B (*Plate V. Fortification, fig. 6.*) They are made in order to occupy some spot of ground which might be advantageous to the besiegers; and likewise to oblige the enemy to open their trenches farther off than they would otherwise do. Their distance from the covert-way ought not to exceed a hundred and twenty toises, that they may be defended by musket-shot from thence. The gorge, *ab*, is forty toises; the flanks, *ac*, *bf*, which are perpendicular to the gorge, ten; and the faces, *cd*, *fd*, thirty: the ditch before it is six toises, ending in slopes at both ends; the covert-way, four; the branches of the covert-way about forty-two toises long; the faces of the places of arms, *y*, *y*, which are perpendicular to the branches, ten; and the other, which is parallel to them, fourteen. The communication from the covert-way to the redoubt is five or six toises wide; and there is a traverse made just at the entrance, and another in the middle when it is pretty long. The parapets of this communication terminate in a slope or glacis. Robertson's *Marine Fortif. p. 20, &c.* Muller's *Fort. p. 43, &c.* See ARROW.

Redoubts are also small works of the same form made in a ravelin.

REDOUBT, *Castle or Donjon.* See REDUCT.

REDOUBTS *en Cremaillere*, differ from other redoubts by having the inside line of the parapet broken, so as to resemble a pot-hook, or the teeth of a saw; by which a greater fire can be brought to bear upon the defile than if only a simple face was opposed to it, and consequently the passage is rendered more difficult.

REDOUTES *de Terre*, Fr. redoubts that are hastily thrown up, and made with earth, for the purpose of securing entrenchments, circumvallations, passages of rivers, &c.

REDOUTES *de Maconnerie*, Fr. redoubts made of masonry-work; generally constructed in places where an enemy might derive advantage from establishing himself; they are likewise built upon the salient angles of the glacis.

REDOUTES *Casematées*, Fr. casemated redoubts, or such as are arched over and made bomb-proof. Those constructed for the defence of Gibraltar, and for the security of Dover castle, are of this description.

REDOUTES *à Machicoulis*, Fr. are those which are made of brick or stone-work several stories high. The highest story juts out about one foot beyond the wall that surrounds or fronts the redoubt.

REDRESSING, the rectifying or setting any thing straight again.

Trees and other plants have a natural faculty of redressing themselves, when, by any external cause, they are forced out of the perpendicular.

In the moral sense, to redress grievances, is to reform or remove them. The redress of injuries is the object with a view to which courts of justice are instituted in every civilized society; in order to protect the weak from the insults of the stronger, by expounding and enforcing those laws, which define rights and prohibit wrongs. This remedy is,

therefore, to be sought for by application to these courts; that is, by civil suit or action.

To redress a stag, among hunters, is to put him off his changes.

REDRILL, *To*, in *Military Language*, is to put a soldier through the first elements of military training. Every soldier, after his return from long absence, must be redrilled before he is permitted to act in the ranks of a company.

REDRUTH, in *Geography*, a considerable market-town in the east division of the hundred of Penwith, and county of Cornwall, England, is situated on the road from Launceston to the Land's-End, at the distance of 262 miles S.W. from London. It occupies the declivity of an eminence in the very centre of the mining district, and derives its support entirely from the mines. Dr. Pryce supposes it to have been a town in Saxon times; but if so, the records of its history during that period have been entirely lost. It is first mentioned in the year 1332, when William Basset, the then proprietor of the manor, obtained for the inhabitants the privilege of fairs and markets. In 1502 a similar grant was made in favour of John Basset, esq.; and in Oliver Cromwell's time, Mr. Buller of Morrall procured a charter for a market on Fridays, which was confirmed by king Charles II. At present there are two weekly markets, held on Wednesday and Friday; and three annual fairs, chiefly for cattle and ozier manufactures. The tolls of two of these fairs and the markets belong to the Buller family; and the other fair to lord de Dunstanville, the descendant of the Bassets. The increase of this town, since the commencement of the copper mines in the last century, has been as six to one, as appears by the average of baptisms. According to the population return of 1801, it contained 664 houses, and 4924 inhabitants; but in 1811 the houses were returned as amounting to 879, and the inhabitants to 5903 in number.

Redruth consists chiefly of one long street. The church, the living of which is a rectory, was built, in 1770, by lord de Dunstanville, in the stead of a more ancient one. This building is situated about half a mile from the town. Here are the remains of a chapel of ease, dedicated to St. Rumon, which has been unroofed for many years. In Redruth are meeting-houses for Quakers and Anabaptists, besides two for Methodists in the town, and a third in the north part of the parish. In 1803, a large school-house was built here by subscription, and a master placed in it by the same means; but the subscription having been discontinued, the school is now kept open by the master on his own account.

Among the numerous mines in Redruth and the contiguous parishes of Gwennap, Kenwyn, and St. Agnes, those denominated the *Gwennap mines* are considered to be the principal. These lie to the south-east of Redruth, in a part of the county where the tin and copper lodes are peculiarly rich, and in some places intersect each other. The country of the united mines Huel-Virgin, Poldice, and Huel-Unity, is schistus; that of Huel-Jewell, Huel-Gorland, and Trefavan, is granite; and it has been remarked, that the metallic veins mostly obey the course of the granite mountains, and run very nearly parallel with them. The united mines employ about 600 men, of whom 400 work under ground. The water is drawn off by four immense steam-engines, one of the cylinders of which is nearly seven feet in diameter. The Huel-Virgin mine is 160 fathoms deep, and is extremely productive; but the Huel-Unity and Poldice mines are still more rich, and are wrought to such advantage, that the proprietors usually share from 16,000*l.* to 20,000*l.* per annum. The depth of the Poldice mine is 170 fathoms; but at present it is not worked at a lower

depth than 140. This is one of the oldest mines in the county, and yields a yellowish copper ore, a rosin tin, and a few stones of galena. The Huel-Gorland mine is 120 fathoms below the surface, and is wrought at the expence of about 1000*l.* a month. The North Down mines, nine in number, occupy an extent of two miles in length, and one in breadth, and have their surplus water carried away by the same long adit which runs through the Gwennap mines to the Carnon-Stream works.

Besides the mines, there are several other objects in the vicinity of Redruth not undeserving of notice. Portreath, about four miles to the north, is a small sea-port for the importation of coals and lime, and the exportation of copper ore to the works in Wales. It is defended by a fort, mounting four guns, and was erected by lord de Dunstanville in the year 1782, and is maintained at his expence. Tehidy park, the ancient seat of the Dunstanville family, adjoins Portreath on the south-west. This manor is first mentioned as being in their possession as early as the year 1100, about thirty years before the marriage of Cecilia de Dunstanville with William Basset, who carried the Dunstanville estates to the Bassets. The present manor-house is of modern erection, consisting of a centre, and four detached pavilions at the angles, the whole constructed chiefly of Cornish free-stone. The principal rooms are decorated with some good portraits by Vandyke, Kneller, and sir Joshua Reynolds; and also with a few pieces by Rubens, Carlo Dolci, Bononi de Ferrari, Rembrandt, Borgognone, and others of less note. The park and pleasure grounds attached to this mansion are very extensive; containing about seven hundred acres, finely varied by wood and lawn, and appearing like a well-cultivated garden in the midst of a desert.

Westward from Redruth, about a mile and a half, is Carn-breh hill, which Dr. Borlase and others contend ought to be regarded as the grand centre of Druidical worship in this county, almost every kind of monument commonly attributed to the Druids being found, as they allege, upon that eminence. How far this opinion is correct, we shall not pretend to decide; but we may observe, that several late writers maintain, that a part of the supposed monuments of religion, *viz.* the caves, are in fact the result of natural convulsion. No doubt, however, some of them are artificial, and probably belonged to the Druids; and what seems to corroborate this idea is, the circumstance of Redruth being a corruption for Dre-Druith, which signifies the Druids' town. On the summit of this hill is a circular fortification, called the Old Castle, which appears to have been formerly surrounded by a strong wall; and about 300 yards to the eastward, on a ledge of succumbent rocks, stands Carn-breh castle, part of which lays claim to a very high antiquity; but the remainder is of comparatively modern date. The rocks upon which this structure is erected not lying at all contiguous to each other, are connected by massive circular arches thrown over the cavities.

On the south-west side of Carn-breh hill is Pendarves, the seat of John Stackhouse, esq. It is a large handsome building, situated on an eminence commanding extensive views over the western parts of the county. In a field contiguous is a large cromlech, composed of three upright stones, and an impost. Clowance, situated about three miles further to the south-west, has been for several centuries a seat of the family of St. Aubin. The house is deeply embosomed in wood; and contains, besides several pictures of curiosity and value, a large collection of rare and choice prints, accumulated in the portfolios of its present possessor. Lysons's *Magna Britannia*, vol. iii. London, 1814, 4to.

Bautics of England and Wales, vol. ii. by John Britton and E. W. Brayley.

REDSEAR. See IRON.

REDSTONE, in *Geography*, a town of Pennsylvania, on the Monongahela; 55 miles N.W. of Pittsburg.

REDUBBORS, those who buy stolen clothes, &c. and, to the end they may not be known, turn them into some other fashion, &c. See FRIPPERY, and REGRATOR.

REDUCE, in *Chemistry*. See REDUCT.

To REDUCE a Place, in *Military Language*, is to oblige the governor to surrender it to the besiegers by capitulation.

To REDUCE the Circle, is to restore or bring back a battalion or company which has been formed in circle to its original position in line.

To REDUCE the Square, is to restore a battalion or battalions which have been formed in a hollow or oblong square to their natural situation in line or column.

REDUCED CHART. See CHART.

To be REDUCED, in *Military Language*, is to be taken off the establishment, or cease to receive pay as soldiers. When a regiment is reduced, the officers are generally sent upon half pay. Sometimes, as at the close of a war, the corps are reduced, and the officers remain upon full pay. Hence are derived the expressions *in* and *out* of the break. In the break denotes the liability of being reduced: *out of the break* signifies the certainty of being kept upon the establishment.

To be REDUCED to the Ranks, is to be taken from a superior appointment in a regiment, and to be ordered to the duty of a common soldier. This sometimes happens by way of punishment, when a serjeant or corporal misbehaves. A serjeant, however, cannot, at present, be reduced, except by sentence of a regimental court-martial.

REDUCING SCALE, is a thin broad piece of box, with several lines and scales of equal parts upon it; for turning chains and links into acres and rods, by inspection.

It is used by surveyors to reduce maps and draughts from one dimension to another; it is sometimes also called a *surveying scale*.

REDUCT, REDUIT, or *Redoubt*, a military term, signifying an advantageous piece of ground, intrenched and separated from the rest of the place, camp, &c. for an army, garrison, &c. to retire to, in case of a surprise. Reduits have been sometimes made for the purpose of securing different posts in a town independent of its citadel. They were proposed by the celebrated Vauban. See DONJON.

REDUCT, in *Building*, a kind of recess, or little place, taken out of a larger, to make it more uniform and regular; or for some other convenience, as for a little cabinet aside of a chimney, for alcoves, &c.

REDUCT, or *Redux*, among *Chemists*, is a powder by which calcined metals and minerals are reduced again to their regulus, or pure substance.

REDUCTION, REDUCTIO, in the *Schools*, a manner of bringing a term or proposition, which before was opposite to some other, to be equivalent to it.

Reduction is effected by the addition or retrenchment of a negative particle. Thus, to reduce this proposition, *no man is an animal*, to be equivalent to its opposite, *every man is an animal*, I drop the negative, and say, *man is an animal*. After the like manner might the term *every man* be reduced, by adding the negative and saying, *there is no man*.

REDUCTION of Propositions is used in a more general sense, for any expression of one proposition, by another proposition equivalent to it.

To a reduction, therefore, there are two propositions required, the *reduced*, and the *reducing*; which are considered as the extremes of it, and to be connected in the reduction by

means of the particle *that is*; which here has the effect of a copula.

As here, *only animals think; that is, animals think, and nothing besides animals thinks*. Where the proposition preceding the particle is reduced, and the subject of the reduction; that following the particle reduces, and has the effect of the predicate of the reduction, and the particle *that is* acts as a copula, importing, not barely that the proposition is expressed by another, but by another equivalent one, or, as it were, the same.

REDUCTION of Syllogisms, is a regular changing or transforming of an imperfect syllogism into a perfect one. Or, it is a change of a syllogism in respect of form, by which the necessity of the illation, or inference, is made more evident.

Reduction obtains in syllogisms of the second and third figure; as also in the indirect modes of the first. By it these are all brought to the first.

There are two kinds of this reduction; the one *direct*, or *ostensive*, performed merely by a conversion of one or both the premises, or by a transposition of them; as when *camestres* is reduced to *celarent*: the other *indirect*, called *per impossibile*, or *ad absurdum*; by which the person who denies the goodness and legitimacy of an imperfect syllogism, is reduced to assert or grant something absurd and impossible, or contradictory to some other thing maintained by him.

Suppose, *e. gr.* a person granting the premises of the following syllogism, denies the conclusion: *All fraud is prohibited; but some trading is not prohibited; therefore some trading is not fraud*. We thus proceed against him if the syllogism be not good, the antecedent is just, but the consequent false; and, therefore, the contrary of the conclusion must be true: now I take the contrary of the conclusion, which you thus give, *viz. all trading is fraud*; and of that, with the other premise of the former syllogism, *viz. the major*, which you likewise grant, make a new syllogism; thus, *All fraud is prohibited; all trading is fraud; therefore all trading is prohibited*. But this proposition, *all trading is prohibited*, and the other, *some trading is prohibited*, which you granted me in the first syllogism, are contradictories.

REDUCTION, in *Arithmetic*, is the converting of monies, weights, or measures, into the same value in other denominations; *e. gr.* pounds into shillings and pence; or shillings and pence into pounds.

The reductions of the principal monies, coins, weights, and measures, ancient and modern, foreign and domestic, are found under COIN, WEIGHT, MEASURE, POUND, FOOT, &c.

Reduction is of two kinds: 1. *Descending*, when a quantity is to be brought from a higher denomination to a lower.

This is done by considering how many of the next less denomination are contained in the next greater before, and by that number multiplying the greater.

Thus pounds are reduced into shillings, by multiplying by 20; shillings into pence, by multiplying by 12; and pence into farthings, by multiplying by 4.

Troy pounds are reduced into grains, by multiplying by 12, 20, and 24: and avoirdupois hundreds into ounces, by 4, 28, and 16.

2. *Ascending*, when a lower denomination is to be reduced to a higher.

In order to this, the business is to divide the least by so many of its denomination as are contained in the next greater: thus, 24,720 pence, divided by 12, and the quotient by 20, gives 103 pounds.

If there remain any thing in each division, it is respectively

ively either odd pence, or shillings: thus, 6713 pence reduced, give 27l. 19s. 5d. cut off the last, the rest are the pounds required.

To expedite the practice, several compendious ways of reduction have been invented. See PRACTICE.

Thus, yards are turned into ells by subtracting a fifth; and into ells Flemish by adding a fifth. Ells Flemish are reduced into yards by subtracting a quarter. Ells Flemish reduced to ells English by multiplying by 6, and cutting off the right-hand figure.

Great pounds of silk of twenty-four ounces are reduced to pounds of sixteen ounces by adding one-half; and pounds of sixteen ounces into pounds of twenty-four by subtracting one-third.

REDUCTION of Decimals. See DECIMALS.

REDUCTION of Fractions. See FRACTIONS.

REDUCTION of Ratios. See RATIOS, Reduction of.

REDUCTION of Surds. See SURDS.

REDUCTION of Equations. Various algebraical operations are classed under this head by different authors; some considering it to be the same as is otherwise, and more properly, called the solution of equations, or the finding of their roots: some define it to be the taking away or exterminating all the unknown quantities except one, otherwise called *elimination*: others again, under this head, treat of what is more usually termed the *transformation* of equations; and others again apply it to the depressing of an equation, or the reduction of it to another of lower dimensions, which latter seems to us the only operation that can properly be treated of under the above designation. See RESOLUTION, and TRANSFORMATION.

There are but few cases in which the reduction of an equation can be effected, viz. only when a known relation has place amongst any of its roots, in which case the equation will admit of being reduced as many degrees lower, as there are independent conditions known to have place. So that if the relation be only between two roots, which is one condition, the equation may be reduced two degrees; if the relation extend to three roots, it may be reduced three degrees; and so on.

The conditions or relations more commonly considered, are those in which the roots of an equation form an arithmetical or geometrical progression, and when an equation has any number of equal roots. The two former relations seem rather objects of curiosity than utility, as it is not probable that an equation should have such relations obtain between its root; but with regard to equal roots they may frequently arise in the solution of various problems. When any geometrical or physical problem is proposed, the number of its possible solutions is generally limited, and therefore the ultimate result arising out of such investigation ought to be an equation, the number of whose roots agree with the limited number of solutions. But it may happen that the analyst, by not pursuing the best mode of operation, is led to an equation of higher dimensions than is requisite, in which cases, upon investigation, it will always be found that his resulting equation has some number of equal roots, which being taken away, will reduce the equation to one of lower dimensions, which gives the proper number of solutions to the original problem. As to the cases in which the roots of an equation form a geometrical progression, they occur almost exclusively in the solution of binomial equations, having prime indices, a property which M. Gauss has turned to a good account in the solution of these equations. See POLYGON, and RECIPROCAL Equations.

Nearly all other relations between the roots of equations

are feigned for the purposes of framing questions, and exercising the ingenuity of authors and their students.

1. To ascertain whether a proposed equation has any equal roots.

Let $x^m + \alpha x^{m-1} + \beta x^{m-2} + \gamma x^{m-3} + \&c. = 0$, be any equation whose roots are $a, b, c, d, \&c.$ then from the known theory of equations we have

$$x^m + \alpha x^{m-1} + \beta x^{m-2} + \gamma x^{m-3} + \&c. = (x-a)(x-b)(x-c)(x-d), \&c.$$

And it may be shewn also, that the equation $m x^{m-1} + (m-1) \alpha x^{m-2} + (m-2) \beta x^{m-3} + \&c. =$

$$\begin{aligned} &(x-a)(x-b)(x-c) \&c. + \\ &(x-a)(x-b)(x-d) \&c. + \\ &(x-a)(x-c)(x-d) \&c. + \\ &(x-b)(x-c)(x-d) \&c.; \end{aligned}$$

that is, it is equal to the sum of all the m equations that can be formed by the different combinations of the m first roots, taking $m-1$ at a time. (See Waring's Meditations Algebraicæ, cap. 3.) Now if we suppose the first equation to have two equal roots, as, for example, $a=b$, the above products will become

$$\begin{aligned} &x^m + \alpha x^{m-1} + \beta x^{m-2} + \gamma x^{m-3} + \&c. = \\ &(x-a)(x-a)(x-c)(x-d) \&c. \text{ and} \\ &m x^{m-1} + (m-1) \alpha x^{m-2} + (m-2) \beta x^{m-3} + \&c. = \\ &(x-a)(x-a)(x-c) \&c. + \\ &(x-a)(x-a)(x-d) \&c. + \\ &(x-a)(x-c)(x-d) \&c. + \\ &(x-a)(x-c)(x-d) \&c.; \end{aligned}$$

where it is obvious that both the one and the other of these equations have the same factor, viz. $(x-a)$.

If the equation had three equal roots, it is equally obvious that both equations would have the common factor $(x-a)^2$; and generally, if the equation had p equal roots, they would both have the common factor $(x-a)^{p-1}$.

Therefore, when it is proposed to find whether a given equation have equal roots, we must from the proposed equation draw the *derived* equation as above, (which, it will be observed, is the same as would arise from taking the fluxion of the first, leaving out of course the x 's,) and find by the usual methods, whether these two functions have any common measure; which, if they have, will furnish us with the equal root sought; and consequently the original equation may then be reduced by division to another of two degrees, lower dimension for two equal roots; of three degrees, lower for three, and so on.

Exam. 1.—It is required to find the equal roots of the equation $x^3 - 48x - 128 = 0$.

Here the derived equation is $3x^2 - 48 = 0$, and the common measure of these two functions is $x+4$; whence -4 and -4 are the equal roots; the third root being $+8$.

Exam. 2.—It is required to ascertain whether the equation

$$x^4 + 3x^3 - 14x^2 - 12x + 40 = 0$$

have equal roots, and what they are.

Here the derived equation is

$$4x^3 + 9x^2 - 28x - 12 = 0;$$

and the common divisor of the two is $x-2$; whence $x=2, 2$, which are two of the equal roots. Divide now the original equation by $x^2 - 4x + 4$, and we have

$$x^2 + 7x + 10 = 0,$$

whose

whose roots are -2 , and -5 ; therefore, the four roots of the proposed equation are $2, 2, -2, -5$.

If the roots of an equation be equal, but with contrary signs, the operation is more simple. For, in this case, we have only to change the signs of the roots in the proposed equation, by changing the alternate signs of its co-efficient; and we shall thus have two equations, having necessarily a common quadratic factor of the form $x^2 - a^2$, which may be found, and the equation depressed as before.

Exam. 3.—Required the roots of the equation $x^4 + 3x^3 - 7x^2 - 27x - 18 = 0$, two of which are equal, but with contrary signs.

By changing the signs of the alternate terms, we have $x^4 - 3x^3 - 7x^2 + 27x - 18 = 0$, the common quadratic divisor of which is $x^2 - 9 = 0$; whence the equal roots with contrary signs are $+3$, and -3 . Now dividing the proposed equation by $x^2 - 9$, we have $x^2 + 3x + 2 = 0$;

whence $x = \frac{-3}{2} \pm \sqrt{\frac{1}{4}} = -2$, and -1 , which are

the other two roots.

On this subject the reader should consult Waring's *Meditationes Algebraicæ*, cap. 3. See also Bonnycastle's *Algebra*, vols. i. and ii.

REDUCTION of Interest of the public Debt. See **FUND.**

REDUCTION of Curves. See **CURVE.**

REDUCTION of a Figure, Design, or Draught, is the making a copy of it, either larger or smaller than the original, still preserving the form and proportion.

The great use of the proportional compasses is in the reduction of figures, &c. whence they are also called *compasses of reduction*.

There are various methods of reducing figures, &c.; the most easy is by means of the *pentagraph* (which see), or parallelogram: but this has its defects. The best and most usual methods of reduction are as follow:

To reduce a figure, as ABCDE (Plate XII. Geometry, fig. 5.) into a less compass.—About the middle of the figure, as z , pitch on a point; and from this point draw lines to its several angles, A, B, C, &c. then drawing the line ab parallel to AB , bc parallel to BC , &c. you will have the figure $abcde$ similar to $ABCDE$.

If the figure $abcde$ had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as zD , zC , &c. and to draw lines, viz. DC , CB , &c. parallel to the sides dc , cb , &c.

To reduce a figure by the angle of proportion.—Suppose the figure $ABCDE$ (fig. 6.) required to be diminished in the proportion of the line AB to ab (fig. 7.): draw the indefinite line GH (fig. 8.), and, from G to H , set off the line AB ; on G describe the arc HI ; set off the line ab as a chord on HI , and draw GI . Then with the angle IGH you have all the measures of the figure to be drawn. Thus to lay down the point c , take the interval BC , and upon the point G describe the arc KL ; also on the point G describe MN ; and upon a , with the distance MN , describe an arc cutting the preceding one in c , which will determine the side bc . And after the same manner are all the other sides and angles to be described. The same process will also serve to enlarge the figure.

To reduce a figure by a scale.—Measure all the sides of the figure, e. gr. $ABCDE$, by a scale, and lay down the same measures respectively, from a smaller scale in the proportion required.

To reduce a map, design, or figure, by squares.—Divide the original into little squares, and divide a fresh paper of the dimensions required, into the same number of squares;

which are to be larger or less than the former, as the map is to be enlarged or diminished.

This done, in every square of the second figure, draw what you find in its correspondent one in the first.
